Aquæ *Segeſte, Ferrieres*, a place belonging to the Senonenſes, between Genabum to the ſouth-weſt and Agedincum to the north-eaſt:—alſo *Segeſte, Aiſſumin*, a place of Gaul belonging to the Seguſiani; placed by M. D'Anville near Liger, and ſouth of Forum Seguſianorum.

Aquæ *Sextiæ*, *Aix*, a town in Gaul, in Narbonnenſis Secunda, to the north of Maſſilia. See Aix.

Aquæ *Siccæ*, probably *Seiches*, a place of Gaul, ſituate, according to M. D'Anville, ſouth-weſt of Toloſa, and near it, and north-eaſt of Vernoſol.

Aquæ *Statiellæ*, or *Staticllorum*, a town of Italy in Liguria, now Acqui, in Montferrat.

Aquæ *Tacapitanæ*, a place of Africa in Bizacium, now called *El-Hammah* of Gabs, i.e. the baths of Gabs, or Tacape. Theſe baths are ſheltered from the weather by low thatched hovels; and their baſons are about the ſize of thoſe at Mereega. See Aquæ *Calidæ*. One of theſe baths is called the bath of the lepers, and below it the water ſtagnates and forms a pool; the ſame, perhaps, with the lake of lepers, mentioned by Leo.

Aquæ *Tauri*, hot baths of Etruria in Italy, three miles from the ſea, ſaid to be diſcovered by a bull, whence their name; now *Aquapendente* in Orvieto.

Aquæ *Voconis*, a place of Spain, ſouth-eaſt of Gerunda.

Aquæ *Volaterranæ*, a place of Italy in Etruria, ſouth of Volaterræ, and on the other ſide of Cecina.

Aquæ *et ignis interdictio*. See Interdiction.

Aquæ *bajulus*, an ancient name for the clerk officiating under the chief miniſter, whoſe buſineſs was to aſſiſt him in carrying the holy water. The office correſponding to it at preſent is that of the parish *clerk*.

Aquæ *hauſtus*, in the *Civil Law*, a right of drawing water, and carrying it through another's ground.

Aquæ *pavor*, is uſed by ſome to denote the hydrophobia. Phil. Tranſ. N° 147.

AQUÆDUCT, Aquæductus, q. d. *ductus aquæ*, *a conduit of water*, in *Architecture* and *Hydraulics*, is a conſtruction of ſtone or timber, built on an uneven ground, to preſerve the level of water, and convey it by a canal, from one place to another. Some of theſe aquæducts are viſible, and others ſubterraneous. Thoſe of the former ſort are conſtructed at a great height acroſs vallies and marſhes, and ſupported by piers and ranges of arches. The latter are formed by piercing the mountains, and conducting them below the ſurface of the earth. They are built of ſtone, brick,

brick, &c. and covered above with vaulted roofs or flat ſtones, ſerving to ſhelter the water from the ſun and rain. Of theſe aquæducts, ſome are double, and others triple; that is, ſupported on two or three ranges of arches. Of the latter kind are the pont-du-gard in Languedoc, ſuppoſed to have been built by the Romans to carry water to the city of Niſmes; that of Conſtantinople; and that which, according to Procopius, was conſtructed by Coſroes king of Perſia, near Petra in Mingrelia, and which had three conduits in the ſame direction, each elevated above the other. Some of theſe aquæducts were paved, and others conveyed the water through a natural channel of clay; and it was frequently conducted by pipes of lead into reſervoirs of the ſame metal, or into troughs of hewn ſtone.

Aquæducts of every kind were reckoned among the wonders of ancient Rome; their great number, and the immenſe expence of bringing water, 30, 40, or 60, and even 100 miles, either upon continued arches, or by means of other works, when it was neceſſary to penetrate mountains and rocks, may well aſtoniſh us. If, ſays Pliny (Hiſt. Nat. l. 36. c. 15.), we conſider the incredible quantity of water brought to Rome for the uſes of the public, for fountains, baths, fiſh-ponds, private-houſes, garden and country-ſeats; if we repreſent to ourſelves the arches conſtructed at a great expence, and carried on through a long diſtance, mountains levelled, rocks cut through, and vallies filled up, it muſt be acknowledged that there is nothing in the whole world more wonderful. For 440 years the Romans contented themſelves with the waters of the Tiber, and of the wells and fountains in the city and its neighbourhood. But when the number of houſes and inhabitants was conſiderably augmented, they were obliged to bring water from remote places by means of aquæducts. Appius commenced this ſcheme of improvement. See APPIAN *aquæduct*. About 39 years after him, M. Curius Dentatus, who was cenſor with Papirius Curſor, brought water from the neighbourhood of the city of Tibur; and applied towards defraying the expence, part of the ſums taken in the ſpoils of Pyrrhus. After them Lucius Papirius, Caius Servilius Cepion, Lucius Longinus Craſſus, Quintus Marcius (who brought water to Rome from a ſpring at the diſtance of ſixty-one miles), Marcus Agrippa, Auguſtus, and others, ſignalized themſelves by their noble aquæducts. Even Tiberius, Claudius, Caligula, and Caracalla, though in other reſpects not of the beſt character, took care of the city in this uſeful article. There are ſtill to be ſeen in the country about Rome wonderful remains of the ancient aquæducts, ſome elevated above the ground by arches continued and raiſed one above the other, and others ſubterraneous paſſing through rocks; ſuch is that ſeen at Vicovaro beyond Tivoli, in which a canal pierces a rock to the extent of more than a mile, and about five feet deep and four broad. With what attention theſe immenſe works were conſtructed, will appear by inſpection of the 128th plate in the 4th volume of Montfaucon's Antiquities. At certain diſtances vents were provided, ſo that the water which was accidentally obſtructed in its paſſage, might be diſcharged, till its ordinary paſſage was cleared; and in the canal of the aquæduct itſelf there were cavities into which the water was precipitated, and where it remained till its mud was depoſited, and ponds in which it might purify itſelf. In the conſtruction of theſe aquæducts, there was a conſiderable variety: that called the *Aqua Marcia* had an arch of ſixteen feet in diameter; it was conſtructed of three kinds of ſtone, and was formed with two canals one above the other: the moſt elevated was ſupplied by the waters of the Tiverone, *Anio novus*, and the loweſt by the *Claudian* water. The entire edifice was 70 Roman feet high. The arch of the aquæduct which brought to Rome the Claudian water was conſtructed of beautiful hewn ſtone. This is repreſented by Pliny (Hiſt. Nat. l. 36. c. 15.), as the moſt beautiful of all that had been built for the uſe of Rome. It conveyed the water through a vaulted canal, through the diſtance of 40 miles, and was ſo high that it ſupplied all the hills of the city. According to him, and the computation of Budæus, the charge of this work amounted to 1,385,500 crowns. This aquæduct was begun by Caligula, and finiſhed by Claudius, who brought its waters from two ſprings called Cæruleus and Curtius. Veſpaſian, Titus, Marcus Aurelius, and Antoninus Pius, repaired and extended it: it is now called *Aqua Felice*. The aquæduct that conveyed the Aqua Neroniana to Rome, was built of brick; this, as well as the former, was 62 Roman feet high. The aquæduct that brought the *Aqua Marcia* into the city was repaired by Agrippa, who laid pipes from it to ſeveral parts of the city. The Aqua Marcia, Aqua Julia, and Aqua Tepula (ſee AQUA), entered Rome in one and the ſame aquæduct, divided into three ranges or ſtories; in the uppermoſt of which flowed the Aqua Tepula, in the ſecond the Aqua Julia, and in the loweſt the Aqua Marcia. This accounts for the extraordinary height of this aquæduct, which far ſurpaſſed that of any other in Rome. From the ruins of this fabric, which ſtill ſubſiſt, and are called "Il caſtel del Acqua Marcia," it appears to have been a very ſuperb ſtructure. The aquæducts were under the care and direction, firſt of the cenſors and ædiles, and afterwards, of particular magiſtrates called "Curatores Aquarum," inſtituted by Agrippa, to whom the aquæducts of Rome were objects of particular attention. Meſſala was one of theſe curatores in the reign of Auguſtus, and Frontinus held the ſame office in that of Nerva. Auguſtus cauſed all of them to be repaired. Procopius reckons only fourteen aquæducts in ancient Rome; but Victor has enlarged the number to twenty. Frontinus, a man of conſular dignity, and who had the direction of the aquæducts under the emperor Nerva, mentions nine that emptied themſelves through 13,594 pipes, of an inch diameter. Vigenere has obſerved, that in the ſpace of twenty-four hours, Rome received from theſe aquæducts no leſs than five hundred thouſand hogſheads of water. The three chief aquæducts now in being are thoſe of the Aqua Virginea, Aqua Felice, and Aqua Paulina. The firſt was repaired by Pope Paul IV. The ſecond was conſtructed by Pope Sixtus V. and is called from the name which he aſſumed before he was exalted to the papal throne. It proceeds from Palæſtrina at the diſtance of twenty-two miles, and diſcharges itſelf at the Fontana di Termini, which was alſo built at his expence, and conſiſts of three arches, ſupported by four Corinthian pillars, and the water guſhes out through three large apertures. Over the middle arch ſtands a beautiful ſtatue of Moſes ſtriking the rock with his rod; over another arch is a baſſo-relievo of Aaron leading the people to the miraculous ſprings in the wilderneſs; and the third exhibits Gideon trying his ſoldiers by their drinking water. Round it are four lions, two of marble, and the other two of oriental granite, ſaid to be brought thither from a temple of Serapis. All the four lions eject water; and on the front is an inſcription, importing that this aquæduct was begun in the firſt and completed in the third year of the pontificate of Sixtus V. 1588. The third was repaired by Pope Paul V. in the year 1612. This divides itſelf into two principal channels, one of which ſupplies Mount Janiculus, and the other the Vatican and its neighbourhood. It is conveyed through the diſtance of thirty miles, from the diſtrict of Bracciano, and three of its five ſtreams are not inferior to ſmall rivers, and ſufficient to turn a mill.

After

After recounting the ancient and modern aquæducts of Rome, we might mention thoſe conſtructed by the Romans in other countries: one of the principal of theſe is the aquæduct of Metz, of which a great number of the arcades ſtill remain. Theſe arcades croſſed the Moſelle, which is broad and deep; and the copious waters of Gorze furniſhed water ſufficient for the repreſentation of a ſea-fight. The water was collected in a reſervoir, whence it was conducted by a ſubterraneous canal formed of hewn ſtone, and ſo lofty that a man might walk in it erect; and it then traverſed the Moſelle, at the diſtance of two leagues from Metz. This aquæduct was ſo accurately wrought and firmly cemented, that its parts have in a great degree reſiſted the ſhocks of the moſt ſevere ſeaſons. From the arcades that croſſed the river, other aquæducts conveyed the water to the baths of Metz, and alſo to the place where the naumachia was exhibited. Of the aquæduct of Segovia, there ſtill remain 159 arcades, conſiſting of ſtones of an enormous ſize, and joined without mortar. Theſe arcades are 102 feet high, and are diſpoſed in two ranges, one above the other. The aquæduct traverſes the city, and paſſes under a conſiderable number of houſes. The famous aquæducts of Conſtantinople, about ſix miles from the village of Belgrade, were built by Valentinian the firſt, Clearchus being præfect, and afterwards repaired by Solyman the magnificent, who exempted twelve adjacent Greek villages from the cuſtomary tribute of the empire, in conſideration of their keeping theſe aquæducts in repair. Of theſe the moſt remarkable are three large and lofty fabrics, built over ſo many valleys betwixt the adjoining hills, of which the longeſt has many but leſs arches, and may poſſibly (ſays Chiſhull, Travels, &c. p. 43.), be the entire work of Solyman. The other two have the appearance of a more ancient and regular architecture, conſiſting of two rows of arches one over the other; and thoſe of the ſecond were incloſed by pillars cut through the middle, ſo as to render the fabric both paſſable like a bridge, and uſeful for the conveyance of water. The more conſiderable of theſe two conſiſts of only four large arches, each twenty yards long, and ſomewhat above twenty high, ſupported by octangular pillars of about fifty-ſix yards in circumference towards the bottom. For an inquiry into the nature and conſtruction of the aquæducts of the Romans, ſee Governor Pownall's Notices and Deſcriptions of Antiquities of the Provincia Romana, of Gaul, 4to. 1788. The aquæduct built by Lewis XIV. near Maintenon, for carrying the river Bure to Verſailles, is perhaps the greateſt now in the world. It is 7000 fathoms long, and its elevation 2560 fathoms; containing 242 arcades. Vide Phil. Tranſ. ap. Lowth. Abr. vol. i. p. 594.

AQUÆDUCTUS *Fallopii*, a name improperly given by Fallopius to the bony canal through which the firm portion of the auditory nerve paſſes out of the cranium.

AQUÆDUCTUS *Cottennii*, are real aquæducts ſerving to carry off redundant water from the labyrinth of the ear. For a more full account of each of theſe articles, ſee the deſcription of the EAR.

AQUÆDUCTUS *Sylvii*, the iter a tertio ad quartum ventriculum, or canalis medius. See BRAIN.

AQUÆMANILIS, from *aqua*, *water*, and *manus*, *hand*, is particularly uſed, in *Eccleſiaſtical Writers*, for a kind of baſon or laver, anciently placed in the veſtibules of churches, ſerving to waſh the hands in.

Aquæmanilis ſtood contradiſtinguiſhed from *urceolus*, as the former was placed under the hands, the latter above them, from whence the water trickled down by a cock. The prieſt alſo, after celebrating maſs, waſhed his fingers in an aquæmanilis.

In the inventories of church plate, we frequently find mention of aquæmanilis, aquaminilia, aquiminalia, of ſilver gilt, wrought, &c. Du-Cange.

AQUAFFO, in *Geography*, a town of Africa on the Gold coaſt, where is held a ſlave market, to the weſt of Cape-coaſt-caſtle.

AQUAFORT, a ſettlement on the eaſt ſide of the ſouth-eaſtern extremity of Newfoundland iſland. N. lat. 47° 10'.

AQUAGE, a water-courſe.

AQUALICULUS, in *Anatomy*, a name given by ſome to the region of the body wherein the trunk terminates, and the thighs commence, and in which alſo the privities are placed.

The aqualiculus is the ſame with what others call *pubes*, others the *hypogaſtrium*, *ſumen*, *imus venter*, &c.

AQUALLA, in *Geography*, a town of Africa, in the country of Soko, on the Gold-coaſt.

AQUAMBOE, a kingdom of Africa on the Gold-coaſt, bounded on the eaſt by the river Volta, and on the weſt by Agonna. That part of Aquamboe which lies on the coaſt is called Acra, and might formerly have been an independent ſtate; but it is now dependent and tributary. Aquamboe is one of the moſt extenſive and powerful monarchies on the coaſt of Guinea; its maritime dominions extending twenty miles along the coaſt, and ten times as far into the inland parts. The territory towards the coaſt is ſaid to be divided into a number of petty royalties, but all of them ſubject to the king of Aquamboe, who exerciſes an unlimited and indiſcriminate authority over them as his meaneſt ſubjects; whence it has become a proverb, that in Aquamboe there are only two ranks of men, the royal family and the ſlaves. The natives of this country are haughty, turbulent and warlike; and their power is formidable to all the neighbouring kingdoms, except ACHEM. All the tributary nations are grevioufly infeſted by the incurſions of the Aquamboans. It has been thought that the king and his nobility are richer in gold and ſlaves, and poſſeſs greater treaſures than all the kingdoms on the coaſt of Guinea, at leaſt on the Gold coaſt; and the extenſive commerce of the maritime part of Acra would be much enlarged, if it were not obſtructed by perpetual quarrels between the natives of Aquamboe and Achem. The ſovereign of the former claims an annual tribute from the latter, the refuſal of which excites frequent diſſenſions; but the former, ſenſible of the ſuperiority of the latter, diverts the ſtorm by creating diſcord in the councils of Achem, and thus he artfully contrives to preſerve the tranquillity and trade of his realm. The chief buſineſs of the people is trade, agriculture, and war; and war in this country promotes trade and huſbandry, by increaſing the number of ſlaves and priſoners, who are obliged to labour for the Aquamboans, while they are maintained by them. Of courſe, they are by intereſt and inclination much addicted to war. Though the ſoil is fertile, yet before the expiration of the year, they are under a neceſſity of ſeeking ſupplies from other countries. The Aquamboans, diſdaining the employments of fiſhing and making of ſalt, leave them to the maritime negroes, who are very numerous, and carry on a great trade with the European ſhipping. The number of ſlaves ſold here is at leaſt equal to what is diſpoſed of on the whole coaſt beſide, not excepting Anamaboa. In time of war, every man fit to bear arms enters the field; and a certain number is detached to cultivate the ground and ſell the priſoners, while the reſt are engaged in oppoſing the enemy. Among the fiſhermen on the coaſt there are few warriors; for as they live under the protection of the Europeans, and are defended on the north by their more warlike countrymen, they are ſeldom attacked, or compelled to change the hook and net for the ſword and buckler.

by Mr. The countries of Lobadde, Ningo, and Soko, all of which have ports on the ſea coaſt, are merely diviſions of the great kingdom of Aquamboe.

AQUA-NEGRA. See Acqua-negra.

AQUANILE, a river of Calabria, ſuppoſed by Swinburne (Travels in the two Sicilies, vol. ii. p. 175), both on account of its name and poſition, to be the Hylias, anciently the limit between Sybaris and Croton. On its banks the Crotoniates gained the victory which made them maſters of the Sybarite territory.

AQUAPENDENTE. See Acquapendente.

AQUAPULCO. See Acapulco.

AQUARIA. See Aquaria.

AQUARIANS, in *Eccleſiaſtical Hiſtory*, a ſect, toward the cloſe of the ſecond century, who, inſtead of wine, uſed nothing but water in the ſacrament.

It is ſaid the occaſion of the abuſe was owing to the perſecution which prevailed in thoſe times: for the Chriſtians, being then obliged to celebrate the ſacrament in the night, found it neceſſary to make uſe of water, leſt the ſmell of the wine ſhould betray them to the heathens. But they afterwards went farther, and actually forbad the uſe of wine in the euchariſt, even when it might be uſed with ſafety.

Epiphanius tells us, the Aquarians were the followers of Tatian; and were ſo called from the word *aqua*, *water*, becauſe they abſtained wholly from wine, and did not uſe it even in the euchariſt.

AQUARIUS, in *Aſtronomy*, the eleventh ſign in the zodiac, reckoning from Aries; from which alſo the eleventh part of the ecliptic takes its name.

The ſun moves through Aquarius in part of the months of January and February: it is marked thus, ♒.

The poets feign that Aquarius was Ganymede, whom Jupiter raviſhed under the ſhape of an eagle, and carried away into heaven, to ſerve as a cup-bearer in the room of Hebe and Vulcan; whence the name.—Others hold, that the ſign was thus called, becauſe, when it appears in the horizon, the weather uſually proves rainy.

The ſtars in the conſtellation Aquarius, in Ptolemy's catalogue, are 45; in Tycho's, 41; in Hevelius's, 47; in Flamſteed's Britannic Catalogue, 108.

AQUARTIA, in *Botany*, a plant ſo named by Jacquin, in honour of his friend B. Aquart, merchant in Martinico, who aſſiſted him in his botanical reſearches. Linn. Gen. 136. Schrebt. g. 176. Jacq. Amer. 15. Juſſ. 126. Claſs, *tetrandria monogynia*. Nat. Order, *Solaneæ* Juſſ. Gen. Char. *Cal.* perianth monophyllous, permanent; tube, bell-ſhaped; limb, ſubquadrifid, expanding; two oppoſite diviſions obſolete. *Cor.* monopetalous, rotate; tube, very ſhort; limb, quadrifid; diviſions linear, ſpreading. *Stam.* filaments ſhort; anthers erect, very large, linear. *Piſt.* germ. ovate; ſtyle, filiform, bending, the length of the corolla; ſtigma ſimple. *Per.* a berry, globular, one-celled. *Seeds*, very many, compreſſed.

Eſſ. gen. char. *Cal.* bell-ſhaped; *corolla*, wheel-ſhaped, with linear diviſions; *berry*, many-ſeeded.

Species, 1. *Aquartia aculeata*. This is a perennial ſpinous plant, with alternate, ovate, obtuſe, petioled leaves. Jacquin obſerves that it riſes with a ſhrubby branched ſtem, to the height of four feet, producing white flowers, and yellow ſhining fruit, about the ſize of a pea. It has the appearance of a ſolanum, and Swartz thinks that it ought to be conſidered as one of that genus, with four ſtamens. A native of the Weſt-Indies, and of South America. Jacq. ed. 2. Am. pict. t. 15.

AQUA-SPARTA, in *Geography*. See Acqua-sparta.

AQUATANIO, or Aqua d'Acio; a ſmall river of Italy, which runs into the Tiber about a mile from Rome.

AQUATIA, in *Middle Age Writers*, a right of fiſhing three days in the year. Du-Cange.

In ancient deeds we find divers grants of this privilege of *aquatia*, or *aquatura*; ſometimes alſo called *aquaria*.

In ſome writings aquatia ſeems alſo to have ſignified a fee, or other ſervice, paid for the privilege of fiſhing.

AQUATIC, ſomething which lives, breeds, or grows on or about the water. Thus we have aquatic plants, and aquatic animals. Trees which grow peculiarly on the banks of rivers, or in marſhes, &c. are alſo called aquatics.

The ancient Romans had alſo their *aquatic* or *aquatile* gods, *dii aquatiles*, called by Catullus, *dii littorales*; concerning whom we have an inſcription in Reineſius, Septvno et diis aqvatilibvs.

To this claſs belonged the Tritons, the miniſters of Neptune.

AQUATIC manure, in *Agriculture*, a term applied to ſuch manure as is formed in conſequence of the diſſolution or decay of various aquatic vegetables, and depoſited at the bottoms of ponds, ditches and other ſimilar places. It has been obſerved by Mr. Marſhall, in the Rural Œconomy of the Midland Counties, that he dreſſed two lands with the aquatic manure (raiſed two or three years before out of a fiſh-pool, and afterwards turned up into a heap of digeſts), the reſt of the piece being manured with yard dung, the quantity of each about eight loads an acre, the two lands dreſſed with the aquatic manure were obviouſly the better crop of turnips; the plants were, he ſays, not more numerous but larger and cleaner-ſkinned, and what was remarkable, while the crop of the piece in general was full of cetlock and chick-weed, which aroſe after the hoeing, the two lands where this ſort of manure was applied, were in a manner entirely free from theſe weeds.

AQUATINTA, in the *Hiſtory of the Arts*, a method of producing engravings very much reſembling drawings in Indian ink.

The principle of this proceſs conſiſts in corroding the copper with aquafortis, in ſuch a manner, that an impreſſion from it has the appearance of a tint laid on the paper. This is effected by covering the copper with a powder or ſome ſubſtance which takes a granulated form, ſo as to prevent the aquafortis from acting where the particles adhere, and by this means cauſe it to corrode the copper partially and in the interſtices only. When theſe particles are extremely minute, and near to each other, the impreſſion from the plate appears to the naked eye exactly like a waſh of Indian ink. But when they are larger, the granulation is more diſtinct: and as this may be varied at pleaſure, it is capable of being adapted with great ſucceſs to a variety of purpoſes and ſubjects.

This powder or granulation is called the aquatinta grain, and there are two general modes of producing it.

We ſhall firſt deſcribe what is called the powder grain, becauſe it was the firſt that was uſed. Having etched the outline on a copper plate prepared in the uſual way by the copperſmith, (for which ſee the article Etching) ſome ſubſtance muſt be finely powdered and ſifted which will melt with heat, and when cold adhere to the plate, and reſiſt the action of aquafortis. The ſubſtances which have been uſed for this purpoſe, either ſeparately or mixed, are, aſphaltum, Burgundy pitch, roſin, gum copal, and gum maſtic; and in a greater or leſs degree all the reſins and gum reſins will anſwer the purpoſe. Common reſin has been moſt generally uſed, and anſwers tolerably well; though gum copal makes a grain that reſiſts the aquafortis better. The ſubſtance intended to be uſed for the grain muſt now be diſtributed over the plate, as equally as poſſible; and different methods of performing this eſſential part of the operation have been uſed

by different engravers, and at different times. The moſt uſual way is to tie up ſome of the powder in a piece of muſlin, and to ſtrike it againſt a piece of ſtick held at a conſiderable height above the plate. By this, the powder that iſſues falls gently, and ſettles equally over the plate. Every one muſt have obſerved how uniformly hair powder ſettles upon the furniture after the operations of the hair dreſſer: this may afford a hint towards the beſt mode of performing this part of the proceſs. The powder muſt fall upon it from a conſiderable height, and there muſt be a ſufficiently large cloud of duſt formed. The plate being covered equally over with the duſt or powder, the operator is next to proceed to fix it upon the plate, by heating it gently, ſo as to melt the particles. This may be effected by holding under the plate lighted pieces of brown paper rolled up, and moving them about till every part of the powder is melted. This will be known by its change of colour, which will turn browniſh. It muſt now be ſuffered to cool, when it may be examined with a magnifier; and if the grains or particles appear to be uniformly diſtributed, it is ready for the next part of the proceſs.

The deſign or drawing to be engraved muſt now be examined, and ſuch parts of it as are perfectly white, are to be remarked. Thoſe correſponding parts of the plate muſt be covered, or ſtopped out, as it is called, with turpentine, or what is better, maſtic varniſh, diluted with turpentine to a proper conſiſtence to work freely with the pencil, and mixed with lamp-black to give it colour; for, if tranſparent, the touches of the pencil would not be ſo diſtinctly ſeen. The margin of the plate muſt alſo be covered with varniſh. When the ſtopping out is ſufficiently dry, a border of wax muſt be raiſed round the plate in the ſame manner as in etching, and the aquafortis, properly diluted with water, poured on. This is called biting in; and it is that part of the proceſs which is moſt uncertain, and which requires the greateſt degree of experience. When the aquafortis has lain on ſo long that the plate, when printed, would produce the lighteſt tint in the drawing, it is poured off, and the plate waſhed with water, and dried. When it is quite dry, the lighteſt tints are ſtopped out, and the aquafortis poured on as before; and this is repeated as often as there are tints to be produced in the plate.

Although many plates are etched entirely by this method of ſtopping out and biting in alternately, yet it may be eaſily conceived that in general it would be very difficult to ſtop round and leave out all the finiſhing touches, as alſo the leaves of trees, and many other objects, which it would be impoſſible to execute with the neceſſary degree of freedom in this manner.

To overcome this difficulty, another very ingenious proceſs has been invented, by which the touches are laid on the plate with the ſame eaſe and expedition as they are in a drawing in Indian ink. Fine waſhed whiting is mixed with a little treacle or ſugar, and diluted with water in the pencil ſo as to work freely, and this is laid on the plate covered with the aquatint ground, in the ſame manner and on the ſame parts as ink on the drawing. When this is dry, the whole plate is varniſhed over with a weak and thin varniſh of turpentine, aſphaltum, or maſtic, and then ſuffered to dry, when the aquafortis is poured on. The varniſh will immediately break up in the parts where the treacle mixture was laid, and expoſe all thoſe places to the action of the acid, while the reſt of the plate remains ſecure. The effect of this will be, that all the touches, or places where the treacle was uſed, will be bit in deeper than the reſt, and will have all the preciſion of touches in Indian ink.

After the plate is completely bit in, the bordering wax is taken off by heating the plate a little with a lighted piece of paper; and it is then cleared from the ground and varniſh by oil of turpentine, and wiped clean with a rag and a little fine whiting, and then it is ready for the printer.

The principal diſadvantages of this method of aquatinting are, that it is extremely difficult to produce the required degree of coarſeneſs or fineneſs in the grain, and that plates ſo engraved do not print many impreſſions without wearing out. It is therefore now very ſeldom uſed, though it is occaſionally of ſervice.

We next proceed to deſcribe the ſecond method of producing the aquatint ground, which is generally adopted. Some reſinous ſubſtance is diſſolved in ſpirits of wine, as for inſtance common reſin, Burgundy pitch, or maſtic, and this ſolution is poured all over the plate, which is then held in a ſlanting direction till all the ſuperfluous fluid drains off, and it is then laid down to dry, which it does in a few minutes. If the plate be then examined with a magnifier, it will be found that the ſpirit in evaporating has left the reſin in a granulated ſtate, or rather that the latter has cracked in every poſſible direction, ſtill adhering firmly to the copper. A grain is thus produced with the greateſt eaſe, which is extremely regular and beautiful, and much ſuperior for moſt purpoſes to that produced by the other method. After the grain is formed, every part of the proceſs is conducted in the ſame manner as above deſcribed.

Having thus given a general idea of the art, we ſhall mention ſome particulars neceſſary to be attended to, in order to enſure ſucceſs in the operation. The ſpirits of wine muſt be rectified, and of the beſt quality: what is ſold in the ſhops contains camphor, which would entirely ſpoil the grain.

Reſin, Burgundy pitch, and gum maſtic, when diſſolved in ſpirits of wine, produce grains of a different appearance and figure, and are ſometimes uſed ſeparately, and ſometimes mixed in different proportions, according to the taſte of the artiſt, ſome uſing one ſubſtance and ſome another.

In order to produce a coarſe or fine grain, it is neceſſary to uſe a greater or ſmaller quantity of reſin; and to aſcertain the proper proportions, ſeveral ſpare pieces of copper muſt be provided, on which the liquid may be poured, and the grain examined before it is applied to the plate to be engraved.

After the ſolution is made, it muſt ſtand ſtill and undiſturbed for a day or two, till all the impurities of the reſin have ſettled to the bottom, and the fluid is perfectly pellucid. No other method of freeing it from thoſe impurities has been found to anſwer. Straining it through linen or muſlin fills it with hairs, which are ruinous to the grain.

The room in which the liquid is poured on the plate muſt be perfectly ſtill, and free from duſt, which, whenever it falls on the plate while wet, cauſes the grain to form a white ſpot, which it is impoſſible to remove without laying the grain afreſh.

The plate muſt be previouſly cleaned with the greateſt poſſible care, with a rag and whiting, as the ſmalleſt ſtain or particle of greaſe produces a ſtreak or blemiſh in the grain.

All theſe attentions are abſolutely neceſſary to produce a tolerably regular grain; and after every thing that can be done by the moſt experienced artiſts, ſtill there is much uncertainty in the proceſs. They are ſometimes obliged to lay on the grain ſeveral times before they procure one ſufficiently regular. The ſame proportions of materials do not always produce the ſame effect, as it depends in ſome degree upon their qualities, and it is even materially affected by the weather. Theſe difficulties are not to be ſurmounted but by a great deal of experience: and thoſe who are daily in the habit of practiſing the art are frequently liable to the moſt unaccountable accidents. Indeed it is much to be

be lamented, that ſo elegant and uſeful a proceſs ſhould be ſo delicate and uncertain.

It being neceſſary to hold the plate in a ſlanting direction in order to drain off the ſuperfluous fluid, there will naturally be a greater body of the liquid at the bottom than at the top of the plate. On this account, a grain laid in this way is always coarſer at that ſide of the plate that was held lowermoſt. The moſt uſual way is, to keep the coarſeſt ſide for the foreground, being generally the part that has the deepeſt ſhadows. In large landſcapes, ſometimes various parts are laid with different grains, according to the nature of the ſubject.

The finer the grain is, the more nearly does the impreſſion reſemble Indian ink, and the fitter it is for imitating drawings. But very fine grains have ſeveral diſadvantages. For they are apt to come off before the aqua fortis has lain on long enough to produce the deſired depth; and as the plate is not corroded ſo deep, it ſooner wears out in printing. Whereas coarſer grains are firmer, the acid goes deeper, and the plate will throw off a great many more impreſſions. The reaſon of all this is evident, when it is conſidered, that in the fine grains the particles are ſmall and near to each other, and conſequently the aqua fortis, which acts laterally as well as downwards, ſoon undermines the particles, and cauſes them to come off. If left too long on the plate, the acid would eat away the grain entirely.

On theſe accounts, therefore, the moderately coarſe grains are more ſought after, and anſwer better the purpoſe of the publiſher, than the fine grains which were formerly in uſe.

Although there are conſiderable difficulties in laying properly the aquatint grain, yet the corroding of the copper, or biting in, ſo as to produce exactly the tint required, is ſtill more precarious and uncertain. All engravers allow, that no poſitive rules can be laid down, by which the ſucceſs of the proceſs can be ſecured: nothing but a great deal of experience and attentive obſervation can enable the artiſt to do it with any degree of certainty.

There are ſome hints, however, which may be of conſiderable importance to the perſon who wiſhes to attain the practice of this art.

It is evident, that the longer the acid remains on the copper, the deeper it bites, and conſequently the darker will be the ſhade in the impreſſion. It may be of ſome uſe, therefore, to have ſeveral bits of copper laid with aquatint ground of the ſame kind that is to be uſed in the plate, and to let the aqua fortis remain for different lengths of time on each; and then to examine the tints produced in one, two, three, four minutes, or longer. Obſervations of this kind frequently repeated, and with different degrees of ſtrength of the acid, will at length aſſiſt the judgment in gueſſing at the tint which is produced in the plate. A magnifier is alſo uſeful to examine the grain and to obſerve the depth to which it is bit. It muſt be obſerved, that no proof of the plate can be obtained till the whole proceſs is finiſhed.

If any part appears to have been bit too dark, it muſt be burniſhed down with a ſteel burniſher; and this requires great delicacy and good management not to make the ſhade ſtreaky; and the beauty and durability of the grain are always ſomewhat injured by it, ſo that it ſhould be avoided as much as poſſible.

Thoſe parts which are not dark enough muſt have a freſh grain laid over them, and be ſtopped round with varniſh and ſubjected again to the aqua fortis. This is called *re-biting*, and requires peculiar care and attention. The plate muſt be very well cleaned out with turpentine before the grain is laid on, which ſhould be pretty coarſe, otherwiſe it will not lie upon the heights only, as is neceſſary in order to produce the ſame grain. If the new grain is different from the former, it will not be ſo clear nor ſo firm, but rotten.

We have now given a general account of the proceſs of engraving in aquatinta; and we believe that no material circumſtance has been omitted, that can be communicated without ſeeing the operation. But after all, it muſt be confeſſed, that no printed directions whatever can enable a perſon to practiſe it. Its ſucceſs depends upon ſo many niceties and attention to circumſtances apparently trifling, that the perſon who attempts it muſt not be ſurprized if he does not ſucceed at firſt. It is a ſpecies of engraving ſimple and expeditious, if every thing goes on well; but it is very precarious, and the errors which are made are rectified with great difficulty.

It ſeems to be adapted chiefly for imitations of ſketches, waſhed drawings, and ſlight ſubjects: but does not appear to be at all calculated to produce prints from finiſhed pictures, as it is not ſuſceptible of that accuracy in the balance of tints neceſſary for this purpoſe. Nor does it appear to be ſuited for book plates, as it does not throw off a ſufficient number of impreſſions. It is therefore not to be put into competition with the other modes of engraving. If confined to thoſe ſubjects for which it is calculated, it muſt be allowed to be extremely uſeful, as it is expeditious, and may be attained with much leſs difficulty than any other mode of engraving. But even this circumſtance is a ſource of miſchief, as it occaſions the production of a multitude of prints that have no other effect than that of vitiating the public taſte.

Engraving in aquatinta was invented by Le Prince, a French artiſt, who kept his proceſs for a long time ſecret: and it is ſaid he ſold his prints at firſt as drawings. But he appears to have been acquainted only with the powder grain, and the common method of ſtopping out. The prints which he produced are ſtill ſome of the fineſt ſpecimens of the art. Mr. Paul Sandby was the firſt who practiſed it in this country, and it was by him communicated to Mr. Jukes. It is now practiſed very generally all over Europe, but no where more ſucceſsfully than in this kingdom.

AQUATULCO. See AGUATULCO.

AQUAVIVA, CLAUD, in *Biography*, the ſon of Andrew Aquaviva, duke of Atri in Naples, was born in 1542, and at the age of 25 admitted among the Jeſuits. In 1581, he was advanced to the office of general of the fraternity, and in the exerciſe of it was diſtinguiſhed by his prudence and mildneſs. He drew up an order under the title of "Ratio Studiorum," printed at Rome in 1586, 8vo.; which much offended the Jeſuits, and was ſuppreſſed by the inquiſition; but it was reprinted in a mutilated ſtate, in 1591. This eccleſiaſtic has left "Letters" in French and Latin, "Meditations on the 44th and 93d pſalms," and alſo a treatiſe intitled "Induſtria ad curandos animæ morbos," printed in 1606, 12mo. Nouv. Dict. Hiſt.

AQUAVIVA, in *Geography*. See ACQUAVIVA.

AQUEDOCHTON, the outlet of lake Winnipiſeogee in New Hampſhire, North America, N. lat. 43° 40′: whoſe waters paſs through ſeveral ſmaller ones in a ſouth-weſt courſe, and empty into Merrimack river between the towns of Sanburn and Canterbury.

AQUELAOR, one of the Lacadives iſlands; N. lat. 10° 45′. E. long. 73° 25′.

AQUENSIS COLONIA, in *Ancient Geography*, the town of AIX.

AQUENSIS, the name of an epiſcopal ſee of Africa, in Mauritania Cæſarienſis: alſo, an epiſcopal ſee in Bizacium.

A Q U

AQUENSIS VICUS, or *Aquæ Onoſiæ*, is the ancient name of the preſent Bagneres.

AQUEOUS, AQUOSUS, ſomething that partakes of the nature of WATER, or abounds therewith.

AQUEOUS *bath*. See BATH.

AQUEOUS *humour*, in *Anatomy*, is the front humour of the eye, which occupies the ſpace between the cornea and the cryſtalline lens, and acroſs which the iris may be conſidered as floating. See EYE.

AQUETTA, a name for a kind of liquid poiſon made much uſe of by the Roman women, under the pontificate of Alexander VII.

This poiſon was prepared, and ſold in drops, by Tophania, or Toffania, an infamous woman, who reſided firſt at Palermo, and afterwards at Naples. From her they obtained the name of *aqua Tophania, aqua della Toffana*, and alſo *acquetta di Napoli*. It is ſaid, that ſhe diſtributed her preparation to wives who wiſhed to have other huſbands, and that it was ſecretly adminiſtered in many caſes, which rendered the removal of obnoxious perſons deſirable; and that five or ſix drops were ſufficient for deſtroying a man, and that the doſe might be ſo proportioned as to operate in a certain time. This woman was impriſoned at Naples, and was living there in 1730, when Keyſler viſited the city. This traveller ſays, that ſince it has been diſcovered that lemon-juice is an antidote to it, the compoſition is ſunk into diſrepute. He adds, that Dr. Branchaletti wrote a book expreſsly on the remedies or antidotes againſt theſe ſtygian drops, which continued to be privately made and vended at the period above mentioned. (Keyſler's Travels, vol. iii. p. 37.) Tophania (ſays Labat in his Travels through Italy, vol iv. p. 33.) diſtributed her poiſon in ſmall glaſs phials, with this inſcription, *Manna of St. Nicholas of Bari*, under a pretence that it was a miraculous oil which dropped from the tomb of that Saint at Bari in the kingdom of Naples, and that it was effectual for the cure of many diſeaſes. Upon being put to the rack, this woman acknowledged her wickedneſs, and impeached ſeveral eccleſiaſtics by whom ſhe was protected. She was afterwards ſtrangled. This art of adminiſtering ſecret poiſon was much practiſed in France and Italy about the cloſe of the 17th and commencement of the 18th century. It was communicated by Godin de Sainte Croix, a diſſipated young man of reſpectable family in France, to the Marchioneſs de Brinvillier, with whom he had intrigues. St. Croix was ſuffocated in his laboratory, whilſt he was preparing his poiſon; and the Marchioneſs, whoſe whole life had been ſingularly infamous, and who confeſſed her horrid crimes, was executed at Paris, July 16th, 1676, and afterwards beheaded and burned. Garelli, phyſician to the emperor Charles VI. who was king of the two Sicilies when Toffania was arreſted, in a letter to the celebrated Hoffman, in 1718 or 1719, ſays, that the ſlow poiſon adminiſtered by this wretch to the deſtruction of 600 perſons, was nothing elſe than cryſtallized arſenic, diſſolved in a large quantity of water by decoction, with the addition, for ſome purpoſe unknown to him, of the herb *cymbalaria*. Hoffman. Med. Ration. Syſtem. t. ii. p. 2. c. 2. § 19. p. 185. Hala 1729. 4to. It has been concluded alſo from the effects produced by the poiſons of Toffania and Brinvillier, that they were arſenical mixtures; though ſome have maintained, that they were compoſed of opium and cantharides. This mixture is repreſented as a liquor, no leſs limpid than rock-water, and altogether inſipid. Its effects were ſlow and almoſt imperceptible, and a few drops of it were adminiſtered in tea, chocolate, or other dietetic liquid.

AQUI, or AQUITA, in *Geography*, a town and province of Japan, in the ſouthern part of the iſland of Niphon, near the ſtraits of Sanguar.

AQUIABENSIS, in *Ancient Geography*, an epiſcopal ſee of Africa, in Bizacium.

AQUIDNECK, the ancient name of Rhode iſland.

AQUIFOLIUM. See ILEX.

AQUIGUI, or ACQUIGNI, in *Geography*, a town of France in the department of the Eure, one league from Louviers.

AQUILA, in *Aſtronomy*, a conſtellation of the northern hemiſphere; uſually joined with Antinous.

The ſtars in the conſtellations, Aquila and Antinous, in Ptolemy's catalogue, are 15; in Tycho's, 19; in Hevelius's, 42; in the Britannic catalogue, 71: but in Aquila alone, Tycho reckons 12 ſtars, and Hevelius 23: the principal ſtar being Lucida Aquila, between the firſt and ſecond magnitudes.

AQUILA, in *Chemiſtry*, has ſeveral ſignifications, according to the epithets joined with it.

AQUILA *alba* is a name given to a combination of corroſive ſublimate with freſh mercury, called *mercurius dulcis*.

AQUILA, in *Ancient Geography*, a river of Scythia, near mount Caucaſus.

AQUILA, anciently *Avia* or *Avella*, in *Geography*, a city of Italy, and the capital of Abruzzo ultra, ſituate on a hill near the river Peſcara; is the ſee of a biſhop, and was once fortified, but now quite diſmantled. In 1703, it ſuffered much from an earthquake, which damaged a great part of the town, and deſtroyed 24,000 perſons, and dangerouſly wounded 1500; on this occaſion, 800 were ſwallowed up, together with the church, to which they had fled for refuge. The territory of Aquila formerly furniſhed Italy, almoſt excluſively, with ſaffron; but ſince that plant has been ſo much cultivated in Lombardy, it has declined in Abruzzo. Aquila is 50 miles NE. of Rome, and 93 N. of Naples. N. lat. 42° 19'. E. long. 14° 20'.

AQUILA, in *Biography*, a native of Sinope, a city of Pontus, flouriſhed at the beginning of the ſecond century, under Adrian, and was employed by him as ſuperintendant of the public buildings, and particularly of the new city called Ælia, which the emperor was erecting on the ſite of the ancient Jeruſalem, deſtroyed by Titus. Here he became a proſelyte to Chriſtianity, and was baptized; but his attachment to aſtrology offended the Chriſtians, and they excluded him from their communion. Diſguſted by this treatment, he renounced Chriſtianity, joined the Jews, and became a diſciple of the rabbi Akibha. At their requeſt, being previouſly inſtructed in the Hebrew language, he undertook, about the year 128 or 129, a new Greek verſion of the Hebrew ſcriptures. In this tranſlation, which was very acceptable to the diſperſed Jews, and which was read in their ſynagogues, he propoſed to adhere more literally and accurately to the Hebrew text than the Septuagint; but he has been charged, both by ancient and modern writers, with perverting the original text, in order to render his verſion leſs favourable to the Chriſtians. On the other hand, it has been alleged in favour of its accuracy and fidelity, that it was not only adopted by the Jews in their ſynagogues, but mentioned with approbation by many Chriſtian writers, and frequently cited by the Chriſtian fathers, inſtead of the Hebrew text, which few of them were capable of reading. This verſion was corrected and improved by Aquila, in a ſecond edition; the public uſe of which was prohibited, as ſome have thought, in Juſtinian's Novella 146, under the title of Διδλεωσιν: but others have ſuppoſed, with greater probability, that this prohibition refers to a diſtinct work, framed by Aquila, from the inſtructions of his maſter Akibha; and containing the traditionary inſtitutions of the Jews. Of Aquila's verſion, ſome few fragments only are extant. See HEXAPLA.

Euſebius Eccl. Hiſt. l. v. c. 8. p. 173. Cave, Hiſt. Lit. vol. i. p. 54. Fabr. Bib. Græc. l. iii. c. 12. t. ii. p. 332, &c.

Aquila and Priscilla were natives of Pontus, and converted to the Chriſtian faith by the apoſtle Paul. They lived at Corinth, being obliged to quit Rome and remove thither by the edict of Claudius, which baniſhed all Jews from that city; and here Paul lodged with them. When the apoſtle left this city, Aquila and Priſcilla accompanied him to Epheſus, A. D. 56, where they expoſed their own lives to danger for preſerving him. When the apoſtle wrote his epiſtle to the Romans, A. D. 58, they were at Rome, as he diſtinguiſhes them in this epiſtle by his ſalutations. We find them again at Epheſus, when St. Paul wrote his ſecond epiſtle to Timothy, A. D. 61., but what became of them afterwards is not known. Theſe early converts were tent-makers; and as they had, probably, a conſiderable number of ſervants in their houſe, who were inſtructed by them in the Chriſtian faith, they had, by means of theſe, "a church in their houſe," wherever they ſettled. Acts, xxvii. 2. &c. Rom. xvi. 4. 2 Tim. iv. 19. The Greeks call Aquila, biſhop and apoſtle, and honour him July 12. The feſtival of Aquila and Priſcilla is placed, in the Roman calendar, July 8.

Aquila, Francesco Faraone, an engraver of ſome eminence, who flouriſhed from 1691 to 1722, was born at Palermo, but chiefly reſided at Rome. His engravings are numerous, and many of them eſteemed. His ſtyle of engraving, in general, is rather neater than that of Pietro, but much inferior in drawing and expreſſion. Strutt.

Aquila, Pietro, an eminent engraver, was born at Palermo, and flouriſhed about the year 1696, and reſided at Rome. As a deſigner and painter, he ſtands high in the eſtimation of the curious; but he is more generally, and perhaps more deſervedly known, as an engraver. He drew admirably, and etched in a bold free manner, finiſhing his lights and harmonizing his ſhadows with ſmall dots. His general faults are want of effect from ſcattering his lights, and what by the artiſt is called "manner" in his drawing. In all his works he manifeſts much ſcientific knowledge. Strutt.

AQUILÆ *Arbor*, in *Botany*, a name given by ſome authors, to the tree whoſe wood is the *agallochum*, or lignum aloes of the ſhops.

AQUILANO, Serafino, in *Biography*, ſo called from Aquila in Abruzzo, the place of his nativity, was born in 1466; and obtained great reputation as an "improviſatori," or extemporaneous maker of verſes, which he recited with enthuſiaſm, and accompanied with the ſtrains of his lute. In conſequence of his performances in this way, he was patronized by many Italian princes; and his written poems alſo gained conſiderable applauſe. A collection of his ſonnets, eclogues, epiſtles, &c. was printed at Rome in 1503, 8vo. The ſonnets have obtained the higheſt reputation, and ſome have preferred them even to thoſe of Petrarch: but the works of Serafino have now ſunk into oblivion. He died at Rome in 1500. Nouv. Dict. Hiſtor.

AQUILANUS, Sebastianus, ſuppoſed to have taken his name from Aquila, the place of his birth, was profeſſor of medicine at Padua, in the latter part of the fifteenth century. He is one of the early writers on the venereal diſeaſe, his account of which "De Morbo Gallico," dedicated to Lewis de Gonzaga, biſhop of Mantua, was publiſhed, Aſtruc ſuppoſes, in 1489. It now ſtands firſt in Luiſinus's collection of writings on the ſubject. He was acquainted with the uſe of mercury in the cure of the diſeaſe, and cautions us againſt employing it in weak and debilitated habits. His work paſſed through ſeveral editions. He alſo wrote "Queſtio de febre ſanguinea," firſt printed at Baſil, in 1537. Aſtruc de morbo Gallico, p. 578, and Haller's Bib. Med. Pract.

AQUILARIA, in *Botany*, from *Aquila*, an eagle, a large tree affecting a lofty ſituation. Lin. gen. Schreb. 1753. Juſſ. 439. Cavanill. Diſſ. 7. p. 377. t. 224. *Alœxylum*, Loureiro Cochinch. 274. Claſs, *decandria monogynia*. Gen. char. *Cal.* perianth. one-leafed, permanent; tube, bell-ſhaped; limb, five-cleft; clefts ovate, acute, flat, ſpreading. *Cor.* none; nectary one-leafed, pitcher-ſhaped, of the length of the tube of the calyx, half five cleft; clefts bifid, obtuſe. *Stam.* filaments ten, alternating with the clefts of the nectary; anthers oblong, verſatile. *Piſt.* germ ovate ſuperior; ſtyle none; ſtigma ſimple. *Per.* capſule on a very ſhort pedicle, obovate, woody, two-celled, two-valved; with the partition contrary, and bipartite. *Seeds* ſolitary, oblong.

Eſſ. gen. char. *Cal.* five-cleft. *Cor.* none; nect. pitcher-ſhaped, half five-cleft; clefts bifid; capſule ſuperior, woody, two-celled, two valved. *Seeds*, ſolitary.

Species, 1. *Aquilaria ovata*; leaves alternate, ovate, mucronate. This is a large tree covered with greyiſh bark. Its leaves are entire, ſmooth, veined, about eight inches long, and ſtand on ſhort hairy footſtalks. The flowers terminate the branches, on many-flowered peduncles. A native of the mountains of Malacca and Cochin-China. The wood of this tree has been long uſed as a perfume; and was formerly an article of the materia medica, under the name of agallochum, lignum aloes, or aloes wood. This wood in its natural ſtate is white and inodorous. That which poſſeſſes the peculiar *aroma* for which it is valued, is ſuppoſed to be the conſequence of a diſeaſed proceſs in the tree, cauſing the oleaginous particles to ſtagnate and concrete into a reſin, in the inner parts of the trunk and branches; by which the natural appearance of the wood is altered, ſo as to become of a darker colour, and of a fragrant ſmell. At length the tree dies, and when ſplitten, the reſinous part is taken out. The perfumes which this wood affords, are highly eſteemed by the oriental nations; and from the bark of the tree is made the common paper which the Cochin-Chineſe uſe for writing; in the ſame manner the Japaneſe make uſe of the bark of a ſpecies of mulberry (morus papyrifera). This perfume is ſaid to be uſeful in vertigo and palſy: given in the form of powder, it is recommended to reſtrain vomitings and alvine fluxes. To us, however, it ſeems to contain little elſe than that camphoraceous matter common to many other vegetable ſubſtances. From its bitter taſte, it has the name of aloes, although no otherwiſe allied to it.

Aquilaria, in *Ancient Geography*, *Lowhareah*, a town of Africa, eaſt-north-eaſt of Niſua, or Seedy Doude, and ſouth-weſt of the promontory of Mercury. In this place, ſays Cæſar (De Bell. Civil. l. ii. 21.), Curio diſembarked his troops, which were afterwards cut in pieces by Sabura. Many fragments of antiquities are ſtill extant in this place. Shaw's Trav. p. 88.

AQUILEGIA, in *Botany*, alſo called Aquilina (from *Aquila*, an eagle; the nectaries being fancied to reſemble an eagle's claws), the plant named columbine, from a ſuppoſed reſemblance the ſame parts of the flower bear to the head of a pigeon (*columba*). Lin. gen. 684. Schreb. 934. Juſſ. 234. Gærtn. t. 118. Claſs, *polyandria pentagynia*. Nat. order, *multiſiliquæ*, *ranunculaceæ*, Juſſ. Gen. char. *Cal.* none. *Cor.* petals five, lanceolate-ovate, flat, ſpreading, equal; nectaries five, equal, alternate with the petals, horned, gradually broader upwards, with an oblique mouth, attached to the receptacle; each produced below into a long attenuated tube, with an obtuſe top. *Stam.* filaments thirty or forty, ſubulate, the outer ones ſhorter; anthers oblong, erect, the height of the nectaries. *Piſt.* germs five, ovate-oblong, ending in ſubulate

ulate ſtyles, longer than the ſtamens; ſtigmas erect, ſimple; chaffs ten, wrinkled, ſhort, ſeparate, involving the germs. *Per.* capſules five, diſtinct, cylindric, parallel, ſtraight, acuminate, one-valved, gaping from the tops inward. *Seeds* very many, ovate, keeled, annexed to the gaping future.

Eſſ. gen. char. *Cal.* none; petals five; nectaries five, horned between the petals. *Capſ.* five, diſtinct.

Species, 1. A. *viſcoſa;* clammy columbine; ſtem almoſt naked, with viſcid hairs, and one or two flowers; leaves ſubtrilobate. It riſes about a foot high, covered with glutinous hairs. Radical leaves palmate, three-lobed; ſtem leaves commonly one, ſometimes two, ternate; peduncles one-flowered. A native of the ſouth of France. 2. A. *vulgaris;* common columbine. It grows three feet high, producing its flowers, which are blue, from the tops of its naked branches. The lower leaves are petiolate, biternate, ſmooth, glaucous underneath; the upper digitate. This plant grows wild in England, and in moſt parts of Europe; and varies much not only in the colour of its flowers, but in the number of its piſtils and nectaries. The varieties to be found in gardens, are α. ſingle garden columbine; β. double-flowered columbine; γ. double inverted columbine; δ. roſe columbine; ε. A. *degener virеſcens* of Ray, Parkinſon, &c.; ζ. ſtarry columbine; η. Siberian columbine. The common columbine has been eſteemed for its medicinal virtues; and for this purpoſe every part of the plant has been uſed: but judging from its ſenſible qualities, there ſeems little or no foundation for its ſuppoſed medical properties, although Linnæus has affirmed that children have loſt their lives by an over doſe of it. 3. A. *alpina;* Alpine columbine; nectaries ſtraight, ſhorter than the lanceolate petal. It has been doubted by ſome botaniſts, whether or not this is a variety of the A. *vulgaris*, from which it differs in having larger flowers, though its ſtem and leaves are ſmaller than thoſe of the common columbine. A native of the Alps, and alſo ſaid to have been found in Weſtmoreland; cultivated by Miller, in 1731. Biennial. 4. A. *Canadenſis;* Canadian columbine; nectaries ſtraight; ſtamens longer than the corolla; root perennial; ſtems very ſlender, reddiſh; lower leaves biternate, irregularly divided, the extreme lobes blunt; the upper lobes ſimply ternate, toothed, or perfectly entire; the uppermoſt ſimple, lanceolate, acuminate; the corollas yellow within and red on the outſide. A native of the northern parts of America. Miller, fig. t. 47. Introduced here by Mr. John Tradeſcant, ſen. before the year 1640. 5. A. *viridiflora;* green-flowered columbine; nectaries ſtraight, thickened, and a little bent at the tip; ſtamens nearly equal to the corolla; root perennial; ſtems a foot high or more, ſlightly angular, villoſe; petals pale green, wrinkled, ſhorter than the borders of the nectaries; which are of a greeniſh yellow within, and browniſh on the outſide; ſtamens only half the length of the corolla; ſtyles longer than the corolla. A native of Siberia, where it was found by Pallas.

Propagation and culture. Theſe plants are all raiſed by ſowing the ſeeds, or parting the old roots, but the former is chiefly practiſed; for the old roots are very apt to degenerate, and produce plain flowers. The ſeeds ſhould be ſown in Auguſt or September, in a nurſery-bed. The ſpring following the plants will appear, when they ſhould be conſtantly cleared from weeds, and occaſionally refreſhed with water. Towards the latter end of May, theſe plants will be ſtrong enough to tranſplant into a bed of good freſh earth; and in the following autumn, the roots ſhould be carefully taken up and planted in the borders of the flower-garden, where they will flower the ſucceeding ſpring. To prevent the plants from degenerating, the flower ſtem ſhould be cut off as the flowers begin to wither. In order to keep up a ſucceſſion of good flowers, freſh ſeeds ſhould be ſown every year, obſerving, not to ſow thoſe that are produced from plain flowers. See Miller's Dict. by Martyn.

AQUILEIA, in *Ancient Geography, Aquilea*, an ancient and a large city of Italy, ſituate on the ſea coaſt at the entrance of the Sinus Tergeſtinus, or gulf of Trieſte, was built, according to Strabo (l. v.), by the Romans, in order to reſtrain the barbarians; and a Roman colony was conducted thither between the firſt and ſecond Macedonian wars. It was waſhed, ſays Pliny (H. N. l. iii. c. 18.), by the two rivers Natiſo and Turrus. It was augmented, according to Livy (l. xliii. c. 17.), by 1500 families, by a decree of the ſenate; and afterwards, as Herodian (l. viii. c. 11) informs us, became a celebrated emporium. Julian aſcribes its name to the augury of an eagle (*aquila*) at the time of building it: Voſſius deduces it from the abundance of its waters, as if it were "Aquilegia;" but the appellation was more probably derived from aquila, the eagle, which was the ſtandard of the Romans, who had long encamped in this place. Strabo (ubi ſupra) ſays, that the harbour, at the mouth of the Natiſo, was at the diſtance of 60 ſtadia from the city, ſo that ſhips of burden were towed up the river. This city was of ſuch importance, that it was one of the firſt places which the partiſans of Veſpaſian took poſſeſſion of A. D. 69. In the year 166, the emperors Marcus Aurelius and Verus wintered there, previouſly to their taking the field againſt the Marcomanni; who, having defeated Vindex, the prætorian prefect, in 170, entered Italy, and approached Aquileia. In 238, it was beſieged by the troops of Maximin, who demoliſhed its ſuburbs and beautiful vineyards, and employed the timber of the buildings, in the engines and towers with which the city was on every ſide aſſaulted. It was defended, however, by the invincible conſtancy of the citizens, and the army of Maximin was repulſed in repeated attacks: his machines were deſtroyed by ſhowers of artificial fire; and the generous enthuſiaſm of the Aquileians was exalted into a confidence of ſucceſs by the opinion that Belenus, their tutelar deity, combated in perſon in the preſervation of his diſtreſſed worſhippers. The Celtic deity, ſuppoſed to be Apollo, received, under that name, the thanks of the ſenate; and a temple was likewiſe erected to Venus the bald, in honour of the women of Aquileia, who had parted with their hair to make ropes for the military engines. In 452, Attila invaded Italy, and beſieged Aquileia with an innumerable hoſt of barbarians. On this occaſion, the walls of the city were aſſaulted by a formidable train of battering rams, moveable turrets, and engines that threw ſtones, darts, and fire; and the monarch of the Huns employed the forcible impulſe of hope, fear, emulation, and intereſt, to ſubvert this only barrier which delayed his conqueſt of Italy. Aquileia was, at that period, one of the richeſt, the moſt populous, and the ſtrongeſt of the maritime cities of the Adriatic coaſt. After an ineffectual ſiege of three months, Attila was compelled, by the want of proviſions, and the clamours of his army, to relinquiſh the enterpriſe, and to iſſue orders for this purpoſe; but as he rode round the walls, penſive, angry, and diſappointed, he obſerved a ſtork preparing to leave her neſt in one of the towers, and to fly with her infant family towards the country. He ſeized, with the ready penetration of a ſtateſman, this trifling incident which chance had offered to ſuperſtition, and exclaimed, in a loud and cheerful tone, that ſuch a domeſtic bird, ſo conſtantly attached to human ſociety, would never have abandoned her ancient ſeats, unleſs thoſe towers had been devoted

devoted to impending ruin and ſolitude. The favourable omen inſpired an aſſurance of victory; the ſiege was renewed and proſecuted with freſh vigour; a large breach was made in the part of the wall from whence the ſtork had taken her flight; the Huns mounted to the aſſault with irreſiſtible fury; and the ſucceeding generations could ſcarcely diſcover the ruins of Aquileia. Gibbon's Hiſt. vol. vi. p. 122—124.

This place, formerly ſo rich and flouriſhing, is now known only by its ruins; and is reduced into a mean village, whence the patriarch of Aquileia derives his title: but as the territory of Aquileia belonged to the houſe of Auſtria, this houſe, and alſo the Venetians, pretended to nominate the patriarch. However, in 1751, the pope ſuppreſſed this patriarchate, and erected Udino, where the patriarch had uſed to reſide, into an archbiſhopric for the Venetians, and Goritia, or Goritz, a town of Carniola, into an archbiſhopric for the houſe of Auſtria. Aquileia is diſtant 18 miles S. S. W. from Goritz, and 20 S. from Friuli. N. lat. 45° 55′. E. long. 13° 30′.

AQUILEIA, *Aquapendente*, a ſmall town of Italy, in Etruria, S. E. of Florentia. The name of *Aquileia* has been alſo ſometimes applied to Forum Julii (Cividad del Friuli), the more recent capital of the Venetian province.

AQUILICIA, in *Botany*. See LEEA.

AQUILICIUM, or AQUÆLICIUM, in *Antiquity*, a ſacrifice celebrated among the Romans, in time of exceſſive droughts, to obtain rain of the gods.

Danet calls this *aquiliciana*. The prieſts who officiated at it were denominated *aquilices, quia aquam eliciebant*, becauſe they brought down water: but where he finds this new order of prieſts, he does not tell us.

AQUILIFER, from *aquila, eagle*, and *fero, I bear*, among the Romans, an enſign-bearer, who carried the ſtandard on which the eagle was repreſented.

AQUILINE, ſomething belonging to an eagle. Hence, aquiline noſe denotes an hooked noſe, or ſuch as is like the beak of an eagle; called alſo a hawk's noſe.

AQUILO, is uſed by Vitruvius for the north-eaſt wind; or that which blows at 45° from the north towards the eaſt point of the horizon.

The poets gave the name *aquilo* to a ſtormy wind dreaded by the mariners.

AQUILONDA, in *Geography*, a large lake of Africa, in Ethiopia, at the foot of the mountains of the ſun, on the confines of Congo and Angola.

AQUILONIA, in *Ancient Geography*, a town of Italy, in Apulia, ſituate in the road from Beneventum to Venuſia. It belonged to the Samnites. This is alſo the name of another town in Apulia, in the road from Beneventum to Canuſium, between Æquus Tullicus to the ſouth-weſt, and Æce to the north-eaſt.

AQUILUS, among the *Ancients*, a dark or duſky colour, approaching to black.

Hence ſome of the heathen gods were called *dii aquili*, q. d. *nigri*.

AQUIMINARIUM, in *Antiquity*, a kind of luſtral veſſel wherein the Romans carried their holy water for expiation, and other religious offices.

AQUINAS, THOMAS, in *Biography*, a famous ſcholaſtic divine, a deſcendant of the illuſtrious family of Aquino in the Terra di Lavora, in Italy, was born at Aquino in the year 1224. He was ſent, at five years of age, for education to Mount Caſſino, and from thence he was removed to the univerſity of Naples. Here he acquired that ſtrong predilection in favour of a retired and ſtudious life, which induced him to enter himſelf, without the knowledge of his parents, among the Dominicans, in the order of the preaching friars. His mother was peculiarly ſolicitous to divert his deſign, and wiſhed to obtain an interview with him for this purpoſe; but the monks were as anxious to retain him; and in order to prevent the effect of his mother's perſuaſion, removed him from one place to another, that ſhe might have no opportunity of ſeeing him. At length, whilſt they were conducting him to Paris, her other ſons ſeized him and conveyed him to her caſtle, where he was confined for two years. Notwithſtanding all his mother's importunities, his purpoſe was fixed; and for the accompliſhment of it, he let himſelf from a window by night; and aided by his Dominican brethren, he eſcaped to Naples. In the year 1244, he was conducted by the maſter of the Teutonic order to Paris; and after ſome ſtay there, he removed to Cologne, and became a diſciple of the famous Albert. Under this eminent preceptor, he was aſſiduous in his application, and made great attainments. His ſilence, however, and apparent ſtupidity, induced his fellow-ſtudents to call him by the contemptuous appellation of the "dumb ox;" but Albert, more penetrating than they, ſaid, "this ox, if he begin to bellow, will fill the whole world with his roaring." Accompanying Albert to Paris in 1246, he remained as a ſtudent in that univerſity till 1248. At length Aquinas, having made himſelf maſter of the dialectics, philoſophy, and theology of the age, became, at 24, an eminent teacher at Paris; and in 1255, obtained the degree of doctor in divinity. Such was his diſtinguiſhed reputation, that he was honoured by the peculiar attention of princes and of popes. On one occaſion, as he was dining with Louis IX. of France, called St. Louis, his thoughts were buſily employed on the objections of the New Manichæans againſt the orthodox faith, and ſtriking the table with his hand, after muſing a long time in ſilence, he ſuddenly exclaimed, "this is a deciſive anſwer to the Manichæans." Upon a viſit to Rome, whilſt he was in the cloſet of pope Innocent IV., an officer brought in a bag of money, procured by the ſale of abſolutions and indulgences: "You ſee, young man," ſaid the pope, "the age of the church is paſt, in which ſhe ſaid, *ſilver and gold have I none:*" Aquinas, replied, "True, holy father; but the age is alſo paſt, in which ſhe could ſay to a paralytic, *riſe up and walk.*" In 1263, he returned to Italy, and was appointed rector of his order in the Roman province; and he continued to diſtinguiſh himſelf as a public preceptor in ſcholaſtic theology in ſeveral of the chief univerſities of that country. He was offered the archbiſhopric of Naples by pope Clement IV., but declined accepting a charge ſo weighty; and when the univerſity of Paris, at a general chapter of the order held at Florence in 1272, demanded his return, he was detained by Charles, king of the Sicilies, and appointed profeſſor of theology at Naples, with a monthly allowance of an ounce of gold as his penſion. Being ſummoned to a general council held at Lyons in 1274, in order to preſent a book which he had written by order of pope Urban IV. for refuting the errors of the Greek church, he was ſeized, in his way through Campania, with a violent diſorder; and died in the monaſtery of Foſſa Nova, in the dioceſe of Terracina, in the year 1274. After his deceaſe, the whole weſtern world began to load him with honours. The Dominican fraternity removed his body to Touloufe; pope John XXII. canonized him; Pius V. gave him the title of "The fifth doctor of the church;" by others he was denominated "the angel of the ſchools," "the eagle of divines," and "the univerſal and angelic doctor;" and the

the vulgar believed that many miracles were wrought at his tomb; and it was ſaid that the ſoul of Auguſtine had paſſed into Thomas Aquinas. His writings were held in the higheſt eſtimation; and his name was aſſumed, in the next century, by a ſect, who, under the appellation of Thomiſts, long occupied the field of controverſy with the Scotiſts, followers of Duns Scotus, in various metaphyſical and theological queſtions.

Notwithſtanding all the extravagant praiſes and honours which were laviſhly beſtowed on Thomas Aquinas, it is certain, that his learning was almoſt wholly confined to ſcholaſtic theology, and that he was ſo little converſant with elegant and liberal ſtudies as not to be even able to read the Greek language. For all his knowledge of the Peripatetic philoſophy, which he ſo liberally blended with theology, he was indebted to the defective tranſlations of Ariſtotle, which were ſupplied by the Arabians; but he obtained from ſome unknown perſon a more accurate verſion of his philoſophical writings. Adopting the general ideas of the age, that theology is beſt defended by the weapons of logic and metaphyſics, he mixed the ſubtleties of Ariſtotle with the language of ſcripture and of the Chriſtian fathers; and, after the manner of the Arabians, framed abſtruſe queſtions without end upon various topics of ſpeculative theology. Upon the whole, his talents and induſtry, which under better direction might have been uſefully employed, were miſapplied to ſubtleties, which tending neither to enlighten the underſtanding nor to improve the heart, muſt be pronounced altogether uſeleſs. His writings are numerous: but the moſt celebrated are his "Summa Theologiæ," or ſummary of theology, which was received with great applauſe, and uſed as a text book of high authority in the inſtruction of youth; of this the ſecond ſection, treating of morals, may be read with advantage; and his "Commentaries upon the works of Ariſtotle." A collection of his works was publiſhed, in ſeventeen folio volumes, at Venice, in 1490; at Nuremburg, in 1496; at Rome, in 1570; at Venice, in 1594; and at Antwerp, in 1612. The "Summa Theologiæ," has ſeparately paſſed through ſeveral editions, as at Cologne, in 1604; Antwerp, 1624; Paris, 1638. But as neither the matter nor the ſtyle of the angelic doctor is much ſuited to modern taſte, his writings have ſunk into neglect and oblivion. Lord Herbert, in his life of Henry VIII., ſays, that one of the chief reaſons that induced him to write againſt Luther, was his having ſpoken contemptuouſly of Aquinas. Cave. Hiſt. Lit. vol. ii. p. 306, &c. Brucker's Hiſt. Phil. by Enfield, vol. ii. p. 372, &c. Nouv. Dict. Hiſtor.

AQUINO, Philip, a learned Jew, was converted to the Chriſtian faith, and baptized at Aquino his native place, whence he derived his name. The clergy of France allowed him a penſion. Such was his knowledge of the Hebrew language, that Le Jay entruſted him with the charge of printing and correcting the Hebrew and Chaldee texts of his polyglot bible. He was the author of ſeveral works; but the principal was his "Dictionarium Hebræo Chaldæo-Thalmudico-Rabbinicum," printed in folio, at Paris, in 1629. His ſon, Lewis Aquino, was alſo very learned in the oriental languages, and has left ſeveral rabbinical works. His grandſon, Antony Aquino, was firſt phyſician to Louis XIV. Nouv. Dict. Hiſtor.

Aquino, *Aquinum*, in *Geography*, a town of Italy, in the kingdom of Naples and territory of Lavora; thirteen miles S. S. E. from Sora. It was the birth-place of Juvenal and of Thomas Aquinas. It was formerly a large municipal town, and a Roman colony; but the emperor Conrade ruined it; and it is now reduced to about thirteen houſes. There are ſome remains of a theatre and amphitheatre, which indicate its former grandeur. N. lat. 41° 32′. E. long. 14° 30′.

AQUIQUI, in *Zoology*, the name of a particular ſpecies of monkey, called by the people of Braſil, the king monkey, as being much larger than all the other monkies. It is the Simia *Beelzebul* of Linnæus.

AQUITANI, in *Ancient Hiſtory*, a people of Gaul, ſituated between the Garonne and the Pyrenees. Cæſar diſtinguiſhes the Aquitani from the Celtæ or Gauls; and, in reality, they were a different nation, and derived their origin from Spain. They were diſtributed in various diſtricts; but that which preſerved the name, was ſituated at the foot of the Pyrenees, where are now found Bearn and the dioceſe of Auch. The Aquitani were rich, as they poſſeſſed many mines, and an extenſive commerce both by ſea and land; hence they became corrupt and effeminate; and in this ſtate the Romans found them; and though they made many efforts for reſiſting the attacks of theſe conquerors, they were at laſt compelled to ſubmit in common with the other Gauls.

AQUITANIA, *Gallia Aquitanica*, or *Provincia Aquitanica*, in *Ancient Geography*, a conſiderable province of Tranſalpine Gaul, Gallia Comata, or Gaul properly ſo called. Some have ſuppoſed that it derives its name from the abundance of waters which the Romans found in this country. Aquitania, in the time of Julius Cæſar, was bounded by the Pyrenees and the Garumna or Garonne: Auguſtus extended it to the Liger or Loire. From his time it comprehended two provinces, known afterwards by the names of Aquitania Prima and Secunda; to which, in the time of Honorius, was added a third province, which had formerly been denominated Novem-populania. *Aquitania Prima* was bounded on the north by the Aureliani; on the eaſt, by the Senones, Ædui, and Seguſiani, the Helvii, and the Volcæ Arecomici; on the ſouth by the Volcæ Arecomici, the Umbranici, and the Toloſates; and on the weſt, by the Nitiobriges, the Petroconi, and the Pictones. It extended about 84 leagues from north to ſouth, and in its greateſt breath about forty. Its chief city was Avaricum, afterwards Bituriges, and now Bourges. *Aquitania Secunda*, ſituate towards the ſea, had on the north the river Liger; on the eaſt, the Bituriges, Lemovices, and Cadurci; on the ſouth, the Veſales, and Cecoſates; and on the weſt, the ocean. It comprehended the Meduli on the left of the Garumna, towards its mouth. Its length was ſixty-three leagues, and its greateſt breadth forty. Its metropolis was Burdigala, now Bourdeaux. *Aquitania Tertia*, or Novem-populania, was bounded on the north by the Bituriges Viviſci; on the eaſt by the Nitiobriges and Volcæ Tectoſages; on the ſouth, by the Pyrenees; and on the weſt, by the ſea. It was about forty leagues long and as many broad. The firſt two provinces, viz. Aquitania Prima and Secunda, were conquered by Cæſar; the third by his lieutenants. When the emperor Honorius was under a neceſſity of ſurrendering to the Viſigoths that part of Gallia Narbonenſis, which was afterwards called Septimania, they ſoon took poſſeſſion of the three provinces of Aquitania, and retained them till the time of Clovis, A. D. 486. Aquitania, after having undergone many revolutions, was erected into a kingdom in 778, by Charlemagne, and afterwards reduced into a dukedom by Charles the Bald. Aquitania, or Aquitaine, in later times, has been included between the Loire, the ocean, and the Pyrenees, and comprehended Guienne and Gaſcony.

AQUIZEBA,

AQUIZEBA, in *Geography*, a river of Spain, which runs into the Orio, below Tolola, in Guipuſcoa.

AQUSA, in *Geography*, a port on the ſouth ſide of the iſland of Candia. N. lat. 35° 3′. E. long. 24° 55′.

AQUULA, the name of a diſorder of the eyes, called alſo *hydatis*.

AR. See Aar.

Ar, called alſo *Areopolis*, *Ariel* of Moab, and *Rabbath-Moab*, in *Scripture Geography*, the capital of the Moabites, on one ſide of the river Arnon, oppoſite to *Aroer* on the other, in Arabia Petræa. St. Jerom ſays, that this city was deſtroyed by an earthquake, when he was young.

Ara *thuribuli*, the *Altar of incenſe*, in *Aſtronomy*, a ſouthern conſtellation, not viſible in our hemiſphere, conſiſting, according to Ptolemy, of ſeven ſtars; and according to Sharp's Catalogue, annexed to that of Mr. Flamſteed, of nine ſtars.

Ara, *Cape*, in *Geography*, anciently *Neptunium promontorium*, is the moſt ſouthern cape of Arabia Felix, forming with the coaſt of Ajan, in Africa, the ſtraights of Babelmandel.

Ara *Amoris*, in *Ancient Geography*, a cape of Ethiopia, upon the Arabian gulph, according to Ptolemy.

Ara *Cæſaris*, *Arſago*, a place of Italy in Inſubria, ten miles north of Melodunum.

Ara *Flavia*, a colony of Germany, noticed on a medal of Domitian.

Ara *Jovis Montani*, a place near the iſthmus of the Thracian Cherſoneſus, between Pteloë and Leucê-Acté.

Ara *Jovis Panomphæi*, a place in the Troade, between the Sigæan and Rhætian promontories.

Ara *Lugdunenſis*, an altar conſecrated to Auguſtus by ſixty cities of Gaul, in the year of Rome 742, upon the point of land formed by the confluence of the Rhone and Saone; called by the writers of the middle age *Attanacum*, now the point of Annai. Dion Caſſius informs us, that in his time, two centuries after Auguſtus, the altar, and the honours rendered to this emperor, ſubſiſted. Juvenal mentions it in his firſt ſatire, v. 44.

Ara *Palladis*, an iſland of the Arabian gulph, mentioned by Ptolemy.

Ara *Tutila*, an ancient city on the eaſtern ſide of the iſland of Corſica, according to Ptolemy.

Ara *Ubiorum*, *Gots-berg*, a place of Gaul, in Germania Secunda, now occupied either by Cologne or Bonn. In this place the Roman Legion, called *prima legio*, was encamped.

Ara *parva*, *the little altar*, a denomination in the *Ancient Surgery*, given to an elegant kind of bandage, ſaid to have been invented by Soſtratus.

Ara, in *Geography*, a river of Spain, which joins the Cinca at Ainſa in Arragon.

Ara, in *Ichthyology*, a name by which the Linnæan ſpecies of Scomber, *Trachurus*, has been called by Kæmpf. jap. i. pl. ii. fig. 5. Vide Donov. Brit. Fiſhes.

Ara, in *Ornithology*, a generic name given by Briſſon, Buffon, and others, to ſome birds which belong, in the Linnæan arrangement, to the genus Psittacus; thus, for example, Psittacus *Macao* of Linnæus and Gmelin is called Ara *Braſilienſis* by Briſſon, Ara *premier* by Fermin, and Ara *rouge* by Buffon; in like manner alſo, Psittacus *Aracanga* Linn. is Ara *Jamaicenſis* of Briſſon, and *Petit* Ara *rouge* of Buffon; Psittacus *ater*, Linn. Ara *noir* of Buffon; Psittacus *cæruleus*, Ara *Jamaicenſis cyaneo-crocea* of Briſſon, &c.

Ara, is alſo a ſynonym of Cuculus *tahitius* of Gmelin, a bird that inhabits the Society Iſlands, and is called by the natives Ara wirroa. Vide Cook's Voyages.

ARAB, or Arabian *horſe*. See Horse.

Arab, in *Scripture Geography*, a town of Paleſtine, belonging to the tribe of Judah. Joſh. xv. 52.

Arab, in *Geography*, a town of Aſia, in Arabia Deſerta, in the country of Najed or Nedſched; one of the moſt ancient of this country, and perhaps of Aſia.

ARABA, a town of Perſia, in Segeſtan, between the city of this name and Candahar. Some have thought that this is the ancient town of Ariaſpe, the capital of Drangiana.—Alſo a river of Perſia, which ſerves as a nominal boundary towards Hindoſtan.

Araba, in *Ancient Geography*, a city of Ethiopia, ſituate, according to Pliny, on the bank of the Nile.

ARABAH, in *Scripture Geography*, a town of Paleſtine, belonging to the tribe of Benjamin. Joſh. xviii. 18.

ARABAN, in *Geography*, a ſmall town of Aſia, on the river Kabur, in Diarbekir, in the Turkiſh government of Urfa or Raca.

ARABANT, from *aro*, *I plough*, in *Law*, *ad curiam domini*, was a term applied to thoſe who held by the tenure of ploughing and tilling the lord's lands within the manor.

ARABAT, in *Geography*, a ſmall maritime town of Europe, in the eaſtern part of Crim Tartary, on the borders of the ſea of Azof, ſouth of Bacha-ſerai, and ſixty miles ſouth-eaſt of Perekop. In 1771, it was aſſaulted and taken by the Ruſſians, under the conduct of prince Tſchibaloff. Moſt of the beſieged were put to the ſword, and the reſt made priſoners of war.

ARABAZARI, a town of Aſiatic Turkey, in the province of Caramania, ſixteen miles north-eaſt of Alameh.

ARABEIA, or Arbela, in *Ancient Geography*, a town of Sicily, mentioned by Silius Italicus, l. xiv. v. 271.

" Sidonios Arbela ferox, et celſus Ietas."

Thoſe critics who would ſubſtitute Arbeia for Arbela, introduce the epithet *ferax*, denoting *fertile*, inſtead of *ferox*. See Sil. Ital ed. Drakenborch. in loc.

ARAB-HISAR, in *Geography*, a town of Aſiatic Turkey, in the province of Natolia, twenty-eight miles north-weſt of Mogla.

ARABESQUE, or Moresque, denotes a ſtyle of painting or of ſculpture, ſo called from the Arabians and Moors, who employed ornaments of this kind for want of human and animal repreſentations, which their religion prohibited their uſing. Theſe ornaments are ſtill in practice; but executed only in painting, and not in ſculpture. Such are ſeen at the chateau of Meudon, that of Sceaux, of Chantilly, at the Menagerie, and at Trianon, painted by Audran; and, in ſhort, at the ſeats of various noblemen, &c. at home and abroad. Berin, Gillot, and Vateau, likewiſe excelled in this ſpecies of decoration, which has furniſhed models for tapeſtry at the Gobelins and La Savonerie, as hangings in the royal private apartments, to which this ſort of ornament is adapted, and no where elſe. Accordingly the beſt architects have only made uſe of them in retiring rooms, or at moſt in ſmall apartments, treating with contempt the bad taſte of thoſe artiſts, who are profuſe of theſe chimerical and imaginary ornaments in apartments that demand gravity, inſtead of preferring the real and beautiful productions of nature.

Arabeſc is uſed by Stephen Riou, eſq. in his book on architecture, to denote that ſtyle of building which is vulgarly

called

called *Modern Gothic*, which he alſo terms *Saracenic* and *Moreſc*; the introduction of which he aſcribes to the Moors, or, which he ſays is the ſame thing, to the Arabians or Saracens, who have expreſſed, he adds, in their architecture, the ſame taſte as in their poeſy, which are both falſely delicate, crowded with ſuperfluous ornaments, and often very unnatural. This manner of building, he ſays, was introduced into Europe through Spain. The cruſades gave the Chriſtians an idea of *Saracenic* architecture, which they afterward imitated. Sir C. Wren diſtinguiſhes the heavy *Gothic* as *Anglo-Saxon*, the lighter as *Arabeſc*.

ARABI, *gulf of Gli*, in *Geography*, called alſo *Gyſis* or *Zygis*, a ſmall gulf on the coaſt of Barbary, between the coaſts of Barca and thoſe of Egypt.

ARABIA, in *Ancient* and *Modern Geography*, a conſiderable country of Aſia, which, taken in its largeſt extent, lies between N. lat. 12° 30′ and 31° 30′, and E. long. 34° 14′ and 59° 14′, and forms one of the largeſt peninſulas in the world. It is bounded on the eaſt by the Euphrates, the Perſian gulf, and the bay of Ormus, on the weſt by Paleſtine, part of Syria, the iſthmus of Suez, and the Red Sea, on the ſouth by the ſtraits of Babelmandel, and the Indian ocean, and on the north by part of Syria, Diarbekir, Irak, and Khuzeſtan. Its northern limits, however, are leſs ſtrongly marked than the others; for in both ancient and modern times, they aſcend to an angle about 100 miles to the eaſt of Palmyra, which is not included in Arabia. In theſe parts, the proximity of the Euphrates to the Mediterranean forms a peninſula. Its length, eſtimated from the cape of Babelmandel to the extreme angle on the Euphrates, may be ſtated at about 1800 Britiſh miles, and its mean breadth at about 800; or from the port of Jedda to the cape of Razal-Gad, not leſs than 1200. Its limits, however, have been either enlarged or contracted by various geographers, according to the times in which they wrote; ſome having compriſed under the name of Arabia, ſuch of the neighbouring countries as might perhaps be ſubject to ſome particular tribes, and others detaching from it certain diſtricts ſubmitted to a foreign dominion. Accordingly the limits of the Proper Arabia reached no farther than the iſthmus, extending from Ailah at the north point of the Arabian gulf to the extremity of the Perſian gulf, and the borders of the territory of Cufa; which tract of land was nearly comprehended by the Greeks under the appellation of Arabia Felix: and here the Arabs have been ſettled almoſt ever ſince the flood. The eaſtern geographers aſſign Arabia Petræa partly to Egypt and partly to Syria; and they call Arabia Deſertâ, the deſerts of Syria: but as the Arabs have for many ages reduced theſe two provinces, the Turks and Perſians now include them in Arabiſtan. The ancients alſo aſſigned different limits to this large peninſula. Pliny extended it as far as the border of Commagène, the northern part of Syria, on account of the many Arabian colonies eſtabliſhed there by Tigranes; and Xenophon included in it the greateſt part of Meſopotamia: but, according to Ptolemy, the city of Phara, between the Elanitic and Heroopolitan gulfs, or rather a line paſſing a little weſtward of this city, near the diſtrict of Heroopolis, was its boundary on the ſide of Egypt. On the weſt, it was terminated by Paleſtine, part of Syria, the confines of Egypt, and the Arabian gulf; on the north, by the Euphrates, from the city of Thapſacus, near the borders of the Palmyrene, to the diſtrict of Idicara in Babylonia; on the eaſt, by the Chaldean mountains and the Perſian gulf; and on the ſouth, by the Erythræan ſea. The ſame ſituation and extent are aſſigned to it by Diodorus and Strabo. Whatever be deemed its extent, it may juſtly be conſidered as a peninſula, becauſe in the northern region it is confined between the Euphrates and the Mediterranean.

The revolutions of time have produced no change in its primitive denomination; ſince even in the ages bordering upon the deluge it was known by the name of Arabah; which ſome derive from the Hebrew ערב, *arab*, or *ereb*, ſignifying *the weſt*, a *mixture*, or *merchandiſe*, or *traffic*; others from Jarab, the ſon of Joktan, and grandſon of Eber; and others again from Arabah or Arbah, a diſtrict of Tehama, inhabited by Iſhmael. By the Syrians and many of the orientals, it was called Arabiſtan; and, in our ſacred books, it is ſometimes denominated the land of Cuſh. Moſes himſelf ſtyles the weſtern Arabia, Arabah, which affords a ſtrong preſumption, that its original name was derived from its ſituation: and when the Iſhmaelites, who poſſeſſed it, gradually reduced the adjacent parts, they carried with them the appellation Arabah, and applied it to the whole peninſula. The firſt part of the peninſula of the Arabs was divided into Kedem and Arabah, as we learn from ſcripture. Kedem comprehended the Arabia Felix and Arabia Deſerta of Ptolemy. Arabah correſponded to that country which was called, from Petra its metropolis, Arabia Petræa by Ptolemy; Arabia Citerior, from its ſituation with reſpect to Italy, by Pliny; and Arabia Vetus, by Stephanus and Procopius. Moſes, with a geographical accuracy that defies the ſeverity of criticiſm, determines the boundaries of this kingdom, when he tells us, that on the ſouth, it reached to the ſea of Suph, or the Red Sea; on the weſt, to Paran and Tophel; on the north, to Laban, Hatſeroth, and Di-Zahab, that is, to the borders of Syria; and on the eaſt, to Kadeſh-Barnea, about eleven days journey from Mount Horeb. As Arabah imports the *weſt*, ſo Kedem does the *eaſt*: and theſe ſignifications correſpond to the reſpective ſituation of theſe countries. The firſt inhabitants of Arabah, or the weſtern Arabia, were the Caſluhim, deſcended from Mizraim, the Caphtorim, and the Horites, who occupied Mount Seir, before they were expelled from thence by Eſau and his poſterity. Afterwards Iſhmael and his deſcendants ſettled here; and laſt of all, the Edomites or Idumæans. Kedem, or the eaſtern Arabia, was firſt peopled by the ſons of Joktan, who are reputed the aboriginal Arabians; though, in proceſs of time, the Iſhmaelites ſpread themſelves over this country. Some of the Cuſhites alſo gained early poſſeſſion of part of it; and the children of Abraham by Keturah contributed, as ſacred hiſtory informs us, to augment the number of its inhabitants.

Ptolemy ſeems to have been the firſt who divided this peninſula into Arabia Petræa, Arabia Deſerta, and Arabia Felix; and ſince his time this diviſion has generally prevailed.

Arabia Petræa, or the *ſtony*, was contiguous, on the eaſt, to Syria and Arabia Deſerta; on the weſt, to Egypt and the iſthmus of Suez; on the north, to Paleſtine, the lake Aſphaltites, and Cœloſyria; and on the ſouth to Arabia Felix. This tract did not admit of much cultivation, the greateſt part of it being covered with dry ſands and rocks (whence its name), interſperſed with ſome fruitful ſpots. Its metropolis was Petra: the other moſt conſiderable places noticed in ſcripture as belonging to this diſtrict were Paran, Duma, and Pithom. The principal people that inhabited it were the Iſhmaelites, the Nabathæans, the Cedræi or Kedareni, and the Hagareni or Agareni. Of theſe the Iſhmaelites were the moſt powerful, if they did not comprehend the whole of it. The moſt remarkable places in this region were the town of Kolſum or Kolzom, the wilderneſs of Shur, that of Sin, that of Sinai, the mounts Caſius and

Sinai, Eziongaber, the promontory of Paran, Adra, Elusa, Bostra, and Mocha. See the several articles.

Arabia Deserta was bounded on the north by the Euphrates, separating it from Mesopotamia: on the west, by Syria, Judæa, and Arabia Petræa; on the east, by Chaldæa and Babylonia, or a ridge of mountains dividing it from those countries; and on the south, by Arabia Felix, from which it was disjoined by several ranges of hills. The Canchabeni, according to Ptolemy, inhabited that part of this province bordering upon the Euphrates, and the Batanæi occupied that which lay on the confines of Syria. The Agubeni and Rhaabeni were placed more southerly towards the frontiers of Arabia Felix, and near the Persian gulf, the Orcheni. Near the Canchabeni, on the borders of Babylonia, dwelt the Æsitæ, supposed by Bochart to have inhabited that tract in which was the country of Job; and above the Rhaabeni were the Masanæ. In the interior part were the Agræi; and in the mountainous region, near Chaldæa, were situated the Marteni. The towns of this district, enumerated by Ptolemy, if such they might be called, were places of no great importance.

Arabia Felix was limited on the north by the provinces already mentioned; on the south, by the Erythræan sea; on the east and west by part of that sea, together with the Arabian and Persian gulfs; and corresponded to that tract which the oriental geographers regarded as the proper peninsula of the Arabs. Strabo says (l. xvii.) that, in his time, it was divided into five kingdoms, corresponding to the division of the proper Arabia into five provinces by the eastern writers. The principal nations noticed by the ancients in this province were the Sabæi, Gerræi, Minæi, Atramitæ, Maranitæ, Catabani, Asciræ, Homeritæ, Sapphoritæ, Omanitæ, Saraceni, Nabathæi, Thamydeni, and Bnizomenæ. The most remarkable places were Nysa, Arga, Badeo, Pudni, Musa, Ocelis, Arabiæ emporium or Aden, Mosha or Maskat, and Atamas portus or Cadhema.

The best eastern writers have divided this peninsula into five provinces or kingdoms, namely Yaman, Hejaz, Tehama, Naid, and Yamama. The province of *Yaman* or *Yemen*, so called either from its situation to the right hand or south of the temple of Mecca, or from the verdure of its soil, extends along the Indian ocean from the straits of Babelmandel to cape Razal-Ghad or Rasalgat. It is bounded by part of the Red Sea on the west and south, and on the north by the town of Nairan, the Nagara of Ptolemy; Haly or Haljo on the sea Al Kolzom, and Oman or Sohar; and it is subdivided into several lesser provinces as Hadramaut, Shihr, Oman, Najran, and Mahra, of which Shihr alone produces the frankincense. This country has been famous, from a very remote period, for its fertility and riches, and the happiness of its climate. The principal cities known to the ancients were Mocha, Aden, Sanaa the capital of the province, and now reckoned the chief city of Arabia, Saba or Mareb, Shibam, Dhafar, and Oman or Sohar. This province, known under the appellation of Arabia Felix, called by the Greeks *most happy*, and formerly extolled for the verdure of its trees, the purity of its air, the flavour of its fruits, and the diversity and abundance of its products, manifests at present few traces of its ancient opulence; insomuch that it is difficult to conceive how it has acquired the name of *happy;* being a country where the greater part of the land remains without culture; and, exsiccated by burning heats, it is destitute of inhabitants, excepting in places remote from the sea, where the mountains afford a refuge by their shade. It may therefore be presumed, that the articles of luxury which it produces, and which polished nations have converted into wants, have given rise to the belief, that wherever superfluities are found, there the necessaries of life must be enjoyed in abundance; just as the vulgar imagine, that the most fortunate countries are those which produce gold, pearls, and diamonds. This province, far less fertile than either Egypt or Syria, which lie at no great distance, seems only to have usurped the title of *happy*, from a comparison with the barren and indigent tracts that surround it.

Hejaz, so called because it *divides* Najd from Tehama, is limited on the south by Yemen and Tehama; on the west, by the sea Al Kolzom; on the north, by the deserts of Syria; and on the east, by the province of Najd. The chief towns are Mecca, Medina, Taifa, Aidab, Yanbo, Madian, and Hejr. The soil in this province is more barren than that of Yemen, and it is so parched as to afford neither water, nor fruits, nor genial harvests; and yet superstitious credulity produces plenty, insomuch that a province, doomed by nature to scarcity and want, is become the wealthiest and most flourishing of Arabia. It was known, in the earliest ages, under the name of the Madianite, or Arabia Petræa. It owes its opulence and celebrity to the towns of Mecca and Medina; the former having had the honour of giving birth to Mahomet; and the other boasting of having granted him an asylum, when, at the commencement of his ministry, he was obliged to retire from the sword of his persecutors. Many honourable pretensions add lustre to this province. It was here, according to report, that Abraham laid the foundations of the most ancient temple in the world; it was hither that Ishmael, on being forced to quit the paternal roof, came to seek a second country; it was hither that Moses, when a fugitive from Egypt, withdrew from the vengeance of those who wanted to punish him for having killed the Egyptian; here he married the daughter of Jethro, a prophet highly revered, who, as the Arabians relate, gave useful lessons to the leader of the Hebrews; in short, it is here that we behold the two mountains of Horeb and Sinai, where Jehovah gave laws to his people, amidst awful thunder and lightning. It is from these illustrious claims that a province, which offers to the sight only sands and rocks from whence flow bitter waters, establishes its pre-eminence, and finds resources ever new in a glorious and profitable tradition.

The province of *Tehama*, so denominated from the vehement heat of its sandy soil, and *Gaur*, from its low situation, is bounded on the west by the Red Sea, and on the other side by Hejaz and Yemen, extending almost from Mecca to Aden. The Arabian geographers have sometimes confounded this province with Yemen and Hejaz. Abulfeda mentions several towns in Tehama, which must have been undoubtedly of great antiquity, but unknown both to the Greeks and Romans. As the ground of this district is the lowest in Arabia, it abounds with springs, which are an invaluable treasure to a dry and parched region.

The province of *Najd* or *Neged*, signifying a rising country, lies between those of Yamama, Yemen, and Hejaz, and is bounded on the east by Irak. This elevated country presents to the view only rocks and deserts, from whence men and animals are totally excluded, on account of the scarcity of water, except in some few more favoured districts, where the shade of the mountains affords a defence against the scorching heat of the sun.

Yamama, called also *Arud*, from its oblique situation in respect of Yemen, is surrounded by the provinces of Najd, Tehama, Bahrein, Oman, Shihr, Hadramaut, and Saba. The chief city is Yamama, which gives name to the province; and it was anciently called Jaw or Gjauva; it is particularly famous for having been the residence of Mahomet's competitor, the false prophet Moseilama.

The inland parts of Arabia, occupied by the extensive province

province or defert called *Neged*, were, till of late years, almoft utterly unknown. The relations of travellers were confined to the coafts of that vaft country, to which, without doubt, their peregrinations were limited. Michaelis, the celebrated profeffor of Gottingen, propofed to the late king of Denmark, to find five able perfons to explore the territory and productions of Arabia. Of thefe five Danes, four dying in the journey, M. Niebuhr, who had been appointed to the geographical department, took upon him to execute the object of the expedition alone. From the relation which he publifhed in 1772, we fhall make fome extracts. Of all the maps of Arabia that have hitherto been publifhed, this learned traveller gives the preference to that of M. D'Anville, publifhed in 1751, under the title of "Premiere Partie de la Carte de l'Afie, la Turquie, l'Arabie, l'Inde, & la Tartarie." He collected a great number of inferiptions and medals in Cufic characters, to which he annexes the explications given by Mr. Reifke, profeffor at Leipfic. Among thefe antiques, he prefents one of bronze, on which appears the figure of the crofs, with the name of a caliph and a Turkifh legend. Our aftonifhment at this curious mixture will ceafe, on learning that the medal was ftruck in a country that was, at the fame time, governed by the Greek emperors and the caliphs of Bagdad.

Arabia is divided by the inhabitants themfelves into eight provinces, entirely independent on one another, viz. Yemen, on the fouth, towards the ftraits of Babelmandel, Hadramaut, on the fhores of the Indian Ocean, Oman, on the fouth of the entrance of the Perfian Gulf, Hadsjar, or Hajar, the Héjer of M D'Anville, or Lahfa, Nedfied, or Neged, and Hedjas, or Hejaz. The territory of the Bedouins, or of the Arabs in the defert of Syria, may be reckoned a feventh province; and to this again may be added the Arabian eftabliffments on the fouthern coaft of Perfia. See the feveral articles.

Of all the governments of Arabia, which is divided among numerous Imams and Sheiks, that of Yemen is the moft uniform and beft regulated, and an idea of the reft may be formed from that of Yemen, defcribed by Niebuhr. The title of Imam, denoting Vicar, that is of Mahomet, is eccleſiaſtical; in Arabia it is confidered as fynonymous with Caliph, and Emir el Mumenin, or prince of the faithful. Its antiquity is not explained, but the hiftory of the Imams of Yemen is very modern: and though they fometimes celebrate divine fervice, the ſtyle of Emir, which they themfelves aſſume on their coins, feems more proper and preciſe. The inferior governments are conducted by Sheiks, a term fignifying old men, and rarely blended with the eccleſiaſtical character.

The throne of Yemen is hereditary; and the Imam, or Emir, an independent power, acknowledging no fuperior in fpiritual or temporal affairs. He poſſeſſes the prerogative of peace and war; but cannot be called defpotic, as he cannot deprive even a Jew or a Pagan of life; but the cauſe muſt be tried before the fupreme tribunal of Sana, conſiſting of feveral Cadis, while he is only preſident. When an Emir fhews a defpotic diſpoſition, he is merely dethroned. The next in rank are the Fakis, a title ſo lax as ſeemingly only to imply gentlemen. The governors of diſtricts are called Dolas; or, if ſuperior in birth, Walis. The Dola correſponds in ſome degree with the Turkiſh Paſha. The chief magiſtrate of a ſmall town without a garriſon is called Sheik; as a ſuperior governor is ſometimes called Emir, and in little villages, Hakim. The Baſkateb, or comptroller, is an officer who depends on the prince, and inſpects the conduct of the Dola, and the management of the revenues. In each diſtrict there is alſo a Cadi, who, like thoſe in Turkey, are judges of eccleſiaſtical and civil affairs; and perhaps depend on the chief Cadi at Sana, as thoſe of Turkey do on the Mufti: but in Arabia the prince himſelf is the high prieſt. His army, in peace, was computed at 4000 infantry, and 1000 cavalry; the ſoldiers being, as uſual in the eaſt, without uniforms. There is no navy, and the veſſels in general are very rudely conſtructed, thoſe of Yemen having ſails made of matting. Yemen adopted the koran in the 7th year of the Hegira. This fine province has at ſeveral times excited the ambition of Egypt, and been ſubjected to the Ottoman ſultan. It ſucceſſively became a prey to Saladin, Guri, and Solyman; but the love of liberty always triumphed in the mountains over the Ottoman arms. In 1630, Khaſſem, one of the independent Sheiks, forced the Turkiſh Paſhas to quit the country; and Iſmael, his ſon, eſtabliſhed this happy revolution, and took on himſelf the office of Imam.

The general aſpect of Arabia, ſays a modern geographer (Mr. Pinkerton), preſents a central deſert of great extent, with a few fertile "oaſes," or iſles, as in Africa; while the flouriſhing provinces are thoſe ſituated on the ſhores of the ſea, which ſupplies rain ſufficient to maintain the vegetation. In Yemen there are mountains of conſiderable height, but chiefly barren and unwooded; while the temperature and plants form a ſtriking contraſt with thoſe of the plains; yet the want of rivers, lakes, and perennial ſtreams, muſt diffuſe ideas of ſterility through the Arabian landſcape. In the defect of rivers ſtrictly belonging to Arabia, the Euphrates and Tigris, which paſs through Irak-Arabi, have been claimed by ſome geographers; and the Euphrates may be juſtly conſidered as an Arabian river. But in Arabia Proper, what are called rivers are mere torrents, which deſcend from the mountains during the rains, and for a ſhort period afterwards. Such is the Aſtan of Neged. The moſt important river is probably that which ariſes near Sana, and joins the Indian ſea below Harjiah. The little river of Krim flows from Mahrah into the ſame ſea, and is followed by two or three brooks in Omon, or Oman. One or two ſmall ſaline lakes occur in ſituations encircled with hills, which prevent the eſcape of the water.

The chief range of mountains ſeems to proceed in the direction of the Red ſea; towards the north, not more than 30 miles diſtant, and ſometimes in the ſouth about 150; a circumſtance which imparts extent and fertility to Yemen. The hills of Oman ſeem a continuation of thoſe on the other ſide of the Perſian gulf; and the iſles in the mouth of that gulf may be regarded as ſummits of that range. In the country of Segar, commonly aſcribed to Hadramaut, there is a range of hills remarkable for the product of frankincenſe. The direction of the other ranges cannot be accurately aſcertained in the imperfect geography of the country. In Arabia Petræa is the celebrated mountain of Sinai, with its two ſublime ſummits of red granite.

The agriculture of Arabia is employed in the production of wheat, maize, "durra," or a kind of millet, barley, beans, lentiles, and rape, with the ſugar cane, tobacco and cotton. Rice ſeems unknown in Yemen, and oats throughout Arabia: the horſes being fed with barley, and the aſſes with beans. They alſo cultivate "uars," a plant which dyes yellow, and is exported in great quantities from Mocha to Oman; and "ſua," uſed in dyeing red; likewiſe indigo. The wheat, in the environs of Maſkat, yields little more than ten for one; and in the beſt cultivated diſtricts of Yemen, 50 to one; but the durra ſometimes much exceeds this ratio, yielding in the highlands 140, and in the Tehama, or plain, from 200 to 400. By their mode of ſowing, and watering this grain, the inhabitants of Tehama reap

three ſucceſſive crops from the ſame field in the ſame year. The plough is ſimple, and the pick is uſed inſtead of the ſpade. The principal exertion of the huſbandman's induſtry is to water the lands from the rivulets and wells, or by conducting the rains. Barley is reaped near Sana in the middle of July; but the ſeaſon depends on the ſituation. At Maſkat, wheat and barley are ſown in December, and reaped in March; but durra is ſown in Auguſt, and reaped in the end of November. The Arabians pull up their ripe corn by the roots; but the green corn and graſs, as forage for the cattle, are cut with the ſickle. In threſhing their corn, they lay the ſheaves down in a certain order, and then lead over them two oxen dragging a large ſtone.

The greater part of Arabia, being compoſed of dry barren deſerts of ſand, either wholly deſtitute of water, or furniſhing ſcanty ſprings of that which is brackiſh, preſents few objects to botanical inveſtigation. The vegetables in ſuch diſtricts, expoſed to the vertical ſun, and refreſhed merely by nightly dews, belong for the moſt part to the genera of aloe, meſembryanthemum, euphorbia, ſtapelia, and ſalſola. On the weſtern ſide of the Arabian deſert, numerous rivulets, deſcending into the Red Sea, diffuſe verdure; and on the mountains from which they run, vegetation is more abundant. Hither many Indian and Perſian plants, diſtinguiſhed for their beauty or uſe, have been tranſported in former ages, and are now found in a truly indigenous ſtate: ſuch is the caſe probably with the tamarind, the cotton tree (inferior to the Indian), the pomegranate, the banyan tree or Indian fig, the ſugar cane, and many ſpecies of melons and gourds. Arabia Felix may peculiarly boaſt of two valuable trees, namely, the coffee (coffæa Arabica), found both cultivated and wild; and the amyris opobalſamum, which yields the balm of Mecca. Of the palms, Arabia poſſeſſes the date, the cocoa nut, and the great fan palm. It has alſo the ſycamore fig, the plantain, the almond, apricot, and peach, the papaw, the bead tree, the mimoſa nilotica, and ſenſitiva, and the orange. Among its ſhrubs and herbaceous plants may be enumerated the ricinus, the liquorice, and the ſenna, uſed in medicine; and the balſam, globe amaranth, the white lily, and the greater pancratium, diſtinguiſhed for their beauty and fragrance.

The mineralogy of Arabia is not very important. It has no native gold, nor any ſilver, beſides that which is mingled in the lead mines of Oman. In the northern diſtrict of Yemen, called Saade, there are ſome mines of iron, which is brittle. Its precious ſtones have been imported from Hindoſtan; its agates, called Mocha ſtones, are brought from Surat, and the beſt cornelians from the gulph of Cambay. Yemen, however, produces onyxes; a kind of Sardonyx is found near Damar. Rock ſalt appears near Loheia; and in Ajemen, Niebuhr has obſerved pentagonal pillars of ſalt, with bluiſh alabaſter, ſelenite, and various ſpars; but it does not appear that any of the gems are produced in Arabia. The pearls and ſpices, of which Arabia formerly boaſted, were probably the products of the Indies and the coaſts of Africa, whither the Egyptians went to fetch them, in order to diſperſe them among the nations of the weſt; and as it was their intereſt to conceal the ſource of their wealth, they choſe rather to have it thought that they traded to Arabia, where it was impoſſible to penetrate far, without imminent danger of death in the ſands of the deſerts.

The principal riches of Arabia conſiſt in flocks and herds, and eſpecially thoſe ſpecies of animals that require only ſucculent herbs for their nouriſhment. The cow here yields but little milk; and the fleſh of the ox, which like her delights in fat paſtures, is inſipid and juiceleſs. The wool and mutton of the ſheep are coarſe. In the mountains of Arabia Petræa is found the rock-goat. It is probable that Arabia, notwithſtanding the ſterility of its ſoil, was formerly overſtocked with cattle, ſince that commodity formed a prime object of commerce with the neighbouring countries; nevertheleſs it is a well-known fact, that in all the torrid regions there is a greater conſumption of fruits and vegetables than of fleſh. Of all the animals of Arabia, the horſe claims the pre-eminence. According to Zimmerman (Zool. Geog. 1777, 4to. p. 140.), this animal is found wild in the extenſive deſerts on the north of Hadramaut: this might have been the caſe in ancient times, unleſs it ſhould be thought more probable that the wild horſe of Tartary has paſſed through Perſia, and has been only perfected in Arabia. The horſes here are diſtributed into two claſſes, *viz.* the *Kadiſchi*, or common kind, whoſe genealogy has not been preſerved, and the *Kochlani*, or noble horſes, whoſe breed has been aſcertained for 000 years, proceeding, as their fables aſſert, from the ſtalls of Solomon. They are reared by the Bedouins in the northern deſerts between Baſſora, Merdin, and the frontiers of Syria; and though they are neither large nor beautiful, their race and hereditary qualities being the only objects of eſtimation, the preſervation of their breed is carefully and authentically witneſſed; and the offspring of a Kochlani ſtallion with an ignoble race is reputed *Kadiſchi*. Theſe will bear the greateſt fatigues, and paſs whole days without food, living, according to the Arabian metaphor, on air. They are ſaid to ruſh on a foe with impetuoſity; and it is aſſerted that ſome of them, when wounded in battle, will withdraw to a ſpot where their maſter may be ſecure; and if he fall, they will neigh for aſſiſtance. Accordingly their value is derived from their ſingular agility, an extreme docility, and an uncommon attachment to their maſters. The Arabian ſteeds are ſometimes bought at exceſſive rates by the Engliſh at Mocha. The duke of Newcaſtle aſſerts, that the ordinary price of an Arabian horſe is 1000, 2000, or even 3000l.; and that the Arabs are as careful in preſerving the genealogy of their horſes, as princes in recording that of their families: the grooms are very exact in regiſtering the names of the ſires and dams of theſe animals, and ſome of them are of very ancient date in this ſpecies of pedigree. It is affirmed that Arabian colts are brought up with camel's milk. In this country there is alſo a ſuperior breed of aſſes, in form and qualities approaching to the mule, and ſold at high prices. Arabia, or Africa, ſeems to be alſo the native country of the camel. Niebuhr obſerved camels of different kinds, and he ſeems to have decided the queſtion concerning the dromedary, by ſaying that this animal in Arabia and Egypt has always one hunch only, and can otherwiſe be ſcarcely diſtinguiſhed from the camel, but in being more light and ſpeedy. The buffaloe ſeems to be unknown in this country; and the cattle in general have a hunch on the ſhoulder. Arabia is infeſted with almoſt all kinds of ferocious beaſts, that prefer burning ſands and arid mountains to humid regions: they fix their abode in the caves of the mountains, in the clefts of the rocks, or in dens which they dig for themſelves. The other animals are the jackal, or chacal; the hyæna, towards the Perſian gulf and the deſert mountains of Arabia Petræa; numerous monkies in the woods of Yemen; the jerboa, or rat of Pharaoh, in Neged; and there are alſo antelopes, and wild oxen, with wolves, foxes, and wild boars, and the large panther, called in Arabia, "nemer," and a ſmall panther, called the "fath." The tiger ſeems utterly unknown, and the lion only appears beyond

yond the Euphrates. But if ferocious animals of various kinds exercife with impunity their ravages in the deferts, the mountains teem with other animals, which produce great advantages to commerce; fuch as the civet-cat, the bezoar goat, the muſk-rat, and various others, which are diveſted by nurture of their ſavage diſpoſition, and inured by habit to domeſtic diſcipline.

Among the birds may be named the pheaſant, common in the foreſts of Yemen, and the grey partridge in the plains, beſides all ſorts of common poultry. On the coaſts of the Red Sea, the ſpecies of ſea-fowls that live on fiſh are numerous, and in an iſland of this ſea are pelicans; in the deſerts are oſtriches; and the birds of prey in Arabia are eagles, falcons, vultures, and ſparrow-hawks. A bird of the thruſh kind, called by Mr. Forſkal, "turdus ſeleucus," is very ſerviceable in deſtroying locuſts, and is thought to come annually from Khoraſan. It is denominated "Samarman," or, "Samarmog." Arabia abounds with land-tortoiſes, which are eaten by the eaſtern Chriſtians in Lent; ſeveral ſorts of lizards, and alſo of ſerpents; and of the latter, the only ſort that is formidable is that called "Bætan," which is ſmall and ſlender, and ſpotted with black and white; its bite is ſo poiſonous, that it occaſions inſtant death. The Red ſea is ſtored with a great variety of fiſhes. Mr. Forſkal is ſaid to have obſerved more than 100 new ſpecies; ſome of which he could not rank among any of the known genera. The locuſts are very numerous; and that ſpecies which infeſts Arabia is called by Mr. Forſkal, "Gryllus gregarius," which he thinks to be different from the "Gryllus migratorius" of Linnæus. All the Arabians, whether living in their native country or in Perſia, Syria, and Africa, are accuſtomed to eat locuſts; and they aſcribe a peculiar delicacy to the red ſort, which they eſteem fatter and more ſucculent than any of the others. The ſwarms of theſe inſects darken the air, and at a diſtance appear like clouds of ſmoke. In flying, their noiſe is tremendous, and reſembles that of a water-fall. When ſuch a ſwarm falls upon a field, it is ſoon conſumed and deſpoiled of its verdure. A ſmall inſect, named "Arda," (the "Termes fatale" of Linnæus,) is another ſcourge of Arabia, as well as of hot countries in general. Theſe live and work together like ants, and are very deſtructive to trees. The inhabitants of the country, for preſerving their gardens from the depredation of theſe miſchievous inſects, ſurround their trees with ſheep's dung, the ſmell of which the arda cannot endure. A ſpecies of "ſcolopendra" torments the Arabians, and affects thoſe on whom it fixes with burning pains. Among the "Tenebriones," there is one ſpecies which the women of Arabia and Turkey dig out of the filth of the garden; and they ſwallow three of them fried in butter every morning and evening, in order to acquire that plumpneſs which is deemed in the eaſt a beauty.

The Red Sea is full of marine inſects; and Mr. Forſkall, from a number of obſervations, inferred, that an immenſe number of theſe animals contribute to produce the refulgence perceived at night in ſea-water. The ſhells of the Arabic gulf are numerous, and ſome of them belong to rare ſpecies. The moſt beautiful is a "pinna," with ſuperb colours. The Arabic gulf abounds with immenſe banks of coral; ſo that moſt of the houſes in the Tehama are built of coral rock. Theſe rocks, riſing ſometimes ten fathoms above the ſurface of the ſea, are ſoft under the water; and as they are eaſily wrought, they are preferred to all other ſtones for the purpoſes of building.

In the whole peninſula of Arabia the year has only two diſtinct ſeaſons, the dry and the rainy. The latter commences in the province of Yemen, about the middle of June, and terminates in September; but the ſky is rarely covered with clouds for 24 hours at a time. At Maſkat, and in the eaſtern mountains, it falls from the middle of November to the middle of February; and in Oman and Hadramaut, from the middle of February to the middle of April. Theſe regular rains are very beneficial, as they render the vallies lying among the mountains fertile and delightful. In the plains of Yemen rain is ſometimes uncommon for a whole year; and in the dry ſeaſon, a cloud is ſcarcely to be ſeen. The heat is no leſs ſubject to variation, than the wet and cold. At Sana, in the mountains, it has never exceeded 85° from the 18th to the 29th of July; whereas in Tehama, which is lower than Yemen, it has ſtood at 98° from the 6th to the 20th of Auguſt. It ſometimes, though rarely, freezes at Sana, while at Loheia the thermometer is at 86°. Hence the inhabitants of Yemen live as if they belonged to different climates; and even at a ſmall diſtance are found fruits and animals which might indicate remote countries. The wind from the ſea is generally moiſt, that from the interior deſerts dry; and in the northern deſerts are chiefly perceived the diſaſtrous effects of the burning wind called Sam, Smam, or Samiel. The Arabs diſcern its approach by an uncommon redneſs in the air; and to defend themſelves from the imminent danger, they throw themſelves flat on the earth. The people of the iſle of Chaudſi and of the Maredin, have nothing to dread from this deadly wind; ſleeping in the open air from the 18th of May to October, without feeling any inconvenience.

Although the Arabians are ingenious and diligent, their manufactures are of little conſequence. Even in Yemen, the works in gold and ſilver, and the coin itſelf, are produced by Jewiſh manufacturers. In the whole country of Arabia there are neither wind-mills nor water-mills. The muſkets that are made in the country, warlike as the Arabians were formerly deemed, are mere matchlocks of mean fabric. At Mocha there is one glaſs-houſe; and in Yemen there are ſome linen manufactures, chiefly coarſe. Among the chief vegetable products of Arabia, Niebuhr reckons aloes, myrrh, frankincenſe of an inferior kind, and coffee; and alſo cocoa trees, pomegranates, dates, apricots, peaches, almonds, filberts, pears, figs, and tamarinds. But the beſt frankincenſe, with ſpikenards, cinnamon, caſſia, cardamums, and pepper, are imported from Hindoſtan. The orange trees are brought from Portugal, and the lemon from Italy; the mangoſteen and cocoa, with ſeveral others, are imported from Hindoſtan.

The commerce of Arabia was formerly very conſiderable, as its ports facilitated a communication between the eaſtern and weſtern world. But ſince the Portugueſe opened a paſſage to India by the Cape of Good Hope, its intercourſe with Hindoſtan has very much declined.

The chief articles exported from Yemen are coffee, aloes, and myrrh (of which the beſt is brought from Abyſſinia), oliban (or an inferior kind of frankincenſe), ſenna, ivory, and gold from Abyſſinia. The European imports are iron, ſteel, cannons, lead, tin, cochineal, mirrors, knives, ſabres, cut glaſs, and falſe pearls. Niebuhr regards aloes and frankincenſe (the latter chiefly from Hadramaut) as the only native articles of commerce, before coffee came into uſe. The principal trading ports are Jidda or Gedda, the harbour of Mecca, Loheia, and Beit el Fakih, carrying on a conſiderable trade in coffee; Gezan, trading in ſenna and coffee; Hodeida, Mocha, Aden, Maſkat, Sur or Seger, Faitach and Dafar, on the Arabian ocean; Bahrin and El Katif, in the gulf of Baſſora; Baſſora, &c. See the articles.

Beſides the maritime commerce, a conſiderable traffic is carried on by land by means of the caravans of Aleppo and

Suez, which bring hither velvets, fattins, armoiſins, and all ſorts of rich ſtuffs; ſaffron, mercury, vermilion, &c.; and take in return, partly the natural products of the country, partly manufactures, and partly the foreign merchandizes that have been brought from the Indies, from Aleppo, and from Europe. Niebuhr obſerves, that the trade on the coaſt of the Red Sea cannot be advantageous to any nation that has not ſettlements in India. The Arabians, he ſays, make no uſe of the productions of Europe. It will be, therefore, neceſſary to ſupply them with India goods, and to take coffee in return, which can be bought cheaper from ſhips which take it in merely to avoid returning empty. There is, however, a great quantity of iron ſold in Arabia, which the Engliſh purchaſe chiefly from the Danes. This ingenious traveller cautions ſtrangers againſt the knavery of the Mahometan brokers; and he recommends their applying rather to the Banians, among whom are many very conſiderable merchants, who are very honeſt men. In his deſcription of the extenſive country of Neged, he informs us, that the Arabs, who inhabit it, are not more inhuman towards ſtrangers than the reſt of their nation, nor leſs hoſpitable; but as this country contains many little independent ſtates, each governed by a Sheik, it may be eaſily conceived that travellers here find little ſecurity. Each prince endeavours to get from them all he can; and as they are commonly at war with each other, ſtrangers are deſpoiled by the firſt, that his neighbours may not be the richer. Hence opulent foreign merchants cannot hazard their caravans in theſe regions; and thoſe that come from Oman and Lahſa to Mecca, are generally compoſed of beggars, or people who wiſh to paſs for ſuch; and the caravan which every year leaves Bagdad for Mecca, accompanied with many rich Perſians, is, in proportion to its number, charged with ſimilar expences and extortions with thoſe of Turkey, Egypt, and Magreb, which paſs by Hejaz. Yet there is reaſon to believe that the towns of Neged carry on a conſiderable trade among themſelves, and with the neighbouring places in Hejaz, Yemen, and Lahſa; and by theſe means it may be poſſible for an European traveller to inſpect this internal part of Arabia.

The population of Arabia conſiſts chiefly of Mahometans, intermixed with ſome Jews and Chriſtians. Banians alſo from India are ſettled in great numbers in their commercial cities. For their manners and cuſtoms, language, and literature, and other particulars, ſee the following articles, and thoſe already referred to in the general account of the country.

Of the various Arabian colonies ſettled in the maritime parts of the gulf of Perſia, the moſt conſiderable is the city of Abuſchar, 28° 59′ from the equator. That of Gombron, founded by Shah Abbas, has been loſing, ever ſince the troubles conſequent on the death of Shah Nadir, the opulence and ſplendour which it derived from the extent of its commerce. Beſides ſeveral iſles of little conſequence in the Arabian gulf, there are SOCOTRA in the Arabian ſea; and the iſle of BAHRIN, or AUAL, in the Perſian gulf, in which there is a fortified town; and on this and the groupe of adjacent ſmall iſles, there are 50 or 60 mean villages.

ARABS, *hiſtory, Character, cuſtoms*, &c. *of the*. According to the oriental writers, the Arabs are diſtinguiſhed into two claſſes, viz. the old loſt Arabians, and the preſent. The former were very numerous, and divided into ſeveral tribes, which are now all deſtroyed, or elſe loſt and ſwallowed up among the other tribes; nor are any certain memoirs or records extant concerning them. The moſt famous tribes among theſe ancient Arabians were *Ad*, *Thamud*, *Taſm*, *Jadis*, the former *Jorham*, and *Amalek*. The preſent Arabians, according to their own hiſtorians, are ſprung from two ſtocks, Kahtan or Joktan, the ſon of Eber, and Adnan, deſcended in a direct line from Iſhmael, the ſon of Abraham and Hagar. The poſterity of the former they call *Al Arab*, *Al Arabi*, i. e. the genuine or pure Arabs; and thoſe of the latter, *Al Arab al Moſtarcba*, i. e. naturalized or inſtitutious Arabs. Beſides theſe tribes of Arabs, mentioned by their own authors, who were not deſcended from the race of Shem, others of them were the poſterity of Ham, by his ſon Cuſh, who inhabited the banks of the Euphrates, and of the Perſian gulf, whither they came from Chuzeſtan, or Suſiana, the original ſettlement of their father. To theſe three ſtocks traditionary report aſcribes the origin of the Arabians. Some time after the confuſion of languages at Babel, or according to the computation admitted in Europe about 3600 years ago, Yarab, the elder of Joktan's ſons, it is ſaid, ſucceeded his father in the kingdom of Yemen, giving name, as the Arab writers maintain, to their country and language; and Jorham, the younger, founded the kingdom of Hejaz, where his poſterity poſſeſſed the throne till the time of Iſhmael. The kingdom of Yemen, or at leaſt the better part of it, particularly the provinces of Saba and Hadramaut, was governed by princes of the tribe of Hamyar, the ſon of Saba, and the great grandſon of Kahtan; though at length the kingdom was tranſlated to the deſcendants of Cahlan his brother, who ſtill retained the title of king of Hamyar. The princes of the Hamyarites, called Homerites by the later Greek and Latin authors, had the general title of "Tobba," ſignifying ſucceſſor, as the Egyptian kings had that of Pharaoh, the Roman emperors that of Cæſar, and the ſucceſſors of Mahomet that of Caliph. This kingdom laſted, according to Abulfeda, 2020 years; or, as other Arabian writers ſay, above 3000; the length of the reign of each prince being very uncertain. The firſt great calamity that befel the tribes ſettled in Yemen was the inundation of Aram, which is ſaid to have happened ſoon after the time of Alexander the Great, and to have been occaſioned by the irruption of a mound, or dam, erected near the city of Saba, afterwards called Mareb, and ſerving as a reſervoir for receiving the water which came down from the mountains for the ſupply of the city, and for watering their lands. On this occaſion, eight tribes were forced to abandon their dwellings; and ſome of them, in their migration, gave riſe to the two kingdoms of Ghaſſan and Hira; both of them out of the proper limits of Arabia. The founders of the former, in Syria Damaſcena, maintained their kingdom, according to Abulfeda, 616 years. Five of theſe princes were named Hareth, written by the Greeks Aretas; and it was the governor of one of theſe who ordered the gates of Damaſcus to be watched, for the purpoſe of apprehending the apoſtle Paul. This tribe was Chriſtian; but their laſt king, on occaſion of the ſucceſſes of the Arabs in Syria, profeſſed Mohammediſm under the Caliph Omar; however, on receiving ſome diſguſt, he returned to his former faith, and retired to Conſtantinople. The other kingdom of Hira, founded in Chaldæa, or Irak, continued, with ſome ſmall interruption by the Perſians, till the caliphate of Abubeker, and its duration was near 623 years. The princes were under the protection of the kings of Perſia, acting as their lieutenants over the Arabs of Irak, as the kings of Ghaſſan were for the Roman emperors, over thoſe of Syria.

Jorham, the ſon of Kahtan, who founded the kingdom of Hejaz, and his poſterity, maintained poſſeſſion of it till the time of Iſhmael, who, marrying the daughter of Modad, one

one of the princes of the country, had 12 ſons; to one of whom, called Kidar, the crown was reſigned by his uncles, the Jorhamites; but others ſay, that the deſcendants of Iſhmael expelled that tribe, who, retiring to Johainah, were, after various fortune, all deſtroyed by an inundation. Of the ſucceſſive kings of Hamyar, Hira, Ghaſſan, and Jorham, Dr. Pococke, in his "Specimen Arab." has given catalogues, that are ſaid to be tolerably exact.

After the expulſion of the Jorhamites, the government of Hejaz ſeems not to have remained for many centuries in the hands of one prince, but to have been divided among the heads of tribes, almoſt in the ſame manner as the Arabs of the deſert are governed at this day. At Mecca, an ariſtocracy prevailed, where the chief management of affairs, till the time of Mohammed, was in the tribe of Koreiſh; more eſpecially after they had obtained the cuſtody of the Caaba from the tribe of Khozaah, one of thoſe tribes that had migrated from Al-Aram.

Beſides the kingdoms already enumerated, there were ſome other tribes, which in latter times had princes of their own, and formed ſtates of inferior note; ſuch, in particular, was the tribe of Kenda, which had ſeveral kings.

Having given a brief abſtract of the hiſtory of the ancient Arabs before Mahomet, it may not be improper to ſubjoin a conciſe account of the principal tranſactions in which thoſe people were concerned with the Egyptians, Perſians, Greeks, and Romans, extracted from the moſt approved writers of the two laſt nations. According to Diodorus Siculus (lib. i.), Seſoſtris, the Seſac of Joſephus and Sir Iſaac Newton, ſubdued Arabia. But it is evident, that the Arabs were never completely ſubjugated, nor for any long time rendered any homage to the kings of Egypt, becauſe Seſac himſelf, as the ſame author informs us, was obliged to draw a line from Heliopolis to Peluſium, in order to ſecure Egypt from the incurſions of the Arabs and Syrians. The Scenite Arabs, contiguous to Paleſtine and Syria, muſt, therefore, have been independent on that prince. Nor can it be inferred from Diodorus, that he ever haraſſed Arabia Felix, though he had a fleet of 400 ſail upon the Red Sea; but only coaſted it, or at moſt ſeized upon ſome of its maritime provinces in his voyage to India: and by the teſtimony of this hiſtorian, who has extolled the conqueſts of Seſoſtris, it ſufficiently appears, that the whole peninſula of the Arabs never was, at leaſt for any conſiderable time, in a ſtate of ſervitude to the Egyptians. It appears on the contrary, that they gave kings to Egypt, who were known under the name of Shepherds. From Diodorus (l. ii.) we alſo learn, that neither the Aſſyrians, Medes, nor Perſians, could ever gain any conſiderable ſettlement among them. The Perſian monarchs were reſpected by them as their friends, and received from them, as Herodotus informs us (l. iii. c. 97.), an annual preſent of frankincenſe; and yet they never made them tributary, and gave law to them; nor is Arabia found in any enumeration of their provinces: ſo far indeed were the Perſians from being their maſters, that Cambyſes, in his expedition againſt Egypt, was obliged to aſk permiſſion to paſs through their territories. The Spartans, inured to conqueſt, made a deſcent on their coaſts, and repented of their temerity. When Alexander the Great had ſubdued the Perſian empire, the Arabians, however exorbitant and generally dreaded his power was, in conſequence of the extent and fame of his victories, had ſo little apprehenſion of him, that they alone, of all the neighbouring nations, ſent no ambaſſadors to him. The preparations which he made ſhew, that he regarded this conqueſt as worthy of his utmoſt exertions, but death put a ſtop to his enterpriſe, ſo that it is impoſſible to decide what would have been the event; but perhaps this people might have convinced him that he was not abſolutely invincible. The ſucceſſors of Alexander, who attempted to proſecute his deſign, were as often defeated. For an account of the unſucceſsful enterpriſe of Athenæus, the general of Antigonus, ſee ANTIGONUS.

The reply of the Arabs to Demetrius, who undertook a ſecond expedition againſt them, demonſtrates their manly reſolution, and their indifference to the fame that is acquired by arms. "King Demetrius" ſaid they, "what are thy pretenſions? what wouldſt thou have of us? what motive brings thee to diſturb the ſilence of our deſerts, where nature, a cruel ſtepmother to us, grants her children no other than the painful means of ſubſiſtence? our parched and ſandy deſerts have no charm for us except the liberty they allow us to enjoy, and which thou art come to raviſh from us. It is the love of independence, that renders ſuch hardſhips as are unknown to the other inhabitants of the earth, ſupportable to us. Our rocks are too hard to be broken by thy ſceptre: if then thou wouldſt ſubject us to thy yoke, begin by ſubjugating our ſentiments; alter our manner of life; but firſt contrive means of ſubſiſtence in a country that has nothing but ſand, and rocks, and metals. Be adviſed, and let thoſe people live in peace againſt whom thou haſt no cauſe of complaint, and who deſire to have no quarrel with thee. Accept the preſents we here bring thee; and may they induce thee to believe that the Nabathæans are thy friends."

The Romans made incurſions into Arabia, but never ſubdued it. Some few tribes, vanquiſhed by Lucullus, did homage to the majeſty of the Roman people. Pompey, as Plutarch informs us, obliged Aretas, an Arab prince, whoſe dominions bordered upon Syria and Meſopotamia, to receive a Roman garriſon; and the ſame general likewiſe ſubdued the Arabs who dwelt about mount Amanus, by his lieutenant Afranius. After which the king of the Arabs, reſiding in Petra, addreſſed a letter of ſubmiſſion to him; but it does not appear that Pompey ever gained poſſeſſion of that fortreſs. Craſſus, ambitious of making the conqueſt of this country, entered a diſtrict of it with a numerous army, which periſhed in the deſerts from thirſt and miſery. Ælius Gallus, in the reign of the emperor Auguſtus, in ſome meaſure repaired the diſgrace of this diſaſter. He, of all the Roman generals, ſeems to have penetrated fartheſt into theſe immenſe and frightful deſerts. At firſt he met with ſome brilliant ſucceſſes; but the deadly heats conſumed the flower of his troops, and he was obliged to retire with the remains of his army, whoſe fruitleſs victories were celebrated by the flatterers of Auguſtus. Caius, his grandſon, convinced of the impoſſibility of ſubjugating a people, who only regarded life inaſmuch as they could live free, inveſted their towns with fire and ſword; and having forced them to ſurrender, he thence made excurſions upon the territories of the empire; but after all his exertions, contented himſelf with the glory of having deprived them of the means of offence. From that time to the reign of Trajan, we read of no conteſt between the two nations. This emperor laid ſiege to the capital of the Hagarenes; and after repeated efforts, ſubmitted to the diſgrace of raiſing it. Notwithſtanding the flatteries of Trajan, by the hiſtorians and orators of his time, and the medals ſtruck by him, he did not ſubdue the Arabs; the province of Arabia, which he is ſaid to have added to the Roman empire, ſcarcely reaching farther than Arabia Petræa, or the very ſkirts of the country. About eighty years after this period, the emperor Severus, being greatly incenſed againſt the Arabs bordering on Syria, laid ſiege to Atræ their capital, with a formidable army; but he was obliged to raiſe it, and to retire into his own dominions. The Sa-

racens,

racens, the moſt celebrated people among the Arabs, ravaged Meſopotamia in the time of the emperor Conſtantius, and joined the Perſians againſt Julian. This prince, and ſome of his predeceſſors, had paid a ſubſidy to the Saracens who ſerved in their armies; but Julian, who conſidered them as his ſubjects and not as his allies, thought the treaty degrading to the majeſty of the empire, and refuſed to pay a tribute under the qualifying term of a ſubſidy. Of thi infraction the barbarians complained; but the prince, who knew how to fight as well as to govern, haughtily anſwered: "My implements are iron: I know nothing of gold." This expreſſion they reſented, deſerted to the Perſian, and ever after continued faithful to him. Sometime afterwards theſe warlike people marched to the relief of Conſtantinople, of which city they became the deliverers. It was under the reign of Theodoſius that they began to make war in their own behalf; and after having been the ſtay of the tottering empire, they became its terror. The Arabs, hitherto divided in tribes, now united their forces, and ſallied forth to make conqueſts. It appears that the ſeeds of that barbarous valour they now diſplayed had been concealed in their breaſts, and that their hard and laborious life had prepared them for becoming intrepid ſoldiers. Their deſerts were a rampart that ſecured them from foreign incurſions; it was impoſſible to penetrate them without the danger of periſhing for want of water, as the wells for the ſupply of it were known only to the inhabitants, who never diſcloſed the ſecret. Their towns were little elſe than magazines, in which they ſtored up the fruits of their predatory attacks, conſiſting of little more than a collection of huts, which they abandoned on the approach of an enemy; their citadels were the work of nature, ſteep rocks from whence they defied the moſt numerous hoſts, who, like them, had nothing to fear, except the dearth of water and famine. Being ignorant in the art of fortification, they were but little verſed in the attack of ſtrong holds; thus their offenſive wars were nothing more than tranſitory incurſions: the forts which their enemies erected on the frontiers were ſufficient to reſtrain their depredations. They were wont to thank heaven for giving them ſwords inſtead of ramparts. Their education was martial; they trained their children to the uſe of the bow and the ſword, and in breaking their horſes. An excellent ſword was a family token, which a father bequeathed to his children, to remind them of the bravery of their anceſtors. Prodigal of their own blood, it cannot be imagined that they were ſparing of that of others. They fought only by day-light, becauſe courge is roufed by having witneſſes of its efforts, and they thought that darkneſs was favourable to cowardice. It is therefore by no means ſurpriſing, that a people born with ſuch noble propenſities ſhould have achieved ſuch prodigies of valour, when once they had yielded to the ambition of conqueſts. The Arabs then, naturally warlike, only waited for circumſtances to render them conquerors; for a long time, however, pacific and obſcure, they took up arms merely from greedineſs of ſpoil, and never with a view of extending their borders, holding mankind in too great contempt for wiſhing to have them for ſubjects. They marched to battle without order or diſcipline; but accuſtomed to contend with ferocious animals, they carried courage to the exceſs of ferocity. Some, however, more ſavage than the reſt, ſold their blood and their ſervices to ſuch kings as were able to buy them; and it was not ſo much from a ſentiment of honour, as from the hope of ſpoil, that they abandoned the tranquillity of their ſolitudes. The Romans and the Perſians, as we have ſeen, had in their armies a body of Saracens, who frequently decided the fortune of war. Though ſatisfied with their independence, they were ſcrupulous of attacking the liberty of their neighbours; and their greateſt glory was their never having ſubmitted to foreign dominion. To this, however, they have undoubtedly a diſtinguiſhing claim; thoſe who at different times attempted to ſubjugate them, having merely ſucceeded againſt a few tribes, ſettled in the cities on the Arabian gulf, or in the vicinity of Syria; and even here their power was extremely tranſient. After the time of Mahomet, Arabia was for about three centuries under the Caliphs his ſucceſſors; but neither he, nor the Caliphs, could ever entirely ſubdue their own nation. Many chiefs in the interior parts of the country ſtill maintained their independence, without reſpecting the Caliph in any other light than as the head of their religion; and the authority of the Caliphs was merely ſpiritual, except in their dominions over a part of the coaſt, where they were acknowledged as ſovereigns. In the year 325 of the Hegira, a great part of the country was poſſeſſed by the KARMATIANS, to whom the Caliphs were obliged to pay tribute, that the pilgrimage to Mecca might be regularly performed. After the ruin of the power of the Caliphate by the Turks, Arabia ſhook off the yoke to which it had been partly ſubjected, and was governed, as it formerly had been, by a number of chiefs more or leſs powerful, deſcended from different indigenous families. No neighbouring power ever attempted to ſubdue this country, till the Portugueſe penetrated into India, and made their appearance in the Red Sea. Then, in the beginning of the 16th century, Sultan "El-Gury," fitted out a fleet to expel theſe invaders; and their fleet ſeized almoſt all the ſea-port towns of Arabia. But when the dynaſty of the Mamelukes was terminated by the Turks, theſe cities fell again into the hands of their natural ſovereigns. In the continuance of the war between the Turks and the Portugueſe, Solomon Pacha, with a powerful fleet, ſeized all the towns upon the Arabian gulf. His ſucceſſors puſhed their conqueſts ſtill farther, and ſubdued great part of Yemen, penetrating into the highlands; ſo that Arabia became almoſt entirely a province of the Sultan of Conſtantinople, and was governed by Pachas, like the other provinces of the Ottoman empire. Theſe events happened, under a lieutenant of Soliman I., A. D. 1538, and under Selim II., A. D. 1568. In the interior parts, however, there were ſtill independent princes and Sheiks, who had never been ſubdued; but continued to haraſs the Turks, and to drive them towards the coaſts. After various reiterated efforts, a prince of the family now reigning at Sana, at length ſucceeded, about the middle of the 17th century, and obliged the Turkiſh nation to evacuate all the places upon the Arabian coaſt, which they had occupied for more than a century. The Turks now poſſeſs nothing in this country, ſays Niebuhr, but a precarious authority in the city of Jidda; and it is therefore abſurd to reckon Arabia among the Ottoman provinces, ſince it is properly to be conſidered as independent of all foreign powers. From the view above preſented of the independence of Arabia, the contemptuous reflection of a popular hiſtorian (ſee Gibbon's Hiſt. vol. ix. p. 229.), ſeems not juſtly warranted; who, after obſerving, that "the perpetual independence of the Arabs has been the theme of praiſe among ſtrangers and natives," adds, "the arts of controverſy transform this ſingular event into a prophecy and a miracle, in favour of the poſterity of Iſhmael. Some exceptions, that can neither be diſſembled nor eluded, render this method of reaſoning as indiſcreet as it is ſuperfluous." This reflection was aimed at the authors of the Ancient Univerſal Hiſtory, who had obſerved (vol. xvi. p. 299.), that the manner of life, diſpoſition, power, and government of

of the Scenite Arabs, now known under the name of Bedouins, as well as their never having been thoroughly ſubjugated by any foreign power, from the age of Iſhmael to the preſent time, illuſtrate the truth of a ſcripture prediction, Gen. xvi. 12. The learned hiſtorian himſelf allows, that, though the kingdom of Yemen has been ſucceſſively ſubdued by the Abyſſinians, the Perſians, the ſultans of Egypt, under a brother of the great Saladin, A. D. 1173, who founded a dynaſty of Curds or Ayoubites, and the Turks: though the holy cities of Mecca and Medina have repeatedly bowed under a Scythian tyrant; and though the Roman province of Arabia embraced the peculiar wilderneſs, in which Iſhmael and his ſons muſt have pitched their tents in the face of their brethren; yet theſe exceptions are temporary or local, and the body of the nation has eſcaped the yoke of the moſt powerful monarchies. This writer, however, has admirably delineated the cauſes of the freedom and independence of the Arabs, and alſo the effects thus produced on their diſpoſition and character.

Arabia, like other nations of the eaſt, was partitioned into different tribes, each of which had its chief, its cuſtoms, and its ſacred rites peculiar to itſelf: although every family formed a ſpecies of domeſtic government abſolutely independent, though diſtant from one another, without any relations of intereſt or friendſhip, they had retained certain features which clearly indicated, that they were ſo many branches ſprung from the ſame ſtock; all had the ſame love of independence, and, free in their native deſerts, they pitied the nations that were ſubjected to maſters. This love of liberty which is the paſſion of noble and generous minds, was in them a national fanaticiſm; which, cauſing them to deſpiſe the reſt of mankind, prevented their participating in the diſorders and crimes which have poiſoned the ſource of public morals. The long memory of their independence was the firmeſt pledge of its perpetuity; and ſucceeding generations were animated to prove their deſcent, and to maintain their inheritance. Their domeſtic feuds were ſuſpended on the approach of a common enemy; and when they advanced to battle, the hope of victory was in the front; in the rear, the aſſurance of a retreat. The arms and deſerts of the Bedouins are not only the ſafeguards of their own freedom, but the barriers alſo of Arabia Felix; whoſe inhabitants, remote from war, are enervated by the luxury of the ſoil and climate. In every tribe among the Arabs, ſuperſtition, or gratitude, or fortune, has exalted a particular family above the heads of their equals. The dignities of ſheik, and emir, invariably deſcend in this choſen race; but the order of ſucceſſion is looſe and precarious; and the moſt worthy, or aged, of the noble kinſmen, are preferred to the ſimple though important office of compoſing diſputes by their advice, and guiding valour by their example. The momentary junction of ſeveral tribes produces an army, their more laſting union conſtitutes a nation: and the tribes and families are held together by a mutual and voluntary compact. In the ſimple ſtate of the Arabs, the nation is free, becauſe each of her ſons diſdains a baſe ſubmiſſion to the will of a maſter. His breaſt is fortified with the auſtere virtues of courage, patience, and ſobriety; the love of independence prompts him to exerciſe the habits of ſelf-command; and the fear of diſhonour guards him from the meaner apprehenſions of pain, of danger, and of death. The vigour of their frame is preſerved by the laborious exerciſes of an active life, that enures them to toil and fatigue. The frugality to which they are conſtrained by the ſterility of their climate, ſeems to be a virtue in them; and they are thus preſerved from the imbecility and diſeaſe that are the reſult of intemperance either in eating or drinking, and enabled to prolong their life to old age. Their virtues and their vices partake of the influence of their ſituation and climate. That complexional gravity, which renders them inſenſible to whatever affects the reſt of mankind, that ſcornful indifference and inſolent pride with which they regard others, and that torpid inſenſibility which they manifeſt, are contracted and nouriſhed in their ſtate of ſolitude. The gravity and firmneſs of the mind are indicated in the outward demeanour of an Arab; his ſpeech is ſlow, weighty, and conciſe; he is ſeldom provoked to laughter; his only geſture is that of ſtroking his beard, the venerable ſymbol of manhood; and the ſenſe of his own importance teaches him to accoſt his equals without levity, and his ſuperiors without awe. A more ſerious charge than any thing already mentioned is brought againſt the Arabs, and from which it is difficult to juſtify them; this is an habitual cruelty prompting them to ſhed human blood without benefit and without remorſe. Their own hiſtorians have tranſmitted to us ſuch acts of atrocity, as teſtify that this ferocious people propoſed not ſo much to conquer the world, as to deſtroy it. "In the ſtudy of nations and men," ſays Mr. Gibbon, "we may obſerve the cauſes that render them hoſtile or friendly to each other, that tend to narrow or enlarge, to mollify or exaſperate the human character. The ſeparation of the Arabs from the reſt of mankind has accuſtomed them to confound the ideas of ſtranger and enemy; and the poverty of the land has introduced a maxim of juriſprudence, which they believe and practiſe to the preſent hour. They pretend, that in the diviſion of the earth, the rich and fertile climates were aſſigned to the other branches of the human family; and that the poſterity of the outlaw Iſhmael might recover, by fraud or force, the portion of inheritance of which he had been unjuſtly deprived." Thus, the ſeizure of a caravan is not a robbery that can excite in them any remorſe. They look upon it as the recompence of their courage, as well as a reſtitution of uſurped property; and hence their errors concerning the right of war have precipitated them into a deluge of crimes. According to the remark of Pliny, the Arabian tribes are equally addicted to theft and merchandiſe. If a Bedouin diſcovers from afar a ſolitary traveller, he rides furiouſly againſt him, crying with a loud voice, "Undreſs thyſelf, thy aunt (my wife) is without a garment." A ready ſubmiſſion entitles him to mercy, reſiſtance will provoke the aggreſſor, and his own blood muſt expiate the blood which he preſumes to ſhed in legitimate defence. A ſingle robber, or a few aſſociates, are branded with their genuine name; but the exploits of a numerous band aſſume the character of lawful and honourable war. The temper of a people, thus armed againſt mankind, was doubly inflamed by the domeſtic licence of rapine, murder, and revenge. Each Arab might, with impunity and renown, point his javelin againſt the life of his countryman; as in each community, the juriſdiction of the magiſtrate was weak and impotent. Hoſtility was embittered with the rancour of civil faction, and the recital, in proſe or verſe, of an obſolete feud, was ſufficient to rekindle the ſame paſſion among the deſcendants of the hoſtile tribes. In private life, every man, at leaſt every family, was the judge and avenger of its own cauſe. The nice ſenſibility of honour, which weighs the inſult rather than the injury, ſheds its deadly venom in the quarrels of the Arabs; the honour of their women, and of their beards, is moſt eaſily wounded; an indecent action, or a contemptuous word, can be expiated only by the blood of the offender; and ſuch is their patient inveteracy, that they expect whole months and years the opportunity for revenge.

A fine or compenſation for murder is familiar to the barbarians of every age; but in Arabia, the kinſmen of the dead are at liberty to accept the atonement, or to exerciſe with their own hands the law of retaliation. The refined malice of the Arab refuſes even the head of the murderer, ſubſtitutes an innocent to the guilty perſon, and transfers the penalty to the beſt and moſt conſiderable of the race by whom they have been injured. If he falls by their hands, they are expoſed, in their turn, to the danger of reprifals; the individuals of either family lead a life of malice and deſpotiſm; and fifty years may ſometimes elapſe, before the account of vengeance is finally ſettled. The modern theory and practice, in the revenge of murder, are deſcribed by Niebuhr; and the harſher features of antiquity may be traced in the Koran, c. 2. p. 20, c. 17. p. 230, with Sale's obſervations. The attachment of the Arabs to their cuſtoms and opinions, their ſecluded life ſevering them from mankind, and their contempt of death, which they contemplate with a cold intrepidity, were ſo many cauſes adapted to render them barbarous. He who deſpiſes life is inacceſſible to pity; and no enemy is more formidable than he who is ready to die. Nevertheleſs, this ſanguinary ſpirit, ignorant of pity or forgiveneſs, has been moderated by the maxims of honour, which require, in every private encounter, ſome decent equality of age and ſtrength, of numbers and weapons. An annual feſtival of two, perhaps of four months, was obſerved by the Arabs before the time of Mahomet, during which their ſwords were religiouſly ſheathed, both in foreign and domeſtic hoſtility. But the ſpirit of rapine and revenge was further attempered by the milder influence of trade and literature. The ſolitary peninſula is encompaſſed by the moſt civilized nations of the ancient world; the merchant is the friend of mankind; and the annual caravans imported the firſt ſeeds of knowledge and politeneſs into the cities, and even the camps of the deſert. The Arabs have always blended a very conſiderable degree of beneficence, hoſpitality, and politeneſs, with their ferocity. The ſame hoſpitality which was practiſed by Abraham, and celebrated by Homer, is ſtill renewed in the camps of the Arabs; and examples of this kind, among them, exceed any thing that can be produced from other nations. The contrary vice was held among them in ſuch contempt, that one of their poets upbraids the inhabitants of a certain diſtrict in terms of bitter reproach, alleging, that none of their men had the heart to give, nor their women to deny. After the time of Mahomet, they were no leſs liberal than their anceſtors had been. Sale (Pref. Koran, p. 21.) mentions the following ſingular inſtance. Three men were diſputing in the court of the Caaba, who was the moſt liberal perſon among the Arabs. One gave the preference to Abdallah, another to Kais, and a third to Arabah. It was propoſed, however, for the deciſion of the diſpute, that each ſhould go to his friend, and aſk his aſſiſtance. Abdallah's friend found him with his foot in the ſtirrup, mounting his camel, and juſt ſetting out on a journey, and thus accoſted him; "Son of the uncle of the apoſtle of God, I am a traveller, and in diſtreſs." Upon which Abdallah inſtantly diſmounted, and preſented the pilgrim with his camel, its rich capariſon, ſome veſts of ſilk, and a purſe of 4000 pieces of gold. The ſervant of Kais informed the ſecond ſuppliant that his maſter was aſleep, but that he had rather relieve his neceſſity, than awake his maſter: accordingly, he gave him a purſe of 7000 pieces of gold, aſſuring him that it was all the money they then had in the houſe; and he directed him to go to thoſe who had the charge of the camels, with an order for a camel and a ſlave. When Kais awoke, and was informed of what his ſervant had done, he gave him his freedom, and aſked him why he did not call him; for, ſays he, "I would have given him more." The third perſon went to Arabah, who, being dim-ſighted, was leaning on two ſlaves, and juſt coming out of his houſe in order to attend the hour of prayer. As ſoon as his caſe was made known, Arabah clapped his hands, lamented his misfortune, as he had no money, but deſired him to take his two ſlaves. When theſe were refuſed, Arabah proteſted, that if they were not taken, they ſhould be enfranchiſed; and, leaving the ſlaves, groped along by the wall. Arabah was pronounced the moſt generous of the three. The character of Hatem is the moſt perfect model of Arabian virtue. He is repreſented, by D'Herbelot (Bibl. Orient. p. 406.), as brave and liberal, an eloquent poet, and a ſucceſsful robber; forty camels were roaſted at his hoſpitable feaſts; and at the prayer of a ſuppliant enemy, he reſtored both the captures and the ſpoil. In the deſert, and on the roads, the Arabs will carry off the ſpoils of the traveller, and in a moment afterwards embrace, without inquiry or heſitation, the ſtranger who dares confide in their honour, and enter their tent. His treatment is kind and reſpectful; he ſhares the wealth or the poverty of his hoſt; and, after neceſſary repoſe, he is diſmiſſed on his way with thanks, with bleſſings, and perhaps with gifts. In every inhabited diſtrict, fires are lighted up at night, which are called the fires of hoſpitality, to invite the travellers that miſs their way, or are in want of reſt from the fatigues of their journey; and after well regaling them, they are ſet forward on their route with the ſound of inſtruments and with preſents. Their humanity is alſo manifeſt in the modes and degrees of puniſhment which they inflict on perſons convicted of crimes. The Arabs extend their generoſity and kindneſs even to the animals that grow old in their ſervice; granting them the privilege of grazing in the richeſt paſtures, exempt from every ſpecies of labour; and they ſend them provender even to the ſummits of their mountains. In politeneſs, the Arabs vie with the Perſians. The common mode of ſalutation is the "ſalam aleikum," or, peace be with you; in pronouncing which words, they raiſe the right hand to the heart; but this form is ſeldom addreſſed to Chriſtians. On meeting, in their wide deſerts, the ſalutations are multiplied; and the hand of a ſuperior is kiſſed in token of reſpect, a ceremony which ſometimes paſſes among equals; and hence probably was derived, by means of their Mooriſh victors, the Spaniſh expreſſion of kiſſing the hands. Nor were theſe the only good qualities of the Arabs; they are commended by the ancients for the affection and reſpect that ſubſiſt between parents and children, and other kindred; and for the fidelity with which they fulfil their engagements. He who violates the ſanctity of an oath, is doomed to grow old in ignominy; and it is with their blood that they ſign their alliances, in order to impreſs upon them a more ſacred character. The rights of friendſhip are deemed inviolable; and when two friends contract reciprocal obligations, they cannot decline them without being treated as profligates.

The primitive form of government, among the Arabs, was of the patriarchal kind; and the ſame form, according to Niebuhr, has ever ſubſiſted without alteration; a circumſtance which proves the antiquity of this people. Among the Bedouins, or paſtoral Arabs, the deſcendants of the ancient Scenites, it is preſerved in all its purity. Of theſe, ſuch who live in tents, have many ſheiks, each of whom governs his own family with a power almoſt abſolute. All the ſheiks, however, who belong to the ſame tribe, acknowledge a common ſheik, whoſe authority is limited

by cuſtom. The dignity of grand ſheik is hereditary in a certain family; but the inferior ſheiks, upon the death of a grand ſheik, chooſe a ſucceſſor out of his family, without regard to age, or lineal ſucceſſion, or any other conſideration, except ſuperiority of abilities. This right of election obliges the grand ſheik to treat thoſe of the inferior order rather as aſſociates than ſubjects, ſharing with them his ſovereign authority. The ſpirit of liberty, which animates this warlike nation, renders them incapable of ſervitude. But this ſpirit is leſs prevalent among thoſe who live in towns, or who are employed in huſbandry. In the fertile diſtricts of this country, there have been always monarchies, formed either by conqueſt, or religious prejudices. Such are the preſent dominions of the ſheriff of Mecca, of the imams of Sana and Maſkat, and of ſome princes in the province of Hadramaut. However, as theſe countries are interſected by large ranges of mountains, the mountains are occupied by independent ſheiks. But, although ſo many independent chieftains have their domains interſperſed through the territories of theſe ſeveral ſovereigns, yet nothing of the feudal government appears here. The ſheiks poſſeſs no fiefs; they have only a ſort of property in the perſons of the people of their ſeveral tribes. Even thoſe who ſeem to be tributary ſubjects to the princes within whoſe dominions they dwell, are not actually ſo, but they retain their independence; and the tribute they pay, is merely a tithe for the uſe of the land of which they are a ſort of farmers. Such are the ſheiks ſettled in Syria, Egypt, and over the whole of mount Atlas. This multiplicity of petty ſovereigns, occaſions ſeveral inconveniences to the people in general. Wars cannot but frequently ariſe among ſtates, whoſe territories are ſo intermingled together, and whoſe ſovereigns have ſuch a variety of jarring intereſts to manage. But, happily, theſe quarrels are ſcarcely ever productive of very fatal conſequences. An army of a thouſand Arabs will betake themſelves to flight, and think themſelves routed, if they loſe ſeven or eight of their number; and their conteſts are terminated as eaſily as they are excited. It is ſomewhat ſurpriſing, that the Arabs, in a country ſo rich and fertile, ſhould be ſo uncomfortably lodged, indifferently fed, ill cloathed, and deſtitute of almoſt all the conveniences of life. But the cauſes are ſufficient to account for the effects. As to the wandering Arabs, their poverty is voluntary. They prefer liberty to wealth, paſtoral ſimplicity to a life of conſtraint and toil, which might procure for them a greater variety of gratifications. Thoſe who live in cities, or who are employed in the cultivation of the land, are kept in poverty by the exorbitancy of the taxes to which they are ſubject. The whole ſubſtance of the people is conſumed in the ſupport of their numerous princes and prieſts. The general cauſe of the impoveriſhment of Arabia is, without doubt, its having ceaſed to be the channel of trade with India, ſince the diſcovery of the paſſage by the Cape of Good Hope. Yet, if the lands were better cultivated, this country might, without the aid of foreign trade, afford ſufficient reſources to ſupply all its inhabitants with abundance of the neceſſaries and common conveniences of life.

The houſes of the Arabs are built of ſtone, and have terrace roofs; but thoſe occupied by the lower people are ſmall huts, formed, for ſuch as inhabit the banks of the Euphrates, of branches of the date-tree, having a round roof, covered with ruſh mats. The poor ſpread their floors with ſtraw mats, and the rich with fine carpets. No perſon ever enters a room, without having firſt put off his ſhoes. The men occupy the fore part of the houſe, and the women the back part. If there are no ſeparate apartments for the different ſexes, the Arabians, when they introduce a ſtranger, enter before him, and cry out, "Tarik," retire; upon which the women inſtantly diſappear. The great have often in their halls baſons with *jets d'eau* to cool the air. The Arabians practiſe ſeveral modes of ſitting; but that to which they recur, for the greateſt eaſe, is croſſing their legs under their body; but in the preſence of ſuperiors, an Arab ſits with his two knees touching each other, and with the weight of the body reſting upon the heels. The chief amuſements of the Arabians are ſought at coffee houſes, in markets, and public meetings, which they are fond of frequenting; and in order to divert the dulneſs of domeſtic life, they recur much to the uſe of tobacco; and perſons of opulence and faſhion carry with them a box of odoriferous wood, a piece of which they put into the pipe of a perſon to whom they wiſh to ſhew reſpect; this communicates a fragrant ſmell and an agreeable taſte. Inſtead of opium, which the Arabians do not uſe, they conſtantly chew "kaad," or the buds of a certain tree, which are brought in ſmall boxes from the hills of Yemen. The lower people addicted to intoxication, ſmoke, for this purpoſe, the dried leaves of a ſort of hemp, which raiſes their ſpirits, and throws them into a ſtate in which delightful viſions dance before their imagination. At their meals, they ſquat themſelves upon the ground when they ſit; and as they have no knives nor forks, they uſe their fingers with great dexterity, and eat of all diſhes with the hand. The food of the moſt eminent ſheiks is "pilau," or boiled rice. The Arabs repeat always a ſhort prayer before they ſit down to a meal; "In the name of the moſt merciful God;" and every one when he has done retires, pronouncing, "God be praiſed." As they drink little when they eat, after waſhing they drink cold water and a cup of coffee, which they uſe without either milk or ſugar. In Yemen, however, of which the coffee-plant is a native, the uſe of coffee is rare. The favourite drink of this province is prepared from the huſks of coffee-beans ſlightly waſhed and pounded; it taſtes like tea, and is deemed refreſhing. Intoxicating liquors of various kinds are privately uſed in different parts of Arabia; and they are obtained from the Chriſtians and Jews. The Arabians, in general, are ſober, frugal, and abſtemious. Their uſual articles of food are rice, pulſe, milk, butter, and whipped cream. They ſeldom eat animal food. Of this, mutton is the moſt common; and the Arabians in the deſert uſe it freely. The common people in Arabia have little other food beſides bad bread, made of "durra," by kneading it with camel's milk, oil, butter, or greaſe. Their grain is bruiſed with ſtones, as they have no mills; and in the deſert they bake their cakes on a plate or gridiron, or on live coals, or on camel's dung, where they cover it till it is penetrated by the heat. In the towns, they have ovens like ours, and their bread is of barley meal, in form reſembling our pancakes.

There is a great variety in the national dreſs of the Arabians. Their head-dreſs conſiſts of fifteen caps laid over one another; ſome of which are of linen, and the reſt of thick cloth or cotton. The uppermoſt is one richly embroidered with gold, and ſome ſentence of the Koran; and over all they wrap a large piece of muſlin, ornamented at the ends, and flowing looſe upon the ſhoulders, with ſilk or golden fringes. The Arabs of the common claſs wear only two caps, with the ſaſh careleſsly bound on the head. Some have drawers and a ſhirt; but the greater number have only a piece of linen about their loins, a large girdle, and a piece of cloth upon their ſhoulders; in other reſpects they are naked, having neither ſhoes nor ſtockings. In the highlands, where the weather is colder, the people wear

ſheep ſkins; and in the night, as a ſecurity againſt inſects, they ſleep in ſacks. Perſons of middle rank wear ſandals inſtead of ſhoes. The ordinary dreſs of the Arabs is very ſimple; but they have alſo a ſort of great coat without ſleeves, called "abba," which is ſtill more ſimple. In ſeveral parts of Arabia, the men wear no drawers; but theſe, with a large ſhirt, are the whole dreſs uſed by the women. In ſeveral provinces, they wear different ſorts of veils. All wear rings on their fingers, arms, noſe, and ears. They ſtain their nails red, and their hands and feet of a brownish yellow, with the juice of the alhenna; and they paint the circle of the eyes, and even the eye-laſhes, black, with a preparation of lead ore. The women of Yemen alſo make black punctures in the face, to improve their beauty. Every body, without exception, wears the beard of its natural length; but the Arabs keep their muſtachios very ſhort. The Jews are forbidden the uſe of the turban, uſing inſtead of it a ſmall bonnet; nor are they permitted to dreſs in any colour but blue. The dreſs of the Banians ſettled in Arabia, conſiſts of a red turban of a particular form, a piece of white linen upon the ſhoulders, another about their loins, and ſlippers.

The Arabs are attached to certain cuſtoms, which they inherit from their progenitors, and which they obſerve in common with other oriental nations with which they have no immediate connection; and this circumſtance ſeems to prove that they have been led to them by the nature of their climate. As cleanlineſs is indiſpenſably neceſſary to health, the founders of ſeveral ſects have enjoined various purifications and frequent ablutions as a religious duty; and the Arabians are ſcrupulous in the obſervance of the precepts that enforce them. They not only waſh, bathe, and pare their nails very often, but cut away all hairs from the body. The painful rite of circumciſion, which they adopted from Iſhmael, has been retained under the perſuaſion that it checked the ravages of particular diſeaſes; and hence the practice of circumciſing girls is general in the ſame countries where boys are circumciſed. The diſtinction of meats into allowed and prohibited was a leſſon deduced from experience, teaching that ſuch aliments as have an influence on the phyſical conſtitution, had in like manner a ſecret influence on the moral; and therefore a diſcreet police was authorized to interdict the fleſh of the hog, and other unclean animals, that might at once be prejudicial to the health and to morals. With ſimilar views, Mahomet, and ſome other founders of ſects, have affixed ideas of ſpiritual impurity to the act of touching a dead body.

Polygamy, which was authorized by the example of the patriarchs, has been perpetuated in Arabia; but the Arabians ſeldom avail themſelves of the privilege of marrying four lawful wives, and entertaining at the ſame time any number of unlawful ones. None but rich voluptuaries marry ſo many, and their conduct is blamed by all ſober men. An Arabian, in moderate circumſtances, ſeldom marries more than one wife; and as the huſband is by law obliged to treat his wives ſuitably to their condition, and to diſpenſe his favours among them with perfect equality, the privilege of polygamy is thought rather troubleſome than convenient. Beſides, divorce may be obtained without much difficulty; though the Arabians never exerciſe the right of repudiating a wife, unleſs urged by the ſtrongeſt reaſons, becauſe this is conſidered as diſhonourable, and entails diſgrace on the woman and her relations. Wives are entitled to demand a divorce, when they think themſelves ill uſed by their huſbands. The Arabian women enjoy a great portion of liberty, and often, of power, in their families. Their dowries, and the annual income which they afford, remain at their diſpoſal during marriage; and, in the caſe of divorce, the whole of their own property is reſerved to them. Some travellers have abſurdly ſaid, that the Mahometan wives are all ſlaves, and ſo entirely the property of their huſbands, that they are even inherited by their heirs. This repreſentation confounds ſlaves that have been purchaſed with women of free eſtate, who diſpoſe of themſelves in the Eaſt as they do in Europe; and the erroneous opinion ſeems to have ariſen from the equally miſtaken notion, that fathers in Arabia ſell their daughters to the higheſt bidder. The caſe is ſo much otherwiſe, that every man, in tolerably eaſy circumſtances, inſtead of ſelling his daughter, ſtrives to give her a dowry, which may continue her own property. The marriage is made out by the Cadi, and ſigned in his preſence; and it ſecures to the wife not only her dowry, but alſo a ſeparate maintenance in caſe of a divorce. Many ridiculous ſtories have been related of the teſts of virginity which an Arab expects when he marries a young woman: but moſt of theſe ſtories greatly exaggerate the truth. The Bedouins and the highlanders of Yemen, a rude and almoſt ſavage race, do indeed regard the want of theſe tokens as a mark of diſhonour, and ſend a woman back to her relations, when her chaſtity cannot be thus evinced; but the more civilized inhabitants of the towns ſeldom or never concern themſelves about ſuch trifles. Many ſuperſtitious obſervances reſpecting marriage ſtill prevail in Arabia. The Arabs believe in the virtue of enchantments, and in the art of tying and untying the knots of fate. The miſerable victim of this art addreſſes ſome phyſician, or ſome old woman; for the old women are always ſkilled in ſorcery. The Chriſtians of the Eaſt have ſtill a more certain remedy againſt the effects of witchcraft. They ſay maſſes for the afflicted perſon, and the honour of his cure is always aſcribed to the influence of theſe maſſes. In Arabia there are no eunuchs; and the Arabians abhor the cruel operation which is requiſite to render a man a fit guardian of the chaſtity of a haram.

The characters of nations are very much formed and modified by climate, government, and education. To the firſt of theſe the Arabs owe their vivacity and their diſpoſition to indolence; the ſecond increaſes their ſloth, and gives them a ſpirit of duplicity; and the third is the one principal cauſe of that formal gravity which influences the faculties of their minds, as well as their carriage and exterior aſpect. The mode of education among the Arabs is very different from that of the Europeans. The former ſtrive to haſten the age of maturity, as much as the latter endeavour to retard it. The Arabs, ſays Niebuhr, are never children; but many Europeans continue children all their lives. As ſoon as boys in Arabia leave the Haram, about the age of five or ſix years, they are accuſtomed to think and ſpeak with gravity, and to paſs whole days in the company of either fathers or preceptors. As muſic and dancing are eſteemed indecent among the Arabs, women are alſo excluded from all aſſemblies, and the uſe of ſtrong drinks is forbidden. The young Arabs thus become penſive and ſerious even in infancy. Nevertheleſs they have in reality a great degree of vivacity, which varies in the different provinces. This vivacity makes them fond of company and of large aſſemblies, notwithſtanding their ſeeming ſerioufneſs. Several travellers accuſe the Arabs of being cheats, thieves, and hypocrites. An arbitrary government, which impoveriſhes its ſubjects by extortion, can, indeed, have no favourable influence upon the probity of the nation, yet Niebuhr avers, from his own experience, that ſuch accuſations have been exaggerated beyond the facts. The irritable and vindictive ſpirit of the Arabians has been already noticed.

The Arabs, proud of their remote origin, have always made

made their genealogies a ſubject of ſerious ſtudy; and as their anceſtors could neither read nor write, they were unable to tranſmit to them the records of their deſcent; and for the ſame reaſon, it is impoſſible to convict them of error. For about thirty-ſix centuries, however, the filiations have been depoſited in the public archives. This cuſtom, which is religiouſly obſerved, is ſaid to have been introduced by Adnan, one of the anceſtors of Mahomet. In ſhort, a people ſo little numerous, that has not contracted any foreign alliance, and which, in its ſolitary leiſure, is always occupied about the intereſts of its vanity, may eaſily have preſerved the remembrance of its anceſtors, and the ſeries of its generations. All thoſe petty princes, who govern in Arabia, are very proud of their birth, and this pride may be aſcribed to the independence and ſovereign power which their families have enjoyed from time immemorial. The nobility, who are free, or dependent only on the chiefs of their tribes, are infected with the ſame vanity. What adds to the high conceit which the Bedouins have of their nobility is its being incommunicable, and not to be transferred by any ſovereign prince, nor even by the caliphs. The deſcendants of Mahomet are thoſe who hold the firſt rank among the great families in Arabia. Theſe deſcendants have received different titles; in Arabia, they are called SHERIFFS or SEJIDS; in the Mahometan countries ſituate northward, *Sheriffs* or *Emirs*; and in the Arabian colonies in the eaſt, ſimply *Sejids*. Of all the titles in uſe among the Arabian nobility, the moſt ancient and moſt common is that of SCHEICK or SHEIK. Other families that are anxious to preſerve their genealogies, are thoſe that are deſcended from the tribe of Koreiſh, and who have held, by hereditary right, certain employments ſince the days of Mahomet and his ſucceſſors. The Arabs ſeem ſtill to be vain of thoſe long names which are ſo diſguſting in their hiſtory; but their length of names and titles is occaſioned by the difficulty of diſtinguiſhing individuals among a nation that knows not the uſe of family names.

Although in Arabia there are neither numerous academies nor men of profound learning, yet the Arabian youth are not entirely neglected. In the cities, many of the loweſt rank are taught both to read and write; and the ſame qualifications are alſo common among the ſheiks of the deſert, and in Egypt. Perſons of diſtinction retain preceptors in their families to inſtruct their children and young ſlaves. In almoſt every moſque is a ſchool, having a foundation for the ſupport of teachers, and the entertainment and inſtruction of poor ſcholars. In great towns, there are likewiſe other ſchools, to which people of middle rank ſend their children to receive religious inſtruction, and to learn reading, writing, and arithmetic. There are no girls taught in theſe ſchools, but they are privately taught by women. Beſides theſe ſmall ſchools, there are more conſiderable ſeminaries of education in ſome of the great towns of Arabia. There are colleges in which the ſciences of aſtronomy, aſtrology, philoſophy, and medicine are taught; but the Arabians, for want of books and good maſters, make little progreſs, and their attainments are very partial and imperfect. In the dominions of the Imam, there have been for a long time two famous academies; one at Zebid for Sonnites, and the other at Damar for the Zeidites. The chief employments of men of letters among the Arabians are the interpretation of the Koran, and the ſtudy of the ancient hiſtory of the Mahometans.

Some ſeeds of the ſciences ſeem to have ſprung up in Arabia before they were known to other nations. They were the firſt who ſtudied the laws of the heavenly bodies. A roaming people, in a region lying beneath a ſerene and cloudleſs ſky, ſolely employed in tending their flocks, either in the open plains, or on the tops of mountains, muſt, at an early period, have acquired ſome knowledge of the planets and the ſtars; and it affords a preſumption of their having been among the firſt aſtronomers, that the names which denote the different conſtellations, are taken from the different ſpecies of animals known in thoſe parts, and many of the ſtars are called by their names. Their knowledge, however, was neither very accurate nor very extenſive. It was derived from long obſervation and experience, and not from any regular ſtudy or aſtronomical principles and rules. The Arabians, as well as the Indians, chiefly reſtricted themſelves to the obſervation of the fixed ſtars, and in this they differed from other nations, whoſe obſervations were almoſt confined to the planets; and they foretold their effects from their influences, not from their nature; and hence, it hath been ſaid, aroſe the difference between the idolatry of the Greeks and Chaldæans, who chiefly worſhipped the planets; and that of the Indians, who worſhipped the fixed ſtars. The ſtars by which they moſt uſually obſerved the weather, were thoſe they called "Anwâ," or houſes of the moon, which were twenty-eight in number, and divided the zodiac into ſo many parts, through each of which the moon paſſes every night; and from their riſing and ſetting, the Arabs, by long experience, obſerved the changes that happened in the air; and at length they were led to aſcribe a divine power to them, ſaying that their rain was from ſuch and ſuch a ſtar, which expreſſion Mahomet condemned and prohibited. The old Arabians, therefore, ſeem to have made no farther progreſs in aſtronomy, which ſcience they afterwards cultivated with ſo much ſucceſs and applauſe, than to obſerve the influence of the ſtars on the weather, and to give them names: ſo that they became aſtrologers and magicians, rather than aſtronomers. The infancy of ſcience is generally infected with an inclination to the marvellous; accordingly, in Arabia, pretended ſages aroſe who boaſted of underſtanding the language of birds; and others, profaning the name and office of prophet, retired into caverns and deſerts, where, after long faſtings and painful macerations to gain the favour of the deity, they were gratified with viſions, which they ſolemnly related to the multitude, who could not diſcern the impoſtor concealed under the figure of a pale and haggard being, often covered with wounds and ulcers which they fondly and fooliſhly imagined to be the marks of ſanctity. It was likewiſe in that part of Arabia, which borders on Egypt, that the ſwarms of adventurers ſtarted up, who, wandering on the globe, without a native home, under the appellation of gypſies and fortune-tellers, procure a wretched livelihood by their tricks from the ſtupid vulgar. It was with arrows, divinity rods, philters, amulets, and charms, that theſe vagabond impoſtors, by pronouncing certain myſterious words, practiſed their magical operations, and impoſed on the credulity of mankind in an *age of ignorance*: ſuch was the Arabian expreſſion for the period that preceded the time of Mahomet. The Arabians, even in a later period, deſtitute of books and inſtruments, have made little progreſs in aſtronomy. Although it is known to all men of ſenſe in Arabia, that eclipſes are owing to the interception of one heavenly body by the interpoſition of another, yet the multitude ſtill maintain the abſurd opinion, that a huge fiſh purſues the planet which is eclipſed; and women and children aſcend the roofs of their houſes, and make a hideous noiſe with brazen kettles and baſons, in order to chaſe away the fiſh. The Arabians, indeed, at this time, ſeem to ſtudy aſtronomy ſolely with a view to their ſucceſs in the cultivation of aſtrology, which is a ſcience highly eſteemed, and very lucrative, in the eaſt. The occult ſciences, as they are called, are in high eſtimation.

tion among the Arabians. One of theſe is denominated "Ism Allah," or the ſcience of the name of God, which is the moſt ſublime of all: for God, they ſay, is the lock, and Mahomet the key; and conſequently none but Muſſulmans can acquire it. It enables its poſſeſſor to diſcover what is paſſing in the moſt diſtant countries, to make himſelf familiar with genii, and to oblige them to obey his pleaſure; to diſpoſe of the winds and ſeaſons as he chuſes; and to cure the bites of ſerpents, and many other diſeaſes and infirmities. To this ſcience, the abſurdity of which is evident from the mere mention of it, belongs alſo the art of diſcovering hidden treaſure; and in this the Magrebins, or Arabians of Barbary, are known to excel. The art of procuring ſublime viſions is alſo known to the Arabians. The ſecond of the occult ſciences, called "Simia," teaches juggling tricks, and this is practiſed even by ſome orders of the derviſes to prove the truth of their religion and the ſanctity of the founder of their order. The ſcience of "Kurra" teaches a perſon to compoſe billets which ſecure him that wears them from the power of enchantment, and from all ſorts of accidents. Theſe billets are incloſed in ſmall purſes of ſkin, and worn on the head, arm, or breaſt; and bound for particular purpoſes upon the necks of horſes or aſſes. The ſcience of "Ramle" is the art of fortune-telling; and that of ſorcery is called "Sihhr, which is applied to many infamous purpoſes. Alchemy is ſtill in vogue among the Arabians.

The grave and ſerious ſciences that depend on calculations and reaſoning could not make any great progreſs among a people governed by an imagination always heated, and almoſt incapable of direction and reſtraint. Theſe ſciences, baniſhed from the climate bordering on the tropic, have been replaced by the agreeable arts that delight in the irregularities and diſorders which aſtoniſh the mind, and captivate the heart. In Arabia we find the cradle of poetry and eloquence, which had ſcarcely appeared before they arrived at a ſudden maturity. The Arabs are all poets and orators: for an account of the poetry of the Arabs, ſee ARABIAN *Poetry*. Among the ancient Arabs, eloquence was an accompliſhment for which they valued themſelves. Their orations were of two ſorts, metrical and proſaic: the one being compared to pearls ſtrung, the other to looſe ones. They attempted to excel in both; and whoever was able, in an aſſembly, to perſuade the people to a great enterpriſe, or to diſſuade them from a dangerous one, or gave them any other ſalutary advice, was honoured with the title of "Khatab," or orator, which is now given to the Mahometan preachers. They purſued a method very different from that of the Greek and Roman orators; their ſentences being like looſe gems, without connection; ſo that this ſort of compoſition ſtruck the audience chiefly by the fulneſs of the periods, the elegance of the expreſſion, and the acuteneſs of the proverbial ſayings; and ſo confident were they of their pre-eminence in this way, that they would not allow any nation to underſtand the art of ſpeaking in public, except themſelves and the Perſians; and the Perſians were reckoned, in that reſpect, ſays Pococke (Spec. 161.), much inferior to the Arabians. In Arabia, eloquence is not now much cultivated. Occaſions for the exerciſe of it very rarely occur. The Arabians, however, tell us that they have great orators in their moſques. The only theatres for the exerciſe of profane eloquence are the coffee-houſes, which are commonly large halls, having their floors ſpread with ſtraw mats, and illuminated at night by a multitude of lamps. The gueſts are ſerved with pipes and a cup of coffee. They are alſo amuſed by readers and orators, who are commonly "Mullahs," or poor ſcholars, and who either read or repeat paſſages from ſome favourite authors, or recite tales and fables of their own invention. When the orator has ended, he obtains a voluntary contribution from his hearers.

It was Arabia that gave birth to the Apologue, a method of inſtruction, which, in all ages, has been in uſe among the oriental nations, who love to conceal under a myſterious veil the moſt trivial ſubjects, in order to give them an air of dignity. The Arabs eſpecially have diſplayed their ſubtilty in the ſolution of ænigmas. They boaſt of having produced a Lokman, ſurnamed "Al Hakim," i. e. the wiſe or the ſage, whoſe features bear too great a reſemblance to thoſe of *Æſop*, to admit a doubt concerning the identity of their perſons. Some, however, have thought it more likely that the compiler of theſe fables had ſeen thoſe of *Æſop*, and choſe to inſert ſome of them in his own collection. This celebrated fabuliſt has ſerved as a model to all thoſe who have come after him; and the Arabians have thus, guided by their own genius alone, drawn from its native funds thoſe riches which others have reciprocally borrowed of their neighbours. For the Arabic characters, chronology, language, muſic, philoſophy, phyſic, poetry, and religion; ſee the following articles.

The mechanical arts could not well be brought to any conſiderable degree of perfection among a people who knew but few wants. As their productions are leſs ſplendid than uſeful, it is rather in towns than in the boſom of deſerts that they grow up, becauſe neceſſity is the parent of induſtry. The Arabs, entirely occupied in warring againſt man and beaſt, excelled only in the manufacture of ſcymetars, bows and arrows, and darts; nor, as it has been already obſerved, have they made any great progreſs in modern times. Their cotton ſtuffs were never greatly eſteemed; and few of their other manufactures are the produce of the ſkill and labour of native Arabians. Sale's Koran Pref. Anc. Un. Hiſt. vol. xvi. p. 242—327. Aſiatic Reſearches, vol. ii. p. 1, &c. Niebuhr's Travels through Arabia, &c. paſſim. Pinkerton's Mod. Geog. vol. ii. p. 405—430.

ARABIC, or ARABIAN, ſomething that relates to Arabia, or the Arabs.

ARABIC *Characters* or *Figures*, are the numerical characters commonly made uſe of in arithmetical computations; and they ſtood contradiſtinguiſhed from the Roman. Concerning the origin of theſe figures, ſee FIGURES.

ARABIC *Chronology*. The Arabs divided their year formerly, as is now the caſe, into twelve months, to which they gave names; but an anceſtor of Mahomet gave them new names deduced from certain events happening in every month; and the old ones were, by the authority of Mahomet, totally aboliſhed in every part of Arabia. The year was alſo anciently divided into ſix ſeaſons, viz. 1. The ſeaſon of herbs and flowers; 2. Summer; 3. The hot ſeaſon; 4. The ſeaſon of fruits; 5. Autumn; 6. Winter. The ancient Arab year was luniſolar; but the cuſtom of intercalary months, in order to make the courſe of the moon agree with that of the ſun, was aboliſhed by Mahomet; and the learned now reckon by months correſponding to the courſe of the ſolar year, and conſiſting of the ſame number of days with ours. See YEAR. The Arabs, like the Egyptians, Indians, Greeks, and Romans, anciently computed their time by weeks, or periods of ſeven days, as we learn from a very ancient poet, who died many ages before the publication of the Koran. The Arabian day conſiſts of twenty-four hours, and laſts from ſun-ſetting to ſun-riſing; ſo that their hours are of uncertain duration, and vary with the length of the natural day, or the time during which the ſun is above the horizon. The different parts of the day, as they have no preciſe idea of the duration of their hours, are diſtinguiſhed by vague and uncertain denominations.

ARABIAN *Gulf.* See RED *Sea.*

ARABIC *gum, gum Senegal, gummi Arabicum, Acaciæ veræ ſuccus.* This valuable article of commerce is a very pure concrete mucilage, which exudes from the *Mimoſa Nilotica*, or *Acacia Vera*, a tree that grows abundantly on the ſandy ſoil of Egypt and Arabia, on the banks of the rivers Senegal and Niger, near the Cape of Good Hope, and in ſeveral other parts of Africa. The fruit of the ſame tree alſo yields another mucilaginous juice, but at the ſame time conſiderably aſtringent, and of a brown colour, which has been already mentioned under the article ACACIA.

The pureſt gum arabic is brought in caravans to Cairo by the Arabs of the country around mount Tor and Sinai, who bring it from this diſtance on the backs of camels, ſewn up in bags of ſkin, and often adulterated with ſand and other matters.

The ſettlement at Senegal is another great mart for this commodity; and the gum, which bears the name of this place, is generally in larger maſſes, and of a yelloviſh or amber colour, but it does not ſenſibly differ from the Egyptian gum in any of its properties.

This mucilage exudes ſpontaneouſly in a liquid ſtate from the trunk and boughs of the tree, and hardens by contact with the air and the heat of the ſun. It begins to flow about December, immediately after the rainy ſeaſon, near the flowering time of the tree. Afterwards as the weather becomes hotter, inciſions are made through the bark, to aſſiſt the tranſudation of the juice.

The beſt gum arabic is brought over in oblong or roundiſh lumps ſeldom bigger than a walnut, nearly tranſparent, white, or of a pale yellow, wrinkled, and of a ſhining fracture. It is ſo brittle as eaſily to be reduced to a fine powder. It is alſo perfectly inſipid and inodorous, diſſolving in the mouth into a clammy liquid.

As the gum arabic is the moſt perfect ſpecimen of a *gum* MUCILAGE, all the properties which we ſhall now mention to belong to it, may be conſidered as deſcriptive of this whole claſs of chemical ſubſtances.

The habitudes of this gum with water affords one of its moſt ſtriking characters. When added to water, either cold or hot, and not leſs than twice its weight, it diſſolves ſlowly, and converts the whole into a very ſlimy viſcid liquor. Heat does not coagulate this ſolution; a gentle evaporation will expel the water and leave the gum as ſolid and brittle as before, equally reſoluble in water, and unaltered in any of its properties. In this reſpect it differs in a ſtriking manner from moſt other vegetable ſubſtances.

It is entirely inſoluble in ardent ſpirit and in oils; alcohol indeed coagulates the watery ſolution, by uniting with the water, and thus precipitating the gum.

Gum mucilage is but little inflammable, when put into the fire it ſwells and grows puffy, and ſoon is reduced into a voluminous coal. Diſtilled *per ſe* in a retort, it firſt yields a limpid water, then an acid (which was at one time ſuppoſed to be peculiar, and was termed the PYRO-MUCOUS), and afterwards a thick empyreumatic oil, and a little volatile alkali, like all the diſtillations of vegetable matter.

The pure gum mucilages, when dry and ſolid, will remain unchanged for any length of time: the watery ſolution is likewiſe the leaſt alterable of all the vegetable liquids; but by long keeping it becomes ſour and grows mouldy on its ſurface, if it is prevented from drying up by the evaporation of its water.

When nitric acid is diſtilled off gum arabic, or any other of the gum mucilages, a peculiar acid is formed, which appears as a white powder of difficult ſolution, and has been termed the MUCOUS *acid*. It is the ſame with the SACCHOLACTIC *acid* of Scheele.

The ſpecific gravity of the ſolid mucilages, according to Fourcroy, is from 1.3 to 1.48.

The gum which exudes in conſiderable abundance in our own climates from the apricot, plum and cherry trees, bears the ſtrongeſt reſemblance to the gum arabic in all its properties, only it is generally of a yellower colour, not ſo brittle, and forms a mucilage of ſomewhat leſs tenacity.

Gum arabic is employed for a number of valuable purpoſes both in the arts and in medicine. It may be uſed either to ſuſpend in water a number of ſubſtances which could not otherwiſe be kept equally diffuſed in this liquid, or as a means of glueing together a variety of articles of light work; and as a clean colourleſs cement perfectly eaſy of application, and which may be prepared in a few minutes, it is peculiarly valuable. Gum Senegal is uſed in very large quantities by the calico printers, to mix the colours and the mordants in block printing; gum arabic forms the baſis of crayons, and the cakes of water colours, and of ſeveral liquid colours, of which common writing ink is a familiar example.

All the gum mucilages are conſiderably nutritious; in the countries where the gum arabic and ſenegal grow native, it forms an important article of food, either by itſelf, or mixed with milk, rice, &c. Haſſelquiſt relates an inſtance of the travellers of a large caravan, who had conſumed all their proviſions in the middle of their journey, preſerving themſelves from famine by the gum arabic which they were bringing as merchandiſe.

In medicine, this gum is employed, either by itſelf, or as a vehicle for other ſubſtances. Taken internally, it has been ſuppoſed to be incraſſating and obtunding; qualities, however, which probably have little foundation in fact and real obſervation. As it is ſimply mucilaginous, it will certainly in ſome degree protect the parts with which it comes in contact from the effect of any acrid and ſtimulating ſubſtances; and thus it is of uſe in quieting the tickling cough which ariſes from any acrimony in the fauces, and in ſome caſes it is of material ſervice in diarrhœa and dyſentery. It is given either in powder, or diſſolved in water, almond milk, &c.; and one ounce of the gum is ſufficient to give a conſiderable thickneſs to a pint of liquid, without making it too ſlimy to drink with pleaſure.

In pharmacy, gum arabic poſſeſſes the valuable property of rendering miſcible with water the balſams, reſins, fixed oils, and ſimilar ſubſtances, whereby they may be very commodiouſly taken in a liquid form. One part of gum arabic previouſly ſoftened with water (or an equivalent quantity of the mucilage), will thus render four parts of balſam or oil ſoluble in any watery liquid, and will form an uniform emulſion. Even mercury may be thus ſuſpended in water by being previouſly rubbed for a conſiderable time with gum arabic, which preparation is called, from the inventor, *Plenk's ſolution.* The corroſive acids, when taken internally, are beſt diluted with a ſolution of this gum.

The pharmaceutical preparations, in which gum arabic enters as a principal ingredient, are the *Mucilago gummi Arabici*, a ſimple ſolution of one part of the gum in two parts of boiling water; the *Emulſio Arabica Ph. Edin.* which is gum arabic diſſolved in almond milk; the *Trochiſci Arabici*, with gum arabic, ſtarch and ſugar; and the *Pulvis tragacanthæ compoſitus Ph. Lond.* a powder made of tragacanth, gum arabic, ſtarch, and ſugar. *Murray Appar. Med. Fourcroy, &c.*

ARABIC *language* is derived from the ſame ſtock with the Hebrew, Syriac, and Chaldaic tongues. Its near affinity to the Hebrew is almoſt univerſally acknowledged, and ſome have even maintained, that it was not only a ſiſter dialect of

this

this language, but in its original and unſophiſticated ſtate, pure Hebrew. Of courſe it muſt unqueſtionably be one of the moſt ancient languages in the world. The Arabs, by whom it was ſpoken, having inhabited the country now poſſeſſed by their deſcendants almoſt from the deluge, without intermixing with other nations, or being ſubjugated by any foreign power, their language muſt have been formed ſoon after, if not at the confuſion of Babel. The Arabian writers aſcribe it to Joktan, the ſon of Eber, and its name to Yarab, the ſon of Joktan or Kahtan, ſuppoſed to be the ſame that is mentioned, Gen. x. 26. This opinion is adopted by many learned moderns. See Hunt. Orat. de Antiq. et Eleg. Ling. Arab. p. 1. Pococke Spec. Hiſt. Arab. p. 29. Bochart in Geog. Sacr. c. ii. c. 15. Golius, in Lex. Arab. Schultens, in Orig. Hebr. The two principal dialects of this language were, that ſpoken by the Hamyarites and other genuine Arabs, and that of the Koreiſh in which Mahomet wrote the Koran. The Hamyaritic dialect is ſuppoſed to have approached nearer to the purity of the Syriac, and conſequently to have been more remote from the true genius of the Arabic than that of any other tribe. The dialect of the Koreiſh, uſually termed the pure and ancient Arabic, and in the Koran the perſpicuous and clear Arabic, is referred to Iſhmael as its author, who, according to the oriental writers, firſt ſpoke it; and, as Dr. Pococke apprehends, after he had contracted a matrimonial alliance with the family of Jorham, formed it of their language and the original Hebrew. This latter dialect of the Koreiſh was conceived to conſiſt chiefly of the Hebrew; but its politeneſs and elegance ſhould rather be attributed to their having the cuſtody of the Caaba and dwelling in Mecca, the centre of Arabia; for by their ſituation, they had leſs intercourſe with foreigners, who might have corrupted the language, and were more frequented by the Arabs of the whole circumjacent country, who reſorted to Mecca on a religious account, and for the accommodation of their differences; from their diſcourſe and verſes the Koreiſh took the words and phraſes which they judged to be moſt pure and elegant, and thus the beauties of the whole tongue were transfuſed into this dialect. Other circumſtances alſo contributed to the improvement of this dialect. Of the pilgrims who reſorted to Mecca, many were of the firſt rank, and poſſeſſed all the ſcience of their country and age. In the great feaſts which were held during their ſtay in this city, a variety of amuſements occupied their attention, and literary compoſitions, which called forth an emulation to excel, formed ſome of their principal entertainments on theſe occaſions. Hence the dialect of the Koreiſh, the nobleſt and the moſt learned of all the weſtern Arabs, became the pureſt, the richeſt, and the moſt polite of all the Arabian idioms; and about the beginning of the ſeventh century, it was the grand language of Arabia; the other dialects being either gradually diſuſed, or incorporated with it. By this union, and by commercial intercourſe with Alexandria, the ſeat of learning, and with other places where they might obtain an acquaintance with Grecian literature, the Arabic language acquired a fecundity and alſo an elegance, in a great degree peculiar to itſelf.

The Arabs are ſo extravagant in the commendations of their language, that they not only repreſent it as peculiarly harmonious and expreſſive, but they alſo ſay, that it is ſo copious and comprehenſive, that no uninſpired perſon can be a perfect maſter of it in its whole extent. To this purpoſe it has been alleged, that this language has 500 names for a lion, 200 for a ſerpent, more than 80 for honey, and above 1000 for a ſword. Nevertheleſs, the Arabs believe that the greateſt part of their language has been loſt; and this opinion is not very improbable, when we conſider how lately the art of writing was introduced into Arabia. To this purpoſe Dr. Robertſon (ubi infra) has obſerved, that the genius of the Arabic language reſembles that of the Hebrew; as all its primary or radical words are compoſed of different combinations of conſonants by *triads*, ſo that the various combinations and copulations of three letters form more than 10,000 roots, without including thoſe which may ariſe from the concourſe of guttural letters. To this quality of the language he partly aſcribes that ſtability or permanence which this language poſſeſſes in common with the Hebrew, by reaſon of which it has retained its purity and integrity for ſo many thouſand years, without thoſe changes and fluctuations to which other tongues have been ſubject. Sir William Jones alſo obſerves (Aſiatic Reſearches, vol. ii. p. 61), that as the Arab roots are univerſally trilateral, the compoſition of the twenty-eight Arabian letters would give 22,000 elements of the language; and this circumſtance demonſtrates its ſurpriſing extent; for although great numbers of its roots are confeſſedly loſt, and ſome perhaps were never in uſe, yet if we ſuppoſe 10,000 of them, without reckoning quadriliterals, to exiſt, and each of them to admit only five variations, one with another, in forming derivative nouns, even then a perfect Arabic dictionary ought to contain 50,000 words, each of which may receive a multitude of changes by the rules of grammar. To this circumſtance it is probably owing, that the Arabic, and alſo all its ſiſter dialects, abhor the compoſitions of words, and invariably expreſs any complex ideas by circumlocution; and this genius of its language has been one ſource of its copiouſneſs and extent. And yet, notwithſtanding the variety of its words, in which it is far ſuperior to the Greek and Latin, and indeed to moſt other languages ancient and modern, it is equally diſtinguiſhed by its perſpicuity and preciſion. This excellence of the ancient Arabic, this union of brevity and variety, by which it is able to expreſs with clearneſs and energy what could not be deſcribed in other tongues without hideous circumlocutions, is particularly mentioned and illuſtrated, among other diſtinguiſhing qualities of this language, by the learned Pococke in his "Oration on the Arabic language."

Dr. Robertſon has cited an appoſite paſſage to this effect, which is here ſubjoined for the ſatisfaction of the curious and learned reader. "Neque in nullâ certè laudis parte, mira illa (inquit doctiſſimus Pocockius), quâ non ſolum verborum in ſignificando perſpicuitati, ſed in prolatione elegantiæ et dulcedini caverunt, ſedulitas; quâque non ſolum accuratâ inter literas et ſignificatâ proportione, ſenſus vel intenſioni vel remiſſioni, prout res poſtulaverit, literarum appoſitione, ſubductione, vel juxta organorum ratione, proſpexerunt; ſed et nè quid delicatulis auribus ingratum, nè quid horridum aut ασυμφωνον reperiatur, effecerunt. Hoc in genere eſt, quod nuſpiam in verbo aliquo, genuinæ apud Arabes originis, concurrant, non intercedente vocalis alicujus motione, conſonantes, cum vel tres vel plures, aliis in linguis frequenter collidantur. Immo neque, ſi adſint, quæ aſperitati remedio ſint, vocales, quaſlibet tamen temere committunt conſonantes: ſed ſi ita rei natura poſtulat, ut concurrere debeant illæ, quæ ſe invicem ſine aſperitatis alicujus inductione conſequi, et inter ſe connecti non poſſint, illi vel ſitus vel literarum mutatione, eas abjiciendo, inſerendo, emolliendo, aliiſve quibus poſſint modis, remedia quærunt; adeo ab omni, quod vel abſonum vel diſſonum eſt, abhorrent. Quod ſi nobis ſecus videatur, et aſperius ſonare ab Arabibus prolata, illud auribus noſtris et uſu, non linguæ imputandum; nec mollius illis ſonare noſtra, quam eorum nobis cenſendum. Quin et gutturalium, quæ nobis

nobis maxima aſperitatis cauſa videntur, abſentiam, ut magnum in linguâ Græcâ defectum, arguunt Arabes." The learned Dr. Hunt, late profeſſor of the Hebrew and Arabic languages at Oxford (in his Orat. de Ling. Arab. p. 17.), expreſſes his opinion of the excellencies of this language much to the ſame purpoſe: "Nuſquam mihi credite (inquit), auribus magis parcitur, quam in Arabiâ; nulla lingua a κακοφωνια omni alienior, quam Arabica. Quanquam enim nonnullæ ejus literæ minùs fortaſſe ſuavitèr, immo duriùs etiam ſonuerint, ita tamen Arabes eas temperârunt, ut aſperas cum lenibus, duras cum mollibus, graves cum acutis, miſcendo, voces inde non minùs auditu jucundas, quam pronunciatu faciles confecerint, totique ſermoni miram ſonorum tam dulcedinem quam varietatem addiderint. Quod quidem orationis modulandæ ſtudium in Corano adeo manifeſtum eſt, ut primi Iſlamiſmi oppugnatores eum librum magicâ ideò arte ſcriptum dixerint. Nec auribus tantum gratus eſt Arabiſmus, ſed et animi conceptibus exprimendis aptus, ſonos ſuos ſententiis ſemper accommodans, et felici verborum junctură ipſam rerum naturam depingens." It is needleſs to multiply teſtimonies of a ſimilar kind, extracted from the writings of Bochart, Erpenius, Golius, Schultens, &c.

Some have maintained that the Arabic tongue deſcended from the deluge to the time of Mahomet in its original purity; but that it ſhould remain altogether unſophiſticated for a period of more than 3000 years, is not very probable. Whatever care might have been taken of it, however tenacious the Arabs were of their ancient cuſtoms and inſtitutions, and however favourable their ſituation might have been for preſerving the language unmixed, it is not likely, nor indeed can we conceive it to be poſſible, that it ſhould have eſcaped a variety of changes in that long period; or that it ſhould have not acquired in its progreſs downwards from the mere lapſe of time, from neceſſary or voluntary intercourſe with diſtant and neighbouring nations, and from a variety of other cauſes, diminutions or additions, or intermixtures, which render the words, idioms, and phraſeology of the Koran very different from the Hebrew, Syriac, or Chaldaic, to either of which the ancient Arabic muſt have been nearly allied. But theſe changes affected merely or principally the dialects of the language, whilſt the ſubſtance or marrow of it, as Schultens calls it, remained untouched; and comprehended the letters, vowels, and pronunciation. Dr. Robertſon, profeſſor of oriental languages in the univerſity of Edinburgh, in an elaborate diſſertation, "De Origine, Antiquitate, Converſatione, Indole, et Utilitate Linguæ Arabicæ," prefixed to his "Clavis Pentateuchi," is an able and zealous advocate for the unſophiſticated purity of the ancient Arabic; inſomuch that it did not degenerate from its original purity in the ſame manner as the Spaniſh, Italian, and French dialects have degenerated from the Latin ſtock. This opinion is ſanctioned by the authority of the learned Schultens, in his Orig. Heb. vol. ii. p. 20, 21. Orat. Ling. Arab. p. 28. and by ſeveral others, who have been beſt acquainted with the ſtructure of the Arabic language, and with the hiſtory of the ancient Arabs. Without deviating into the unfounded extreme of Hutchinſon, who aſcribes a comparatively modern origin to this language, and traces it no higher than the age of Mahomet, we may allow that ſuch changes as have been already mentioned might have been introduced into it, without diſputing its antiquity, or upon the whole its uncorrupted ſtate for many ages previous to the time of Mahomet. This celebrated impoſtor indeed makes his boaſt, that the language of the Koran was the ſame, with reſpect to its purity and perfection, with that which was anciently uſed by Abraham and Iſhmael. Dr. Robertſon (ubi ſupra) maintains, that the Arabic language uſed by Mahomet was the ſame with that of the Joktanites and Iſhmaelites; and, in ſupport of this opinion, he refers to ſeven poems written before his time, and ſuſpended in the temple of Mecca, intitled "Moallekat," and ſtill extant at Paris and Leyden; and alſo to ancient monuments found near Aden in Arabia Felix, of which an account was publiſhed by Schultens in his "Monumenta Vetuſtiora Arabiæ," 4to. Leyden, 1740.

The learned Hyde is alſo an advocate for the affinity of the Arabic to the Hebrew, and alſo for its permanent purity. To this purpoſe he ſays (Diſſert. vol. ii. p. 454, &c.) that the Arabic is more pure and unmixed than any other, allowing merely for ſome Perſian medical terms, and for a few Latin words which it acquired by means of the wars and negotiations between the Arabians and Romans. In other reſpects, he ſays, it is pure and free from mixture; and this he aſcribes partly to the number of books and writers who preſerved it entire, partly to the cultivation of it by the Arabs, who were devoted to poetry and eloquence, and partly alſo to the deſert, inacceſſible, and unſubdued country which they inhabited.

Since the age of Mahomet, it is an acknowledged fact, that all the dialects of the Arabic have been greatly corrupted, ſo that the language in which the Koran was written is become a dead language, and ſtudied in the colleges of Arabia juſt as the European Chriſtians acquire the Hebrew, Greek, and Latin. It is not eaſy to conceive how the identity and purity of a language could be preſerved for many ages among a people who had no written characters. Among the Hamyarites or Homerites, who for many centuries had poſſeſſion of the principal part of Arabia, the art of writing ſeems, indeed, to have been known at a very early period. Their character was perplexed, the letters not being diſtinctly ſeparated; and from the mutual connection and dependence of the letters and their ſeveral parts, it was denominated "Al Moſnad." But this alphabet was neither publickly taught, nor ſuffered to be uſed without permiſſion. It correſponded in the number and order of the letters to the Hebrew alphabet, and was called "Abgad Hevez," from the firſt Hebrew letters in their natural order, viz. אבגדהון. According to Chardin (vol. iii. p. 54.), the firſt word is formed by the letters, A, B, G, D, which were formerly the firſt of the Arabic language, as they are ſtill of the Hebrew. Theſe, according to this learned traveller, were the ancient characters of the Arabs, and differed from the Cufic characters which were afterwards introduced; and he is of opinion that they were furniſhed with vowel points. Some ancient monuments are ſaid to be ſtill remaining of this character, which Pococke apprehends to have been the rude Chaldaic in its unimproved and unpoliſhed ſtate: To theſe Job is ſuppoſed to refer, ch. xix. v. 23, 24; and Ebn Haſhem relates that an inſcription in this old Arabic character was found in Yemen, as ancient as the time of Joſeph. Theſe traditions may have led ſome authors to conclude, that the Arabians were the inventors of letters; and Sir Iſaac Newton (Chronology, Oper. vol. v. p. 155. Ed. Horſley) ſuppoſes that Moſes learned the alphabet from the Midianites, who were Arabians.

The Koreiſhites and other Arabs, ſome Jews and Chriſtians excepted who were called the people of the book, were for many ages ignorant of the art of writing, and do not ſeem to have acquired it till the ſixth century. Moramer Ebn Morra of Anbar, a city of Irak, who lived not many years before Mahomet, was the inventor of the preſent Arabic character, which Baſhar the Kendian is ſaid to have learned from thoſe of Anbar, and to have introduced at Mecca among the Koreiſhites, a little while before the inſtitution of Mahometaniſm. The letters of Moramer

were different from the Hamyaritic; and though far from being either convenient or beautiful, they were long used by the Arabs. They were denominated Cufic from Cufa, a city of Irak; and in this character the Koran was firſt written. Theſe letters are alſo uſed occaſionally, at this day, by the Arabs for the titles of books and public inſcriptions. The more elegant and expeditious character that is now uſed, was firſt formed from the Cufic by Abuali Ebn Moklah, vizier to the caliph of Bagdad, about 300 years after Mahomet, and perfected by Ali Ebn Bowab, who died in the year of the Hegira 413, A. D. 1022. Herbelot, Sale, and Dr. Hunt inform us, that the perſon, who completed and reduced it to the form in which it now exiſts in ſome of the moſt beautiful copies of the Koran, was Yakut Al Moſtaſemi, the laſt of the caliphs of the family of Abbas, a little after the year of the Hegira 640, A. D. 1242; for which reaſon he obtained the appellation of "Al Khattat," or the ſcribe.

Concerning the æra of the invention of the Arabic vowel points, there has been a difference of opinion among the learned. Hottinger (Tract. Philolog. p. 400. 4to. Tiguri, 1659) maintains and adduces teſtimonies from the Arabian writers to prove, that vowels were in uſe from the moſt ancient times. But they are not now the ſame as they were formerly. A ſingle point, in the moſt ancient copies of the Koran, denoted different vowels, according to its poſition above, below, or within the letter. Schultens (Clav. Dialect. p. 323, &c.), ſpeaking of the improvement of the Arabian alphabet in the 10th century by Ebn Moklah, ſays, that its form, at this time, underwent a change; and that its former clumſy embarraſſed character was made to give way to the poliſhed, eaſy, and expeditious type. Regarding this expedition alone, the author of the invention left very few vowel characters; and as the Hebrew mode of writing admits five long ones and five ſhort ones, in different ſhapes, he taught how to expreſs all the vowels, both long and ſhort, agreeably to the genius of the language, by three, or rather by two, ſmall points, without any danger of miſtake; an abbreviation truly admirable, and worthy of being recorded! For by placing a ſmall line above ـَ he expreſſed the ſounds of *a* and *e*, and by placing the ſame below, ـِ he meant to expreſs *i* only. To the other ſhort ones *o* and *u*, he aſſigned a ſmall *waw* or *w* above, as ـُ For repreſenting the long ones, he uſed the "matres lectionis," or quieſcent letters, אוי, اوي. So that *phata* with *elif* expreſſed *a* and *o* long, that is *kametz* and *kholem*; and *jod* placed after *keſram* became *tzeri* and *chirek* long, and *waw* added to *damma* became *ſchurek*. From this ſtatement we may infer that, before the tenth century, the Arabians had no vowel points; and conſequently that they read without vowels, or contented themſelves with the "matres lectionis" above mentioned. Dr. Gregory Sharp, in his "Diſſertation upon the Origin, Conſtruction, &c. of Languages," p. 87, expreſſes his opinion, that the Arabians were the original authors of the vowel points; and that they invented three called *fatha (a)* and *(e)*, *damma (o)* and *(u)*, and *keſra (i)*. But theſe, he conceives, were not in uſe till ſeveral years after Mahomet; for the firſt copies of the Koran were without them. The rabbins, he adds, ſtole them from the Arabs. Capellus, Walton, Simon, and others are of opinion, that all the vowels were expreſſed by the three letters אוי, اوي, called "matres lectionis." But it has been alleged, that theſe three letters have, in the Koran and in other punctuated copies, various vowel points annexed to them: whence it is inferred, that they are conſonants. See Points.

The importance and utility of an acquaintance with the Arabic tongue cannot be diſputed. To the divine, ſuch is the affinity between this language and the Hebrew, it muſt be of great uſe in explaining and interpreting the ſcriptures of the Old Teſtament. How much Schultens has availed himſelf of his knowledge of this language in the illuſtration of the book of Job, and alſo of the Proverbs, thoſe will readily allow who have examined his learned commentaries on theſe books. There are alſo many valuable works to which the Arabic ſcholar may have acceſs. And to thoſe who travel for purpoſes of curioſity or commerce into thoſe parts of the eaſt, the knowledge of this language muſt be peculiarly uſeful. But the acquiſition of it, it may be juſtly ſaid, is attended with great difficulty. For the knowledge, ſays Sir William Jones (Aſiatic Reſearches, vol. ii. p. 4.), which any European may, at his pleaſure, obtain of the Arabic language, we are principally indebted to the univerſity of Leyden. Schultens, Erpenius, and Golius, to whom we may add Richardſon of our own country, will afford him all neceſſary aſſiſtance, and enable him to underſtand Arabic better than the moſt profound ſcholar at Conſtantinople or at Mecca. Niebuhr informs us, that the dialect ſpoken at Mecca in the days of Mahomet differs very widely from the modern language of Arabia. That of the highlands of Yemen has the ſtrongeſt analogy to the language of the Koran; becauſe thoſe highlanders have little intercourſe with ſtrangers. The old Arabian language is, through all the eaſt, a learned tongue, to be acquired only in colleges, or by the peruſal of the beſt authors. Perhaps there is no other language diverſified by ſo many dialects as that of Arabia; and the pronunciation of one province differs as much as the dialect from that of other provinces.

Arabic, or Arabian *learning*, is divided into two ſtates, or periods, viz. Ante Mahometan, and Mahometan.

The *Arab* learning in the firſt period, called the time of ignorance, conſiſted, according to Abulpharagius, in the knowledge of their language, the propriety of diſcourſe, the compoſition of verſe, and the ſcience of the ſtars: but their chief attention ſeems to have been directed to *oratory* and *poetry*. Hiſt. Dynaſt. Renaudot de Barbar. Ariſt. verſ. Fabricii Bibl. Græc. lib. vi. cap. 5. § 6.

The ſecond period is more diſtinguiſhed, at leaſt from the time of Al Mamon, the ſeventh caliph of the family of the Abbaſſides, who flouriſhed about the year 820, and has the honour of being the founder of the modern Arabian learning. Almanzor, about fifty years before Al Mamon, commenced the literary reform, when he moved the imperial ſeat from Damaſcus to Bagdad; and when he extended the Arabian literature, which had been confined to medicine and a few other branches, to ſciences of every denomination. His grandſon, Al Mamon, completed the work which was only begun, and ſent for all the beſt books out of Chaldea, Greece, Egypt, and Perſia, relating to phyſic, aſtronomy, coſmography, muſic, chronology, &c. and penſioned a number of learned men, ſkilled in the ſeveral languages and ſciences, to tranſlate them into Arabic. By this means, divers of the Greek authors, loſt in their own country and language, have been preſerved in Arabic. The eaſtern conquerors carried their empire from Aſia even into the remote regions of Spain; and letters followed them wherever they went. Elmac. Hiſt. Sar. lib. ii. cap. 8. Leo Africanus de Viris illuſt. ap. Arabes, cap. 1. Fabricii Bib. Græc. lib. vi. cap. 9. Græv. in Præf. ad. Tab. Geog. Voſſ. de Sect. Phil. cap. 3 § 17. See Al Mamon.

From that time Arabia became the chief ſeat of learning; and

and we find mention by Abulpharagius, Pococke, D'Herbelot, and Hottinger, of learned men, and books without number.

The revival of learning in the tenth century, by Gerbert, known after his elevation to the pontificate by the title of Silveſter II. and afterwards among the Europeans in general, may be aſcribed to the inſtructions and writings of the Arabian doctors and philoſophers, and to the ſchools which they founded in ſeveral parts of Spain and Italy. And in the twelfth century, the inquiſitive of different countries frequented the ſchools of the Saracens in Spain, and diſſeminated the knowledge which they obtained there, after their return. At this time, many of the learned productions of the Arabians were tranſlated into Latin, which facilitated the general progreſs of ſcience.

Arabic or Arabian *logic*, was that of Ariſtotle, as explained by Avicenna and Averrhoes. As the Arabians applied themſelves to this branch of ſcience, they became proficients in the knowledge of words rather than things. Whence they have been ſometimes denominated, "maſters of the wiſdom of words;" and ſometimes the talking ſect.

Arabic *marble*, *Arabicum marmor*, a name given by the ancient Greeks to a ſpecies of marble brought from Egypt and Arabia, and remarkable for its beautiful whiteneſs.

Arabian *muſic*. In the Encyclopedie Methodique, we have a long article on this ſubject, chiefly taken from the Eſſai on Muſic, by M. la Borde. If, in a careful peruſal of this article, we had been able to diſcover any eſſential qualities in this muſic that would improve our ſcale, intervals, melody, harmony, meaſures, or the tone of our voices or inſtruments, we ſhould ſedulouſly have ſtudied and adopted them. But notwithſtanding the inflated praiſes beſtowed on their muſic, by their own and the Perſian poets, and the parade with which the Arabian ſcale and muſical terms have been exhibited, we do not find ourſelves much enlightened by the peruſal. Indeed we are inclined to imagine that muſic in Europe has been cultivated with ſo much more ſucceſs than that of any other quarter of the globe; our inſtruments, our harmony, and our melody, are arrived at ſuch a ſuperior ſtate of perfection, that to abandon or neglect them for any refinements or properties which the muſic of Aſia, Africa, or America could furniſh, would indeed be letting our corn-fields lie fallow, and feeding on acorns; or throwing aſide the poetry of Milton, Dryden, and Pope, to read and imitate only Chaucer, Gower, and Lidgate.

As national tunes, the airs of the Arabians, Turks, and Perſians, would amuſe curious inquirers after exotics; but as to their theory, practice, and taſte, faith in their excellence is wanting to make us imagine them worth the time and labour neceſſary to their acquiſition. If, therefore, the article Arabian muſic has not been further extended, and ſhould diſappoint our readers by its brevity, the conceſſions made by M. Ginguené, who has compiled and digeſted the article in the new Encyclopedie, will a little abate their curioſity, and apologize for our want of time and zeal to inveſtigate this muſic.

After giving us the ſcale and technica of the Arabian muſic in the language of the country, but expreſſed in letters of the French alphabet, M. G. ſays; "The Arabians, like other oriental people, never paſs from one ſound to another, however diſtant, either in riſing or falling, without running through all the intermediate intervals. Theſe continual ſlides of the voice, which to us are inſupportable, conſtitute, according to them, the charm of their muſic, and grace of their melody." Now the difficulty and effects of ſuch miauling or mewing paſſages will be eaſily conceived by our readers, from what follows in the article of M. G. "From C to D they reckon four intervals; from D to E the ſame; and from E to F two." So that it is all done in quarter tones, or the enharmonic genus and ſcale. And where ſhall we find voices or inſtruments to furniſh theſe intervals? "They have no knowledge of harmony (continues M. G.), and in their concerts, all the parts are performed in unifons and octaves, and all on ſtringed inſtruments; of which they ſometimes ſweep the whole number, to produce more or leſs effect, or at leaſt more noiſe, which neceſſarily occaſions a diſcordance, to which, from their ignorance of harmonic chords, their ears are inſenſible." Their inſtruments are chiefly thoſe of percuſſion, or thrumbed with the fingers or nails; they have, indeed, a flute, called *Nai*, with ventages. The tube is a ſection of a reed, with a mouth-piece of horn. It is to the ſound of this flute that the derviſes dance. Two or three muſicians are placed in a gallery that ſurrounds the moſque. The Iman is ſtationed in the midſt of the derviſes; he gives the ſignal, the Nais begin to ſound, and the derviſes turn round with extreme rapidity. The Iman gives another ſignal, the flutes then ceaſe to ſound, and the derviſes ſtop, and throw themſelves into a particular attitude.

They have an inſtrument which reſembles a lute, to which they aſſign more marvellous effects than the Grecians did to the lyre of Apollo. "They tell you, with the utmoſt gravity, that each of the ſtrings of this inſtrument, four in number, has particular virtues: the firſt, for inſtance, acts as a ſpecific againſt bile and phlegm; the ſecond is a ſovereign cure for the moſt inveterate melancholy and vapours; the third gives health and vigour to young people of both ſexes; and, laſtly, the fourth ſtring affords relief the inſtant it is heard, to a ſanguine temper and diſpoſition."

But the power of theſe ſtrings depends much on the manner with which they are pinched or thrummed; which, like the power of the bow on the violin, is attained by long and laborious practice. "They have a particular *pizzicato*, or pinch, for every action and paſſion; courage, liberality, and noble ſentiments, by one mode of thrumming; love and pleaſure by a ſecond; the dance is inſpired by a third; ſleep and tranquillity by a fourth.

"At the diſtance which ſeparates us from Arabia, and the difference in our ideas and ſentiments (concludes M. G.), we can form no juſt conception of theſe fancied effects, from which we muſt doubtleſs abate much of the marvellous. What they aſcribe to each inſtrument, ſtring, and ſtroke of the fingers, and delicate ſhades of perfection, only convinces us, that they are a people endowed with a ſenſibility very different from ours."

Arabic or Arabian *oratory*, according to Renaudot, conſiſted in a luxuriancy of quaint, high-flown words, epithets, and deſcriptions. That the ancient Arabs were eloquent in a high degree, and that they poſſeſſed wonderful powers of ſpeaking, without preparation, in flowing and forcible periods, is evident from their whole hiſtory. Their eloquence was an harmonious and cadenced proſe, adapted to their ears, and accommodated to the genius of their language, and to the caſt of their character, but can never ſerve as a model for foreigners. Their orators, like their poets, were honoured and rewarded; and their orations were much the offſpring of the imagination, without concatenation in the arguments, but conſiſting of diſtinct ſentences following one another without connection, and remarkable for abrupt antitheſes, and for ſudden and unexpected tranſitions, rather dazzling than enlightening. See *Hiſtory of the* Arabs.

Arabic or Arabian *philoſophy* claims, according to ſome writers, and more particularly Ludwig, a very remote antiquity. On this ſubject the Greek writers are ſilent; but this, it is alleged, is a proof of their pride, and not of the barbariſm of the Arabs. The Saracens themſelves have

confeſſed, that before the riſe of Mahometaniſm, their country was in a low ſtate of civilization; and to this effect we have the teſtimony of Abulpharagius. Nevertheleſs, the advocates of the wiſdom of the ancient Arabians have alleged, that from them, according to the relation of Porphyry, Pythagoras acquired a great part of his knowledge; that Moſes fled out of Egypt into this country, and carried with him the wiſdom of the Egyptians; that the queen of the eaſt, who viſited Solomon, was of Saba, a region in Arabia; and that the wiſe men, who paid their homage to Jeſus, were from this country. Beſides, their origin leaves no doubt concerning the culture of their minds; for as they were deſcended from Abraham, it is pretended that they muſt have derived from their common father, not only a philoſophic ſpirit, but a conſiderable portion of ſcience. To all which is added the acknowledgment of Abulpharagius, that even before Iſlamiſm, to which, in that country, is owing the revival of letters, they thoroughly underſtood their language, that they knew its value, and the ſeveral properties of it; and that they were good poets, excellent orators, and able aſtronomers. It is very poſſible, that the Arabians might have poliſhed their language; that they were ſkilled in divination, and the interpretation of dreams; that they were ſucceſsful in the compoſition and ſolution of ænigmas; that they had even ſome knowledge of the courſes of the planets; and yet have no juſt title to the character of philoſophers: ſince all theſe arts, if they can deſerve the appellation, tend rather to nouriſh and foment ſuperſtition, than to diſſeminate truth, and purge the ſoul from the tyranny of the paſſions. As to Pythagoras, nothing is more uncertain than his journey to the eaſt; and if it were more unqueſtionable, we can only infer from this circumſtance, that he learned from the Arabians the arts of divination, with which they, in common with other eaſtern nations, were well acquainted. If Moſes went into Arabia, and ſettled there on marrying one of the daughters of Jethro, it could not be with the deſign of ſtudying among the Arabians, or of gratifying their idle curioſity with philoſophical ſyſtems. Providence permitted this retreat of Moſes, for conveying thither the knowledge of the true God, and his religion. With reſpect to the remaining arguments, if they be allowed their utmoſt force, they will give the Arabians a very ſmall ſhare of the credit ariſing from the ancient philoſophy of the eaſt. But it has been further ſaid, that there was in Arabia, at a very remote period, a ſect of philoſophers called Zabians or Sabians. But the exiſtence of this ſect is doubtful. No mention is made of it by Greek or Roman writers. We owe all our information concerning them to the Arabians, from whom Maimonides, the Jew, borrowed his account. The probable truth concerning them is, that they were a mixed body of Gentiles and Jews, who, to give the ſanction of antiquity to their inſtitutions, pretended to derive them from Sabi, the ſon of Seth. Their ſyſtem of opinions was an heterogeneous maſs, which muſt have been the produce of a period much later than that to which we now refer. See SABIANS. The Arabians, beſides what has been already ſaid of their ſcience, in this article, and that of the *Hiſtory of the* ARABIANS, ſeem, like the neighbouring Chaldeans and Perſians, to have had their wiſe men, by whom their knowledge, ſuch as they had, was taught, and their religious ceremonies and ſuperſtitious arts were practiſed. Pliny (H. N. l. xxx. c. 1.) mentions the Arabian magi, and ſpeaks of Hippocus, an Arabian, as belonging to their order. It can ſcarcely be ſuppoſed, that the Arabians were unacquainted with moral wiſdom. The fables of Lokman, mentioned in a preceding article, tranſlated from Arabic into Latin by Erpenius, afford no inelegant ſpecimen of the moral doctrines of the Arabians; better adapted, however, to popular inſtruction than to the improvement of philoſophy, which the Arabians do not appear to have cultivated, till the period when their government fell into the family of the Abbaſſides. Brucker's Hiſt. Phil. by Enfield, vol. i. p. 56. See the article ARABIAN *learning*. Sir William Jones (Aſiatic Reſearches, vol. ii. p. 9.) ſays, that he finds no trace among them, till their emigration, of any philoſophy but ethics; and even their ſyſtem of morals, generous and enlarged as it ſeems to have been in the minds of a few illuſtrious chieftains, was, on the whole, miſerably depraved for a century at leaſt before Mahomet; the diſtinguiſhing virtue which they boaſted of cultivating and practiſing, was a contempt of riches, and even of death.

ARABIC, or ARABIAN *phyſic* and *phyſicians*, ſucceeded the Grecian, and handed down the art to us, having made conſiderable improvements, chiefly in the pharmaceutical and chemical parts.

It is certain we owe to them moſt of our ſpices and aromatics, as nutmegs, cloves, mace, and other matters of the produce of India. We may add, that moſt of the gentler purgatives were unknown to the Greeks, and firſt introduced by the Arabs; as manna, ſena, rhubarb, tamarinds, caſſia, &c. They likewiſe brought ſugar into uſe in phyſic, in which, before, only honey was uſed. They alſo found the art of preparing waters and oils, of divers ſimples, by diſtillation and ſublimation.

The firſt notice of the ſmall-pox, and the meaſles, is likewiſe owing to them. Laſtly, the reſtoration of phyſic in Europe took its riſe from their writings.

M. Le Clerc has given a ſketch, and Dr. Freind an ample hiſtory of the Arabian phyſic. We have alſo a *notitia* of all the Arabian phyſicians by Fabricius.

Thoſe who now practiſe the art of medicine in Arabia, know little more than the technical terms as they find them in the writings of Avicenna, and the uſe of ſimples. All the phyſicians in Yemen, Niebuhr ſays, acted at the ſame time as chemiſts, apothecaries, ſurgeons, and horſe-doctors; and yet, by the practice of all theſe arts together, they could hardly earn a livelihood. A diſeaſe very common in Yemen, and aſcribed to the uſe of putrid waters, is occaſioned by the Guinea-worm; but it is not dangerous if the perſon that is attacked can extract the worm without breaking it. The leproſy ſeems to have been always an endemic diſeaſe in Arabia; and there is one ſpecies which authors diſtinguiſh by the character of Arabian. Three different variations of it are known there at preſent; of which two, named "bohak," and "barras," are rather diſguſting than dangerous; but the third, called "juddam," is very malignant, and apparently infectious. The laſt prince of Abuſhahkr uſed to ſend to the iſle of Bahrein all who were attacked with the leproſy, or with venereal complaints. At Baſra, all lepers are ſhut up in a houſe by themſelves; and in Bagdad there is a quarter ſurrounded with walls, and full of barracks, to which lepers are carried by force, if they retire not thither voluntarily; but government does not provide with due care for the maintenance of theſe lepers. Inoculation for the ſmall-pox has been in uſe from time immemorial among the Bedouins: mothers perform this operation on their children, by opening the ſkin of the arm with the prickle of a thorn.

ARABIC or ARABIAN *poetry*, may be divided into two ages. The ancient, according to Voſſius, was no other than rhiming; was a ſtranger to all meaſure, and rule; the verſes looſe and irregular, confined to no feet, number of ſyllables, or any thing elſe, ſo that they rhimed at the end; oftentimes all the verſes in the poem ended with the ſame rhime. It is in ſuch verſe that the ALCORAN is ſaid to be written.

Poetry

Poetry was in ſo great eſteem among the ancient Arabs, that it was a great accompliſhment, and a proof of ingenuous extraction, to be able to expreſs one's ſelf in verſe, with eaſe and elegance, on any extraordinary occurrence; and even in their common diſcourſes, they made frequent applications of celebrated paſſages of their famous poets. In their poems they preſerved the diſtinction of deſcents, the rights of tribes, the memory of great actions, and the propriety of their language; for which reaſons an excellent poet reflected an honour on his tribe. So that as ſoon as any one began to be admired for performances of this kind in a tribe, the other tribes ſent publicly to congratulate them on the occaſion; and made entertainments, at which the women aſſiſted, dreſſed in their nuptial ornaments, ſinging to the ſound of timbrels, the happineſs of their tribe, who had now one to protect their honour, to preſerve their genealogies, and the purity of their language, and to tranſmit their actions to poſterity; for this was wholly performed by their poems, to which they were ſolely obliged for their knowledge and inſtruction, moral and œconomical, and to which they recurred, as to an oracle, in all doubts and differences. It is no wonder then, that a public congratulation was made on this account; an honour ſo diſtinguiſhing, that it was conferred only on one of theſe three occaſions; namely, on the birth of a boy, the riſe of a poet, and the fall of a foal of generous breed. To keep up an emulation among their poets, the tribes had once a year, a general aſſembly at Ocadh, a place famous on this account, and where they kept a weekly mart or fair, held on our Sunday. This annual meeting laſted a whole month, during which time they employed themſelves, not only in trading, but in repeating their poetical compoſitions, contending and vying with each other for the prize; whence the place, it is ſaid, took its name. The poems that were judged to excel, were laid up in their king's treaſuries, as were the ſeven celebrated poems thence called "Al Moallahat," or "Moallekat," rather than from their being hung up in the Caaba, which honour they alſo had by public order, being written on Egyptian ſilk, and in letters of gold; for which reaſon they had alſo the name of "Al Modhahabat" or the golden verſes. Theſe poems, which have appeared in our own language, exhibit an exact picture of the virtues and vices of the Arabians, their wiſdom and their folly; and ſhew what may be conſtantly expected from men of open hearts and tumultuous paſſions, with no law to control, and little religion to reſtrain them. The fair and aſſembly at Ocadh was ſuppreſſed by Mahomet; in whoſe time, and for ſome years after, poetry ſeems to have been in ſome degree neglected by the Arabs, who were then employed in their conqueſts. When theſe were completed, and peace was eſtabliſhed, this ſtudy was revived; and almoſt all kinds of literature were encouraged and greatly improved by them. This interruption, however, occaſioned the loſs of moſt of their ancient pieces of poetry, which were then chiefly preſerved by memory; the uſe of writing being rare among them, in their time of ignorance. Though the Arabs were ſo early acquainted with poetry, they did not at firſt write poems of a juſt length, but only expreſſed themſelves in verſe occaſionally. Albert Schultens has preſerved, in his Ancient Memorials of Arabia, two little poems, in an elegiac ſtrain, which are ſaid to have been found about the middle of the ſeventh century, in ſome fragments of ruined edifices in Hadramaut, near Aden, and which are ſuppoſed to be of an indefinite, but very remote age. Sir W. Jones ſuggeſts, that theſe were modern compoſitions on the inſtability of human greatneſs, and the conſequences of irreligion; illuſtrated by the example of the Hamyaric princes; and to the ſame claſs of literary impoſtures belongs, as he ſuſpects, the firſt poem quoted by Schultens, and aſcribed by him to an Arab in the age of Solomon.

The modern Arabian poetry takes its date from the caliphate of Al Raſchid, who lived towards the cloſe of the eighth century. Their poetry then became an art, and rules of proſody were digeſted by Al Khalil Ahmed al Farahidi, who lived in the reign of this caliph. The Arabians ſtill cultivate poetry, and ſometimes reward thoſe who excel in it, though they have at preſent among them no great poets. The beſt are among the Bedouins of Dsjof. To this purpoſe it is mentioned by Niebuhr, that a ſheik of that country was impriſoned at Sana, and that obſerving a bird upon the roof of a houſe, he recollected the opinion of thoſe pious muſſulmans, who think it a meritorious action to deliver a bird from a cage. He thought that he himſelf had as good a right to liberty as any bird, and expreſſed this idea in a poem which he got by heart, and which becoming generally known, at length reached the monarch's ears, who was ſo pleaſed with it, that he ſet the ſheik at liberty, although he had been guilty of various acts of robbery. The exploits of their ſheiks are now frequently celebrated in the Arabian ſong.

Arabic, or Arabian *Religion* was, in the ſtate of ignorance, as they called the period before Mahomet, entirely Sabian; but the Sabian faith is not clearly and ſatisfactorily aſcertained. See Sabians.

It is generally allowed, that they admitted the exiſtence of one ſupreme God, the Creator and Lord of the univerſe, whom they denominated "Allah Taala," the moſt high God: and the religion of the noble and learned Arabs, as well as of the poets, was pure theiſm. We have Arabian verſes of unſuſpected antiquity, which contain pious and elevated ſentiments with reſpect to the goodneſs, and juſtice, and omnipotence of "Allah," or God. If an inſcription, ſaid to have been found on marble in Yemen, be authentic, the ancient inhabitants of that country preſerved the religion of Eber, and profeſſed a belief in miracles and a future ſtate. It is certain, however, that the people of Yemen very ſoon degenerated, and fell into the error of adoring the ſun and the firmament; for even the third in deſcent from Joktan, who was conſequently as old as Nahor, took the ſurname of "Abduſhanes," or ſervants of the ſun; and his family, we are aſſured, rendered particular honours to that luminary. Other tribes worſhipped the planets and fixed ſtars; and by degrees a ſtupid idolatry prevailed among the lower orders of the people. The idolatry of the Arabs, or Sabians, chiefly conſiſted in the worſhip of the fixed ſtars and planets, and the angels or intelligences which, as they ſuppoſed, reſided in them, and governed the world under the ſupreme Deity. Theſe they honoured as inferior deities, and as mediators with God, implored their interceſſion. To the worſhip of the heavenly bodies the Arabs were eaſily led, by obſerving the regularity of their motions, whence they thought them to be animated: and alſo that the changes of the weather happened at the riſing or ſetting of ſome of them for a conſiderable period; and hence they aſcribed to them a divine power, and conceived themſelves indebted to them for their rains, which were highly beneficial to their parched country. This kind of worſhip was proſcribed by Moſes, and is frequently alluded to in the book of Job, particularly ch. xxxi. 26—28. Accordingly they had ſeven celebrated temples dedicated to the ſeven planets; and this planetary worſhip has been ſuppoſed by ſome perſons to have been the firſt ſpecies of idolatry. To this purpoſe Pauſanias intimates (Laconic. Oper. lib. iii.), that the worſhip of the planets was earlier than the firſt arrival of the Pelaſgi in Greece; and that before this time they had ſtatues erected to their honour. Beſides thoſe ſtars, which were the general objects of worſhip throughout Arabia, there were ſome that were more peculiarly revered in particular provinces.

ces. Of the angels or intelligences which they worſhipped, the Koran mentions three, namely, Allat, Al-Uzzah, and Manah; theſe were called Goddeſſes, and the daughters of God; and this appellation they bellowed not only on angels, but on their images, which they believed to be animated by the angels. All religious addreſſes, they conceived, were made as effectually before the one as before the other; and to this practice ſome have traced the origin of image-worſhip. Allat, or Allah, was the idol of the tribe of Thakif, who dwelt at Tavef, and had a temple conſecrated to her in a place called Nakhlah. Al-Uzza was the idol of the tribes of Koreiſh and Kenanah, and part of the tribe of Salim, as ſome ſay; but according to others, it was a tree called the Acacia, worſhipped by the tribe of Ghatfan, and firſt conſecrated by Dhalem, who built a chapel over it. Manah was the object of worſhip of the tribes of Hodhail and Khozaah, poſſibly the Caſſanitæ of Ptolemy, who dwelt between Mecca and Medina; and as ſome ſay, of the tribes of Aws, Knazraj and Thakif alſo. Dr. Pococke ſuggeſts, that the Manah of the Arabs was the Meni of the prophet Iſaiah. This idol was a large ſtone, demoliſhed by Saad in the 8th year of the Hegira, a year ſo fatal to the idols of Arabia; and its name is ſuppoſed to be derived from "Manah," to flow, from the effuſion of the blood of the victims ſacrificed to the deity and intelligence repreſented by it: others ſay it was the name of a conſtellation. Beſides theſe, the Arabian writers deſcribe five antediluvian idols, who are ſaid to have been men of great piety and reputation, whoſe ſtatues the Arabs at firſt reverenced with a civil honour only, which in proceſs of time was heightened into religious worſhip. The Arabs had alſo a great number of other idols; and each country, and even each family, had its appropriate deity. There were, it is ſaid, no leſs than 360 idols, equal to the number of days in their year, in and about the Caaba of Mecca.

Some of the Pagan Arabs believed neither a creation paſt, nor reſurrection to come; but attributed the origin of things to nature, and their diſſolution to age. Others allowed both. Some adopted the opinion of a metempſychoſis, or tranſmigration of ſouls. The Arabs in general were ſtrongly prepoſſeſſed in favour of auguries and fatality. On perceiving any beaſt or bird of ill omen, they kept cloſe within their tents; and the moſt preſſing occaſions of buſineſs or curioſity would never have determined them to ſet out on a journey under ſuch unfavourable auſpices. The prieſthood among them gave no pre-eminence over the reſt of the people; every family had its altar, its idol, and its ſacrificer, who was not excuſed from bearing arms in defence of the common cauſe, nor from the other obligations impoſed on their fellow-citizens. They were ſelected from among the aged; and it ſeems probable that the prieſthood was a temporary dignity conferred on every miniſter employed in acts of religious worſhip; and when the ſervice ended, theſe ephemeral prieſts returned into the claſs of ordinary citizens; but whilſt they were in office, it was expected that they ſhould exhibit examples of moderation and ſobriety. The Sabian prieſts reſerved to themſelves no part of the ſacrificed victim, which was the caſe with the Pagan prieſts, but reduced it to aſhes; abhorring the preſumption and ſacrilege of ſitting down to the tables of the gods, and touching the viands that were offered to them. The ancient Arabs never imagined that tears and maceration could be grateful to the deity; and therefore they celebrated their religious feſtivals with dances and concerts, and the public jubilation was conſidered as the teſtimony of their gratitude towards the God who ſhowered his bounty upon them. It is true, however, that every tribe had its particular cuſtoms, and ſtamped its own character, jovial or gloomy, on its ceremonies of devotion. The Magian religion was introduced among ſome tribes of Arabia a long time before Mahomet, in conſequence of the vicinity of the Perſians, and their intercourſe with the Arabians; and hence this impoſtor borrowed many of his inſtitutions from it. Judaiſm alſo is ſaid to have been introduced among the idolatrous Hamyarites by Abu Carb Aſad, who was the ſovereign of Yemen about 700 years before Mahomet; and the Jews, who fled into Arabia in great numbers after the deſtruction of their country by the Romans, made proſelytes of ſeveral tribes, and particularly thoſe of Kenanah, Al Hareth Ebn Caaba, and Kendah; and in time they became very powerful, and obtained poſſeſſion of ſeveral towns and fortreſſes. At length Yuſef, king of Yemen, raiſed a dreadful perſecution againſt them, and put them to death by various tortures, one of which was throwing them into a glowing pit of fire, from which circumſtance the Arabs gave him the opprobrious title of the "Lord of the pit;" and Caleb, or Eleſbaan, king of Ethiopia, to revenge the maſſacre of the Chriſtians at Najran, put an end to Judaiſm and the kingdom of the Hamyarites in Yemen, at the ſame time. This event happened in the reign of the emperor Juſtin.

Chriſtianity had likewiſe made a great progreſs in Arabia before the time of Mahomet. Whether St. Paul preached in any part of Arabia, properly ſo called, it is not eaſy to determine; but that the Chriſtian religion was planted at a very early period in this country is an unqueſtionable fact. When the eaſtern church, ſoon after the beginning of the third century, was much haraſſed by diſorders and perſecutions, great numbers of them ſought ſhelter in Arabia; and as theſe were for the moſt part of the Jacobite communion, this ſect generally prevailed among the Arabs. The principal tribes that embraced Chriſtianity were Hamyar, Ghaſſan, Rabia, Taghlah, Bahra, Tomuh, part of thoſe of Tay and Kodaa, the inhabitants of Najran, and the Arabs of Hira. See JACOBITES.

Such as we have above recited were the principal religions which obtained among the ancient Arabs; but as freedom of thought, ſays Sale, was the natural conſequence of the political liberty and independence of the Arabs, ſome of them fell into other opinions. The Koreiſh, in particular, were infected with Zendiciſm, an error ſuppoſed to have a near affinity with that of the Sadducees among the Jews, and perhaps not much different from modern Deiſm; for ſeveral of that tribe, before the time of Mahomet, worſhipped one God, and were free from idolatry; though they embraced none of the other religions of the country.

Since the eſtabliſhment of Mahometaniſm in Arabia, there are ſeveral ſorts of this profeſſion in the country; ſuch as the Sonnites, Sciites, Zeidites, &c. of which an account will be given in the courſe of this work. In Arabia there are at this time many Jews, who are diſperſed through different cities, having their ſynagogues, and enjoying a conſiderable degree of freedom. As they are fond of living together, they commonly form a village near every principal town. In the neighbourhood of Kheibar, there are ſome Jewiſh tribes; who are not barely tolerated, but poſſeſs the ſovereign authority. Although the Chriſtians were once numerous in Arabia, Niebuhr ſays, that he knows no Chriſtian church remaining at preſent in this whole country. In the province of Lachſa were many Sabæans, or Chriſtians of St. John; but the Chriſtianity of this ſect is a kind of confuſed medley of the opinions and ceremonies of ſeveral different religions. In the commercial cities there are many Banians from India: at Mocha, however, they undergo many mortifications; but at Maſcat, among the tolerant ſect of the Beraſi, they are permitted to obſerve the laws and cultivate the worſhip of their own religion, without diſturbance. A conſiderable degree of religious toleration

is exercised among the Arabs. Their contempt, however, of those who differ from them is more chiefly manifested towards the Banians than the Jews, and least of all to the Christians; who, in return, express the least aversion for the Mussulmans. This progress towards general toleration among the Arabians preserves them from the rage of making proselytes. They seek neither to entice nor constrain any person, except sometimes their young slaves, whom they compel to embrace Mahometanism; but when a proselyte voluntarily enters himself, they are, by the laws of their religion, obliged to receive him, and to provide for his maintenance.

Arabic *Version*. See *Arabic* Bibles.

Arabic *Year*. See Arabic *Chronology*, and Year.

ARABICA, in *Conchology*, a species of Cypraea that is found in India. This shell is slightly turbinated; characterised with irregular letter-like marks; and has a simple longitudinal streak down the back of it. Lin. Gmel. &c. *Cypræa Arabica*, or Arabic cowry, is about three inches in length; its ground colour is whitish or bluish, and is covered with characters of a chesnut or dark brown, that somewhat resemble Arabic letters upon the back; the edges are thick and spotted with purple. When the outer coat is worn off, the back of the shell is pale, with dark transverse bars. The inside of the mouth is violet; lips reddish-grey; crenulations chesnut. It is called by Rumphius, Porcellana literata s. Arabica.

ARABICI, a sect which sprung up in Arabia, about the year 207, whose distinguishing tenet was, that the soul died with the body, and also rose again with it.

Eusebius, lib. 6. c. 38, relates that a council was called to stop the progress of this rising sect; and that Origen assisted at it; and convinced them so thoroughly of their error, that they abjured it.

ARABICUS *costus*. See Costus.

ARABIS, in *Botany*, Wall-cress (Ἀραβίς, Dioscor. from Arabia, Lin.), Lin. gen. 818. Schreb. 1094. Juss. 238. Class, *tetradynamia siliquosa*. Nat. Order, *siliquosæ*. *Cruciferæ*, Juss. Gen. char. *Cal.* perianth, four-leaved, deciduous: leaflets from parallel-converging; two opposite larger, ovate-oblong, acute, a little prominent at the base, gibbous, concave; the other two linear, erect. *Cor.* four-petalled cruciform, each ending in claws of the length of the calyx. *Nectaries*, four; each from a little scale within the bottom of the calycine leaflet, affixed to the receptacle, reflex, permanent. *Stam.* Filaments subulate, upright, two the length of the calyx, four twice as long; anthers cordate, erect. *Pist. Germ.* columnar, the length of the stamens. *Style*, none. *Stigma* obtuse, entire. *Per.* silique, compressed, very long, linear unequal, with swellings at the seeds; valves almost the length of the partition. *Seeds*, many, roundish, compressed. Ess. gen. char. Nectareous glands four, one within each leaflet of the calyx, like a reflex scale. Species 1. A. *Alpina*, alpine wall-cress; leaves clasping the stem, toothed; root perennial, creeping, from which proceed many leaves collected into heads, spreading circularly: they are whitish, oblong, and indented at the edges. From the centre of these arise the flowering stems, which grow nearly a foot high, with alternate leaves closely embracing the stem. The flowers are white, in bunches towards the top. Flor. Dan. t. 62. A native of the Alps and other mountains of Europe, on rocks, in caverns, and in woods. It was cultivated in the botanic garden at Oxford, in 1658, and is now common in gardens. 2. A. *lucida*, shining wall-cress, leaves embracing the stem, shining. Stem four inches high, simple, smooth, leaves entire; those at the bottom obovate, obtuse; those on the stem alternate, cordate, clasping the stem. Petals erect, white, linear, in corymbs, which become racemose. A native of Hungary, perennial. 3. A. *grandiflora*, great flowered wall-cress, stem naked; root-leaves many, two inches long, lanceolate, cut beyond the middle like pinnate leaves, with acuminate divisions. Corymb terminating with alternate flowers, on very short peduncles. A native of Siberia, perennial. There is one variety of this species with entire leaves, and another with white flowers. 4. A. *thaliana*, common wall-cress, leaves petiolate, lanceolate, perfectly entire. Curt. Lond. 2. 49. Eng. Bot. Root-leaves sometimes toothed near the base, stem-leaves sessile and toothed, hairy; stem upright, somewhat branched, round, crooked, hairy; the little branches alternate and drooping; petals white, entire, obtuse, twice the length of the calyx; silique half an inch long, containing several yellowish seeds. A common annual, growing in sandy grounds, and on old walls. 5. A. *bellidifolia*, daisy-leaved wall-cress, leaves subdentate; those of the root obovate, of the stem lanceolate. Jacq. Flor. Aust. 3. t. 280. Root perennial, producing tufts of leaves, and several stems, which are undivided, round, smooth, bending, lengthened out gradually at top, into a long raceme; flowers corymbed, inodorous, white, consisting of obovate petals; siliques parallel to the stem, linear, compressed, opening at both ends. A native of the foot of the Alps in Switzerland and Austria. Introduced into the Royal garden of Kew, by John earl of Bute, in 1773. A smaller variety of this species is described and figured by Jacquin; see l. c. A. *pumila*. 6. A. *lyrata*, lyrate-leaved wall-cress, leaves smooth; those at the root lyrate, on the stem linear; root annual; the flower-stalks nearly a foot high, terminated by white flowers. Linnæus observes, that this differs in no respect from the fourth species, except that the root-leaves are lyrate and smooth, and the flowers larger. A native of North America. 7. A. *hispida*, rough wall-cress: this, according to Professor Martyn, is the A. *stricta* of Hudson and Withering; leaves wedge-shaped, sublyrate, hispid; stem-leaves half embracing the stem, lanceolate; siliques stiff, ancipital; root annual; stems many, six inches high: root-leaves very many, toothed and gash-toothed, rough, hairy; stem leaves three or four, toothed, hispid: flowers white, in racemes, on short peduncles: siliques an inch and a half long, quadrangular at the base, striated. It grows wild in most parts of Europe; and was found on St. Vincent's rocks near Bristol, by Mr. Hudson, who describes it as a new species. 8. A. *Halleri*, Haller's wall-cress, stem-leaves sublyrate, those on the branches lanceolate, gashed; stem erect, six inches high; root-leaves on long petioles, obtuse, repand, a tooth or two at the base; stem-leaves petioled, oblong, sinuate-toothed; petals white, with green claws. This plant sends off runners from the root and base of the stem. A native of Germany, Carniola, and Piedmont. 9. A. *canadensis*, Canadian wall-cress; stem-leaves lanceolate, toothed, smooth; flowers pendulous. A native of North America, two feet high, with broad, lanceolate, irregular, serrate leaves; flowers in lateral racemes. 10. A. *pendula*, pendulous wall-cress; leaves stem-clasping; siliques ancipital, linear; calyces sub pilose; stem nearly a foot high, rough with scattered stiff hairs; leaves rough, partly embracing the stem, serrate; peduncles long, filiform, loose; flowers white; siliques smooth, nodding. A native of Siberia. Cultivated by Miller, in 1759. 11. A. *turrita*, tower wall-cress, Eng. Bot. Leaves stem-clasping; siliques bending down, flat, linear; calyces subrugose; root woody, biennial; stem usually simple, from nine inches to two feet in height, upright, downy, round; leaves hairy on both sides; root-leaves petioled, oblong, thick, hispid, waved, and toothed; stem-leaves similar, stem-clasping, tomentose, regularly decreasing as they approach the top; flowers upright, white or yellowish, on short peduncles; siliques

very

very long, linear, compreſſed, curved; ſeeds round, compreſſed: common on old walls, rocks, &c. 12. A. *ſaxatilis*, ſtem erect; leaves ſtem-claſping, lanceolate, toothed; ſiliques the length of the raceme; ſtem about ſix inches high, round, ſimple; leaves crowded, upright, cared at the baſe, deeply toothed, and as well as the whole plant covered with ſoft hairs; umbel of flowers terminating, nodding; petals white, ſmall, ſquarish; ſiliques in ſhort racemes, flat, compreſſed, annual. Allioni and Villars differ conſiderably in their deſcriptions of this plant. A native of the ſouth of Europe, on rocks. 13. A. *ſcabra*, root leaves roundiſh, rough, toothed; ſtem leaves embracing, hairy. This, in many reſpects, agrees with the 5th ſpecies. Its ſtem is ſmooth, erect, from four to ſix inches high; ſimple, furniſhed with one or two ovate-lanceolate leaves; flowers large, white; calyces whitiſh; ſiliques broadiſh, bowed at the end, upright, parallel to the ſtem. A native of the ſouth of Europe. 14. A. *ſerpyllifolia*, all the leaves elliptical entire; ſtem flexuoſe; ſtems filiform, bending, entangling one with another; leaves ſmall, ſeſſile, beſet with forked hairs; petals ſmall, white; ſiliques very thin, a little compreſſed. A native of Dauphiné. 15. A. *recta*, ſtem ſtraight, leaves rectangularly toothed, ſeſſile; ſiliques from erect ſpreading. This reſembles the 14th ſpecies, except that its ſtems are conſtantly ſtraight. It is annual or biennial, and found on walls or rocks about Grenoble.

Propagation and Culture. All the above are hardy plants, and will thrive in any ſituation. They may be eaſily propagated by ſeeds, which they produce in great plenty. The firſt ſpecies is moſt common in our gardens, and by multiplying faſt by its creeping roots, few perſons are at the trouble of ſowing its ſeeds. It flowers early, and having many ſtrong ſtems from one root, it makes a pretty variety in cold ſituations, where many finer plants will not thrive.

ARABIS. See CARDAMINE.

ARABIS, or ARBIS, in *Ancient Geography*, a river of Perſia, in the province of Gedroſia, which took its riſe on a ridge of mountains that ran acroſs the province, and after a ſhort courſe, diſcharged itſelf into the Indian ocean. The mouth of the Arabis is placed by Mr. Rennell in E. long. 65° 34′, and N. lat. 25° 26′, about 44′ Weſt from the weſtern mouth of the Indus. Arrian mentions an iſland at the mouth of the river; and there is ſtill a ſmall town, called Sommeany, at the entrance, and labouring under the ſame difficulty for water, which is noticed by Arrian; who ſays, that they were obliged to go up the country above two miles to find a well. From the Indus to the river Arabis, the Greeks, in the voyage of Nearchus, found the coaſt inhabited by an Indian tribe, whom they have named Arabies; and contiguous to them were the Oritæ, whoſe territory extended from the Arabis to Malana, or Cape Moran, which terminates a ridge of mountains ſhooting off from a chain which bounds this country on the north. *Ara*, the capital, now *Haur*, is placed by M. D'Anville on the Tomerus: the country appears to have been fully peopled; and the Oritæ are deſcribed as dreſſed and armed like the Indian tribes; but their cuſtoms, manners, and language, ſays Dr. Vincent, "On the Voyage of Nearchus," mark them as a different race. The modern inhabitants conſiſt chiefly of a predatory people, denominated "the Balluches."

ARABISM, ARABISMUS, an idiom, or manner of ſpeaking peculiar to the Arabs, or the Arabic language. R. Martin maintains that the ה ſometimes expreſſes an oath in the Hebrew as well as the Arabic.

ARABISSUS, in *Ancient Geography*, a town of Aſia, ſituate on a plain to the ſouth of the river Melas.

ARABIST, a perſon curious of, and ſkilled in the learning and language of the Arabians: ſuch were Erpenius and Golius. The ſurgeons of the 13th century are called *Arabiſts* by Severinus. Freind, Hiſt. Phyſ. tom. ii. p. 301.

ARABISTAN, in *Geography*, a name given by the Turks and Perſians to modern Arabia.

ARABKIR, a town of Aſia, in the province of Caramania, 105 miles ſouth-eaſt of Yurcup.

ARABLE FARM, in *Agriculture*, that ſort of farm which is either wholly or in a great part under the plough. See FARM.

ARABLE *Land*, that kind of land which is proper for being tilled or cultivated by means of the plough, with the view of producing grain or other crops. The dry and friable ſorts of ſoil are moſt adapted to this purpoſe. See LAND.

ARABS, in *Entomology*, a ſpecies of TENEBRIO that inhabits the eaſt. It is black; thorax ſerrated; antennæ and legs teſtaceous brown. Fabricius. Gmelin.

ARABS, a ſpecies of CIMEX found in South America. The thorax is ſpinous; body ovate, livid; end of the abdomen bidentated. Linn. Fab. Gmel. This is called by Sloane, Cimex ſylveſtris fœtens viridis triangularis.

ARABS, in *Ornithology*, a ſpecies of OTIS that inhabits Arabia Felix, and which Dr. Latham concludes muſt be the flying oſtrich of Le Maire and Adanſon; though Buffon ſuppoſes that bird to be the Linnæan OTIS ATRA. Its ſpecific character is very conciſe, "ears with erect creſts." Gmelin. Briſſon calls it *L'Outarde d'Arabie*; and Buffon, *Le Lobong, ou l'Outarde huſſpé d'Arabie*; and it is likewiſe the *Arabian Buſtard* of Edwards and Latham.

The ſize is that of the great buſtard, but the bill, neck, and legs are longer in proportion. The bill is pale horn colour; back of the head black and creſted; forehead whitiſh; a black mark on each ſide of the head, paſſing into the creſt behind; the reſt of the head, neck, and upper parts of the body, rufous, mixed with black, and ſomewhat reſembling the markings on the plumage of the woodcock; the throat, and fore-part of the neck, aſh-colour croſſed with brown lines; breaſt and belly white; quills black; ſecondaries black and white in ſpots, thoſe neareſt the body rufous, with duſky marks acroſs; tail white except the two middlemoſt feathers, which are blackiſh rufous; all of them are mottled and marked with a black band acroſs; the legs are pale brown.

ARABSCHAH, in *Biography*, a Mahometan writer of the fifteenth century, was a native of Damaſcus, where he died in the year 1450. He is the author of a hiſtory of Tamerlane, intitled, "The wonderful effects of the divine decrees in the affairs of Tamerlane," and of a theological treatiſe "On the unity of God." D'Herbelot Bibl. Orient.

ARABUM LEPRA. See LEPROSY.

ARABUM *ſandaracha*. See SANDARACHA.

ARAC, or ARRAC, a ſpirituous liquor, imported from the Eaſt Indies; chiefly uſed by way of dram, and in punch. The nature and compoſition of this celebrated liquor have been much controverted.—The name arac, Mr. Lockyer aſſures us, is an Indian word for ſtrong waters of all kinds; as they call our ſpirits and brandy, Engliſh arac.—But what we underſtand by the name arac, is really no other than a ſpirit procured by diſtillation from a vegetable juice called *toddy*, which flows by inciſion out of the cocoa nut tree, and ſome other trees, like the birch-juice procured among us.

The *toddy*, Mr. Lockyer adds, is a pleaſant drink of itſelf, when new, but purges thoſe not uſed to it; and when ſtale, is heady; and finally makes good vinegar. The Engliſh at Madras uſed it as leaven to raiſe their bread with.

Others are of opinion, that the arac, or arrac, is a vinous

ſpirit

ſpirit obtained by diſtillation, in the Eaſt Indies, from rice or ſugar fermented with the juice of cocoa nuts.

The Goa arac is made from the toddy, the Batavia arac from rice and ſugar. There is likewiſe a kind of ſhrub from which arac is made.

Goa and Batavia are the chief places for arac:—At Goa there are divers kinds; ſingle, double, and treble diſtilled. The double diſtilled, which is that commonly ſent abroad, is but a weak ſpirit in compariſon with Batavia arac; yet, on account of its peculiar and agreeable flavour, it is preferred to all the other aracs of India. This is attributed to the earthen veſſels which they uſe at Goa to draw the ſpirit; whereas at Batavia they uſe copper ſtills.

The Parier arac, made at Madras, and the Columbo and Quilone arac, at other places, being fiery hot ſpirits, are little valued by the Europeans, and therefore rarely imported: though highly prized among the natives. In the beſt Goa arac, the ſpirits of the cocoa juice do not make above a ſixth or eighth part: the manner of making the Goa arac is this. The juice of the trees is not procured in the way of tapping, as we do; but the operator provides himſelf with a parcel of earthen pots, with bellies and necks like our ordinary bird-bottles: he makes faſt a number of theſe to his girdle, and any way elſe that he commodiouſly can about him. Thus equipped, he climbs up the trunk of a cocoa-tree; and when he comes to the boughs, he takes out his knife, and cutting off one of the ſmall knots or buttons, he applies the mouth of the bottle to the wound, faſtening it to the bough with a bandage; in the ſame manner he cuts off other buttons, and faſtens on his pots, till the whole number is uſed: this is done in the evening, and deſcending from the tree, he leaves them till the next morning; when he takes off the bottles, which are moſtly filled, and empties the juice into the proper receptacle. This is repeated every night, till a ſufficient quantity is procured, and the whole being then put together, is left to ferment, which it ſoon does.

When the fermentation is over, and the liquor or waſh is become a little tart, it is put into a ſtill, and a fire being made, the ſtill is ſuffered to work as long as that which comes over has any conſiderable taſte of ſpirit.

The liquor thus procured is the low wine of arac, and this is ſo poor a liquor, that it will ſoon corrupt and ſpoil, if not diſtilled again, to ſeparate ſome of its phlegm; they therefore immediately after pour back this low wine into the ſtill, and rectify it to that very weak kind of proof ſpirit, in which ſtate we find it. The arac we meet with, notwithſtanding its being of a proof teſt, according to the way of judging by the crown of bubbles, holds but a ſixth, and ſometimes but an eighth part of alcohol, or pure ſpirit: whereas our other ſpirits, when they ſhew that proof, are generally eſteemed to hold one half pure ſpirit. Shaw's Eſſays on Diſtilling.

There is a paper of obſervations on arac, in the Melanges d'Hiſtoire Natur. tom. v. p. 302. By fermenting, diſtilling, and rectifying the juice of the American maple, which has much the ſame taſte as that of the cocoa, the author ſays he made arac not in the leaſt inferior to any that comes from the Eaſt Indies; and he thinks the juice of the ſycamore and of the birch trees would equally anſwer the end.

Beſide the common ſorts of Goa and Batavia arac, there are two others leſs generally known; theſe are the bitter arac, and the black arac.

By ſtat. 11 Geo. I. c. 30. arac on board a ſhip within the limits of any port of Great Britain, may be ſearched for and ſeized, together with the package; or if found unſhipping or unſhipped before entry, may be ſeized by the officers of exciſe, in like manner as by the officers of the cuſtoms. 33 Geo. II. c. 9. 9 Geo. III. c. 6.

Upon an exciſe officer's ſuſpicion of the concealment of arac, and oath made of the grounds of ſuch ſuſpicion, before the commiſſioners or a juſtice of the peace; they may empower him to enter into ſuch ſuſpected places, and ſeize the liquors, with the caſks, &c. If the officers are obſtructed, the penalty is 100 l.

Arac is not to be ſold but in warehouſes, entered as directed in the 6th of Geo. I. c. 21. upon forfeiture, and the caſks, &c. If permits are not returned, which are granted for the removal of arac, or if the goods are not ſent away within the time limited, the penalty is treble the value. If the permits are not returned, and the decreaſe is not found to be ſufficient, the like quantity is forfeited. Permits are not to be taken out but by direction in writing to the proprietor of the ſtock, or his known ſervant, upon forfeiture of 50 l. or three months' impriſonment.

By ſtatute 9 Geo. II. c. 35. if arac is offered to ſale without a permit, or by any hawker, pedlar, &c. with a permit, the perſon to whom it is offered, may ſeize and carry it to the next warehouſe belonging to the cuſtoms or exciſe, and bring the perſon offering the ſame before any juſtice of the peace, to be committed to priſon, and proſecuted for the penalties incurred by ſuch offence. The perſon ſeizing ſuch goods may proſecute in his own name; and on recovery is entitled to one-third part of the groſs produce of the ſale; and the commiſſioners are, if deſired, upon a certificate from the juſtice of the offender's being committed to priſon, to advance to the ſeizer 15 s. per gallon for the arac ſo ſeized.

Arac (except for the uſe of ſeamen, two gallons each) found in any ſhip or veſſel arrived from foreign parts, at anchor, or hovering within the limits of any port, or within two leagues of the ſhore, and not proceeding on her voyage (unleſs in caſe of unavoidable neceſſity and diſtreſs of weather, notice whereof muſt be given to the collector or chief officer of the port, upon the ſhip's arrival), is forfeited; with the boxes, caſks, or other package, or the value thereof. 5 G. III. c. 43. 19 G. III. c. 69. 21 G. III. c. 39. 24 G. III. c. 47.

Arac is alſo the name of a ſpirituous liquor made by the tartars of Tunguſia, of mares' milk, allowed to become ſour, and afterwards diſtilled twice or thrice between two earthen pots cloſely ſtopped, whence the liquor runs through a ſmall wooden pipe. It is ſaid to be more intoxicating than brandy.

ARACA-Puda, in *Botany*. See Drosera.

ARACÆI, Araceans, or Arkites, in *Ancient Geography*, a people ſuppoſed to be deſcended from Arak the ſon of Canaan, who inhabited a diſtrict in the vicinity of Sidon, which afterwards fell to the lot of the tribe of Aſher, where Joſephus places a town called Arce or Arca. From hence they removed farther north to a town of the ſame name between Aradus and Tripolis. The Arce mentioned by Joſephus, and belonging to the tribe of Aſher, was otherwiſe called Antipas. The Jewiſh hiſtorian ſays, that Baanah, mentioned, 1 Kings, iv. 16. as ſuperintendant of the tribe of Aſher, was governor of the country round about the city of Arce, which lies upon the ſea. In the latter times of the Jewiſh commonwealth, this city was a part of Agrippa's kingdom.

ARACAN, in *Geography*. See Arracan.

ARACANGA, in *Ornithology*, a ſpecies of Psittacus, or parrot, in the Linnæan ſyſtem; the *Aracanga* of Marcgrave, the *Aracanga Maccaw* of Willughby, *Ara Jamaicenſis* of Briſſon, *Petit Ara Rouge* of Buffon, *Jamaica Maccaw* of Albinus and Brown, *red and yellow Maccaw* of Bancroft and Latham. It is of a pale ſcarlet colour, with

naked wrinkly cheeks; the ſcapular feathers are yellow, and tipt with green; the wing quills are blue above, and red beneath. Mr. Latham ſuſpects, that this may be a younger bird of the ſpecies called ARA, which is ſomewhat bigger. It inhabits Guiana, Braſil, and Jamaica.

ARACARI, a ſpecies of RAMPHASTOS. It is green; abdominal band, vent, and rump red; belly yellow. Gmel. &c. Ramphaſtos with a black beak, the upper mandible white on the ſides, and three-lobed at the baſe. Linn. Syſt. Nat. Marcgrave calls this bird *Araçari*; Briſſon, *Tucana Braſilienſis Viridis*; and Buffon, *Grigri*, and *Toucan Vert du Breſil*.

The length of this bird is ſixteen inches, of which the bill meaſures four inches and a quarter; it is hooked at the tip; the upper mandible white, marked above with a black ſtripe the whole length: the lower mandible is wholly black, and deeply ſerrated at the edges. The head, throat, and neck black; on each ſide of the head is a ſmall cheſnut ſpot juſt above the ears; the upper part of the back, ſcapulars, and wing-coverts are dull green; lower part of the back, rump, and upper tail-coverts, bright red. Breaſt, belly, and ſides brimſtone, with a bright red band acroſs the belly. Tail wedge-ſhaped; legs blackiſh green; claws black. Inhabits South America.

ARACCA, in *Ancient Geography*, a town of Aſia, in Suſiana, on the eaſtern branch of the Tigris, according to Ptolemy. This is probably the city of Chaldæa, built by Nimrod the grandſon of Cuſh, and mentioned under the name of Erach, Gen. x. 10. Ammian calls it Arecha; hence originates the name of Arechæan plains, deſcribed by Tibullus (l. iv. p. 403. ed. varior.):

"Ardet Arecteis aut unda per hoſpita campis."

And this city might probably have led the Arabians to call the large province of Aſia, Iraca or Irak, the capital of which was formerly Babylon, and now Bagdad.

ARACENA, in *Geography*, a town of Spain, in the province of Andaluſia, ſituate near the Sierra Morena, in the country of Seville, with a caſtle on an eminence; 10 leagues N. N. W. from Seville.

ARAC-GELERAN, a ſmall diſtrict of Chuſiſtan, a province of Perſia.

ARACH, or ERACH, a name now given to the ancient PARTHIA.

ARACH, in *Botany*. See ATRIPLEX.

ARACHIDNA, and ARACHIDNOIDES. See ARACHIS, GLYCINE, and LATHYRUS.

ARACHIS (from ἀ privative, *damnum, vel noxa*), in *Botany*, *earth-nut*. Lin. gen. 876. Schreb. 1177. Gærtn. t. 144. Juſſ. 354. Arachidna, Plum. 37. Arachidnoides, Niſſ. act. gall. 1723. t. 19. Claſs, *diadelphia decandria*. Nat. Order, *Papilionaceæ* or *leguminoſæ*. Gen. Char. *Cal.* perianth two-parted, gaping; upper lip ovate, ſemitrifid; the intermediate diviſion the largeſt, emarginate; under lip lanceolate, concave, acute, rather longer than the upper. *Cor.* papilionaceous, reſupine; banner roundiſh, flat-deflex, very large, emarginate, longer than the calyx; wings free, ſubovate, ſhorter than the banner; keel ſubulate, incurved, the length of the calyx, very ſlightly bifid at the baſe. *Stam.* filaments ten, all united at bottom, ſubulate; anthers alternately roundiſh and oblong. *Piſt.* germ oblong; ſtyle ſubulate, the length of the germ; ſtigma ſimple. *Per.* a legume, ovate-oblong, columnar, valveleſs, gibbous, one-celled. *Seeds* two, oblong, obtuſe, gibbous, truncate. *Obſ.* Moſt of the flowers have a piſtil without a germ.

Eſſ. Gen. Char. *Cal.* bilabiate. *Cor.* reſupine. *Fil.* connected. *Legume* gibbous, toruloſe, veined, coriaceous.

Species, 1. A. *hypogæa*, common earth or ground nut. Stem herbaceous, procumbent. The ſtem is annual, three feet high, round, very hairy, reddiſh, ſubercét, with ſpreading procumbent branches; leaves ſcattered, abruptly pinnate; leaflets two pairs, ovate, hairy, entire; ſtipules ſharp, bifid, oppoſite, half ſtem claſping; flowers gold-coloured, growing ſingly on long axillary pedicles; the legumes contain three or four ſeeds. Native of the Eaſt Indies, and cultivated very abundantly in China and Cochin-China. β. The African ground nut differs from the Aſiatic in having the leaflets ſmooth, the ſtipules entire, the flowers uſually in pairs, and only two or three ſeeds in each legume. All the European ſettlements in America now abound with the ground nut, but it is generally ſuppoſed that it was originally brought by the ſlaves from Africa. In South Carolina there is great plenty of this plant; the inhabitants roaſt the nuts, as they are commonly called, and make uſe of them as chocolate. In the eaſtern countries, they are a ſubſtitute for almonds, and like them afford a limpid oil, which in Cochin-China is very much uſed for lamps. It is alſo uſed at table, but not ſo much eſteemed as the oil of olives. The ground nut was cultivated in the Chelſea garden ſo early as the year 1712. 2. A. *fruticoſa*, ſhrubby earth or ground nut; ſtem ſhrubby, upright; the whole plant is viſcid; ſtems ſlender, many, filiform; leaves reſembling thoſe of myrtle, of different ſizes, oblong, ternate, hirſute, partly ſheathing the ſtem at the foot-ſtalks; flowers at the end of the branches, yellow, collected into ſolitary heads with bractes under them. A native of the Eaſt Indies, in Tranquebar and the iſland of Ceylon.

Propagation and Culture. In England, the ſeeds of the earth nut muſt be ſown on a hot-bed in the ſpring, and the glaſſes kept over the plants till towards the end of June; after which, if the weather proves warm, they may be expoſed to the open air by degrees. The branches trail upon the ground, and as ſoon as the flower begins to decay, the germ thruſts itſelf under ground, and the pod is formed and ripened.

ARACHNE, in *Entomology*, a ſpecies of PAPILIO (Nymp. G. Linn.). The wings are entire, black; a rufous band with two eye-ſhaped ſpots on both ſides of the anterior pair; poſterior pair marked with a cinereous jagged band on the under ſide. Inhabits Auſtria. Fabr. Gmel. *Obſ.* This is not PAPILIO *Arachne* of Cramer, deſcribed by Fabricius and Gmelin under the ſpecific name *Morvus*.

ARACHNE, in *Fabulous Hiſtory*, a Lydian damſel, the daughter of Idmon, of the town of Colophon, who conteſted with Minerva the honour of pre-eminence in the arts of ſpinning linen and manufacture of tapeſtry. Minerva was ſo incenſed by her preſumption, that perceiving the peculiar excellence of her rival's performance, ſhe flung the ſhuttle at her head: this inſult ſo offended the diſtreſſed Arachne, that ſhe hung herſelf in deſpair. Minerva, it is ſaid, reſtored her to life under the form of a ſpider, which employs itſelf in ſpinning. The fable is undoubtedly derived from ἀραχνη, the Greek name of the ſpider.

ARACHNOIDEA TUNICA, or *Arachnoides*, from ἀραχνη, *a ſpider*, and εἰδος, *a form*, in *Anatomy*, is a ſemitranſparent thin membrane which is ſpread over the brain and pia mater, and for the moſt part cloſely connected with the latter membrane. See the article BRAIN.

The ſame term, or *Tunica Aranea*, has been alſo applied to that capſule of the cryſtalline lens, which is a continuation of the membrana hyaloidea. See EYE.

ARACHNOIDES, in *Natural Hiſtory*, a genus of the ECHINI *marini*, in Klein's arrangement of teſtaceous and cruſtaceous animals. There is only one ſhell of the Echinus genus that ſtrictly agrees with the character of Arachnoides,

which is *Placenta*; it therefore forms a ſubdiviſion of the genus in the Linnæan ſyſtem, and is thus defined; circular mouth central; vent ſquare, and placed on the ſurface: *Arachnoides Kleinii.*

ARACHNOIDES is alſo a ſpecies of MADREPORA found foſſil. The ſtars are very ſmall, crowded, and flattened; rays ſomewhat undulated, ſhort, and equal. Gmel. &c.

ARACHNOIDEUS, in *Botany*, denotes cobwebbed.

ARACHOSIA, in *Ancient Geography*, a province of Perſia, bounded on the weſt by Drangiana, on the north by Paropamiſus, on the eaſt by the river Indus, and on the ſouth by Gedroſia. It was anciently inhabited by the Arimaſpi. Ptolemy enumerates thirteen cities in this province; the principal of which were Arachotus, Alexandria, and Arbaca. The ancient Arachoſia is traced by major Rennell in the preſent AROKHAGE. Captain Wilford ſays (ſee Aſiatic Reſearches, vol. vi. p. 517.) that *Roh Coi*, according to the Balluch pronunciation, denoting the mountains of Coi, or *Row-Coz* as ſoftened by the Pattans, is the Arachoſia of the Greeks; and that it includes the diſtricts of Gazni and Candahar. Arachoſia is now called Cawer or Caweran; but even this appellation is becoming obſolete. By a ſtrange miſtake, ſays this ingenious writer, the country of Arachoſia, and the river which flows through it, have been placed by the learned D'Anville to the ſouth of Candahar. He adds, that if this famous geographer had recognized Gazni in the Shakeni-Couze of Tavernier, this miſtake would not have happened. Mr. Wilford having converſed often with natives of Candahar, of Kálá-at-Náſir-Khàn, and Cojhur, as well as other intermediate places, obtained ſufficient local knowledge of that country to rectify this error.

ARACHOTI, an ancient people of India, ſuppoſed by Bryant (Anal. of Anc. Mythol. v. III. p. 199) to be the ſame with the CATHAIANS, and ſo denominated from their city Ar-Chota, the ſame as Cothopolis, or city of Cutha. The Arachotians are ſtyled Ἀραχλαῶι from their particular habit which was of linen; and were a branch of the Amonians, who, wherever they ſettled, were famous for this manufacture.

ARACHOTUS, a town of Aſia in Arachoſia, built on a lake of the ſame name by the famous Semiramis, who is ſaid to have given it the name of Cophes. This city, ſays captain Wilford, (ubi ſupra), was probably Coj-vara or Cojhar, Cojwar, and Cajhur, the Kodzar and Kozdar of Perſian authors; and literally the habitation of Coj, and by implication, the capital city of Coj. The river Arachotus, called alſo Choaſpes and Cophes, is now called Abeh-Tarnic, or the river Tarnic. It riſes in the hills north-eaſt of Gazni, and after having watered the whole valley of Arachoſia, loſes itſelf in a marſh about four miles to the ſouth of Candahar, which marſh was the Arachoſian marſh of the ancient geographers. The preſent river Arachotus is formed by a ſmall ſtream, which riſes a little above Mucur in this marſh, and hence it is often called the water of Mucur.

ARACHTHUS, a town of Ætolia, according to Ptolemy

ARACHTHUS, a river of Epirus, which ran into the gulf of AMBRACIA.

ARACHUS, in *Botany*. See ERVUM.

ARACIA, in *Ancient Geography*, an iſland of the Perſian gulf, ſituated on the Perſian ſide; and placed by Nearchus between the iſle of Caïcandros and the mountain Ochus.

ARACIANA, a town of Parthia, mentioned by Ptolemy.

ARACILLUM, an ancient town of Spain, taken and deſtroyed by Auguſtus.

ARACINTHUS, in *Entomology*, a ſpecies of PAPILIO (Hef. Urb. Linn.). The wings are rounded, entire, and brown; poſterior pair beneath grey, with white eye-ſhaped ſpots. Fabr. Sp. Inſ. This butterfly inhabits France, Germany, and Siberia: it is *Papilio morpheus* of Pallas, and *Papilio ſteropes* of Eſper.

ARACLEA, in *Geography*, a ſea-port town of European Turkey, in Romania, on the north-weſt coaſt of the ſea of Marmora, called by the Turks Erekli, 15 leagues weſt of Conſtantinople.

ARACNÆUS MONS, in *Ancient Geography*, a mountain of the Argolidæ, part of a chain which ſeparated the peninſula of Morea on the ſouth-eaſt. It lay to the north-weſt of Epidaurus.

ARACOUA, or ARAGHOVA, in *Geography*, a borough of Greece in Livadia, near the gulf of Lepanto; ſuppoſed to be the ancient *Ambriſſa*.

ARACUITES, a people of South America in Braſil, in the vicinity of the prefecturate of Pernambuco.

ARACUS, in *Botany*. See OROBUS.

ARACUS *Aromaticus*, in the *Materia Medica*, a name given by ſome authors to the *Vanilla* uſed in making chocolate.

ARACYNTHUS, in *Ancient Geography*, a mountain of Greece in Bœotia, whence, according to Steph. Byz. Minerva was denominated *Aracynthis*. Strabo places this mountain in Ætolia, and Pliny in Carmania.

ARAD, ARADUS, a town in an iſland of the ſame name on the coaſt of Phœnicia, over againſt Antaradus Strabo ſays that this town was built by the exiles of Sidon: and Joſephus informs us, that it had at firſt its own kings, in common with the other cities of Phœnicia; but, in progreſs of time, it was ſubdued by the Tyrians. After the Perſians took poſſeſſion of Phœnicia, the kings of Aradus were tributary to Perſia. Arrian ſays, that Strato, the ſon of Geroſtratus, obtained of Alexander the Great, for himſelf and his father, the eſtabliſhed poſſeſſion of this kingdom. It afterwards, as a part of Phœnicia, was ſubject to the Lagidæ, to whom Egypt was aſſigned under the ſucceſſors of Alexander. During the war carried on by Antiochus the Great againſt Ptolemy Philopator, the Aradians were governed by their own laws, and Antiochus did not moleſt this privilege: but they were deprived of it by Antiochus Epiphanes, who, on his return from Egypt, took their city, and ravaged the whole province. When Pompey made a conqueſt of Syria and Phœnicia, the Aradians became ſubject to the dominion of the Romans. The city of Arad, though it had no harbour in the iſland, became powerful at ſea by means of a port which it had on the continent at the mouth of the river Eleutherus. Its inhabitants deteſted piracy, and ſeparated from the Cilicians, who were addicted to it. Strabo, l. xvi. The iſland Aradus, the Arpad of the Scriptures, and the ſeat of the Arvadite or Aradite (ſee Gen. xi. 17.), is at preſent called *Rou-Wadde*: and this iſland, and alſo El-Hammah, the ancient Hamath, the ſeat of the Hamathite, lying over againſt it (Ezek. xlvii. 29.), ten leagues to the eaſtward, are the moſt northern ſettlements of the ſons of Canaan. The proſpect of Rou-wadde from the continent is very magnificent, and furniſhes at a diſtance a continued train of fine buildings and impregnable fortifications. But this is altogether owing to the height of its ſituation, and the rocks that abound in it. Its whole ſtrength and beauty, though it was called Rou-wadde, or Arpad, probably from the Hebrew רִיד, *firmus fuit*, conſiſts of a weak unfortified caſtle, defended by a few ſmall cannon. Formerly, however, it was ſurrounded by a ſtrong wall, conſtructed with ſtones of an immenſe ſize adapted to each other without cramps and mortar, ſo as to withſtand the violence of the ſea, and the battering engines of an enemy. In the time of its proſperity, art and nature had conſpired to render it a place of ſuch ſtrength and im-

portance, as ſufficiently to juſtify the boaſt, "Where is the king of Arpad?" (II Kings, xix. 13.) which Sennacherib made in the conqueſt of it. This iſland is now deſerted, nor has tradition retained the memory of a ſpring of freſh water in its vicinity, which the people of Arados are ſaid to have diſcovered at the bottom of the ſea; and from which they drew water in time of war, by means of a leaden bell and a leathern pipe fixed to its bottom.

ARAD, or *Arada*, a city of Paleſtine, ſituate in Arabia Petræa, ſouth of the tribe of Judah, and of the land of Canaan. The Iſraelites, in their progreſs towards Canaan, were oppoſed and defeated by the king of Arad; but as ſoon as they became maſters of Canaan, they deſtroyed all its cities. Numb, xxi. 1. ch. xxxiii. Arad was afterwards rebuilt; for Euſebius places it in the neighbourhood of Kades, four miles diſtant from Malethis, and twenty from Hebron. See ARED.

ARAD, in *Geography*, a town of Upper Hungary on the river Mariſch, twenty-four miles north of Temeſwar.

ARADA, in *Ornithology*, a name given by Buffon to the Gmelinian TURDUS *cantans*; which ſee.

ARADI, in *Geography*, a town of Aſiatic Turkey in the province of Natolia, ſixteen miles north-weſt of Kaſtamemi.

ARADIS, in *Ancient Geography*, the name of a town in the iſland of Sardinia, which, according to Dion, was taken by Menas.

ARADITA, an epiſcopal city of Africa, in the proconſular province.

ARADOS, in *Medicine*, ſignifies, according to Hippocrates, that perturbation which is excited in the ſtomach by concocting meats of different qualities. It alſo ſignifies any internal perturbation, occaſioned by purging medicines, vehement exerciſe, or other cauſes.

ARADRIPHE, in *Ancient Geography*, a town of Media according to Ptolemy.

ARADUCA, a town of Hiſpania Tarragonenſis.

ARADUCTA, a town of Luſitania, according to Ptolemy.

ARADUS. See ARAD.

ARADUS, an iſland of the Red Sea, mentioned by Steph. Byz.—Alſo, the name of an iſland in the Perſian gulf, mentioned by Euſtathius, and alſo by Strabo.

ARÆ. Athenæus mentions three iſlands of this name on the coaſt of Ionia. There are ſeveral places under this denomination, derived from the altars that were erected in them, on various occaſions and for different purpoſes.

ARÆ *Philænorum*. See PHILÆNI.

ARÆGENUS, a town of ancient Gaul, ſuppoſed by M. D'Anville to have been Bayeaux; formed of Bajocaſſos, whoſe capital was this city.

ARÆOMETER, formed of αραιος, *thin*, and μετρον, *meaſure*, an inſtrument wherewith to meaſure the denſity or gravity of fluids.

The invention of the aræometer has been commonly aſcribed to Hypatia, the daughter of Theo, about the end of the fourth century; but this account, ſays Salverte (Annales de Chemie, xxvii. 13.), is not accurate, if the poem, "de ponderibus et menſuris," annexed to the works of Priſcian, and written by Rhemnius Fannius Palæmon, be truly aſcribed to him. Rhemnius has given a perſpicuous and exact deſcription of aræometry; and he lived under Tiberius, Caligula, and Claudius Cæſar, three centuries before Hypatia; and he attributes the invention to Archimedes. However, if it be conſidered that valuable inventions are forgotten and diſcovered again during the lapſe of a ſhorter period than three centuries, Hypatia may be allowed the honour of a ſecond invention.

The aræometer, or water-poiſe, is uſually made of glaſs; conſiſting of a round hollow ball, which terminates in a long ſlender neck, hermetically ſealed at top; there being firſt as much running mercury put into it as will ſerve to balance or keep it ſwimming in an erect poſition.

The ſtem is divided into degrees (as repreſented *Plate* IX. *Pneumatics*, *fig.* 70.); and by the depth of its deſcent into any liquor, the lightneſs of that liquor is concluded; for that fluid in which it ſinks leaſt muſt be heavieſt; and that in which it ſinks loweſt, lighteſt.

M. Homberg has invented a new aræometer, deſcribed in Philoſ. Tranſact. N° 262. thus: *A* (*fig.* 71.) is a glaſs bottle or mattraſs, with ſo ſlender a neck, that a drop of water takes up in it about five or ſix lines, or half of an inch. Near that neck is a ſmall capillary tube *D*, about ſix inches long, and parallel to the neck.—To fill the veſſel, the liquor is poured in at the mouth *B* (which is widened to receive a tunnel), till it run out at *D*; that is, till it riſe in the neck to the mark *C*, by which means you have always the ſame quantity of liquor; and conſequently by means of the balance, can eaſily tell, when different liquors fill it, which weighs moſt, or is moſt intenſely heavy.

Some regard, however, is to be had in theſe trials to the ſeaſon of the year, and the degree of heat and cold in the weather; becauſe ſome liquors rarefy with heat, and condenſe with cold, more than others; and accordingly take up more or leſs room.

By means of this inſtrument, the ingenious author has made a table to ſhew the different weights of the ſame bulk of the moſt conſiderable chemical liquors, both in ſummer and winter, as follows:

The aræometer full of	Weighed in ſummer. oz. dr. gr.	In winter. oz. dr. gr.
Quickſilver,	11 00 06	11 00 32
Oil of tartar,	01 03 08	01 03 31
Spirit of urine,	01 00 32	01 00 43
Oil of vitriol,	01 03 58	01 04 03
Spirit of nitre,	01 01 40	01 01 70
——— ſalt,	01 00 39	01 00 47
Aquafortis,	01 01 38	01 01 55
Vinegar,	00 07 55	00 07 60
Spirit of wine,	00 06 47	00 06 61
River water,	00 07 53	00 07 57
Diſtilled water,	00 07 50	00 07 54

The inſtrument itſelf weighed, when empty, one dram twenty-eight grains. See HYDROMETER.

ARÆOPAGUS. See AREOPAGUS.

ARÆOSTYLE, ARÆOSTYLOS, in the *Ancient Architecture*, a ſort of intercolumniation, wherein the columns were placed at the diſtance of eight, or, as ſome ſay, ten modules from one another.

In the aræoſtyle, the columns were the wideſt and openeſt they were ever planted at; whence the name—from the Greek αραιος, *rarus*, and στυλος, *column*.

The aræoſtyle is chiefly uſed in the Tuſcan order, at the gates of great cities and fortreſſes.

ARÆOTICS, in *Medicine*, ſuch remedies as tend to open the pores of the ſkin, and render them large enough for the morbific matter's being carried off by ſweat, or inſenſible perſpiration.

To the claſs of aræotics belong diaphoretics, ſudorifics, &c.

ARÆTHUS, in *Ancient Geography*, the name of a river in Epirus.

ARAF, or AL-ARAF, in the *Mahometan Theology*. See AL-ARAF.

ARAFA. See CORBAN.

ARAFAT, in *Geography*, a mountain of Arabia, near Mecca, ſo called, as ſome ſay, becauſe Adam there met and knew his wife, after a ſeparation of 200 years: or, according to others, becauſe Gabriel, after he had inſtructed Abraham in all the ſacred ceremonies, coming to Arafat, there aſked him if he *knew* the ceremonies which had been ſhewn him; to which Abraham replying in the affirmative, the mountain thence had its name, and was called "the mountain of knowledge." To this mountain the Mahometan pilgrims proceed in a tumultuous manner on the ninth day of the month Dhulhajja, after morning prayer; and here they continue performing their devotions till after ſun ſet. When their devotion is finiſhed on this mountain, they depart to Mozdalifa, an oratory between Arafat and Mina, and there ſpend the night in prayer and reading the Koran.

ARAGON. See ARRAGON.

ARAGON, a town of Arabia, 100 miles E. S. E. of Sanaa.

ARAGUA, a town of South America, in the country of Terra Firma, and province of Cumana.

ARAGUAGUA, in *Ichthyology*, a name given by Marcgrave to a ſpecies of ſhark, ſince called by Linnæus SQUALUS PRISTIS, which ſee.

ARAGUS, in *Ancient Geography*, a river of Aſiatic Iberia, which, according to Strabo, joins the Cyrus; but Pliny calls it Alazon, and ſays that it deſcends from mount Caucaſus, ſeparates Iberia from Albania, and diſcharges itſelf into the Cyrus.

ARAHUM, or HARAHUM, in *Ancient Writers*, denotes a place conſecrated or ſet apart for holy purpoſes. Du-Cange.

Hence the phraſe, *in arabo jurare*, or *conjurare*, to make oath in the church; becauſe by the Ripuarian laws, all oaths were to be taken in the church on the relics of the ſaints.

ARAIA, FRANCINO, in *Biography*. See FRANCINO.

ARAIGNEE, in *Fortification*, ſometimes denotes a branch, return, or gallery of a mine.

ARAIRE, the name of a ſmall plough uſed in Provence and Languedoc, in France.

ARAL, in *Geography*, the name of a lake or ſea of Great Bucharia, in Independent Tartary, about 100 miles to the eaſt of the Caſpian ſea. It is about 200 miles long, and about 70 broad: and receives the river anciently called Jaxartes, and more recently the Sirr or Sihon, and the Oxus of antiquity, now called the Gihon. It is very probable that the Caſpian ſea and the Aral formerly conſtituted one lake, though they are now ſeparated by an elevated plane, occaſioned, perhaps, by the ſand rolled down by the Gihon, the Sirr, and other rivers which now flow into the ſea of Aral. The waters of this lake are ſaline, like thoſe of the Caſpian, and the fiſh found in both are of the ſame ſpecies. N. lat. 42° 45′ to 46° 40′. E. long. 57° 4′ to 61° 14′.

ARALIA, in *Botany*, *angelica tree*. Linn. gen. 386. Schreb. 525. Juſſ. 218. Claſs. *pentandria pentagynia*. Nat. Ord. *hederaceæ: araliæ*. Juſſ. Gen. Char. *Cal.* involucre very ſmall, of a globular umbellule. *Perianth.* five-toothed, very ſmall; ſuperior. *Cor.* petals five, ovate, acute, ſeſſile, reflex. *Stam.* filaments five, ſubulate, of the length of the corolla; anthers roundiſh. *Piſt.* germ roundiſh, inferior; ſtyles very ſhort, permanent; ſtigmas ſimple. *Per.* a berry roundiſh, ſtriated, crowned, five-celled. *Seeds* ſolitary, hard, oblong.

Eſſ. Gen. Char. Flowers in an umbellule, with an involucre; *Cal.* five-toothed, ſuperior. *Cor.* five-petalled. Berry five-ſeeded.

Species, 1. A. *ſpinoſa*; thorny aralia, or angelica-tree; angelica arboreſcens, &c. Comm. hort. 1. t. 47. chriſtophoriana, &c. Pluk. phyt. t. 20. Sp. char. arboreſcent. Stem and leaves prickly. This riſes with a woody ſtem to the height of eight or ten feet, dividing into ſeveral branches, with branching leaves, compoſed of many divaricating wings. The ribs of the leaves, as alſo the branches and ſtem, are armed with ſtrong crooked ſpines, rendering the place where the plants grow in plenty, very difficult to paſs through. The flowers are produced in large looſe umbels, at the extremities of the branches, and are of an herbaceous colour. The berry is three-cornered and three-celled. A native of Virginia, whence it was ſent to England in 1688, and cultivated by biſhop Compton at Fulham. 2. A. *pentaphylla*; five-leaved aralia; arboreous, prickly; leaves quinate. The branches of this tree are prickly, round, flexuoſe, aſh-coloured; prickles axillary, ſolitary, horizontal; leaves petioled, from one bud, to three, four, or more; leaflets ovate-acute, ſerrate at top, ſmooth; flowers in umbels, which are peduncled; ſtamens longer than the corolla. A native of Japan. 3. A. *chinenſis*; Chineſe aralia; frutex aquoſus mas, Rumph. amb. 4. t. 44. Nalugu, Rheed. mal. 2. t. 26. ſhrubby; ſtem and petioles prickly; leaflets unarmed, villoſe; ſtem ſimple, cloſely beſet with prickles; leaves confined to the top of the plant, on three-parted prickly villoſe petioles; partial leaves pinnate; leaflets ovate-ſerrate, villoſe, large; panicle branching, with numerous umbellules. It was found in China by Oſbeck, alſo in Cochin-China by Loureiro. It is a native of Malabar, and of Amboina; but Rumphius ſpeaks of it as a large tree growing in the woods; whereas Loureiro deſcribes it in Cochin-China as procumbent or ſcandent. See his Fl. Cochin. 187. 4. A. *japonica*; Japaneſe aralia; Kæmp. ic. ſel. t. 10.; ſhrubby, leaves lobate: ſtem unarmed, upright, ſix feet high; leaves towards the top cloſe, alternate, petioled, ſeven-lobed, young leaves five-lobed; bractes many, involving the whole panicle of flowers, which are terminal in compound panicles, with alternate umbelled peduncles; umbels ſimple; no involucre. A native of Japan. 5. A. *racemoſa*; berry-bearing aralia; ſtem leafy, herbaceous, ſmooth. This grows three or four feet high, dividing into many irregular branches; leaves ramoſe, alternate; peduncles axillary, terminated by round umbels of ſmall four-leaved flowers, of a whitiſh colour, ſucceeded by round channelled berries. A native of Canada, where the berries are eaten, and the leaves and roots uſed as ſallads and pot-herbs, by the Indians and French. 6. A. *nudicaulis*; naked-ſtalked aralia; ſtem naked; leaves in pairs, ternate; ſtem ſo very ſhort, as to ſcarcely deſerve the name: leaves decompound; leaflets pinnate, with five ſerrate pinnas; ſcape long, ſupporting about three umbellules, in ſhape and colour like thoſe of the preceding ſpecies. This, and alſo the fifth ſort, were cultivated by Miller in 1731. It is a native of Canada and Virginia. See Pluk. alm. 98. t. 238. f. 5. The roots of this plant have been ſold for thoſe of ſarſaparilla, and are ſtill uſed as ſuch by ſome of the inhabitants of Canada, though very different from the true ſarſaparilla. 7. A. *cordata*; heart-leaved aralia; herbaceous; ſtem angular, unarmed; leaves ſimple, heart-ſhaped: ſtem ſuffruticoſe, aſcending, villoſe, branching but little; leaves alternate, petioled, ovate-acute, toothed, rough on both ſides; pale and ribbed beneath, unequal; flowers axillary, umbelled; peduncles trichotomous. A native of Japan. 8. A. *octophylla*; digitate-leaved aralia; ſtem arboreous, unarmed; leaves digitate, with eight leaflets; panicle umbelled. A tree, ten feet high; leaves on long footſtalks; leaflets oblong, obtuſe, entire, ſmooth, unequal, diſpoſed in a ring; flowers yellow, ſprinkled with red, in a vaſt terminating panicle, ending in umbels; no involucre; calyx truncate; petals oblong ſpreading.

ſpreading. It is a native of Cochin-China, where it is alſo cultivated, and uſed as a medicine in dropſies. Near Canton there is a ſpecies or variety of aralia with ten ſtamens, and a ten cleft ſtigma. 9. *A. palmata*; palmate-leaved arabo; ſtem ſcandent, prickly; leaves five-lobed; umbels ſimple, lateral: ſtem ſhrubby; leaves large, ſcattered, on long foot-ſtalks; flower white, without an involucre; petioles and pedunicles unarmed; prickles on the ſtem, ſcattered, bowed back. A native of China. The bark of this is alſo uſed in dropſies, and in cutaneous diſorders. Poſſibly ſome of the above ſpecies may, on more accurate examination, be found to belong more properly to the genus HEDERA, which ſeems nearly allied to the aralia.

Propagation and Culture. The firſt ſort is propagated by ſeeds, which are eaſily procured from North America, and which ſhould be ſown in pots filled with light earth, and placed in a ſhady ſituation till autumn, when the pots ſhould either be plunged into an old bed of tan, or planted in a warm border, ſheltered by a hedge or wall; and if the winter prove ſevere, it will be proper to cover the pots with ſtraw or peas-haulm, to prevent the froſt from penetrating deep into the ground. In March the pots ſhould be plunged into a temperate hot-bed, which will bring up the plants early, ſo that they will have more time to get ſtrength before the following winter. The pots ſhould be conſtantly kept clean from weeds, and when the plants come up, they ought to be frequently refreſhed with water; in May they ſhould be inured to the open air; and when they are removed out of the bed they ought to have a ſhady ſituation. In mild weather theſe plants ſhould be always expoſed to the open air; but great care muſt be taken to guard them againſt froſt; therefore the frames under which they ought again to be placed in October, are to be conſtantly opened when the weather is not ſevere. In the ſpring, before the plants begin to puſh, they ſhould be carefully ſhaken out of the pots and ſeparated; part of them ſhould be planted ſingly in ſmall pots, and the other may be planted in a bed of light earth, in a warm ſituation. If thoſe which are planted in ſmall pots, be placed in a moderate hot-bed, it will greatly forward their growth; but they muſt be early inured to bear the open air, otherwiſe they will draw up weak. In the following ſummer, they muſt have a ſhady ſituation, and next winter ſheltered again; the ſpring following they may be ſhaken out of the pots, and planted where they are deſigned to remain. Thoſe plants which were planted in the beds will require protection from the froſt the firſt winter; but if the ſurface of the ground be covered with old tanner's bark, it will prevent the froſt from penetrating to the roots; and in hard froſts ſome ſtraw, peas-haulm, or any light covering, will ſecure the ſtems from being injured; and after they have remained in the beds two years, they will be ſtrong enough to be tranſplanted in the places where they are intended to grow. This plant may be alſo propagated by its roots. The fifth and ſixth ſpecies are hardly enough to be propagated with very little trouble. Their ſeeds ſhould be ſown in autumn. See Miller's Dict. by Martyn.

ARALIA *arborea & capitata.* See HEDERA.

ARALIA, in *Ancient Law Writers*, denotes arable, or ploughing lands.

This is otherwiſe denominated *aratoria, araturia.*

In Domeſday for Eſſex, we meet with *decem acras prati, duos runcal. quatuor aralia*—Where *aralia* ſeems to denote land fit for ploughing and tillage, by way of contradiſtinction to *runcalia*, which was over-run with briars and thorns. Du-Cange.

ARALIASTRUM, in *Botany.* See PANAX.

ARALUCUS, in *Ancient Geography*, a place of Gallia Narbonenſis, north-north-eaſt of Forum Julii. Venus had in this place a temple, which was deſtroyed in the year 427.

ARAM, a name given in ſcripture to Syria, from Aram the fifth ſon of Shem, by whoſe deſcendants, called Aramæans, Syria was peopled.

ARAM, a town of Judæa, in the half tribe of Manaſſeh, on the other ſide of Jordan.

ARAM, in *Geography*, a town of Arabia, 38 miles N. E. of Chamir.

ARAM *Beth-Rehob*, that part of Syria which lay N. of Paleſtine, and was the territory of the city of Beth-Rehob, belonging to the tribe of Aſher.

ARAM *Damaſk.* or Syria Damaſcena, a principal and moſt powerful part of Syria, of which Damaſcus was the capital.

ARAM-*Maacha*, a diſtrict of Syria at the foot of mount Hermon, on the borders of the half tribe of Manaſſeh, on the other ſide of Jordan, called the coaſt of Maachathi.

ARAM *Naharaim*, or Syria of the rivers, or Meſopotamia, ſituate between the Euphrates and Tigris, whence the name.

ARAM-*Zoba*, a country of Syria, near the Euphrates, conquered by David, and afterwards the ſite of Palmyra; bounded on the E. by the Euphrates, and on the W. by the land of Canaan and Syria Damaſcena.

ARAMACA, in *Ichthyology*, a name given by ſome naturaliſts to the ſpecies of PLEURONECTES, called by Linnæus maculatus. Vide Ruyſch. theatr. anim. Marcgrave, &c.

ARAMAGARA, in *Ancient Geography*, a town of India, on this ſide of the Ganges, according to Ptolemy.

ARAMASCHEVA, in *Geography*, a town of Siberia, 30 leagues S. of Tobolſk.

ARAMATHA, in *Ancient Geography*, a metropolitan city of the Ammonites, according to Joſephus.

ARAMAVA, the name of a town of Arabia Felix, according to Ptolemy.

ARAMBYS, the name of the five factories eſtabliſhed by Hannon, the Carthaginian admiral, on the weſtern coaſt of Africa, between the river Lixus and the promontory of Solöe.

ARAMEI, ARAMÆANS, a name given by the Jewiſh lawgiver Moſes, to the inhabitants of Syria and Meſopotamia. See ARAM. Pliny places a people of this appellation among the Scythians.

ARAMITS, in *Geography*, a town of France, in the department of the Lower Pyrenées, and chief place of a canton in the diſtrict of Oleron, on the Vert, ſeven miles S. W. of Oleron. The place contains 1050 and the canton 5,883 inhabitants: the territory includes 262½ kiliometres, and 6 communes.

ARAMO, a town and fortreſs of South America, in the kingdom of Chili, near the Pacific Ocean.

ARAMONT, a town of France, in the department of the Gard, and chief place of a canton in the diſtrict of Nimes, on the weſt ſide of the Rhone; 8 miles below Avignon. The place contains 2200 and the canton 10,577 inhabitants: the territory comprehends 120 kiliometres, and 10 communes.

ARAMPO, or MAN-EATER, in *Zoology*, a name given by the negroes on the gold coaſt of Africa, to a long ſlender animal, in ſhape reſembling a weaſel, with a long tail, and large bruſh at its extremity, of a pale brown colour, and long thin hair. It is ſo called becauſe it digs up graves, and is eager for human fleſh. See ADIVE.

ARAMROY, in *Geography*, one of the principal ports of the diſtrict inhabited by a piratical tribe named Sangarians, and ſituated on the ſouth coaſt of the gulph of CUTCH, between the mouth of the river Indus or Sinde, and the river Puddar.

ARAN, a town of Perſia, in the province of Irak, 35 leagues north of Iſpahan.

ARANAS,

ARANAS, a town of Sweden, in the province of Weſt Gothland. Alſo, a river of Spain, which runs into the Agra, one league below Pampeluna.

ARANCE, a town of France, in the department of the Ain, and chief place of a canton in the diſtrict of St. Rambert; 8 miles E. of Ambronay.

ARANDA, a town of Spain, in Arragon, 19 miles N. W. of Calalaiud.

Aranda *de Duero*, a ſmall town of Spain, in Old Caſtile, on the Ducro; 30 leagues north of Madrid, and 11 ſouth of Burgos.

ARANDON, a town of France, in the department of the Iſere, and chief place of a canton in the diſtrict of la Tour du Pin, 10 miles S. of St. Sorian.

ARANE, in *Ancient Geography*, a town of the Leſſer Armenia, according to Ptolemy.

ARANEA, in *Entomology*, a genus of apterous inſects, well known by the common Engliſh name, Spider. The mouth is furniſhed with ſhort horny jaws; lip rounded at the apex; feelers two, incurved, jointed, very acute at the tip, clubbed, with the genitalia in the male; no antennæ; eyes eight, or rarely ſix; feet eight; anus furniſhed with papillæ, or teats for ſpinning. Gmel. Linn. &c.

Schæffer adds to the Linnæan character, that the feet are made for running; the head united to the thorax and the abdomen, which is of an oval form, and joined to the thorax by a ſhort pedicle or ſtalk. He divides them into different families, according to the various ſituations of the eyes, in which he followed Friſch, Geoffroy, and others. The eyes of ſpiders are immoveable, and their ſtructure is different from thoſe of moſt other inſects; conſiſting each of only one lens, which deprives them of the faculty of multiplying objects, as their immobility does that of ſeeing them if placed otherwiſe than exactly before either of them. Geoffroy had obſerved before, that all ſpiders have eight eyes, and that the eye at each extremity of the line, in the ſpecies which Linnæus believed to have only ſix, is double.

Fabricius and Gmelin have attended, in the ſubdiviſions of the genus, very carefully to the ſituation of the eyes, which differs greatly in different ſpecies: in ſome, for example, they form a quadrangle on the back of the head, two looking in front, two behind, and two on each ſide; the diſpoſition of them in the ſpecies globoſa is altogether different; five of them form a ſemicircle in front, and three lie parallel to each other behind; in argentata, the order is preciſely reverſed, three parallel eyes are in front, and the ſemicircle of five are behind them; in extenſa, they form two parallel lines acroſs, of four eyes each; again, in pulchra, two are in front, and ſix in a tranſverſe ſtreak; three of which incline to one ſide, and three to the other; in goezii, they form two ſomewhat oblique longitudinal ſtreaks, having four eyes in each; in avicularia, four are contiguous in the centre, and form a quadrangle, and the four others are diſpoſed in the ſame order, one at each angle; in conica, according to Gmelin, are two more than uſual; three being placed in front, three behind, and two on each ſide; and in albifrons, all the eyes are diſpoſed in one line, which bends a little in the middle.

The ſpecies are numerous; Gmelin deſcribes the following: faſciata, diadema, marmorea, reticulata, cucurbitina, calycina, octopunctata, bipunctata, arundinacea, angulata, riparia, labyrinthica, quadrilineta, redemita, corollata, montana, ſanguinolenta, nigra, notata, rufipes, nocturna, ſexpunctata, carnifex, flaviſſima, bimaculata, quadri punctata, militaris, truncorum, rupeſtris, aquatica, paluſtris, triguttata, ſcorpiformis, vireſcens, fornicata, hexacantha, tetracantha, aculeata, ſpinoſa, ſpinipes, fuſcata, opilionoides, Oſbeckii, Wilkii, ſpecioſa, horrida, latro, domeſtica, trilineata, dorſata, impreſſa, viatica, laevipes, tricuſpidata, globoſa, argentata, fumigata, clavipes, faccata, extenſa, lobata, longimana, cancriformis, nidulans, latens, fignata, mactans, nigrita, cornuta, fimbriata, dorſalis, tarantula, cinerea, pubeſcens, fulvata, ſcenica, pulchra, goezii, avicularia, truncata, conica, albifrons, myops, longipes, ſcrofa, ſenoculata, ſcopulorum, luca, bicornis caſpia, argentea, holoſericea, ſpinimobilis, cruentata, hirtipes, venatoria, ocellata, tribullus, alba. Which ſee reſpectively.

Spiders have uſually five teats or nipples at the extremity of the abdomen, whoſe apertures they can enlarge or contract at pleaſure. It is through theſe apertures that they ſpin a gluey ſubſtance, with which their bellies are full. They fix the end of their threads by applying theſe nipples to any ſubſtance, and the threads lengthen as the animal recedes from it. They can ſtop the iſſuing of the threads by contracting the nipples, and re-aſcend by means of the claws on their feet, much in the ſame manner as men warp up a rope. When the common houſe-ſpider begins her web, ſhe generally chooſes a place where there is a cavity, ſuch as the corner of a room, that ſhe may have a free paſſage on each ſide, to make her eſcape in caſe of danger. Then ſhe fixes one end of her thread to the wall, and paſſes on to the other ſide, dragging the thread along with her, (or rather the thread follows her as ſhe proceeds), till ſhe arrives at the other ſide, and there fixes the other end of it. Thus ſhe paſſes and repaſſes, till ſhe has made as many parallel threads as ſhe thinks neceſſary for the purpoſe. After this, ſhe begins again, and croſſes theſe by other parallel threads. Theſe are the toils or ſnares which ſhe prepares for entangling flies, and other ſmall inſects. But beſides this large web, ſhe generally weaves a ſmall cell for herſelf, where ſhe lies concealed, watching for her prey. Betwixt this cell and the large web ſhe has a bridge of threads, which, by communicating with the threads of the large one, both give her early intelligence when any thing touches the web, and enables her to paſs quickly in order to lay hold of it. There are many other methods of weaving, peculiar to different ſpecies of ſpiders, and ſome that deſerve particular notice. Aranea venatoria forms a large cylindrical web under ground, with a lid connected by a kind of hinge, which ſhe can open or ſhut at pleaſure; ſhe watches for her prey at the entrance of her den, which is level with the ſurface of the ground, and at the leaſt approach of danger retreats into it and ſhuts the lid, by which means ſhe is completely ſecure; this is a native of the hotter parts of South America. An European ſpecies, labyrinthica, ſpins an horizontal web on the ground, with a cylindrical cavity below the ſurface, in which ſhe watches her prey: marmorea ſpins on the ground nearly in the ſame manner: ſome live in trees, and ſpin long perpendicular webs, as angulata: latens, horrida, and others, ſpin little webs on the underſide of the leaves of plants: and one kind, calycina, will ſecrete itſelf in the calyx of a flower, after the corolla has fallen off, and faſten on flies and other inſects that may come to extract its juices.

The darting of long threads, by means of which ſome ſpecies alſo can convey themſelves to a vaſt diſtance, is remarkable; and ſome have aſſerted, on that account, that ſpiders have the power of flight; though unqueſtionably no one will believe that a ſpider can have wings, as it could no longer be an apterous inſect. Dr. Liſter ſays, that attending cloſely to a ſpider weaving a net, he obſerved it ſuddenly to deſiſt in the mid-work; and turning its tail to the wind, it darted out a thread with the violence and ſtream with which we ſee water ſpout out of a jet; this thread taken up by the wind

wind was immediately carried to ſome fathoms length, ſtill iſſuing out of the belly of the animal. Some time after, the ſpider leaped into the air, and the thread mounted her up ſwiftly. Upon this diſcovery, he made the ſame obſervation on near thirty different ſorts of ſpiders, and found the air filled with young and old, ſailing on their threads, and doubtleſs ſeizing gnats and other inſects in their paſſage, there being often manifeſt ſigns of ſlaughter, legs and wings of flies, &c. on theſe threads, as well as in their webs below. Dr. Huiſe made the like diſcovery about the ſame time.

Dr. Liſter thinks there is a fair hint of the darting of ſpiders, in Ariſtotle, Hiſt. An. lib. ix. cap. 39.; and in Pliny, lib. x. cap. 74. But with regard to their ſailing the ancients are ſilent, and he thinks it was firſt ſeen by him. He alſo obſerves of thoſe ſailing ſpiders, that they will often dart, not a ſingle thread only, but a whole ſheaf at once, conſiſting of many filaments, yet all of one length, all divided each from the other, and diſtinct, until ſome chance either ſnap them off, or entangle them: but for the moſt part it may be obſerved, that the longer they become the more they ſpread, and appear like the numerous rays of a blazing ſtar. As for that which carries them away in the air ſo ſwiftly, it is partly their ſudden leap, partly the length and number of the threads projected, and partly the poſture and management of their feet. Dr. Liſter obſerved ſome ſorts to uſe their legs, very like wings or oars; theſe being ſometimes cloſe joined, at others opened, and again bent and extended as neceſſity required. To fly they cannot be ſtrictly ſaid, becauſe they are carried into the air by external force; but they can, when the wind will ſuffer them, ſteer their courſe, and perhaps mount or deſcend at pleaſure; and in rowing themſelves along the air, it is obſervable that they ever take their flight backwards. It is ſcarcely credible to what height they will mount; which yet is preciſely true, and may be eaſily obſerved by any one that ſhall fix his eye ſome time on any part of the heavens, the white webs at a vaſt diſtance very diſtinctly appearing from the azure ſky; but this is in autumn only, and in very fair and calm weather. Such are briefly the remarks of Dr. Liſter, to which may be added part of his letter to Mr. Ray on the ſame ſubject: "Laſt October, &c. I took notice that the air was very full of webs; I forthwith mounted to the top of the higheſt ſteeple on the Minſter (in York), and could there diſcern them exceeding high above me." He further obſerves, that they not only thus ſhoot their threads upward, and mount with them in a line almoſt perpendicularly; they alſo project them in a line parallel to the horizon, as may be ſeen by their threads running from one wall to another in a houſe, or from one tree to another in a field, and even from wall to wall acroſs gardens of conſiderable extent.

The matter of which the ſpider's web is formed, as before obſerved, is a viſcid juice prepared in the body of the creature, and emitted from the teats at the extremity of the abdomen. The apertures in theſe are numerous, and according to Reaumur, there are enough even in the compaſs of a pin's head to yield an amazing number of diſtinct threads. The holes are perceived by their effects: take a garden ſpider ready to lay its eggs, and apply the finger on a part of the papillæ, and as you withdraw the finger a vaſt number of diſtinct threads will appear. Reaumur has often counted ſeventy or eighty with a microſcope; but has perceived that there were infinitely more than he could tell. In effect, if he ſhould ſay that each tip of a papilla furniſhed a thouſand, he is perſuaded he would ſay much too little. The part is divided into an infinity of little prominences, like the eyes of a butterfly. Each prominence, no doubt, makes its ſeveral threads; or rather between its ſeveral protuberances, there are holes that give vent to threads; the uſe of the protuberances, in all probability, being to keep the threads aſunder, at their firſt exit before they are yet hardened by the air. In ſome ſpiders theſe protuberances are not ſo ſenſible; but in lieu thereof there are tufts of hairs which may ſerve the ſame purpoſe, viz. to keep the threads at a proper diſtance from each other. Be this as it will, there may threads come out at above a thouſand different places in every papilla; conſequently the ſpider having five papillæ, has holes for above five thouſand threads.

Such is the tenuity of the threads in the larger ſort of ſpiders. But if we examine the young produced by thoſe, we ſhall find that they no ſooner quit their egg than they begin to ſpin. Indeed their threads can ſcarcely be perceived, but the webs may: they are frequently as thick and cloſe as thoſe of the houſe-ſpiders; and no wonder, there being four or five hundred little ſpiders concurring to the ſame work. How minute muſt the apertures in the papillæ of theſe ſpiders be! The whole ſpider is perhaps leſs than a papilla of the parent which produced it. But there are even ſome kinds of ſpiders ſo ſmall at their birth, that they are not viſible without a microſcope. There are uſually found an infinity of theſe in a cluſter: they only appear like a number of red points; and yet there are webs found under them, though well nigh imperceptible. What muſt be the tenuity of one of theſe threads? Leeuwenhoek has computed that one hundred of the ſingle threads of a full grown ſpider are not equal to the diameter of the hair of his beard; and conſequently, if the threads and hair be both round, ten thouſand ſuch threads are not bigger than ſuch a hair. He calculates further, that when young ſpiders firſt begin to ſpin, four hundred of them are not larger than one which is of a full growth; allowing which, four millions of a young ſpider's thread are not ſo thick as the ſingle hair of a man's beard.

Some experiments have been made to manufacture the threads of ſpiders into a kind of ſilk; and it is ſaid that a *ſhort-legged* ſpecies of garden-ſpider yields a ſilk ſcarcely inferior to that of the ſilk-worm. The webs of ſome foreign ſpecies might even be employed with ſtill greater propriety for this purpoſe, than thoſe which inhabit Europe. A later writer, Sir G. Staunton, in "the Embaſſy to China," alludes to this when ſpeaking of the Java foreſts. "In ſome open ſpots (ſays that author) were found webs of ſpiders, woven with threads of ſo ſtrong a texture, as not eaſily to be divided without a cutting inſtrument; they ſeemed to render feaſible the idea of him who, in the ſouthern provinces of Europe, propoſed a manufactory of ſpiders' threads, which was ſo ridiculous to the eyes of thoſe who have only viewed the flimſy webs ſuch inſects ſpin in England."

M. Bon, of Languedoc, about ſeventy years ago, contrived to manufacture a pair of ſtockings and mittens from the ſilk of the ſpider already mentioned: they were of a beautiful natural grey colour, and were almoſt as ſtrong as thoſe of common ſilk; and he publiſhed a diſſertation concerning his diſcovery. M. Reaumur being appointed by the Royal Academy to make farther inquiry into this new ſilk-work, raiſed ſeveral objections and difficulties againſt it, which appeared in the Memoirs of the Academy for the year 1710. His arguments againſt it are chiefly theſe: the natural fierceneſs of the ſpiders renders them unfit to be bred and kept together. Four or five thouſand being diſtributed into cells, fifty in ſome, one or two hundred in others, the big ones ſoon killed and eat thoſe which were leaſt, ſo that in a ſhort time there were ſcarcely above one

or

or two left in each cell; and to this inclination of devouring their own ſpecies in common with any other inſect they can overcome, Reaumur aſcribes the ſcarcity of ſpiders, conſidering the vaſt number of eggs they lay.

But this is not all; he affirms, and it is well known ſince, that the ſpider's bag is inferior to that of the ſilk-worm, both in ſtrength and luſtre, and produces leſs of the material proper to be manufactured. The thread of the ſpider's web, he ſays, can only bear a weight of two grains without breaking; and that of the bag bears thirty-ſix. The latter therefore, in all probability, is eighteen times thicker than the former; yet it is weaker than that of the ſilk-worm, which bears a weight of two drams and an half. So that five threads of the ſpider's bag muſt be put together to equal one thread of the ſilk-worm's bag. Now it is impoſſible theſe ſhould be applied ſo juſtly over one another as not to leave little vacant ſpaces between them, whence the light will not be reflected; and of conſequence, a thread thus compounded muſt fall ſhort of the luſtre of a ſolid thread. Add to this, that the ſpider's thread cannot be wound off as that of the ſilk-worm may, but muſt of neceſſity be carded; by which means being torn in pieces, its evenneſs, which contributes to its luſtre, is deſtroyed. In effect, this want of luſtre was taken notice of by M. de la Hire, when the ſtockings were preſented to the Academy. Again, ſpiders furniſh much leſs ſilk than the worms: the largeſt bags of theſe latter weigh four grains, the ſmaller three grains; ſo that 2304 worms produce a pound of ſilk. The ſpiders' bags do not weigh above one grain; and when cleared of their duſt and filth, loſe two-thirds of that weight. The work of twelve ſpiders, therefore, only equals that of one ſilk-worm; and a pound of ſilk will require at leaſt 27,648 ſpiders. But as the bags are wholly the work of the females, who ſpin them to depoſit their eggs in, there muſt be kept 55,296 ſpiders to yield a pound of ſilk: yet this will only hold good of the beſt ſpiders; thoſe large ones ordinarily found in gardens, &c. ſcarcely yielding a twelfth part of the ſilk of the others. Two hundred and eighty, it ſeems, of theſe would not yield more than one ſilk-worm; 663,552 of them would ſcarcely yield a pound.

The act of generation among ſpiders varies in different ſpecies. As theſe inſects prey upon each other, except during the time of their amours, they dare not come within reach of one another but with the utmoſt caution. They may be ſometimes ſeen ſtretching out their legs, ſhaking the web, and tampering with each other by a ſlight touch with the extremity of their feet; then, in a fright, dropping haſtily down their thread, and returning in a few moments to make a freſh trial by feeling. When once both parties are well aſſured of the ſex they have to deal with, the approaches of their feet in order to feel are more frequent, confidence takes place, and amorous dalliance enſues. "We cannot," ſays Lyonnet, "but admire how careful they are not to give themſelves up blindly to a paſſion, or venture on an imprudent ſtep, that might become fatal to them." A caveat this to the human kind. Liſter and Lyonnet, two accurate obſervers, ſay, that the extremity of thoſe arms or claws, which the ſpider uſes to graſp his prey with, ſuddenly opens, as it were by a ſpring, and lets out a white body, the ſexual organs in the male; thoſe of the female are beneath the abdomen; a fact which later naturaliſts have aſcertained.

Theſe diſguſting animals, in every ſtage of their exiſtence, prey with the moſt ſavage ferocity upon all inſects they can overcome, and alſo upon one another, as already obſerved. They caſt their ſkins once in a year, and this they perform by ſuſpending themſelves in ſome corner, and creeping out of it. In reſpect of colour, they vary greatly in individuals of the ſame ſpecies. The ſphex and ichneumon are their mortal enemies.

The weapon wherewith the ſpiders ſeize and kill their prey is a pair of ſharp crooked claws, or forceps, placed in the fore-part of the head. They can open or extend theſe pincers as occaſion may require; when undiſturbed, they ſuffer theſe to lie one upon another. Leeuwenhoek ſays, that each of theſe claws has a ſmall aperture, or ſlit, through which he ſuppoſes a poiſonous juice is injected into the wound it makes. Dr. Mead, in his Eſſay on Poiſons, diſſents from this opinion altogether, having never been able, on repeated examinations, to diſcover any ſuch opening, not even in the claws of the largeſt ſpiders; which being above fifty times larger than any of the European ſpiders, would have more eaſily afforded a view of the opening, if nature had allotted any to this part of the animal. Beſides, repeated obſervations alſo convinced him that nothing dropped out of the claws of the living ſpider when he bit any thing, becauſe they were always perfectly dry; but that a *ſhort proboſcis* was at the ſame time thruſt out of the mouth, which inſtilled a liquor into the wound. And the ſame writer obſerves, that the quantity of liquor emitted by the common ſpiders when they kill their prey is viſibly ſo great, and theſe wounding inſtruments (the claws) ſo minute, that they could contain but a very inconſiderable portion thereof, if it were to be diſcharged through them. In juſtice to this remark of Dr. Mead, it may be added, that though there is an apparent groove or indentation viſible on theſe fangs, in ſome very gigantic ſpecies, they do not appear to be perforated; and in general they are ſmooth without even this apparent indent. The form of the fang may be compared in ſome reſpects to thoſe of a poiſonous ſnake: the latter, beſide the aperture at the baſe, has a linear opening near the tip; and through this, and perhaps the other alſo, it diſcharges a mortally poiſonous fluid into the wound it inflicts, in the ſame manner as the ſpider is ſuppoſed to do: now, in ſome great ſpiders, theſe fangs are nearly, if not quite, as large as thoſe of a rattleſnake of a moderate ſize; and yet, in ſuch, this aperture, if it does really exiſt, is not only inviſible to the naked eye, at the ſame time that they are ſufficiently obvious in the fang of the ſnake, but appears even doubtful under the deepeſt glaſſes with which the claw can be examined. There is, as before ſaid, a kind of grooved indent in the claws of ſome ſpecies; but whether they anſwer the above purpoſe, or are even perforated, is a point on which the naturaliſt muſt decide with caution.

The ſkins that have been ſhed, and are found in the webs, being dry and tranſparent, have alſo the claws attached to them; and theſe may be more eaſily examined than in the living ſpider.

ARANEA, in *Mineralogy*, a ſilver ore found only in the mines of Potoſi, or in the ſingle mine there of Catamito. It owes its name to ſome reſemblance it bears to a cobweb, being compoſed of threads of pure ſilver, which to the ſight appear like a ſilver lace when burned to ſeparate the ſilk from it. It is the richeſt of all kinds of ſilver ore.

ARANEA *Tunica*. See ARACHNOIDES.

ARANEIFORMIS, in *Entomology*, a ſpecies of CERAMBYX. The thorax is ſpinous and tuberculated; wing-caſes porous; antennæ long, with a ſingle tooth on the fifth joint. Fabr. Spec. Inſ. *Obſ.* Gmelin miſquotes the Fabrician character, "articulo quinto unidentato," for "articulo quinto barbato," p. 1819. This inſect inhabits South America.

ARANEIFORMIS, in *Natural Hiſtory*, a ſpecies of ECHINUS. It is orbicular, grey, with ſhining greyiſh-purple ſpines,

ſpines, which are thickeſt in the middle. This is *Echinometra multipes ſ. ſpinoſiſſima Americana* of Seba; and *Spinekopf*. Pnelf. Zee-egel. Inhabits the American ſeas. Gmelin.

ARANEOIDES, in *Entomology*, a ſpecies of CIMEX, in the ſection "oblongus." It is yellow, with very long legs, and inhabits Germany. Schæff. Gmelin.

ARANEUS, a ſpecies of CANCER, found in the European ſeas. The thorax is ovate, tuberculated, and hairy; front bifid; claws ovated. Linn. Fabr. Gmel.

ARANGAS, in *Ancient Geography*, a mountain placed by Ptolemy in the interior Libya.

ARANGHERA, in *Geography*, one of the Biſſagos iſlands in the Atlantic, at the mouth of the river Grande, near the coaſt of Africa.

ARANIMEGIES, a ſmall but beautiful town of Hungary, in the country of Zatmar, ſituate in the middle of a plain between the rivers Samos and Tur; three leagues north-eaſt of Zatmar.

ARANIOS, a river of Tranſylvania, which riſes near Clauſemburg, and joins the Mariſch.

ARANJUEZ, a village and royal palace of Spain, in New Caſtile, ſituate on the Tagus, ſix leagues north-eaſt of Toledo, and ten ſouth of Madrid.

ARANJUEZ, a town of South America, in Mexico, in the province of Coſta Rica.

ARANNOS, a town of Spain, in Navarre, three leagues from St. Eſtevan.

ARANTA, a ſea-port town of South America, in Peru, and juriſdiction of Arequipa, with a deep harbour and narrow entrance; ten leagues ſouth-weſt of Arequipa.

ARANTIA, in *Ancient Geography*, a country of Peloponneſus, according to Pauſanias; and alſo a town of the ſame country, ſituate on a hill, called "Arantinus Collis."

ARANTIUS, JULIUS CÆSAR, in *Biography*, a celebrated anatomiſt and phyſician, born at Bologna, about the year 1530; ſtudied under his uncle Bartholomew Maggius, and under Veſalius; and took his degree of Doctor in Medicine, and was afterwards made profeſſor of medicine, anatomy, and ſurgery, in the ſame univerſity; in which ſituation he continued to the time of his death, in 1589. He was indefatigable in his reſearches into the ſtructure of the human body, which he took every opportunity of diſſecting and examining. In his firſt work, "De humano fœtu," publiſhed at Rome, in 1564, he corrected many miſtakes of former anatomiſts, in their deſcription of the uterus, which they had generally taken from brutes. He properly deſcribes the veſſels of the uterus as derived from the ſpermatics and hypogaſtrics. He deſcribed the foramen ovale, and ductus anterioſus in the fœtus; and denies the exiſtence of urachus, or of allantoid membrane, in the human ſubject. This book has been frequently republiſhed. In 1579, he publiſhed "In Hippocratem de vulneribus capitis brevis commentarius;" and in 1581, "De tumoribus præter naturam liber," 4to.; in which he deſcribes a pair of forceps he had contrived to extract polypi from the noſtrils. He ſhewed there was no paſſage from the right to the left ventricle of the heart, but that the blood was carried from the heart, through the lungs, by the pulmonary artery; thus making one ſtep towards the diſcovery of the circulation of the blood, which was afterwards completed by Harvey. Haller Biblioth. Anat. et Bib. Chirurg.

ARANYVAN, in *Geography*, a fortreſs of Tranſylvania, in the county of Weiſſemburg, on the north ſide of the Mariſch, ſix miles north of Millenbach.

ARAPABACA, in *Botany*. See SPIGELIA.

ARAPHIA, in *Ancient Geography*, an iſland which belonged to Caria. Steph. Byz.

ARAPUS, the name of a river of Carmania, according to Ptolemy.

ARAQUES, in *Geography*, a town of Spain, in Arragon, four leagues north-north-weſt of Jaca.

ARAQUIL, a town of Spain, in Navarre, five leagues weſt of Pampeluna; ſuppoſed to be the ancient Aracillum, or Arocellis.

ARAR, in *Ancient Geography*, the *Saone*, a river of Celtic Gaul, which, according to Cæſar, ſeparated the territory of the Sequani from that of the Ædui; and the courſe of which is ſo ſlow, that its motion cannot be perceived; whence Pliny calls it "the ſluggiſh river;" and Silius Italicus deſcribes it (lib. xv. v. 504. p. 773. ed. Drakenb.) to the ſame purpoſe:

"Quorum ſerpit Arar per rura pigerrimus undæ."

Over this river the ſoldiers of Cæſar built a bridge in one day.

ARARAT, a mountain of Aſia, in Armenia, on which the ark of Noah reſted after the ceſſation of the deluge. Concerning the etymology of the name, Dr. Bryant obſerves (Anc. Myth. v. iii. p. 2.), that it is a compound of *Ar-Arat*, and ſignifies "the mountain of deſcent," being equivalent to הר-ירד, Har-irad, of the Hebrews.

Of the preciſe ſituation of this mountain different accounts have been given. Some have ſuppoſed that it was one of the mountains which divide Armenia on the ſouth from Meſopotamia and that part of Aſſyria inhabited by the Curds, from whom thoſe mountains took the name of Curdue, or Cardu; by the Greeks denominated Gordyæi. It is called by the Arabs Al-Judi, and alſo Thamanin. In confirmation of this opinion, it is alleged that the remains of the ark were to be ſeen on theſe mountains; and it is ſaid, that Beroſus and Abydenus both declare, that ſuch a report exiſted in their time. Epiphanius pretends, if we may credit his aſſertion, that the relics of the ark were to be ſeen in his time; and we are further told, that the emperor Heraclius went from the town of Thamanin, up the mountain Al-Judi, and ſaw the place of the ark. Others maintain, that mount Ararat was ſituated towards the middle of Armenia, near the river Araxes, or Aras, about twelve miles from it, according to Tournefort, above 280 miles diſtant from Al-Judi, to the north-eaſt. This mountain is called "Maſis" by the Armenians, and by the Turks "Agridagh," or the heavy and great mountain; and ſtands about twelve leagues to the ſouth-eaſt of Erivan, and of Ejmiadzin, from which it is diſtant about two ſhort days' journey; four leagues from the Aras, and ten to the ſouth-weſt of Naxuan, or Nachidſhevan, or Nactſhevan, of M. D'Anville, and the Naxuana of Ptolemy. Near this city is another ſmall town, mentioned by William de Rubruquis, who travelled through Armenia in 1253, and called Cemainum, which is by interpretation eight, and as he ſays, ſo called from the eight perſons who came out of the ark and built it. This is ſuppoſed to be the ſame with Shemainum or Shemanum, formed of the Hebrew שמנה, eight, or the Themanim and Thamanim of Elmacieri and others, which was ſaid to have been built by Noah. Ararat ſeems to be a part of that vaſt chain of mountains called Caucaſus and Taurus; and upon theſe mountains and in the adjacent country, were preſerved more authentic accounts of the ark than in almoſt any other part of the world. The region about Ararat, called Araratia, was eſteemed among the ancients as nearly a central part of the earth; and it is certainly as well calculated as any other for the accommodation of its firſt inhabitants, and for the migration of

of colonies, upon the increaſe of mankind. The ſoil of the country was very fruitful, and eſpecially of that part where the patriarch made his firſt deſcent. The country alſo was very high, though it had fine plains and valleys between the mountains. Such a country, therefore, muſt, after the flood, have been the ſooneſt exſiccated, and conſequently the ſooneſt habitable.

Some have objected to the Moſaic account of the dove and olive, and will not allow that the ark reſted in Armenia, becauſe travellers of late have diſcovered no olives in that country. Thus alſo it might be ſaid, that becauſe there are in theſe days no balſam at Jericho, nor date trees in Babylonia, there were none in ancient times; but the inference with regard to Armenia would be as falſe as it is frivolous. Strabo, who was a native of Aſia Minor, ſpeaks expreſsly of the fertility of Armenia, and eſpecially (lib. xi. t. ii. p. 800.) of the region Gogarene, which he particularly mentions as productive of the olive.

It is not certain when the deſcendants of Noah quitted this country. Many of the fathers were of opinion, that they did not leave it for ſome ages. According to Epiphanius (Hær. lib. i. p. 5.), they remained in the vicinity of Ararat for five generations, during the ſpace of 659 years. Probably Noah might never depart from it; nor have we any account of his ſons leaving it till the general migration.

The mountain has ſtill the name of Ararat, which it has retained through all ages. Tournefort (vol. ii. 267, &c.) has particularly deſcribed it, and from his account it ſeems to conſiſt chiefly of free-ſtone, or calcareous ſand-ſtone. It is a detached mountain in form of a ſugar-loaf, in the midſt of a very extenſive plain, conſiſting of two ſummits; the leſſer more ſharp and pointed, the higher, which is that of the ark, lies north weſt of it, and raiſes its head far above the neighbouring mountains, and is covered with perpetual ſnow. When the air is clear, it does not appear to be above two leagues from Erivan, and may be ſeen at the diſtance of four or five days journey. Its being viſible at ſuch a diſtance, however, is aſcribed not ſo much to its height, as to its lonely ſituation, in a large plain, and upon the moſt elevated part of the country. The aſcent is difficult and fatiguing. Tournefort attempted it; and after a whole day's toil, he was obliged, by the ſnow and intenſe cold, to return without accompliſhing his deſign, though in the middle of ſummer. On the ſide of the mountain that looks towards Erivan, is a prodigious precipice, very deep with perpendicular ſides, and of a rough black appearance, as if tinged with ſmoke.

ARARAT, *Mount*, or the *ſtone head*, is the name of a ſhort range of mountains on the north frontier of North Carolina, in a north-eaſt direction from Ararat river, which is a north-weſt branch of Yadkin river.

ARARAUNA, in *Ornithology*, a ſpecies of PSITTACUS. Above blue, beneath yellow; cheeks naked, with feathered lineations. Gmelin, &c. The length of this bird is two feet ſeven inches. Its bill is black; forehead to the crown and ſides of the head dull green, the reſt of the body above fine blue to the coverts of the tail; cheeks and throat covered with a bare white ſkin; each cheek marked with black lines compoſed of very ſhort feathers, which ariſe at the angles of the mouth, and paſs beneath the eyes towards the back of the head; the eye-lids are edged with black; irides pale yellow; beneath, the body is of a pale ſaffron colour, and in ſome there is an intermixture of this colour on the wing coverts; the tail is blue above, and the inner margins of the feathers violet, except the two in the middle; it is wedge-ſhaped; the legs cinereous, and the claws black.

This bird inhabits Jamaica, Guiana, Braſil, and Surinam.

Another parrot, nearly reſembling this, is deſcribed by different authors; it has not the feathered lines on the cheeks which are ſo conſpicuous in this ſpecies, and the top of the head is blue inſtead of green. Gmelin calls it a variety (β), though he gives it a ſpecific name *cæruleus*; blue parrot, or maccaw; pſittacus maximus cæruleus varius, cauda producta, Brown. Jam. & Gmel. This bird inhabits the ſame places as the other, but is more uncommon. The natives know the two birds by their cry, and they ſay the latter does not pronounce the word *ara* ſo diſtinctly as the blue and red maccaw, or parrot.

ARARI, in *Geography*, a river of South America, in Braſil, which runs into the Northern Sea, in the prefecture of Tamaraca.

ARAS, the ancient ARAXES, a river of Aſia, which riſes in the Caucaſian mountains, and after traverſing Armenia and part of Perſia, diſcharges itſelf into the Kur, or Cyrus.

ARASENG, a town of Perſia, in the province of Irak, ten leagues ſouth of Caſbin.

ARASSI, a maritime town of Italy in the ſtate of Genoa. It is a place of ſome trade, and well peopled; and here veſſels may be hired for Genoa or any part of Italy. N. lat. 44° 4'. E. long. 7° 20'.

ARATEIA, in *Antiquity*, a yearly feſtival celebrated at Sicyon, on the birth-day of Aratus, wherein divers honours were paid by a prieſt conſecrated to this ſervice, who for diſtinction's ſake wore a ribband beſpangled with white and purple ſpots.

The arateia were ſolemnized with much pomp of muſic, the choriſters of Bacchus attending. Potter, Archæol. lib. ii. cap. 20.

ARATHAPESCOW, in *Geography*, an Indian tribe, inhabiting the ſhores of the lake and river of that name, in the north-weſt part of North America, between N. lat. 57° and 59°. North of the abode of this nation, and near the Arctic circle, is lake Edlande, around which live the dog-ribbed Indians.

ARATO-BAFABEN, in *Aſtronomy*, a fixed ſtar of the ſecond magnitude in the head of the DRAGON.

ARATUM *terræ*, in our *Ancient Law Books*, as much land as can be yearly tilled with one plough.—"Hoc manorium eſt 30 aratrorum."

ARATURA *terræ*, an ancient ſervice which the tenant was to do his lord, by ploughing his land.

ARATUS, in *Biography* and *Ancient Hiſtory*, a famous general of the Achæans, was the ſon of Clinias of Sicyon, and born about the year before Chriſt 273. When his father and ſeveral of his kindred and friends were either maſſacred or baniſhed by the tyrant Abantidas; Aratus, being then about ſeven years of age, made his eſcape, and found an aſylum in the houſe of the tyrant's ſiſter: after concealing him for ſome time, ſhe ſent him privately to his friends at Argos. Here he received a liberal education, and diſtinguiſhed himſelf by his ſkill and ſtrength in athletic exerciſes. Having conceived betimes a deteſtation of tyrants, he had ſcarcely attained his 20th year before he formed a plan of reſcuing Sicyon, his native place, from Nicocles, who was then its tyrant. With his view he ſcaled the walls by night, and at day-break invited the citizens, by the voice of a herald, to reſume their ancient liberty. The ſummons was joyfully obeyed, and the city regained its freedom by a revolution, which did not coſt a ſingle life. For its future ſecurity againſt the partiſans of Nicocles, he found it neceſſary to unite this city with the confederacy, called the Achæan league; and having been entruſted with ſupreme conſtitutional power in Sicyon, he exerciſed it in a manner which gained him univerſal eſteem, and contributed

to the eſtabliſhment of order and tranquillity. In the office of prætor, or general of this league, to which he was afterwards advanced, he recovered the citadel of Corinth from a Macedonian garriſon, by a military ſtratagem that has been highly applauded, and thus induced other cities to join the confederacy. Aratus alſo reſcued Argos from its tyrant Ariſtippus, by perſevering ſkill and valour. In the mean time the Ætolians, jealous of the growing power of the Achæans, purſued hoſtilities which were injurious to the reputation of Aratus, and reduced the league to great extremities; and for ſuppreſſing parties which were formed againſt him both in Sicyon and in Corinth, he was under the neceſſity of recurring to ſevere meaſures. In order to obtain effectual aſſiſtance, he was conſtrained, againſt his own principles and inclinations, to adviſe the Achæans to engage the ſupport of Antigonus Doſon, king of Macedon; who, entering the Peloponneſus with a large army, afforded them ſeaſonable relief. When, on a ſubſequent occaſion, the Achæans took part with the Meſſenians againſt the Ætolians, Aratus marched againſt the invaders, and avoided an action. But, during their retreat, and perceiving that they were laden with plunder, he made an unexpected attack upon them, by which they were completely defeated. For this conduct he was publicly accuſed, and eſcaped a cenſure by his ſubmiſſion. The Achæans were then obliged to have recourſe to Philip, the ſucceſſor of Antigonus: and in the war that enſued, the king of Macedon conceived a diſlike to Aratus, which induced him to retire to Sicyon, where he reflected with regret on the imprudence of ever calling the Macedonians into Peloponneſus. This diſlike on the part of Philip was gradually heightened into an invincible hatred: and he determined to ſacrifice the object of his reſentment and averſion. For this purpoſe he employed Taurion, one of his officers, to diſpatch him ſecretly, and it is ſaid that the charge was executed by means of poiſon, which was adminiſtered at an entertainment to which Aratus was invited. The conſequence was a lingering diſorder, which the Achæan general bore with patience and without complaint, though he was not ignorant of its cauſe. Happening one day to ſpit blood before one Cephalion, who was his intimate friend, and who ſeemed ſurpriſed, he ſaid, "Behold, my dear Cephalion, the effect of friendſhip with kings." Aratus died at Ægium in the year before Chriſt 216, in the 57th year of his age; being then prætor of the Achæans for the 17th time. The Sicyonians claimed the honour of burying him; and brought his body in triumphal proceſſion from Ægium to Sicyon, dancing before it, and ſinging hymns and odes in commendation of his eminent virtues. They then buried him in the moſt elevated and conſpicuous part of the city, which was long after called "Aratium," and where they offered two annual ſacrifices, one on his birth-day, and the other on the day when he delivered the city from its tyrants. A prieſt was appointed for performing the rites that were inſtituted in honour of him by the Achæans.

Aratus was regarded as one of the greateſt men of his time, and may be juſtly denominated one of the founders of the Achæan republic. As a military commander, he excelled more in forming and projecting extraordinary enterpriſes, than in executing them. In his adminiſtration, he adopted meaſures of policy which his judgment condemned, and which proved detrimental in the iſſue both to the Achæans and to himſelf; ſuch eſpecially was that of calling in the kings of Macedon to the aſſiſtance of the republic. He was leſs ſuperſtitious than moſt of the Greeks, and acted from the ſuggeſtions of his own mind rather than from omens and oracles. His temper was amiable, and his manners virtuous. As an hiſtorian, he wrote "Commentaries" of his own actions, and the affairs of the Achæans. Plutarch de Arato, apud op. t. i. p. 1027—1052. Polybius, l. viii. p. 518, &c. Anc. Un. Hiſt. vol. vi. p. 81—89.

Aratus, a Greek poet and aſtronomer, was born, according to Strabo, at Soli or Solæ, afterwards called Pompeiopolis, in Cilicia, according to others at Tarſus; and flouriſhed about the 125th Olympiad, or about 278 years before Chriſt. Having received inſtructions from Menecrates the Epheſian grammarian, and the philoſophers Timon and Menedemus, Dionyſius Heraclcotes, and Perſeus the ſtoic, he was patronized by Antigonus Gonatas king of Macedon, who encouraged him in his ſtudies and appointed him his phyſician. He went to Macedon at the time of the celebration of the nuptials of Antigonus and Phila the daughter of Antipater, and continued at his court during the remainder of his life. Of his poetical works, which were his chief productions, the only piece extant is an aſtronomical heroic poem, in Greek, entitled "Phænomena." In this poem he treats of the nature and motions of the heavenly bodies, the figures of the conſtellations, their relative ſituations in the ſphere, their riſing and ſetting, and the fables connected with their names. Cicero, when young, tranſlated this poem into Latin verſe, and highly commended the poetry, though he does not allow that he underſtood aſtronomy. De Orat. lib. i. For the materials of this poem, it is ſaid, that he was indebted to Eudoxus. Grotius thinks, that he transferred into his poem the obſervations of various authors in different climates, and for want of aſtronomical knowledge, confounded them. Among the ancients this poem had many admirers, and it has had numerous commentators: Virgil has copied it in his "Georgics;" and St. Paul has made a quotation from it. Acts, xvii. 28. The words "Του γαρ και γενος εσμεν," for we are alſo his offſpring, are a part of the fifth line of this poem: and other paſſages, to which this citation hath been referred, in Cleanthes's hymn to Jupiter, Pythagoras's golden verſes, and Oppian's Halieutica, though they agree in ſentiment, vary in expreſſion. Quinctilian (Inſtit. Orat. l. x. c. 1.) obſerves, that the ſubject of this poem has nothing of the pathos, no variety, no fictitious perſons introduced ſpeaking, with the other ornaments which have ſo great an effect in other kinds of poetry; however that the author was very capable of executing the deſign he undertook. Beſides Cicero's tranſlation of Aratus, of which a few fragments remain, we have an entire verſion in Latin hexameters, by Cæſar Germanicus, and another by Avienus. In later times, the poem of Aratus has been tranſlated into Latin by Alenus, printed in 4to. at Paris, in 1651; and in 4to. by Grotius at Leyden, in 1600; and alſo into various modern languages. The principal editions of the Greek original are in 4to. by Morell, at Paris, 1559: in folio, by H. Stephens, at Paris, in 1566; in 8vo. at Oxford, by biſhop Fell, in 1672; in Greek and Latin, with the ancient verſions, &c. at Paris, in 4to. 1540; at Baſil, in 1649; in 8vo. by Salvinus, in Greek, Latin, and Italian, at Florence in 1765. It is alſo contained in the editions of the ancient aſtronomers. Fabr. Bib. Græc. l. iii. c. 18. t. 2. p. 490, &c. Gen. Dict.

ARAVA, in *Geography*, a fortreſs of Upper Hungary, in a country and upon a river of the ſame name. N. lat. 49° 20′. E. long. 20°.

ARAVACOURCHY, a town of Hindoſtan, in the Myſore country, 17 miles ſouth-weſt of Carroor, and 23 north of Dindigul. N. lat. 10° 45′. E. long. 78° 1′.

ARAUCO, a fortreſs and town of Chili in S. America, ſituate in a fine valley on a river of the ſame name, north by weſt from Baldivia. The native Indians, called Arauques

or

or Araucéans, are ſo brave that they drove the Spaniards out of their country, though deſtitute of fire-arms. A peace was concluded between them and the Spaniards in 1659, which was celebrated in a poem by Alonzo de Ercilla. S. lat. 37° 30. W. long. 73° 20'.

ARAVITA, a town of Spain, in the country of Cordova, 16 leagues from Cordova.

ARAURIS, now *Eraut*, in *Ancient Geography*, a river of Gallia Narbonnenſis, called by Strabo, Araura.

ARAUSA, a town of Iſtria, placed in the itinerary of Antonine, 20 miles from Blandona, in the way to Salona.

ARAUSIO, *Civitas Arauſienſis*, or *Arauſicorum*, called *Colonia Secundanorum*, becauſe the veterans of the ſecond legion were ſettled there, the capital of the Cavares in Gallia Narbonnenſis. This is now Orange in the weſt of Provence, on an arm of the River Egue, which ſoon after falls into the Rhone, from which it is diſtant about a league to the eaſt, at the foot of a mountain. An ancient amphitheatre is ſtill to be ſeen in this place. N. lat. 44° 10'. E. long. 4° 46'.

ARAUZONA, a town of Illyria, according to Ptolemy.

ARAW, or ARAU, in *Geography*, a town of Swiſſerland, in the Argow, and canton of Berne, ſituate on the river Aar, in a fertile country, and containing about 1700 inhabitants. The principal manufactures are cotton, cotton ſtuffs, printed linens, cutlery, and tanning. It is a large and handſome town; 21 miles ſouth-eaſt of Baſle. The treaty of peace concluded in 1712, at Arau, between the proteſtant and catholic cantons, is one of the fundamental principles of the Helvetic union, or of the code of public law between the combined republics of Swiſſerland. N. lat. 47° 23'. E. long. 4° 46'.

ARAXA, a river of Spain, which runs into the Orio at Toloſa.

ARAXA, in *Ancient Geography*, a town of Aſia, in Lycia, according to Ptolemy and Stephan. Byz.

ARAXAI, in *Geography*, a river of South America, in Braſil; its courſe was towards the prefecture of Paraiba, where it diſcharged itſelf into the river Mongaguaca

ARAXES, in *Ancient Geography*, now ARAS, a river of Armenia Major, which roſe in a mountain called by Strabo Abus (ſee ABA), and by others Capotes and Achos, a part of the Caucaſus; continued its courſe eaſtward to the city of Atropatane, and thence inclining north-weſtward, flowed near Azara and Artaz, and fell at length, as Strabo and other geographers ſay, into the Caſpian ſea, near the mouth of the Cyrus; but according to Plutarch, Pliny, and Arrian, with whom our modern geographers agree, into the Cyrus. Ptolemy, indeed, divides the Araxes into two branches, and repreſents one as falling into the Cyrus and the other into the Caſpian ſea. Its impetuous courſe, which would not admit of a bridge, is deſcribed by Virgil, Æn. viii.

"——pontem indignatus Araxes."

On the banks of this river have appeared, at different times, the moſt renowned warriors of antiquity, Xerxes, Alexander, Lucullus, Pompey, and Mithridates. See ABORAS. Reland and Calmet are of opinion, that the Araxes is the Gihon of Geneſis; and the name of Gihon ſignifying, according to its Hebrew etymology, the *impetuous, eruptive* river, confirms this opinion. However, the Gihon of the Arabians was the Oxus, and not the Araxes of the ancients. There are two rivers which bear the name of Araxes, one in Media and the other in Perſia, which have been ſometimes confounded. The firſt is that above deſcribed; the other runs through Perſia, waſhes the walls of Schiras, and is now diſtinguiſhed by the name of Bend-Emir, or BUNDAMIR.

ARAXUM, a promontory of Achaia, bearing towards the north-weſt.

ARAYA, in *Geography*, a celebrated cape of South America, in S. lat. 11° 2', ſituate in Terra Firma and New Andaluſia, and forming the gulph called by the Spaniards "Golfo di Cariaco."

ARAZ, a mountain of Africa, within the province of Gigeri or Jigel, bordering on the Numidian deſerts; which ſtretches between 25 and 30 leagues in length from north to ſouth, and is every where very difficult of acceſs. The inhabitants are a race of Arabs, called Cabeyl zen; a warlike people, who made this ridge the laſt refuge of their liberty, and have preſerved it ever ſince by the natural ſtrength of their precipices. Before the year 1664, they uſed to traffic with the French factory at Gigeri, and carried thither hides, corn, and wax; but upon the breaking out of a war between France and Algiers, a fort was built on the ſea-coaſt to be a check on theſe Arabs. The French admiral was attacked during the work, and the fort demoliſhed; and ſince this time they have occaſionally plundered all ſtrangers that are wrecked upon their coaſts, and indiſcriminately made ſlaves of their priſoners, though they have belonged to nations in amity with Algiers and the Porte; the Mahometans only are diſcharged, and ſent home with a ſmall viaticum.

ARBA, in *Ancient Geography*, a name given to Hebron, firſt poſſeſſed by giants of the race of Anak; and afterwards given to the tribe of Judah, and the property of it to Caleb. The rabbins pretend that Hebron had the name *Arba*, ſignifying *four*, becauſe the four moſt illuſtrious patriarchs, Adam, Abraham, Iſaac, and Jacob, were buried there; or, as others ſay, with as little reaſon, becauſe four of the moſt celebrated matrons of antiquity were interred there; viz. Eve, Sarah, Rebecca, and Leah.

ARBA, now *Arbe*, an iſland and city of Illyria, now belonging to the ſtates of Venice, and ſituate in the gulf of Quarnaro on the coaſt of Dalmatia. The city is a biſhop's ſee. Although this iſland is not larger in circumference than about 30 miles, wholly uncultivated, and in ſome parts uninhabitable, the city has always, from the time of the Romans, maintained its reputation. In the eleventh century, gold and ſilk were not rare among the inhabitants. It became ſubject to the kings of Hungary, and afterwards dependent on Venetian feudatories, and at length it was reduced under the dominion of the republic, which appoints a governor with the title of count and captain. The whole number of people in the iſland does not exceed 3000, who are nevertheleſs obliged to maintain three convents of friars, and as many of nuns, and near 60 prieſts. The climate is very variable, and ſubject to tremendous and deſtructive ſtorms, which are very fatal to the ſheep that are kept in the paſtures of the mountain; and no leſs injurious, when they occur, to the plants and corn. The air, however, is upon the whole ſalubrious; and the aſpect of the iſland is very pleaſant. On the eaſt it has a high mountain, at the foot of which, towards the weſt, are fruitful plains interſperſed with little hills which are very productive. At the northern extremity is a delightful promontory called Loparo, that ſtretches into the ſea, and that incloſes a cultivated plain; near which are two ſmall iſlands called S. Gregorio and Goli, very uſeful to ſhepherds and fiſhermen. The coaſt that faces the Morlacca mountains is ſteep and inacceſſible, and the channel between them is very dangerous. The long and narrow iſland, called Dolin, lying parallel to Arbe, along the coaſt of Barbado, forms a channel leſs dangerous. In the vicinity of the city of Arbe there are ſeveral harbours, by which the trade of the beſt part of the iſland is facilitated. The city ſtands on an eminence between two harbours, which form a peninſula, and contains about a thouſand inhabitants.

inhabitants. At the foot of the Morlacca, the ſoil towards the ſhore is nothing but marble; but in the diſtrict of Barbado it is gravelly and fit for vines, which yield a wine that is much eſteemed. Below the ruins of Colento, the land bears vines, olives, mulberry, and other fruit-trees; and alſo in the lower parts, corn. The iſland is well ſupplied with ſprings of water, and would furniſh its inhabitants with ample ſubſiſtence, if they were not in the extreme ſtupid and indolent. It produces, however, fire-wood, of which quantities are annually conveyed to Venice; corn, oil, wine, brandy, and ſilk; and alſo hides, wool, ſheep, hogs, and horſes of a good breed. It has likewiſe abundance of good ſalt; and the fiſheries of tunny and mackerel ſupply no inconſiderable articles of trade. The iſland, notwithſtanding theſe advantages, is poor, becauſe much of the land remains uncultivated, and the peaſants are lazy.

Arba, *Aſitab*, a river of Aſia in Perſia. Its ſource is in about 34° 30′ N. lat., and after flowing in a ſouth-weſt direction, it diſcharges itſelf into the Delas, a little above its mouth. It was near this river that the Perſian army aſſembled to protect Cteſiphon, when it was threatened by Heraclius.

Arba, a town of Peloponneſus, in Achaia.

ARBACA, a town of Perſia, in Arachoſia, ſuppoſed to have derived its name from ſome of the kings of Parthia named Arbaces.

ARBACE, the name of a town of Celtiberia, mentioned by Steph. Byz.

ARBACES, in *Ancient Hiſtory*, was general of the Medes and governor of Media under Sardanapalus, king of Aſſyria. Diſguſted by the effeminate manners of Sardanapalus, he took up arms in conjunction with ſome of the principal officers of the Median army; and having formed an alliance with Beleſis, governor of Babylon, attacked Sardanapalus, with an army of 400,000 men. After three ſucceſſive defeats, Arbaces was joined by the Bactrians, and falling ſuddenly in the night on Sardanapalus, drove him from his camp; upon which this prince retired to Nineveh, and entruſted the command of his army with Salamanus, his wife's brother, who was overpowered by the conſpirators, and loſt almoſt the whole of it. The conſpirators proceeded to beſiege Nineveh, and after ineffectual efforts, during two years, for reducing it, a conſiderable breach was made in the wall by the inundation of the river Tigris, and thus they were enabled to enter and take poſſeſſion of the city. Upon this ſucceſs, Sardanapalus retired into his palace, and placed himſelf, his companions, and his treaſures, on a pile of wood, to which he ſet fire, and they were thus all deſtroyed. This event terminated the Aſſyrian empire about the year 820 before Chriſt, according to Euſebius; but according to Juſtin and others, in the year 900 before Chriſt; and Arbaces was declared king. With him commenced the monarchy of the Medes, and he reigned 28 years. He is repreſented as a prince of great generoſity and gratitude; and Dr. Prideaux ſuppoſes that Tiglath-Pileſer and Arbaces are the ſame perſon, under different names; whereas archbiſhop Uſher diſtinguiſhes them, and aſſigns to the one the poſſeſſion of Media, and to the other that of Aſſyria. Prid. Conn. pt. i. b. 1. See Media.

ARBAEJN, in *Geography*, a town of Arabia, 12 miles north of Zebid.

ARBALET. See *Croſs* Bow, and Ballista.

ARBALI, in *Ancient Geography*, a Sarmatian nation, according to Ptolemy, and ſuppoſed to have inhabited the part of Aſia which is near the Wolga.

ARBANA, the name of an iſland in the vicinity of Taprobana, according to Ptolemy.

ARBANIUM, a town placed by Stephan. Byz. in the neighbourhood of the Euxine ſea.

ARBASERA, a town of Aſia Minor, towards Galatia.

ARBATTIS, a town of Paleſtine in Galilee, taken and deſtroyed by Simon Maccabæus. 1 Mac. v. 23.

ARBECA, in *Geography*, a town and caſtle of Spain in Catalonia, 10 miles eaſt of Lerida.

ARBEGEN, a town of Tranſylvania, ſeven miles north of Stoltzenburg.

ARBELA, now called *Erbil* or *Irbil*, in *Ancient Geography*, a city of Aſſyria, in the province of Adiabene, and diſtrict of Arbelis, famous for the complete victory gained by Alexander the Great in the battle with Darius Codomannus, which was fought at the village of Gaugamela in its neighbourhood. Ptolemy places it on the river Capros; but Strabo at an equal diſtance from that river and the Lycus, near mount Nicatorius, ſo called by Alexander, from the above-mentioned victory. Diodorus Siculus and Curtius call it a village; but Arrian (l. vi. p. 391.) dignifies it with the name of a city; and from this the adjacent country was denominated Arbelis and Arbelitis. This battle was fought in the month of October, in the ſecond year of the 112th Olympiad, or 331 years before Chriſt. According to Arrian (De Exped. Alex. l. iii. p. 115. ed. Gronov.), the army of Darius conſiſted of a million of foot, and 40,000 horſe; but according to Diodorus (l. xvii. vol. ii. p. 202. ed. Weſſeling.) of 200,000 horſe, and 800,000 foot. Plutarch (Oper. t. i. p. 682.) ſays that the whole army conſiſted of a million; and Juſtin (l. xi. c. 13.) ſtates the number at half that of Diodorus. The Macedonian army conſiſted of 40,000 foot, and 7000 horſe. Arrian (ubi ſupra) and Curtius (l. iv. c. 25, &c.) have given a particular deſcription of this famous battle. We ſhall here ſubjoin the account of it given by Dr. Gillies, in his "Hiſtory of Greece." Alexander, when apprized of the great ſtrength of the enemy, expreſſed neither ſurpriſe nor apprehenſion. When adviſed by Parmenio to attack Darius's camp in the night, he replied, that it did not become Alexander to ſteal a victory, and therefore he was reſolved to fight and conquer in broad day-light. Darius, he alſo ſaid, by bringing all his forces into one place, had freed him from the trouble of thinking how he might purſue them into different countries. "Having commanded a halt (ſays Dr. Gillies), he encamped four days, to give his men reſt and refreſhment. His camp being fortified by a good intrenchment, he left in it the ſick and infirm, together with all the baggage; and, on the evening of the fourth day, prepared to march againſt the enemy with the effective part of his army, which was ſaid to conſiſt of 40,000 infantry and 7000 horſe, unincumbered with any thing but their proviſions and armour. The march was undertaken at the ſecond watch of the night, that the Macedonians, by joining battle in the morning, might enjoy the important advantage of having an entire day before them to reap the full fruits of their expected victory. About half way between the hoſtile camps, ſome eminences intercepted the view of either army. Having aſcended the riſing ground, Alexander firſt beheld the Barbarians drawn up in battle array, and perhaps more ſkilfully marſhalled than he had reaſon to apprehend. Their appearance, at leaſt, immediately determined him to change his firſt reſolution. He again commanded a halt, ſummoned a council of war; and different meaſures being propoſed, acceded to the ſingle opinion of Parmenio, who adviſed that the foot ſhould remain ſtationary until a detachment of horſe had explored the field of battle, and carefully examined the diſpoſition of the enemy. Alexander, whoſe conduct was equalled by his courage, and both ſurpaſſed by his

his activity, performed theſe important duties in perſon at the head of his light horſe and royal cohort. Having returned with unexampled celerity, he again aſſembled his captains, and encouraged them by a ſhort ſpeech. Their ardour correſponded with his own; and the ſoldiers, confident of victory, were commanded to take reſt and refreſhment.

"Meanwhile Darius, perceiving the enemy's approach, kept his men prepared for action. Notwithſtanding the great length of the plain, he was obliged to contract his front, and form in two lines, each of which was extremely deep. According to the Perſian cuſtom, the king occupied the centre of the firſt line, ſurrounded by the princes of the blood and the great officers of his court, and defended by his horſe and foot guards, amounting to 15,000 choſen men. Theſe ſplendid troops, who ſeemed fitter for parade than battle, were flanked on either ſide by the Greek mercenaries and other warlike battalions, carefully ſelected from the whole army. The right wing conſiſted of the Medes, Parthians, Hyrcanians, and Sacæ; the left was chiefly occupied by the Bactrians, Perſians, and Carduſians. The various nations compoſing this immenſe hoſt were differently armed, with ſwords, ſpears, clubs, and hatchets; while the horſe and foot of each diviſion were promiſcuouſly blended, rather from the reſult of accident than by the direction of deſign. The armed chariots fronted the firſt line, whoſe centre was farther defended by the elephants. Choſen ſquadrons of Scythian, Bactrian, and Cappadocian cavalry advanced before either wing, prepared to bring on the action, or, after it began, to attack the enemy in flank and rear. The unexpected approach of Alexander within ſight of his tents prevented Darius from fortifying the wide extent of his camp; and, as he dreaded a nocturnal aſſault from enemies who often veiled their deſigns in darkneſs, he commanded his men to remain all night under arms. This unuſual meaſure, the gloomy ſilence, the long and anxious expectation, together with the fatigue of a reſtleſs night, diſcouraged the whole army, but inſpired double terror into thoſe who had witneſſed the miſerable diſaſters on the banks of the Granicus and the Iſſus.

"At day-break, Alexander diſpoſed his troops in a manner ſuggeſted by the ſuperior numbers and deep order of the enemy. His main body conſiſted in two heavy-armed phalanxes, each amounting to above 16,000 men. Of theſe the greater part formed into one line; behind which he placed the heavy-armed men, reinforced by his targeteers, with orders that when the out-ſpreading wings of the enemy prepared to attack the flanks and rear of his firſt line, the ſecond ſhould immediately wheel to receive them. The cavalry and light infantry were ſo diſpoſed on the wings, that while one part reſiſted the ſhock of the Perſians in front, another, by only facing to the right or left, might take them in flank. Skilful archers and darters were poſted at proper intervals, as affording the beſt defence againſt the armed chariots, which (as Alexander well knew) muſt immediately become uſeleſs whenever their conductors or horſes were wounded.

"Having thus arranged the ſeveral parts, Alexander with equal judgment led the whole in an oblique direction towards the enemy's left; a manœuvre which enabled the Macedonians to avoid contending at once with ſuperior numbers. When his advanced battalions, notwithſtanding their nearneſs to the enemy, ſtill ſtretched towards the right, Darius alſo extended his left, till, fearing that by continuing this movement his men ſhould be drawn gradually off the plain, he commanded the Scythian ſquadrons to advance, and prevent the farther extenſion of the hoſtile line. Alexander immediately detached a body of horſe to oppoſe them. An equeſtrian combat enſued, in which both parties were reinforced, and the barbarians finally repelled. The armed chariots then iſſued forth with impetuous violence; but their appearance only was formidable; for the precautions taken by Alexander rendered their aſſault harmleſs. Darius next moved his main body, but with ſo little order, that the horſe, mixed with the infantry, advanced, and left a vacuity in the line, which his generals wanted time or vigilance to ſupply. Alexander ſeized the deciſive moment, and penetrated into the void with a wedge of ſquadrons. He was followed by the neareſt ſections of the phalanx, who ruſhed forward with loud ſhouts, as if they had already purſued the enemy. In this part of the field, the victory was not long doubtful: after a feeble reſiſtance, the barbarians gave way; and the puſillanimous Darius was foremoſt in the flight.

"The battle, however, was not yet decided. The more remote diviſions of the phalanx, upon receiving intelligence that the left wing, commanded by Parmenio, was in danger, had not immediately followed Alexander. A vacant ſpace was thus left in the Macedonian line, through which ſome ſquadrons of Perſian and Indian horſe penetrated with celerity, and advanced to the hoſtile camp. It was then that Alexander derived ſignal and well-earned advantages from his judicious order of battle. The heavy-armed troops and targeteers, which he had ſkilfully poſted behind the phalanx, ſpeedily faced about, advanced with a rapid ſtep, and attacked the barbarian cavalry, already entangled among the baggage. The enemy, thus ſurpriſed, were deſtroyed or put to flight. Meanwhile, the danger of his left wing recalled Alexander from the purſuit of Darius. In advancing againſt the enemy's right, he was met by the Parthian, Indian, and Perſian horſe, who maintained a ſharp conflict. Sixty of the *Companions* fell; Hephæſtion, Cœnus, and Menidas were wounded. Having at length diſſipated this cloud of cavalry, Alexander prepared to attack the foot in that wing. But the buſineſs was already effected, chiefly by the Theſſalian horſe; and nothing remained to be done, but to purſue the fugitives, and to render the victory as deciſive as poſſible.

"According to the leaſt extravagant accounts, with the loſs of 500 men he deſtroyed 40,000 of the barbarians, who never thenceforth aſſembled in ſufficient numbers to diſpute his dominion in the Eaſt. The invaluable provinces of Babylonia, Suſiana, and Perſis, with their reſpective capitals of Babylon, Suſa, and Perſepolis, formed the prize of his ſkill and valour. The gold and ſilver found in thoſe cities amounted to thirty millions ſterling; the jewels and other precious ſpoil, belonging to Darius, ſufficed, according to Plutarch, to load 20,000 mules and 5000 camels."

ARBELA, a town of Sicily mentioned by Steph. Byz. and alſo by Suidas.

ARBELA, a village of Paleſtine on the other ſide of Jordan, dependent upon Pella, according to Euſebius.—Alſo a place of Galilee, in the vicinity of Sephoris, according to Joſephus, Antiq. l. 12.—Alſo, a village of Upper Galilee, near which were caverns, where thieves retired for concealment.

ARBENGIAN, in *Geography*, a town of Tartary, in the country of Zagatai, and territory of Samarcand.

ARBERG, a town of Swiſſerland, in the canton of Berne, ſituate on the river Aar, which almoſt encompaſſes it. N. lat. 47°. E. long. 17° 15'.

ARBEROUE, the name of one of the ſeven diſtricts that compoſe lower Navarre, containing ſeven pariſhes.

ARBESPACH, a town of Germany, in the archduchy of Auſtria, ſix miles ſouth-weſt of Zwetl.

ARBESTAAL, a town of Germany, in the archduchy of Auſtria, five miles north of Brugg.

ARBI, a ſmall country of South America, near the Andes, between Popayan and New Granada.

ARBIA, a ſmall river of Italy, which riſes in the territory of Florence, paſſes through that of Sienne, and diſcharges itſelf into the Ombrona.

ARBICA, a town of Spain, in Navarre, ten leagues W. N. W. of Pampeluna.

ARBII, in *Ancient Geography*, a people of Aſia, in Gedroſia, mentioned by Pliny (H. N. l. vi. c. 23.), being the ſame that are placed by Strabo near the mouth of the Indus.

ARBIS, a river of Aſia, which ran, according to Pliny, between the Orita and Indians, and after watering a town of the ſame name, fell at a ſmall diſtance from it into the Indian Ocean.—Alſo, the name of a town of Gedroſia, belonging to the Arbii, and ſituate on a river of the ſame name.

ARBIS, in *Geography*, a town of France, in the department of the Gironde, and chief place of a canton, in the diſtrict of Cadillac, ſeventeen miles ſouth-eaſt of Bourdeaux.

ARBITER, in the *Civil Law*, a judge nominated by the magiſtrate, or choſen voluntarily by two contending parties, on whom they confer a power, by compromiſe, of deciding their differences according to law.

The Romans ſometimes ſubmitted to a ſingle arbiter; but ordinarily they choſe ſeveral, and thoſe always of an uneven number.

In matters wherein the public was concerned, as crimes, marriages, affairs of ſtate, &c. it was not allowed to have recourſe to arbiters: nor was it permitted to appeal from an arbitral ſentence; the effect of an appeal being to ſuſpend the authority of a juriſdiction, not of a compact.

The arbiter, among the Romans, judged in thoſe cauſes which were called "bonæ fidei," and arbitrary, and was not reſtricted by any law or form; hence he was called "honorarius." A perſon choſen by two parties by compromiſe to determine a difference, without the appointment of the prætor, was alſo called arbiter, but more properly "compromiſſarius."

Among the moderns, there are properly divers kinds of arbiters; ſome obliged to decide by the rigour of the law; and others are authorized by the contending parties to relax, or give way to natural equity: theſe are properly called ARBITRATORS.

The ancient Romans, at their feaſts, appointed a perſon to preſide, by throwing the dice, whom they called "arbiter bibendi," and who directed every thing at his pleaſure. Vid. Hor. Od. I. 4. 18. II. 7. 25.

ARBITRARY, in a general ſenſe, that which is not defined or limited by any certain expreſs law or conſtitution, but is left ſolely to the judgment and diſcretion of another. Thus arbitrary puniſhments denote ſuch as are left by the ſtatute to the diſcretion of the judges. Arbitrary fines or mulcts are uſually called *amercements*.

The word is formed from *arbitrium*, *will*; whence alſo *arbiter*, *arbitrator*.

ARBITRARY *power*. See DESPOTISM, MONARCHY, &c.

ARBITRATION, or ARBITRAGE, the referring of a cauſe or diſpute concerning any perſonal chattels or perſonal wrong, to the deciſion of two or more indifferent perſons, under the quality and denomination of arbiters or arbitrators.

If in deciding the controverſy, theſe do not agree, it is uſual to add that another perſon be called in as umpire (*imperator*, or *impar*), to whoſe ſole judgment it is then referred: or frequently there is only one arbitrator originally appointed. This deciſion, in any of these cases, is called an *award*. Thus the queſtion is finally determined, and the right transferred or ſettled, as it could have been by the agreement of the parties, or the judgment of a court of juſtice. But the right of real property cannot paſs by a mere award: yet, doubtleſs, an arbitrator may now award a conveyance or a releaſe of land; and it will be a breach of the arbitration bond to refuſe compliance. For, though originally the ſubmiſſion to arbitration uſed to be by word, or by deed, yet both of theſe being revocable in their nature, it is now become the practice to enter into mutual bonds, with condition to ſtand to the award or arbitration of the arbitrators or umpire therein named. And experience having ſhewn the great uſe of theſe peaceable and domeſtic tribunals, eſpecially in ſetting matters of account and other mercantile tranſactions, which are difficult and almoſt impoſſible to be adjuſted on a trial at law; the legiſlature has now eſtabliſhed the uſe of them, as well in controverſies where cauſes are depending, as in thoſe where no action is brought, enacting by ſtatute 9 & 10 W. III. c. 15., that all merchants and others, who deſire to end any controverſy, ſuit, or quarrel, for which there is no other remedy but by perſonal action or ſuit in equity, may agree, that their ſubmiſſion of the ſuit to arbitration or umpirage ſhall be made a rule of any of the king's courts of record, and may inſert ſuch agreement in their ſubmiſſion, or promiſe, or condition of the arbitration bond; which agreement being proved upon oath by one of the witneſſes thereto, the court ſhall make a rule that ſuch ſubmiſſion and award ſhall be concluſive: and, after ſuch rule made, the parties diſobeying the award ſhall be liable to be puniſhed, as for contempt of the court; unleſs ſuch award ſhall be ſet aſide for corruption or other miſbehaviour in the arbitrators or umpire, proved on oath to the court, within one term after the award is made. And, in conſequence of this ſtatute, it is now become a conſiderable part of the buſineſs of the ſuperior courts, to ſet aſide ſuch awards when partially or illegally made; or to enforce their execution when legal, by the ſame proceſs of contempt as is awarded for diſobedience to thoſe rules and orders which are iſſued by the courts themſelves. Blackſt. Comm. b. iii. vol. iii. p. 16.

The power of arbitrators is to be regulated by the compromiſe between the parties, as to what concerns the differences they are to determine; and whatever they decree beyond that is of no effect.

Among the Athenians, any one who ſubmitted his cauſe to arbitration, was to abide by its ſentence. Arbitrators were to ſwear before verdict was given. If the plaintiff did not appear before ſun ſet, he might be fined; and appeal might be made from arbitrators choſen by lot to other courts of juſtice. The office of arbitrators was annual, and if they were found guilty of corruption, they were puniſhed with ἀτιμία, infamy.

ARBITRATOR, an extraordinary judge or commiſſioner, in one or more cauſes between party and party, choſen by their mutual conſent.

The civilians make a difference between arbiter and arbitrator: though both ground their power on the compromiſe of the parties, yet their liberty is diverſe; for an arbiter is tied to proceed and judge according to the forms of law; whereas an arbitrator is permitted wholly to uſe his own diſcretion, without ſolemnity of proceſs, or courſe of judgment, to hear and accommodate the controverſy committed to him; ſo it be *juxta arbitrium boni viri*. See EPITROPUS.

ARBITRIO, in *Muſic*, is equivalent to *ad libitum*, *al ſuo arbitrio*, at your pleaſure, *al ſuo commodo*, at your convenience. In leſſons and ſolos, and in the ſolo parts of concertos, where all the other parts wait at a pauſe or cloſe on the pleaſure of the principal performer, theſe notices are given. See AD *libitum*.

ARBOGA, or ARBOGEN, in *Geography*, a town of Sweden, in the province of Weſtmanland, ſituate on the river Stora. Within a quarter of a mile is the canal of Arboga, begun in the reign of Chriſtina, widened and deepened by Charles XI. and finiſhed under the reign of his ſon Charles XII. which joins the lake of Hielmar with that of Mælar. In this place a ſynod was held in 1297, under Nicholas, archbiſhop of Upſal.

ARBOIS, a town of France, in the department of Jura, and principal town of the diſtrict of Poligny, celebrated for the excellent wine made in its environs. The place contains 6414, and the canton 12,888 inhabitants: the territory includes 150 kiliometres and 14 communes. N. lat. 46° 55′, E. long. 5° 40′.

ARBON, a town of Swiſſerland, in the Turgow, ſituate on the ſouth ſide of the lake of Conſtance. The inhabitants are chiefly proteſtants. N. lat. 47° 38′, E. long. 9° 30′.

ARBOR, in *Botany*, *Gardening*, &c. ſignifies a tree or perennial plant that has the property of riſing with a ſimple woody and durable ſtem or trunk to a conſiderable height and thickneſs. Theſe laſt circumſtances, in ſome meaſure, form a diſtinction between trees and ſhrubs, which laſt are ſuppoſed to be of a ſmaller growth, and to have generally ſeveral ſtems proceeding from the root, or the ſame ſtem dividing near to it, into different ſmaller ones; and alſo from herbaceous plants, whoſe ſtems are ſoft, often ſucculent, and moſtly riſe in ſpring, and periſh in autumn. This is not, however, general.

It has, indeed, been obſerved by Linnæus, that this diſtinction between trees and ſhrubs is by no means univerſally obvious. Nature, ſays he, has put no limits betwixt trees and ſhrubs; for to ſay that trees are taller than ſhrubs is, in fact, ſaying nothing; unleſs a certain immutable ſtandard were previouſly eſtabliſhed. Beſides, every thing reſpecting dimenſions is ſo variable in its nature, and depends ſo much upon the difference of climate, ſoil, and culture, that no certain ſtandard or boundary can, with propriety, be fixed between them, ſince the ſame plant, in different countries, often aſſumes very different growths: thus the *arbutus* and *laurel*, in warm climates, grow to large trees; while in this country they are generally conſidered as ſhrubs. See FRUTEX.

ARBOR *Camphorifera*. See LAURUS.

ARBOR *crepitans*. See HURA.

ARBOR *Judæ*. See CERCIS.

ARBOR, in *Chemiſtry*.—ARBOR *philoſophica* is a name common to ſeveral metalline cryſtallizations; thus called from their ramifications reſembling a tree.

ARBOR *Dianæ*.—*Arbor mineralis philoſophica*.—*Arbre de Diane*.—*Dianenbaum*, *Silberbaum*. It is the property of ſilver, lead, and tin, when combined with an acid into a readily ſoluble ſalt, to be eaſily ſeparable in the reguline ſtate from ſuch acid by the ſuperior affinity of zinc, mercury, &c.; and while precipitating, to arrange themſelves in a branching filamentous maſs. Hence they were called by the ancient chemiſts *arbores*, trees. Silver being denoted in alchemical language by the moon, Luna, or Diana, the term Arbor Dianæ means therefore metallic ſilver brought by art into an arboreſcent form. As this is a very beautiful preparation, and ſuſceptible of great varieties of figure, a multitude of receipts are to be found in different writers, all of which, however, may be reduced to two. The firſt conſiſts in the decompoſition of a ſolution of pure *nitrat of ſilver* by mercury: the ſecond varies from the firſt in the ſilver being amalgamated with mercury previouſly to ſolution in nitrous acid. The latter of theſe methods is the moſt ancient, being deſcribed by Homberg (Mem. de l'Acad. de Paris, 1692) in the following terms: "Make an amalgam without heat of four drams of ſilver filings, or ſtill better of ſilver leaf, and of two drams of mercury (ſee MERCURY, *Alloys of*,); diſſolve this amalgam in four ounces or a ſufficient quantity of nitrous acid, pure and moderately ſtrong; dilute this ſolution with about a pint and a half of diſtilled water, ſhake the mixture, and preſerve it in a bottle with a glaſs ſtopper. When this preparation is to be uſed, an ounce of it is to be put into a vial together with about the ſize of a pea of an amalgam of gold or ſilver about as ſoft as butter, and the whole is to remain at reſt: ſoon afterwards ſmall filaments will be ſeen iſſuing from the amalgam, which quickly increaſe, branch out on both ſides, and take the form of ſhrubs."

The ſimpler method appears to have been firſt mentioned by Lemery (Cours de Chymie, 1726). He adviſes to diſſolve an ounce of fine ſilver in a ſufficient quantity of pure nitrous acid, and afterwards to mix the ſolution in a flaſk with about twenty ounces of diſtilled water: add to this mixture two ounces of mercury, and let the whole remain at reſt. In about forty days a kind of ſilver tree will be formed upon the mercury with branches reſembling vegetable ramifications.

The two eſſential conditions for the complete ſucceſs of this experiment are, firſt, that the nitrat of ſilver ſhould be free from any exceſs of acid; and ſecondly, that the ſilver ſhould have a firm baſe to adhere to as ſoon as it begins to be precipitated. To enſure the firſt, it is adviſable ſo to proportion the acid to the ſilver, that a very minute portion be left undiſſolved, and then by concentrating the ſolution to diſpoſe it to cryſtallize. The cryſtals thus obtained, being dried on blotting paper, ſhould be diſſolved in diſtilled water, the proportions of which may be varied at pleaſure, provided the ſolution is not, on the one hand, ſo ſtrong as to depoſit cryſtals by ſtanding, and, on the other hand, ſo dilute as to require many days before the experiment is completed: from five to twelve times as much water as nitrat of ſilver is upon the whole the moſt convenient proportion. The fibres of the precipitate will be crowded and ſhort, when the proceſs is brought about rapidly; but long and branched, if a greater time is allowed.

The mercury that is added to effect the precipitation ſhould be mixed with ſilver ſo as to deſtroy its fluidity; for when pure mercury is poured in, the firſt portions of ſilver that are depoſited unite with and diſſolve in the mercury till it is thus brought to a proper conſiſtence.

The tree or arboreſcent precipitate thus obtained is an amalgam of ſilver, the proportions of which appear ſubject to ſome variations. For the theory of this and ſimilar phænomena, ſee PRECIPITATION, and *Metallic* PRECIPITATES. Macquer's Chemiſches Worterbuch, art. Dianenbaum. Encyclopedie Method. art. Arbre de Diane, &c.

ARBOR *plumbi*, is the reſult of a beautiful vegetation of lead. For producing it, two drams of acetite of lead are diſſolved in ſix ounces of diſtilled water; the filtered ſolution is poured into a cylindrical glaſs, and a thin roll of zinc being hung in it, the whole is left ſtanding at reſt. The lead precipitates, adhering to the zinc in metallic leaves, in the form of a tree. Gren's Chem. vol. ii. p. 382.

ARBOR *Genealogica*, tree of conſanguinity, ſignifies a li-

neage drawn out under the figure or reſemblance of root, ſtock, branches, &c.

Arbor *Porphyriana*, among the ſchoolmen, denotes a ſcale of beings; or a figure conſiſting of three rows or columns of words; the middlemoſt whereof contains the ſeries of genera and ſpecies, and bears ſome analogy to the trunk; and the extremes, containing the differences, to the branches of a tree.

	PLATO	

The *arbor porphyriana* is otherwiſe called *ſcala prædicamentalis*.

Arbor *Vitæ*, in *Botany*. See Thuya.

Arbor is alſo figuratively uſed in *Mechanics*, for the principal part of a machine, which ſerves to ſuſtain the reſt.—It is alſo uſed for a ſpindle, or axis, whereon a machine turns; thus, *arbor* of a crane, a mill, windmill, &c.

ARBOREA, in *Entomology*, a ſpecies of Podura deſcribed by Scopoli and others. It inhabits trees in Europe; is oblong and black; legs and fork white. Linnæus. Gmelin.

Arborea, in *Ornithology*, a ſpecies of Anas, that inhabits Jamaica, and is called by Ray, Sloane, and Edwards, the black-billed whiſtling duck. It is brown; the head ſlightly creſted; and the abdomen ſpotted with black and white. Gmelin. This is alſo *Anas fiſtularis Jamaicenſis* of Briſſon; *Canard ſiffleur de la Jamaique* of Buffon Pl. Enl.; and *Siffleur à bec noir*. Nat. Hiſt. Oiſ. of the ſame author.

The moſt remarkable circumſtances of this duck are, that it builds its neſt in trees, and makes a whiſtling noiſe. It is ſuppoſed to frequent Carolina in winter, at leaſt one of the ſame name is ſaid to be found on thoſe coaſts at that time by Lawſon and Cateſby. A bird of this kind is in the Britiſh Muſeum, and is called the Opano Duck, which is the name it bears at Guiana.

In ſize it is leſs than the Mallard, and ſtands high upon its legs; the neck is alſo long and ſlender. The bill is black; irides hazel; crown of the head duſky, ſomewhat creſted behind, and of a rufous brown; hind part of the neck brown; back and ſcapulars the ſame, but the feathers margined with rufous; rump and upper tail-coverts darker; ſides of the head and throat white; fore-part of the neck white ſpotted with black; the breaſt pale rufous ſpotted alſo with black; belly, thighs, and vent much like the forepart of the neck, but the ſpots are ſmaller and moſt numerous on the ſides; the wing-coverts rufous ſpotted with black; quills and tail duſky; legs lead-colour; claws black.

Arborea, a ſpecies of the Alauda genus. See Alauda.

Arborea, in *Zoology*, a ſpecies of Rana, called the tree frog, and thus defined by Gmelin: body granulated beneath, and the feet cleft. Linnæus deſcribes it as having the body ſmooth; the underpart beſet with contiguous tuberculations; the feet cleft, and the toes terminated in orbicular dilated tips. Gmelin enumerates eight ſuppoſed varieties of this ſpecies, which are as follows:

β. Hyla *fuſca* of Laurent. Amph.—Rana pedibus fiſſis, palmis tetradactylis, plantis pentadactylis; geniculis ſubtus tuberoſis. Amoen. Acad. I. p. 135. (Frog with cleft feet, four toes on the anterior, and five on the poſterior feet; and the knees warted beneath.)

γ. Hyla *viridis*, linea flava utrinque recta. Laurent. and Cateſby. (Green, with a ſtraight yellow line on each ſide.)

δ. Hyla *ranæformis*. Laurent. Amph. p. 33. n. 25.

ε. Rana *americana rubra*. Seb. Muſ. 2. t. 7[illegible]. f. 4.

ζ. Hyla *viridi fuſca*. Laurent. Amph. p. 34. n. 29.

η. Hyla *fuſcina*. Laurent. Amph. p. 34. n. 30.

θ. Hyla *rubra*. Laurent. Amph. p. 35. n. 32.

ι. Hyla *ſceleton*. Laurent. Amph. p. 35. n. 33.—Rana braſilienſis gracilis of Seba.

Dr. Shaw gives a new ſpecific character to this creature; Rana *arborea*; viridis, ſubtus albida, linea laterali nigricante, abdomine granulato, pedibus fiſſis. (Green frog, whitiſh beneath, with blackiſh lateral line, granulated abdomen, and unwebbed feet.

"In the beauty of its colours, as well as in the elegance of its form, and the agility of its movements, the tree frog exceeds every other European ſpecies. It is a native of France, Germany, Italy, and many other European regions, but is not found in the Britiſh iſlands. Its principal reſidence, during the ſummer months, is on the upper parts of trees, where it wanders among the foliage in queſt of inſects, which it catches with extreme celerity, ſtealing ſoftly towards its prey in the manner of a cat towards a mouſe, and when at a proper diſtance ſeizing it with a ſudden ſpring, frequently of more than a foot in height. It often ſuſpends itſelf by its feet or abdomen to the under parts of the leaves, thus continuing concealed beneath their ſhade. Its ſize is ſmaller than any other European frog, except the fire frog. Its colour, on the upper parts, is green, more or leſs bright in different individuals; the abdomen is whitiſh, and marked by numerous granules; the under ſurface of the limbs is reddiſh; and the body is marked on each ſide by a longitudinal blackiſh or violet-coloured ſtreak, ſeparating the green of the under parts from the white colour of the lower; the inferior edge of this dark lateral ſtripe is tinged with yellow. The body is ſmooth above, and moderately ſhort or plump; the hind legs are very long and ſlender; the fore feet have four, and the hind feet five toes, all which terminate in rounded, flat, and dilated tips, the under ſurface of which being ſoft and glutinous, enables the animal to hang with perfect ſecurity from the leaves of trees, &c. The ſkin of the abdomen is alſo admirably calculated by nature for this peculiar power of adheſion, being covered with ſmall glandular granules in ſuch a manner as to faſten cloſely even to the moſt poliſhed ſurface; and the animal can adhere at pleaſure to that of glaſs, in whatever poſition or inclination it be placed, by merely preſſing itſelf againſt it." Dr. Shaw, Zool. &c.

It is further remarked by this and other authors, that though the tree frog inhabits the woods during the ſummer months, on the approach of winter it retires to the water, where it conceals itſelf in the ſoft mud or banks, and remains in a ſtate of torpidity till the ſpring; when it again emerges; and, like the reſt of this genus, depoſits its ſpawn in the water at that ſeaſon. The male, at this period, inflates its orbicular gular pouch in a ſurpriſing manner, and emits a loud and ſharp croak, which may be heard at a vaſt diſtance; they make the ſame noiſe on the approach of rain while they live among the trees, and may be conſidered, in ſome meaſure, as a kind of living barometers, more eſpecially the males, which, if kept in glaſſes and ſupplied with proper food, will afford an infallible preſage of the changes of weather. In the German Ephemerides Naturæ

Curioſorum, we meet with an account of one which was kept in this manner for the ſpace of ſeven years.

ARBOREOUS, Arboreus, is applied by ſome naturaliſts to ſuch excreſcences, funguſes, moſſes, and other paraſites, as grow on trees; in contradiſtinction to ſuch as grow on the ground; ſuch are the *lichenoides* and *agarics*.

ARBORESCENS, in *Natural Hiſtory*, a ſpecies of Doris (*Vermes Mollusca*), that inhabits the Norway ſeas. The feelers are ramoſe; back gibbous, and beſet with protuberances. Müll. Zool. Gmelin.

ARBORESCENT, a term uſed to denote any thing that ſhoots or grows up in form of a tree, or which gradually becomes firm and woody; and *arboreus* is that which reſembles a tree, having a permanent woody ſtem.

Botaniſts ſpeak of arboreſcent ſhrubs and plants, &c. Mineraliſts treat of arboreſcent metals, arboreſcent ſilver, arboreſcent iron, arboreſcent ſtones, &c. The fungus marinus is ranked by ſome in the claſs of arboreſcent fluors; the chemiſts produce arboreſcent cryſtallizations, which they call philoſophical trees. Phil. Tranſ. N° 198, N° 111, and N° 129.

Zoologiſts give inſtances of arboreſcent animals, particularly fiſhes.

The *arboreſcent ſtar-fiſh, ſtella arboreſcens*, a ſpecies of Asterias, is one of the curioſities of nature found in ſeveral cabinets of natural rarities.

ARBORETI, in *Entomology*, a ſpecies of Curculio, that inhabits Cayenne. It is of a cinereous colour; thighs of the anterior legs toothed; wing-caſes ſtriated with punctures. Fabr. Gmelin.

ARBOREUM, in *Natural Hiſtory*, a ſpecies of Alcyonium (*Vermes Zoophyta*), found in the Norway and Indian ſeas. The ſtem is arboreſcent, with obtuſe branches and papillary pores. This is Lithoxylon *Norwegicum* of Muſ. Teſſin.; Alcyonionium *ramoſum*, poris papillaribus in tubera lateralia terminaliaque congeſtis of Pallas; Arbuscula *marina coralloides* of Cluſius; *Planta marina coralloides rubra*, J. Bauh.; and *Accarbaar gabba-garba ſ. Accarbaar boazagu, Amboynenſibus Hualupia*, Rumphius.

ARBOREUS, in *Entomology*, a ſpecies of Cimex deſcribed by Degeer. Above it is brown-green, beneath yellowiſh; a tranſverſe yellow line acroſs the thorax; wing-caſes bordered with red; tail of the ſame colour, and bidentated. This is a ſmall inſect, being only five lines in length, and lives in trees. Gmelin.

ARBORIBONZES, in *Modern Hiſtory*, prieſts of Japan, who live an erratic life, and ſubſiſt on alms. They dwell in caverns, and cover their heads with bonnets made of the bark of trees.

ARBORIS pecten. See Pecten.

ARBORIST, Arborista, a perſon ſkilled in trees, their forms, natures, &c.

Arboriſt is an appellation of leſs extent than botaniſt.

ARBOR Scientiæ, a general diſtribution or ſcheme of ſcience or knowledge.

ARBOUC, in *Geography*, a town of Arabia, 116 miles north-weſt of Mecca.

ARBOUCAVE, a town of France, in the department of Landes; four leagues ſouth-eaſt of St. Sever, and $4\frac{1}{2}$ E. N. E. of Orthez.

ARBOURS, in *Gardening*, are ſmall compartments formed with various ſorts of trees and ſhrubs, in ſuch order as to incloſe a certain ſpace, and make a kind of receſs or ſhady retreat for the hot ſummer months. They were formerly held in much higher eſtimation than at preſent, and were commonly formed of ever-greens, as yews, planted very cloſe, the ſides trained erect ſix, eight, or ten feet high, and the tops formed like vaults or trained archways, over arched frames or lattice-work of wood or iron; having arched openings or arcades formed on the ſides, the whole being ſhorn or clipped annually to keep them in due order, which in many caſes appeared very ornamental, according to the ancient ſtyle of gardening. They were alſo frequently formed of deciduous trees, particularly the elm, and ſometimes with the horn-beam, beech, and lime, which were conſtantly ſhorn every ſummer. The forms of both the ever-green and deciduous kinds, were either ſquare, hexagonal, octagonal, or round, and their dimenſions generally from ten to fifteen feet in width and height; the tops were moſtly made either pavilion, turret, or dome-ſhaped, and ſometimes terminated by a globe, pyramid, or other figure, formed of the extreme branches.

The authors of the "Univerſal Gardener" obſerve, that covered arbours or bowers may be formed very quickly, even in one ſeaſon, with ſeveral ſorts of ſhrubby herbaceous climbing plants; ſome of which will advance fifteen or twenty feet in one ſummer. It is likewiſe added, that they ſhould, if poſſible, be erected upon a ſomewhat riſing ground, for the greater advantage of free air, and to enjoy the proſpect of the garden and adjacent country.

They are alſo ſometimes formed in the heads of ſingle large trees, particularly elms, where the trunks have divided at the height of ten or twelve feet, into ſeveral leſſer ſpreading ſtems, ſo as to admit of erecting a ſmall platform between them, cutting down the large boughs, and training the pliable branches archways over lattice-work, till thoſe on each ſide meet; then clipping the ſides annually, the tops may either be cut, or permitted to grow up, or the whole ſuffered to advance in a natural growth. They may likewiſe be formed on the ground in this manner: plant ſome of the talleſt-growing flowering ſhrubs round the inſide, to form the dimenſions of the arbour; then, on the outſide of theſe, others of ſomewhat leſſer growth; ſo continue three or four ranges, diminiſhing gradually in ſtature from the arbour outwardly, permitting the whole to take their natural growth; ſo that at a diſtance it may aſſume the appearance of one of the common ſhrubbery clumps.

The bottoms of them when on the ground, ſhould be well gravelled, and garden chairs placed in them during the ſummer.

ARBRE de mer, in *Natural Hiſtory*, a name given by one French author to the Linnæan Gorgonia Fabellum. Vide Rochef. Antill. c. 19. act. 13. p. 234.

Arbre *Coche*, in *Geography*, an iſland in the north part of lake Michigan in Upper Canada. N. lat. 45° 25′. W. long. 85° 18′.

ARBRESLE, L', a town of France, in the department of the Rhone and Loire, and chief place of a canton in the diſtrict of Lyon; nine miles north-weſt of Lyons. The place contains 871 and the canton 11,597 inhabitants; the territory includes 170 kiliometres, and 17 communes.

ARBROATH. See Aberbrothick.

ARBUCKLE, James, M. A. in *Biography*, was born at Glaſgow, in 1700, and educated in the univerſity of that city, and afterwards kept an academy in the north of Ireland. His poems were publiſhed in one volume, 12mo.; but his tranſlation of Virgil, which he undertook, was never finiſhed. He was a perſon of fine taſte, and much eſteemed by the learned in general. He died in 1734. Biog. Dict.

ARBUSCULA is uſed by Bradley to denote a little, or dwarf-tree, above the rank of ſhrubs, but below that of trees, ſuch e. gr. as the elder.

Arbuscula *marina coralloides alba*. Valent. Ind. 4.

t. 52. f. D. D. This is Madrepora *muricata* of Gmelin.

ARBUSTIVA, in *Botany*, an order of plants in the Fragmenta Methodi Naturalis of Linnæus.

ARBUSTORUM, in *Conchology*, a ſpecies of Helix; a land ſnail found in hedges and ſhrubberies in Europe. This ſhell may be better characterized in the words of Da Coſta than Linnæus; for the latter neglects to include in its ſpecific character the ſingle ſpiral line which is invariably found upon this ſpecies. It is thus defined by Da Coſta; ſhell ſomewhat umbilicated, ſpotted, with a ſingle narrow ſpiral band along the middle of the wreaths of whorls.—Teſta umbilicata convexa acuminata; apertura ſuborbiculari bimarginata; anterius elongata. Linn. Fn. Sv.—The ſhell is brown with yellow lines, or yellowiſh with brown lines, in little irregular daſhes, and the ſpiral ſtreak is darkeſt. Vide Donov. Brit. Shells.

Arbustorum, in *Entomology*, a ſpecies of Musca, (*Syrphus*, Fabr.) that inhabits Europe, and lives in trees. The thorax is grey; abdomen black, except the firſt joint and ſides of the ſecond, which are ruſous. Linnæus. Gmelin.

ARBUSTUM implies a number or multitude of trees planted for the ſake of the fruit.

The word was more peculiarly applied to a place planted with trees for ſaſtening vines to, which are hence called by Columella, *arbuſtivæ*.

Arbustum is ſometimes alſo uſed to denote an orchard or field wherein trees are planted at ſuch a diſtance, that there is room for ploughing and growing corn between them.

ARBUTELLA, in *Entomology*, a ſpecies of Phalæna (*Tinea* Linn.). The wings are ruſous, with ſtreaks of ſilver, the middle ones bifid. Fabricius.

ARBUTHNOT, Alexander, in *Biography*, an eminent Scots divine, was the ſon of the baron of Arbuthnot, and born in the year 1538. Having ſtudied the languages and philoſophy in the univerſity of Aberdeen, and civil law under Cujacius at Bourges in France, he took eccleſiaſtical orders, and became a zealous advocate and promoter of the reformation. In 1568, he aſſiſted as a member of the general aſſembly at Edinburgh; and by this aſſembly he was entruſted with the charge of reviſing a book, intitled, "The Fall of the Roman Church," which had given great offence, and which incurred the cenſure of the aſſembly, chiefly on account of an aſſertion contained in it, "that the king was the ſupreme head of the church." On this occaſion the aſſembly, in direct oppoſition to the principles of the reformation, to which they profeſſed a zealous attachment, iſſued an order that no book ſhould be publiſhed for the future, till it ſhould be licenſed by commiſſioners of their own appointment. In the following year, Mr. Arbuthnot was advanced to the office of principal of the king's college at Aberdeen. In 1572, he was a member of the general aſſembly held at St. Andrews, which ſtrenuouſly oppoſed a ſcheme of church government called "the book of policy," and which was formed by ſome ſtateſmen for the purpoſe of reſtoring the old titles in the church, and retaining among themſelves all the temporalities annexed to them. In the general aſſemblies held at Edinburgh in 1573 and 1577, Mr. Arbuthnot was moderator; and he ſeems to have been conſtantly employed, on the part of the church of Scotland, for conducting the conteſt with the regency concerning the plan of eccleſiaſtical juriſdiction to be adopted in this church. By the courſe he purſued in this buſineſs, and alſo by his publication of Buchanan's Hiſtory of Scotland, he gave offence to James VI.; and a royal order was iſſued forbidding him to abſent himſelf from his college at Aberdeen. The clergy, who were likely to be thus deprived of his important and uſeful ſervices, remonſtrated; but the king was inflexible, and the clergy ſubmitted. By this perſecution Arbuthnot's health and ſpirits were affected; and in the next year, viz. 1583, he ſunk into a decline, and died. Arbuthnot appears to have poſſeſſed a degree of good ſenſe and moderation, which eminently qualified him for the conduct of public buſineſs. Poſſeſſed of a conſiderable ſhare of learning, he patronized and promoted it, and contributed to revive in Scotland a taſte for polite literature. The only literary work which he has left is a learned and elegant treatiſe in Latin, intitled, "Orationes de origine et dignitate juris," printed at Edinburgh, in 1572, in 4to. Biog. Brit.

Arbuthnot, John, M.D. not leſs celebrated for his wit than for his learning, was ſon of an epiſcopal clergyman in Scotland, and born at Arbuthnot, near Montroſe, ſoon after the reſtoration. He received his education at the univerſity at Aberdeen, where he took his degree of Doctor in Medicine. He then came to London, and taught mathematics, in which he was well ſkilled. In 1697, he publiſhed "An Examination of Dr. Woodward's Account of the Deluge." This firſt brought him into public notice, and the reputation thence acquired was increaſed by his "Treatiſe on the Uſefulneſs of Mathematical Learning," which ſoon followed. In 1704, he communicated a paper to the Royal Society, which is publiſhed in their Tranſactions for that year, "On the conſtant regularity obſerved in the births of both ſexes." Though there is a ſmall diſparity, the males exceeding the females by about one in twenty, yet as the males are engaged in occupations of greater hazard and danger, he ſuppoſes their number to be nearly equal, at an adult age. Whence he concluded, "that polygamy is contrary to the law of nature and juſtice, and to the propagation of the human race:" an argument affording a complete anſwer to the doctrine contained in the Thelyphthora, a publication by the late Mr. Madan. On the credit of this paper he was made fellow of the Royal Society, and obtained a more intimate connection with the principal literary characters in the country. Being ſoon after called to attend prince George of Denmark, who was taken ill at Epſom, where the Doctor happened to be at the time, his ſucceſs in reſtoring him to health brought him into favour with queen Anne; and in 1709, Dr. Hannes being indiſpoſed, he was made her phyſician in ordinary, and admitted Fellow of the Royal College of Phyſicians. This would be attended of courſe with an increaſe of profeſſional fame and employment; but it does not appear he was ever popular as a phyſician, or had much general practice, as on the death of queen Anne, in 1714, he found himſelf ſo much neglected, as to have leiſure to go to Paris. On his return he thanks Mr. Pope for "taking notice of a poor old diſtreſſed courtier"; and tells him, "that his friends ſhall find the ſame welcome at Martin's Office in Dover-ſtreet, they had met at his houſe in St. James's, and that he can ſtill afford to give them half a pint of claret." His fondneſs for the converſation of Pope, Swift, Gay, and the other wits of the time, and their affectionate attachment to him, although contributing to his pleaſure, as moſt congenial to his diſpoſition, was probably the real cauſe of the little eſtimation he was in as a phyſician, except among his friends. For though Apollo is called the father of medicine as well as of verſe, yet thoſe who addict themſelves to him in his latter capacity, rarely attain eminence in the firſt. This was afterwards exemplified in the fate of Armſtrong and Akenſide, whoſe fame as phyſicians decreaſed in proportion to their increaſing celebrity as poets.

Arbuthnot had been for ſome time engaged with Pope and

and Swift in writing the "Memoirs of Martinus Scriblerus," intended as a general ſatire on the abuſes in human learning; but which was never completed. It was in alluſion to this, that he called his houſe in Dover-ſtreet *Martin's Office* (ſee his letter to Pope in 1714), which ſhews alſo that he had no inconſiderable ſhare in that exquiſitely witty production. "The life of that ſolemn and abſurd pedant, Dr. Scriblerus" Warton ſays (Introduction to the Memoirs), "of which Johnſon ſpeaks too contemptuouſly, is the only true and genuine imitation we have in our language of the ſerious and pompous manner of Cervantes." Beſides the large ſhare Arbuthnot contributed to theſe memoirs, he is upon good authority ſuppoſed to have written "The hiſtory of John Bull," "A Treatiſe on the ſcolding of the Ancients," and "The Art of Political Lying." There is alſo a philoſophical poem written by him, remarkable for its philoſophical ſentiment, in Dodſley's collection the title "Know thyſelf;" but his principal work is, "Tables of ancient Coins, Weights, and Meaſures," conſiſting of ſeveral diſſertations on theſe ſubjects, which he collected together and publiſhed in 4to. in 1727; they are ſtill held in eſteem. In 1732, now in the decline of life, he publiſhed a treatiſe "On the Choice of Aliments;" and in the following year, "On the effect of Air on human Bodies:" both founded on the doctrine of Boerhaave, the prevailing ſyſtem of the time. Among his ſatirical pieces ſhould be mentioned his "Epitaph on Chartres," a noted uſurer of the time. "Here continues to rot, &c." It is written with uncommon aſperity, but not more than the ſubject demanded. In almoſt all his ſatirical poems there is a good-humoured vein of pleaſantry, which confirms the character given of him by Swift to a lady who deſired his opinion of him: "he has more wit than all our race, and his humanity is equal to his wit." Although they are ſtrongly tinged with party, yet they are generally free from the gall and rancour that too often affects party writings. If indeed the "Memorandums of the ſix days preceding the death of a late Right Reverend," (meaning biſhop Burnet) be his, he cannot, in this inſtance, be acquitted of ſuffering his perſonal diſlike to get the better of his humanity. Dr. Arbuthnot was alſo ſkilled in muſic; and ſir J. Hawkins mentions an anthem, and a burleſque ſong of his compoſition. (Hiſt. Muſ. vol. v. p. 126.) The two volumes publiſhed in 12mo. in 1751, and entitled, "The Miſcellaneous Works of the late Dr. Arbuthnot," contain ſome of his genuine productions; but as for the greateſt part of them, his ſon George Abuthnot, Eſq., upon whoſe judgment and probity we may depend, ſays that they were not written by his father. He had been long afflicted with an aſthma, to which a dropſy was now added. With a view of obtaining relief under this accumulated diſtreſs, for he did not, he told his friends, expect a cure, he removed to Hampſtead, a village in the neighbourhood of London; but, finding little advantage from change of ſituation, he ſoon returned to his houſe in town, where he died Feb. 27, 1735; and ſuppoſing him to have been thirty, when his "Examination of Woodward's Account of the Deluge" appeared, in the 68th year of his age. Dr. Arbuthnot paſſed his days amidſt the endearments of domeſtic life, and the affectionate eſteem of his friends; and bore, with reſignation and cheerfulneſs, the afflictions that fell to his lot. His literary aſſociates, by whom he was beloved, have recorded their mutual friendſhip. Pope dedicated to him an epiſtle, called "A Prologue to the Satires;" and Swift feelingly laments, in one of his poems, that he is

> "Far from his kind Arbuthnot's aid,
> Who knows his art, but not his trade."

During his laſt illneſs, his ſerenity ſupported by habitual piety, never deſerted him; and theſe qualities, with an ardent love of virtue and diſdain of meanneſs and vice, are beautifully diſplayed in his lateſt letters.

ARBUTI, in *Entomology*, a ſpecies of PHALÆNA (*Noctua* Linn.) found in England. The anterior wings are brown; poſterior black, with a yellow band acroſs. Fabr. Donov. Brit. Inſ.

ARBUTUS, in *Botany*, *Strawberry-tree*. Lin. gen. 552. Schreb. 750. Gærtn. 59. Juſſ. 160. *Uva urſi*. Tournef. 370. Claſs, *decandria monogynia*. Nat. Order. *Bicornes. Ericæ*. Juſſ. Gen. Char. *Cal.* perianth five-parted, obtuſe, very ſmall, permanent. *Cor.* monopetalous, ovate, flattiſh at the baſe, diaphanous, with a quinquefid mouth; diviſions obtuſe, revolute, ſmall. *Stam.* filaments ten, ſubulate-ſwelling, very ſlender at the baſe, affixed to the edge of the corolla, and half the length of it; anthers ſlightly bifid, nodding. *Piſt.* germ ſubglobular, on a receptable marked with ten dots; ſtyle cylindric, the length of the corolla; ſtigma thickiſh, obtuſe. *Per.* berry roundiſh, five-celled; ſeeds ſmall, bony.

Eſſ. Gen. Char. *Cal.* five-parted. *Cor.* ovate, diaphanous at the baſe. *Capſ.* five-celled.

Species, 1. A. *unedo*, common ſtrawberry-tree; ſtem arboreous; leaves oblong-lanceolate; panicles ſmooth, nodding. This tree riſes to the height of twenty or thirty feet and uſually puts out branches very near the ground. It is in conſtant verdure; for, during the whole winter, it retains it leaves till puſhed off by thoſe which appear in the ſpring. In the months of October and November, the arbutus makes a very beautiful appearance, as, at this time, its freſh flowers and fruit of the preceding year are in their utmoſt perfection: hence it becomes a very deſirable tenant in ſhrubberies, producing a pleaſing contraſt with moſt other plants, whoſe ſeaſon of beauty is paſt. Mr. Aiton enumerates the following varieties, viz. α. Common white-flowered ſtrawberry-tree. β. Red-flowered ſtrawberry-tree. γ. Double-flowered ſtrawberry-tree. Beſides theſe varieties the nurſerymen make others founded upon the ſhape and ſize of the leaves. It is a native of the ſouth of Europe and of Aſia. This arbutus, we are told, is alſo a native of ſome parts of Ireland, eſpecially about the lake Killarney. 2. A. *laurifolia*, laurel-leaved ſtrawberry-tree; ſtem arboreſcent; leaves oblong, acuminate, ſharply ſerrate, ſmooth; racemes axillary, one-ranked, ſeſſile, ſolitary. This is very like the common arbutus, but differs in its ſharp cuſpidate ſerratures, and its axillary, very ſimple racemes, ſhorter than the leaves, with the flowers all directed the ſame way. A native of North America. 3. A. *andrachne*, oriental ſtrawberry-tree; ſtem arboreous, leaves ovate, entire, and ſerrate; panicles pubeſcent, erect. This alſo has ſome reſemblance to the common arbutus, but the bark is not rough; ſome of the leaves are not ſerrate; the panicle is viſcid. It grows to a middle-ſized tree, with large ſmooth leaves. The flowers reſemble thoſe of the firſt ſpecies, but grow more thinly on the branches. The fruit is oval, and the ſeeds flat. It grows abundantly in the Eaſt, about Magneſia. Cultivated in 1724, by Dr. Sherard, at Eltham. 4. A. *ferruginea*, long-flowered ſtrawberry-tree; ſtem arboreſcent; leaves oblong, obtuſe, ſmooth, entire; racemes terminal. Branches ſingular, ſmooth; leaves alternate, petioled; racemes axillary, ſolitary, terminating the branches; flowers remote, nodding, longer than thoſe of the other ſpecies. Found in America by Mutis. 5. A. *mucronata*, pointed-leaved ſtrawberry-tree; ſtem ſhrubby; leaves alternate, ovate, ſerrate, pointed; peduncles axillary, one-flowered. This is a very ſtiff ſhrub.

Leaves

Leaves flat, ſtiff, cartilaginous at the edge, with four ſerratures on each ſide, on very ſhort petioles; pedunceles ſingle, one-flowered. Found in Terra del Fuego, by Back. 6. A. *pumila*, dwarf ſtrawberry-tree; ſtems diffuſed; leaves alternate, diſtich, oblong, entire; flowers lateral, ſolitary. A low ſhrub, with leaves like thoſe of *Empetrum*, very ſmooth above, keeled beneath. It is a native of the ſame country as the fifth ſpecies. 7. A. *acadienſis*. Acadian ſtrawberry-tree; ſtems procumbent; leaves ovate, ſubſerrate; flowers ſcattered: berries many-ſeeded. A ſmall ſhrub with ſlender trailing branches. Flowers in thin looſe bunches, axillary. It grows in Acadia and other northern parts of America, affecting ſwampy land. 8. A. *alpina*, black-berried alpine arbutus; ſtems procumbent; leaves rugoſe, ſerrate. Branches trailing, flat on the ground; leaves alternate, oval, ſlightly ſerrate, reticulated underneath, wrinkled above; flowers in reflex cluſters, white, each ſtanding upon a ſingle ſhort peduncle; berries globular, on a ſmall blood-red calyx, about the ſize and, when ripe, the colour of a ſloe. It grows in alpine ſituations in the northern parts of Europe; and with us, on many of the highland mountains of Scotland. 9. A. *uva urſi*, bear-berry or trailing arbutus; ſtems procumbent; leaves entire. Branches trailing upon the ground to the extent of two or three feet round the root; leaves like thoſe of the preceding ſpecies, firm and rigid like thoſe of box; flowers of a fleſh-colour, in ſmall cluſters at the ends of the branches, upon ſhort red peduncles; berries, when ripe, are red, and of the ſize of a holly-berry. Common in many mountainous parts of the continent, and in the north of England and Scotland. Eng. Bot. 714. W. Med. Bot. 70. The leaves of this plant, about the middle of the laſt century, acquired great celebrity, not only for their efficacy in gravelly complaints, but in almoſt every other to which the urinary organs are liable, as ulcers of the kidneys and bladder, cyſtirrhœa, diabetes, &c. Among the numerous phyſicians who extolled the virtues of uva urſi in calculous complaints, De Haen may be conſidered the principal, and upon his authority it has been much uſed in this country; but in no inſtance does it appear to have produced that eſſential or permanent relief which is ſaid to have been experienced by the German phyſicians. The leaves of this plant are powerfully aſtringent, and the advantage they have occaſionally afforded in gravelly pains is now wholly aſcribed to this quality. They are uſually given in powder from a ſcruple to a dram, two or three times a day. This plant has been uſed in tanning leather, and alſo in dying an aſh-colour. 10. A. *thymifolia*, thyme-leaved arbutus. Aiton. Hort. Kew; ſtems procumbent; leaves oval, acute, obſcurely ſerrate, ſtrigoſe underneath; flowers axillary, eight-ſtamened. This has the ſtructure of the *vaccinium oxycoccus*, or cranberry, but all the parts are larger. The ſtem is imbricate, with briſtle-ſhaped ſcales. A native of North America, in ſwamps; and extremely abundant there. The berries are brought to market at Philadelphia late in autumn, and uſed for tarts and other kinds of paſtry. Conſiderable quantities of them are exported to Europe and the Weſt Indies. They are much uſed by our paſtry-cooks in London, though thought to be inferior to the cranberries of Britiſh growth. The plant was introduced by Dr. Fothergill in 1776.

Arbutus, *trailing*. See Epigæa.

Arbutus, in *Ornamental Gardening*, is applied to a genus of plants, the different ſpecies of which ſupply the fineſt evergreens for the principal ſituations in ſhrubberies and pleaſure-grounds. They are ſuch as may be ſet out in the open ground or in pots, but in whatever mode of planting it is deſigned to employ them, they ſhould be placed in ſo detached a manner, as to appear conſpicuous at all times, and be permitted to take their own natural growth. The beſt ſeaſon for tranſplanting all ſorts of theſe ſhrubs is in the end of September or October and beginning of November, or in March and April.

The propagation of the different ſpecies is effected moſt commonly by ſeed; they will, however, ſometimes grow by layers and cuttings, though in the latter mode rather more reluctantly; but the ſeed grows freely, from which the handſomeſt plants are frequently obtained. To continue the double-bloſſomed and ſcarlet kinds with certainty, it muſt be done either by layers, cuttings, grafting, or inarching, as theſe varieties will not retain their difference if continued from ſeed. From the ſeed of either the common oval or round-fruited kinds ſome of both ſorts may be expected; but that of the former is rather to be preferred for ſowing. The berries containing the ſeed may be had of the nurſerymen and ſeedſmen in October, November, and Spring; and the ſeeds may either be ſown in pots in autumn, and ſheltered in a frame all winter, or be preſerved in dry ſand until March, and then ſown in pots of light dry earth, and covered about a quarter of an inch deep; if the pots are then plunged into a hot-bed, it will ſo greatly forward the germination of the ſeed, that the plants will riſe in a month or ſix weeks; when they muſt have plenty of air admitted to them, moderate waterings, and be inured by degrees to the full air in ſummer, at which ſeaſon the pots ſhould be plunged into the common ground until October, and then be ſet in a green-houſe or frame, to have ſhelter from the froſt, till March, at which time it is adviſable to tranſplant the ſeedlings ſingly into ſmall pots, which if directly plunged into a ſlender hot-bed, ſhielded and ſhaded occaſionally with mats, giving moderate waterings, they will quickly take root, when the pots may be plunged into a bed of common earth in a ſheltered place, to remain two or three years, indulging the plants with larger pots and protection from ſevere froſts, till they are two or three feet high; then tranſplanting them with balls of earth about their roots into the full ground.

To propagate them by layers, the young ſhoots muſt be employed, otherwiſe they rarely emit roots in leſs than two years. Cuttings will ſend out roots by the aid of heat; in this view plant a number of the ſhort young ſhoots in pots in ſpring and ſummer, and plunge them into a ſubſtantial hot-bed of tan and dung.

Inarching or grafting is performed in the uſual way upon ſtocks of any of the varieties. See Ingrafting, and Inarching.

ARC, Arch, or Ark, formed of *arcus*, *a bow*. See Arch and Ark.

Arc, *Joan of*, in *Biography*, called alſo "the Maid of Orleans;" an extraordinary heroine, was the daughter of a peaſant of Domremi, near Vaucouleurs, on the borders of Lorrain, and born about the beginning of the 15th century. At the age of twenty-ſeven years, ſhe was ſervant in a ſmall inn, where ſhe was accuſtomed to tend horſes, and to perform other menial offices which commonly fall to the ſhare of men-ſervants. About this time king Charles VII. was reduced to the moſt diſtreſſed condition by the Engliſh; but the ſiege of Orleans, which was bravely defended by the garriſon and inhabitants, in ſome meaſure retarded their progreſs. Joan partook of the feelings of ſympathy with the beſieged, that very generally prevailed, and determined to make ſome effort for relieving her ſovereign in his preſent diſtreſſes. Whilſt ſhe was indulging theſe feelings, her enthuſiaſm led her to fancy that ſhe ſaw viſions and heard voices exhorting her to reeſtabliſh the throne of France, and to expel the foreign invaders.

vaders. Under the ſtrong impulſe of paſſion and of imagined inſpiration, ſhe obtained admiſſion to Baudricourt, the governor of Vaucouleurs, who after being informed of her inſpiration and intentions, treated her for ſome time with neglect; but, in conſequence of her renewed and importunate ſolicitations, he gave orders that ſhe ſhould be conducted to the French court, which then reſided at Chinon. It is pretended that Joan, immediately on her admiſſion, knew the king, though ſhe had never ſeen his face before, and though he purpoſely kept himſelf in the crowd of courtiers, and laid aſide every thing in his apparel that might ſeem to diſtinguiſh him; and that ſhe offered, in the name of the ſupreme creator, to raiſe the ſiege of Orleans, and to conduct him to Rheims to be there crowned and anointed. In order to remove his doubts of her miſſion, it is ſaid, that ſhe diſcloſed a ſecret, known only to himſelf, and which ſhe muſt have derived from heavenly inſpiration. She alſo demanded, as the inſtrument of her future victories, a particular ſword which was kept in the church of St. Catharine of Fierbois, and which, though ſhe had never ſeen it, ſhe deſcribed by all its marks, and by the place in which it had long lain neglected. Her intrepid and determined mode of addreſs excited attention, and gained confidence; and ſhe was referred to matrons for proofs of her virginity, and to doctors of the church for evidence of her inſpiration; their report being favourable, ſhe was ſent to the parliament at Poictiers; but they, conſidering her as inſane, demanded from her a miracle. Her reply was, that ſhe would ſoon exhibit one at Orleans. Accordingly ſhe was at length completely armed, mounted on horſeback in the preſence of the multitude, and ſent amidſt the loudeſt acclamations to join the army deſtined to the relief of Orleans. Upon joining the army, conſiſting of 10,000 men, ſhe ordered all the ſoldiers to confeſs themſelves before they ſet out on the enterpriſe; ſhe baniſhed from the camp all women of bad fame; ſhe diſplayed in her hands a conſecrated banner, repreſenting the Supreme Being as graſping the globe of earth, and ſurrounded with flower de luces; and after thus communicating to the ſoldiers a great degree of that enthuſiaſm by which ſhe herſelf was actuated, ſhe advanced towards Orleans. The Engliſh beſiegers were overawed by her orders and menaces, dictated in the name of the Almighty Creator; and ſhe entered Orleans arrayed in her military garb, and diſplaying her conſecrated ſtandard, and was received by all the inhabitants as a celeſtial deliverer. The convoy approached without finding any reſiſtance on the part of the beſiegers; the waggons and troops paſſed without interruption between the redoubts of the Engliſh; and a dead ſilence and aſtoniſhment reigned among thoſe troops, formerly ſo elated with victory, and ſo fierce for the combat. Joan, having thus far ſucceeded, ordered the garriſon, at the ſame time encouraging them with the promiſe of heavenly aſſiſtance, firſt, to attack the Engliſh redoubts, in which meaſure they were ſucceſsful; and then to fall upon the main body of the Engliſh in their entrenchments. In one of theſe latter attacks the French were repulſed, but the intrepid maid led them back to the charge and overpowered the Engliſh. In one of theſe attacks, ſhe was wounded in the neck with an arrow; but retreating behind the aſſailants, ſhe pulled it out with her own hands, had the wound quickly dreſſed, and haſtened back to head the troops, and to plant her victorious banner on the ramparts of the enemy. In conſequence of theſe ſucceſſes, attended with a loſs to the Engliſh of more than 6000 men, their courage and confidence gave way to amazement and deſpair. The French, in order to magnify the wonder of all theſe proſperous events, repreſent the maid, as not only active in combat, but as performing the office of general; directing the troops, conducting the military operations, and ſwaying the deliberations in all the councils of war. But whatever the policy of the French court might ſuggeſt for maintaining this opinion among the multitude, it is much more probable that this unexperienced country girl was prompted in all her meaſures by the wiſer commanders. Having raiſed the ſiege of Orleans, Joan now inſiſted that ſhe ſhould proceed to the accompliſhment of the ſecond part of her promiſe, which was that of crowning the king at Rheims. The king, accompanied by the victorious maid, marched at the head of 12,000 men towards Rheims; receiving the ſubmiſſion of the towns through which he paſſed; till at length arriving near Rheims, a deputation met him with the keys of the city, and he was admitted into it with tranſport. Here the ceremony of his coronation was performed with the holy oil of Clovis; and the maid ſtood by his ſide in complete armour, and diſplayed her ſacred banner. When the ceremony was finiſhed, ſhe threw herſelf at the king's feet, embraced his knees, and with a flood of tears ſhe congratulated him on this ſingular and marvellous event. Charles teſtified his gratitude by ennobling the family of Joan, giving it the name of *du Lys*, probably in alluſion to the lilies of her banner, and aſſigning to her a ſuitable eſtate in land. Having accompliſhed both the objects which ſhe had propoſed, the maid of Orleans expreſſed her wiſh to return to her former condition, and to the occupation and courſe of life which became her ſex: but the French general Dunois urged her continuance with the army, till the Engliſh ſhould be completely expelled, and her predictions fully accompliſhed. Overpowered by his advice, ſhe threw herſelf into the town of Compiegne, which was then beſieged by the duke of Burgundy and the Engliſh; where, on a ſally, having twice driven the enemy from their entrenchments, and finding their number increaſing, ſhe ordered a retreat; but was deſerted by her friends, ſurrounded by the enemy, and taken priſoner by the Burgundians. Inſtead of treating Joan as a priſoner of war, with the courteſy and good uſage, to which, as ſuch, ſhe was entitled, and which civilized nations practiſe towards enemies on occaſions of this kind, ſhe was purchaſed from the captors by the regent duke of Bedford, and a criminal proſecution was inſtituted againſt her on the charges of ſorcery, impiety, idolatry, and magic. The clergy in his intereſt, and even the univerſity of Paris, concurred in the accuſation. An eccleſiaſtical commiſſion was held at Rouen for her trial, and the maid, clothed in her former military apparel, but loaded with irons, was produced before this tribunal. Her trial laſted four months; and in the courſe of that time, many captious interrogatories were put to her, which ſhe anſwered with firmneſs and dignity. Upon being aſked, whether ſhe would ſubmit to the church the truth of her pretended viſions, revelations, and intercourſe with departed ſaints? ſhe replied, that ſhe would ſubmit them to God, the fountain of truth: and when ſhe was charged with being a heretic, and denying the authority of the church, ſhe appealed to the pope; but her appeal was rejected. When ſhe was aſked, why ſhe put her truſt in her ſtandard, which had been conſecrated by magical incantations? ſhe anſwered, that ſhe put her truſt in the Supreme Being alone, whoſe image was impreſſed upon it. When it was demanded, why ſhe carried in her hand that ſtandard at the unction and coronation of Charles at Rheims? ſhe replied, that the perſon who had ſhared the danger was entitled to ſhare the glory. When ſhe was accuſed of going to war, ſhe ſcrupled not to declare, that her ſole purpoſe was to defeat the Engliſh, and to expel them the kingdom. In the iſſue, however, ſhe

was

was condemned for all the crimes of which ſhe had been accuſed, aggravated by hereſy, her revelations were declared to be inventions of the devil to delude the people; and ſhe was ſentenced to be delivered over to the ſecular arm. At length her reſolution failed her; and through dread of the puniſhment to which ſhe was ſentenced, ſhe declared that ſhe was willing to recant; and, accordingly, ſhe acknowledged the illuſion of thoſe revelations which the church had rejected; and ſhe promiſed never more to maintain them. Upon this her ſentence was mitigated; and ſhe was condemned to perpetual impriſonment and to be fed during life on bread and water. But with this vengeance her enemies were not ſatisfied. In order to juſtify the ſevereſt meaſures againſt her, they inſidiouſly placed in her apartment a ſuit of men's apparel; upon the ſight of this garb, in which ſhe had acquired ſo much renown, and aſſumed, as ſhe once believed, by the appointment of heaven, her former ideas and paſſions revived, and ſhe ventured in her fortitude to put on the forbidden dreſs. In this apparel ſhe was detected; it was regarded as a relapſe into hereſy; her recantation became void; her partial pardon was revoked; and ſhe was to be burned in the market-place of Rouen. In June 1431, this barbarous ſentence, much more ignominious to thoſe who inflicted it than to her who was the object of it, was executed. "This admirable heroine, to whom the more generous ſuperſtition of the ancients would have erected altars, was, on pretence of hereſy and magic, delivered over alive to the flames, and expiated, by that dreadful puniſhment, the ſignal ſervices which ſhe had rendered to her prince and to her native country." She met her fate with reſolution, and the Engliſh themſelves beheld the ſcene with tears. The king made no effort for avenging her cauſe; he merely procured a reviſion of the proceſs, and a reſtoration of her memory ten years afterwards by the pope, in an act which ſtyled her a "Martyr to her religion, her country, and her king." Her countrymen, more prompt in the tribute of their reſpect, propagated many tales relating to her execution; and ſome of them would not even allow her to be dead, but profeſſed to expect her ſpeedy return to conduct them again to victory. Of the character and conduct of this ſingular heroine, the moſt probable opinion is, that of her being an honeſt and deluded enthuſiaſt, of whoſe fancies and paſſions the principal perſons in the intereſt of Charles availed themſelves for deluding and rouſing into exertion the paſſions of the people, at a criſis of peculiar importance; in which the maid of Orleans was inſtrumental in giving a deciſive turn to the conteſt between the French and Engliſh. The exploits of Joan of Arc have been celebrated both in proſe and verſe. Of the latter, the ſerious poem of Chapelain has been much leſs ſucceſsful than the burleſque and licentious one of Voltaire; but the injury done by it to her memory has been in ſome degree repaired in England, by Southey's ſublime and ſpirited poem of "Joan of Arc," which exhibits her in the brighteſt colours of virtue and heroiſm. Hume's Hiſt. of Engl. vol. iii. p. 141, &c. Nouv. Dict. Hiſtor. art. *Jéanne.*

ARC, in *Geography*, a rapid river of Savoy, which riſes in the northern part of mount Cenis, on the confines of Aoſta, traverſes the country of Marienne, and diſcharges itſelf into the Iſere about four miles from Montmelian.

ARC, or *Ar*, a river of France, riſes on the ſide of Porciouls, traverſes the plain of Pourieres, where Marius defeated the Cimbri; paſſes by Aix, and loſes itſelf in the lake of Martigues in the department of the mouths of the Rhone. Some have ſuppoſed this to be the *Canum flumen* of Ptolemy.

ARC *en Barrois*, a town of France, in the department of the Upper Marne, and chief place of a canton in the diſtrict of Chaumont, fourteen miles north-weſt of Langres. The place contains 1768, and the canton 5,735 inhabitants: the territory includes 205 kilometres, and 9 communes.

ARC *ſur Tille*, a town of France, in the department of the Côte d'Or, and chief place of a canton in the diſtrict of Dijon, on the river Tille, ſeven miles eaſt-north-eaſt of Dijon.

ARCA, in *Ancient Geography*, a town of Aſia in Meſitene on the weſt of the river Melas, and towards 37° 50′ N. lat.

ARCA, a town of Phœnicia, at the foot of mount Libanus, between Antaradus and Tripoli, upon a ſmall river about half a league from the ſea coaſt. This was the city of the Arkites, who were the offſpring of Canaan, and ſaid by ſome to have been founded by Arac, one of his ſons. The inhabitants conſecrated a temple in this place to Alexander the Great; and the city was denominated in honour of the Roman Emperors, and on account of its ſituation, "Cæſarea of Libanus," which name, as is ſeen in medals, it had borne about a century before the time of Alexander Severus. Shaw, in his travels (p. 270) ſpeaks of the ruins of Arca, and ſays, that the ſituation of this ancient city was very delightful; having to the north the proſpect of an extenſive plain, diverſified with a great variety of towns and villages, ponds and rivers; to the weſt the ſun might be ſeen ſetting in the ſea, and to the eaſt riſing over a long and diſtant chain of mountains. The citadel was erected upon the ſummit of an adjacent mount of a conical form, and muſt in former times have been impregnable. Water was conveyed from the mountains to the city by an aqueduct, whoſe principal arch could not have been leſs than 100 feet in diameter.

ARCA, *Cape d'*, in *Geography*, lies on the coaſt of Africa, E. S. E. from the N. E. end of the iſland of Forteventura, the moſt ſoutherly of the Canaries. It is about N. lat. 27° 15′, and W. long. 12° 10′.

ARCA *cordis* is uſed by ſome *Anatomiſts*, to denote the PERICARDIUM.

ARCA, in *Conchology*, a *genus* of Bivalves, the animal of which is ſuppoſed to be a *Tethys*: the valves are equal; and the hinge beſet with numerous ſharp teeth, inſerted between each other. The ſpecies are arranged in two ſections, viz. the firſt has an entire margin, and in the other the margin is crenulated: each of theſe ſections is ſubdivided into two parts, the firſt having the beaks recurved, and in the ſecond they are inflected. The ſpecies enumerated by Gmelin are, tortuoſa, noae, barbata, modiolus, pella, ovata, pellucida, roſtrata, ſtriata, pulchella, afra, foſſilis, cancellata, minuta, lactea, noduloſa, antiquata, ſenilis, granoſa, corbicula, decuſſata, aequilatera, pallens, cucullus, magellanica, reticulata, candida, indica, jamaicenſis, campechienſis, lata, ſenegalenſis, undata, pectunculus, pectinata, glycymeris, piloſa, nummaria, nucleus, rhomboidea, marmorata, anguloſa, ſcapha.

ARCADE, in *Architecture*, is uſed to denote any opening in the wall of a building formed by an arch.

ARCADES, or *Arcadia*, in *Ancient Geography*, a town on the weſt ſide of the iſland of Crete.

ARCADIA was one of the ſix diſtricts into which the Peloponneſus was divided. Its name is ſaid to have been derived from Arcas their fourth king; and it was anciently called Pelaſgi, being inhabited by the Pelaſgi, who boaſted of their deſcent from Pelaſgus. The Pelaſgians were found in ſeveral parts of Greece; but their chief and primitive ſeat is generally ſuppoſed to have been Arcadia, whoſe inhabitants are univerſally allowed to be the moſt ancient people in Greece. Bounded on the north by Elis, on the eaſt by Argolis, on the ſouth by Laconia, and on the weſt by Meſſenia, Arcadia occupied a central ſituation, and was the only diſtrict of the Grecian peninſula which was not mari-

time. It conſiſted chiefly of mountainous regions, emboſoming vallies which were often interſected by rivers and ſtreams; but in certain places there deſcended from the mountains too abundant waters, which finding no outlet in the plain, ſuddenly precipitated themſelves into profound gulphs, purſued their courſe for ſome diſtance through ſubterraneous caverns, and at length burſt forth and again appeared above the earth. The ſoil, in moſt parts extremely fertile, was peculiarly favourable to paſturage, and nouriſhed a race of herdſmen who, like other highlanders, invigorated by the exerciſe and efforts which the rugged ſcenes of their occupations often required for ſubſiſtence, and emboldened by the dangers of the chaſe, encountered not merely for amuſement but for the ſecurity of their flocks, were ſtrong and courageous; and their courage was increaſed by the confidence which the natural bulwarks of their country afforded againſt foreign invaſion.

Arcadia was divided into upper and lower, the former on the north, and the latter on the ſouth; and this which was the moſt mountainous of the two, was famous for its breed of horſes and aſſes, whence the laſt of theſe animals was denominated the Arcadian nightingale. Both theſe diſtricts abounded with cities, of which the following have been recorded, viz. Megapolis, now Leontari, Mantinea, now Goriza, Palantium, Mœnalus, Tegea, Orchomenon, Clitorium, Nonacris, Pſophis, now Dimazana, Heræa on the river Alpheus, Stymphalus on the lake and river of its name, in which there was a temple of Minerva, and Phialia or Phigala on the river Neda. The chief mountains were Cillene, Pholoe, now Xiria, Stymphalus, now Poglifi, Parthenius, and Lycæus, called alſo Olympus, by Pauſanias Ceraufius, and by the preſent inhabitants Mitena.

At firſt the Arcadians were a ſavage people, living in the woods and fields, and feeding promiſcuouſly on the products of the ground. At laſt they were taught by Pelaſgus, the founder of their monarchy, to build huts, to live ſociably, to exchange their common food for nuts, acorns, or beech-maſt, and to clothe themſelves with the ſkins of wild beaſts. They began afterwards to feed cattle, being invited to it by the fertility of their ſoil. The ſhepherds of Arcadia, amidſt their numerous flocks and herds, were diſtinguiſhed by the tuneful ſtrains of their vocal and inſtrumental muſic, and for the worſhip which they paid to their god Pan.

Affording few temptations to commercial adventures, they had very little of the intercourſe of peace with ſurrounding principalities. The ſecure and inſulated poſition of their territory long preſerved the Arcadians, on the one hand unimproved by the advancing refinement of Grecian civilization, and on the other uninfected by Grecian degeneracy; and when other ſtates had exhibited the higheſt exertions of genius, and were advanced to eminence in the arts, accommodations, and luxuries of life, the Arcadians were diſtinguiſhed by the innocent ſimplicity of their manners and by their fond attachment to paſtoral retirement. "The exuberant fertility (as Dr. Gillies obſerves), the inland ſituation, the generous warmth, yet lively verdure, together with the picturefque and animating ſcenery of this delightful region, ſeemed peculiarly adapted to inſpire, and to gratify, the love of rural happineſs; and to afford in all their elegance and dignity, thoſe ſublime and ſacred joys of the country, which the genius of ancient poets hath felt and deſcribed with ſuch affecting ſenſibility."

Lycaon, the ſon of the founder of the Arcadians, improved what his father had done towards civilizing them, by introducing among them the worſhip of Jupiter. Each of his ſons built a city, which they called reſpectively by their own names; in them the people acquired the habits of ſocial life; and in the next reign they began to ſow corn, make bread, ſpin wool, and manufacture cloth for garments; ſo that in four generations, the Arcadians, from being but one remove from wild beaſts, became civilized, induſtrious, inured to ſociety, huſbandry, and a regular police.

Arcadia, like other ſtates of Greece, was anciently governed by kings. Of theſe kings they reckon twenty-five from Pelaſgus, the founder of their monarchy, to Ariſtocrates II. with whom it terminated. This laſt king was murdered by his ſubjects for his treachery to the Meſſenians his allies, whom he betrayed to the Spartans, then at war with them. This event happened in the firſt year of the 28th olympiad, or the 668th year before Chriſt; and if Pelaſgus was contemporary with Cecrops, the founder of Athens, as Sir Iſaac Newton ſuppoſes, and we refer him, with Blair in Tab. ii. of his Chronology, to the year 1556 before Chriſt, the duration of the Arcadian monarchy will be about 888 years. But about the commencement of this period there is a conſiderable difference of opinion among chronologers. However this be, the kings of Arcadia poſſeſſed only limited authority, but afterwards conſtructed a federal republic, of which the ſeveral departments ſent reſpectively deputies to the ſtates general. With ſuch manners, and a form of policy ſo well adapted to virtuous ſimplicity and a moderate extent of territory, the Arcadians, while they adhered to their innocent purſuits and occupations, were contented and happy.

But the ambition of neighbouring ſtates, and eſpecially the rivalry of the two chief powers of Greece, Athens and Sparta, which involved intermediate and adjacent countries in their contentions, reached the mountains of Arcadia, and compelled the inhabitants frequently to change the crook for the ſword. When obliged by neceſſity, or excited by honour, the Arcadian Iſlanders took the field, they diſplayed ſuch ſtubborn valour, and exerted ſuch efforts of vigour and activity, as made their ſervices eagerly deſired, and purchaſed with emulation, by the ſurrounding ſtates. They commonly appeared clad with the ſkins of wolves and bears, and carried either a little bundle of javelins, or a lance in their hands, which they uſed with a peculiar dexterity. Their women alſo became at length ſuch expert warriors, that they have ſometimes by their ſeaſonable ſuccour decided a doubtful victory. Hence ſuch offers were made to them as induced many, when their own country was at peace, to ſerve as mercenaries in foreign armies. The warfare in which the Arcadians were engaged, firſt from neceſſity, and afterwards from choice, made a very important change in their internal ſituation. From farms and villages they aſſembled into walled towns; they fortified Tegea, and afterwards Mantinea.

The Arcadians of Tegea joined the Grecian patriots of Athens and Sparta, in vindicating the freedom and independence of their native land againſt the attempts of oriental deſpotiſm, and bore an important ſhare in the battle of Platæa, which conſummated the victories of liberty. In the Peloponneſian war, Arcadia, ſituated between the contending parties, was involved in their hoſtilities. The Spartans, after having vanquiſhed their principal rival, endeavoured to ſubjugate the Arcadians, but though ſometimes victorious, yet they were never completely ſucceſsful. At length, after the peace of Antalcidas had withdrawn their chief enemies from the field, they directed their efforts againſt Mantinea, and, that city, become the capital of Arcadia, was after a gallant defence compelled to ſubmit. The Arcadians however were not ultimately ſubdued; Epaminondas, in vindicating the liberties of his own country, aſſerted the independence of other ſtates againſt the overbearing domination of Sparta. In the

firſt invaſion of Laconia, the Arcadians joined the puniſher of their imperious oppreſſors. Now ſo much accuſtomed to the conflicts of war, they alſo partook of its rapacity, and inſtead of the honeſt ſimplicity of ſhepherds, imbibed the plundering ſpirit of mercenary ſoldiers. Auxiliaries to the Theban hero, they had profited by his ſucceſs: encouraged by their advantages, and the depreſſion and diſtreſs of Sparta, they gave ſcope to their ambition, and planned the ſubjugation of the whole peninſula. Acquiring the policy as well as views of their changed national character, to pave the way for the total conqueſt of the Peloponneſus, they began by wreſting ſeveral places from the Elians, the leaſt warlike and moſt wealthy of their neighbours. But the ardour of rapacious avarice operating with too much violence and precipitation, by rouſing confederate reſiſtance, ultimately defeated the purpoſes of ambition. Injuſtice and robbery they aggravated by impiety and ſacrilege; they directed their depredations againſt the temple of Olympia, containing the collected treaſures of many centuries, the rich gifts of vanity and ſuperſtition. Not only neighbouring powers but many of their own countrymen cenſured this ſpoliation; internal diſcord aroſe between the plunderers and thoſe who reprobated the deed, and their ſchemes of boundleſs aggrandiſement proved abortive. The Arcadians now intermingling ſo much in the wars and intrigues of the Grecian ſtates, accompanied them in their declenſion from patriotiſm to ſelfiſh corruption, from corruption to enervation and the decay of military proweſs, until they became dependent and tributary appendages of the Macedonian kings, and afterwards provinces of the Roman empire. Since that time all traces of Arcadia are loſt, and the country is only known as a part of the Grecian or the Turkiſh empire. Several colonies of Arcadians migrated at different periods from their own country, and ſettled in Latium; and may therefore be juſtly reckoned among the firſt inhabitants of Italy. Pauſanias in Arcad. lib. viii. oper. p. 511. ed. Kuhnii. Anc. Un. Hiſt. vol. v. p. 64, &c.

Arcadia, or Cyparissa, in *Geography*, a ſea-port town of European Turkey, in the Morea, ſituate on a gulf to which it gives name, open to the Mediterranean ſea, ſix leagues to the north of Navarin. N. lat. 37° 24′. E. long. 21° 42′.

ARCADIUS, in *Biography* and *Hiſtory*, an emperor of the eaſt, and eldeſt ſon of Theodoſius the Great, was born in Spain, A.D. 377, and inveſted by his father with the purple at the age of ſix years, A.D. 383. At his death, in 395, Theodoſius divided the empire between his two ſons, Arcadius and Honorius; allotting to the former Thrace, Aſia Minor, Syria, and Egypt, with Dacia, Macedonia, and half of Illyricum. Arcadius poſſeſſed none of thoſe qualities that were adapted to his ſtation, and to the extenſive dominion which was aſſigned him; and he had the misfortune, at the commencement of his reign, to be under the direction of his father's unworthy favourite, Rufinus, whoſe ambition led him to aſpire to the ſovereignty itſelf. In order the more effectually to ſecure his influence over the young prince, he concerted a marriage between Arcadius and his daughter: but the eunuch Eutropius contrived to attach the emperor's affections to Eudoxia, and he was married to her in the firſt year of his reign. Rufinus being cut off by an untimely death, Eutropius, who was even a worſe man than Rufinus, ſucceeded to the miniſterial power, and by fraud or violence, removed from the view of Arcadius all thoſe in whom he placed any confidence. This miniſter, however, did not long enjoy the power which he acquired by artifice, and which he exerciſed merely to ſerve the purpoſes of his own ambition and avarice. Having fomented diſcord between Arcadius and his brother Honorius, and perſuaded Gildo to transfer the allegiance of Africa from the latter to the former, he cauſed the emperor A. D. 397, with a view to his own ſecurity and that of his adherents, to paſs an unjuſt and cruel law of treaſon, extending the crime to all practices againſt the miniſters and officers of the ſovereign, and the puniſhment of it to deſcendants. His power was at length overthrown by the rebellion of Tribigild, the Oſtrogoth, A. D. 399, and by the concurring influence of the empreſs Eudoxia, by whom he was ſucceeded in the abſolute direction and government of the feeble Arcadius. She aſſumed the title of "Auguſta," and had her image borne through all the provinces of the empire, which was honoured with the reſpect beſtowed on that of the emperor himſelf. By her perſecution of the venerable Chryſoſtom, who was baniſhed and died in exile, becauſe he too freely expoſed the vices of the court, and of the empreſs, Eudoxia excited diſturbances at Conſtantinople; but in the bloom of youth ſhe died of a miſcarriage, A. D. 404. Arcadius ſurvived her a few years, and witneſſed the calamities that were accumulating on the eaſtern empire. At length in his thirty-firſt year, he died at Conſtantinople; A. D. 408, after having reigned twelve years with his father, and nearly fourteen years after his death. He had one ſon, viz. Theodoſius, who at the time of his deceaſe was eight years of age, and four daughters. Arcadius was a prince of very moderate talents; being indolent, and alſo addicted to pleaſure, he was ſhamefully impoſed upon, and entirely governed by his miniſters and the empreſs, who, under the ſanction and by an abuſe of his authority, oppreſſed the people in the moſt deſpotic and tyrannical manner. "It is impoſſible," ſays Mr. Gibbon, "to delineate his character; ſince, in a period very copiouſly furniſhed with hiſtorical materials, it has not been poſſible to remark one action that properly belongs to the ſon of the great Theodoſius."

The ſuppoſed teſtament of Arcadius, by which he appointed Jezdegerd, the Perſian monarch, guardian of his ſon, and which is mentioned by Procopius, is not authenticated by any ſufficient evidence. Anc. Un. Hiſt. vol. xiv. p. 324—356. Gibbon's Hiſt. vol. v. p. 372. 412.

Arcadius, in *Entomology*, a ſpecies of Papilio (P. Nymph. Fab.) The wings are very entire; the anterior ones black with blue and white ſpots; poſterior ones fuſcous, beneath cheſnut-brown. This kind inhabits Africa. Fabricius. Obſ. Gmelin overlooked this new ſpecies in his Syſt. Nat.

ARCÆ *Cuſtos*, in *Eccleſiaſtical Antiquity*, a title formerly given to the archdeacon, on account of his having the cuſtody of the church's cheſt, or treaſure.

ARCAGANTES, in *Ancient Geography*, called alſo Liligantes and Limigantes, were Sarmatians, who, being expelled their own country, took poſſeſſion of ſome parts of the Roman territory.

ARCALU, in *Geography*, the name of a ſmall principality of the Tartar Moguls, on the river Hoamko; where the great wall of China commenced.

ARCAN, a town of Aſia, in Tartary, upon the frontiers of Mawaralnahra, ſituate upon the river Caſſima, and called alſo Adercand.

ARCANE, a ſmall town of Aſiatic Turkey, in Natolia, upon the coaſt of the Black Sea, between Seriape, or Sinape, and the Cape Piſello.

ARCANGIS, in the *Turkiſh Armies*, an inferior kind of infantry, which ſerve as *enfans perdus*, and to haraſs and pillage the enemies' frontiers.

The Arcangis are an order inferior to the Janizaries;

and, when any of them diſtinguiſh themſelves, are uſually preferred in the Janizaries order. They have no pay, but are to ſubſiſt on their plunder.

ARCANI, in *Geography*, a town of Mingrelia, at the mouth of a river of the ſame name, ſuppoſed to be the ancient Apſarrus.

ARCANIUS, in *Entomology*, a ſpecies of PAPILIO (Dan. Faſt.). The wings are very entire, ferruginous beneath, on the anterior pair one ocellated ſpot; on the poſterior pair five, the firſt of which is ſeparated from the others by a band. Fabricius. This is *Papilio Amyntas* of Scopoli and Poda, and inhabits Europe. It is produced from a green larva, which has an obſcure line along the back, is yellow on the ſides, and bidentated at the tail.

ARCANNA, a kind of red chalk, called by phyſiologiſts *rubrica fabrilis*, as being uſed by carpenters to colour their lines for marking timber, &c.

ARCANO, in *Geography*, a town of Italy, belonging to the Venetian ſtates, in the province of Friuli, eleven miles weſt of Udina.

ARCANUM literally ſignifies a *ſecret*; and is therefore very pertinently applied by quacks and impoſtors in medicine, who conceal their ignorance and fraud under the pretence of ſecrecy. Hence a multitude of arcana.

ARCANUM CORALLINUM, a name formerly given to red mercurial precipitate, on which ſpirit of wine has been burnt in order to render it milder.

ARCANUM DUPLICATUM. This term was invented by Glauber, and applied by him to the ſalt remaining after the diſtillation of nitrous acid, from nitre and ſulphuric acid. It is the ſame as was afterwards known by the name Vitriolated Tartar; or, according to the modern nomenclature, SULPHAT of *Potaſh*.

ARCAS, in *Aſtronomy*, a name given by ſome old writers to the ſtar Arcturus, in the conſtellation Bootes. Arcas, the ſon of Caliſto by Jupiter, it is ſaid, when he was about to kill his mother in the ſhape of a bear, was, together with her, ſnatched up into heaven; where ſhe was converted into the conſtellation of the Great Bear; others ſay into this ſingle ſtar.

ARCAS, in *Entomology*, a ſpecies of PAPILIO. The wings are very entire and fulvous; margin and ſpots black; poſterior ones beneath grey, and without ſpots. Inhabits the Cape of Good Hope. Fabricius and Gmelin.

ARCAS, in *Ancient Geography*, a town of Armenia Minor, according to the Antonine Itinerary.

ARCAS, in *Geography*, a ſmall place of Spain, in Caſtile, the Arcabrica of the ancients.

ARCAS, an iſland in the gulf of Mexico, in the bay of Campeachy. N. lat. 20°. W. long. 92° 50′.

ARCASSON *Bay*, lies on the coaſt of France, 18 leagues ſouth-weſterly from the river of Bourdeaux to Cape Ferret, its north entrance; and before it lies the iſland Terry, with a channel on each ſide.

ARCASTE, an iſland on the weſt coaſt of Africa, ſouth of the river Gambia, and of Cape Roxo.

ARCATIS *Regia Soræ*, in *Ancient Geography*, ARCATE, a town in the interior of the Indian peninſula, on this ſide the Ganges, and the capital of a country called Soretanum Paralia.

ARC-BOUTANT, in *Building*, a kind of flat arch, or part of an arch, abutting againſt the feet of an arch, or reins of a vault, to ſupport, and prevent their giving way.

The name is French; formed of *arc* and *bouter, to abut*. Arc-boutants are only arched BUTTRESSES.

ARCE, in *Ancient Geography*, alſo called Rakem and Petra, the capital of Arabia Petræa.

ARCE. See ARCA and ARACEANS.

ARCE, in *Geography*, a town of Italy, in the kingdom of Naples, and country of Lavora, ſix miles ſouth of Sora.

ARCEGOVINA, a province of Dalmatia, between the country of the Dulcignotes to the ſouth-eaſt, the republic of Raguſa to the north-weſt, a part of Boſnia to the north-eaſt, and the Adriatic ſea to the ſouth-weſt. The principal towns are Riſano, Caſtel-Novo, Cataro, and Budoa, which are all fortified; and the river Moracica traverſes the country, which abounds with mountains, and yet is very fertile, from the north-weſt to the ſouth-weſt. The Venetians poſſeſs the greateſt part of it, and the reſt belongs to the Turks.

ARCELES, a town of France, in the department of the Eaſtern Pyrenées, and chief place of a canton, in the diſtrict of Ceret, four leagues ſouth-eaſt of Perpignan, and four eaſt-north-eaſt of Ceret.

ARCELLA, in *Entomology*, a ſpecies of PHALÆNA (*Tinea*); wings pure white, with a common arched mark, and two marginal ſpots of brown. Fabricius, Gmelin. Inhabits Germany.

ARC-EN-QUEUE, in *Ornithology*, the name of the Linnæan ORIOLUS *Annulatus*, in Buffon's Hiſt. Nat. des Oiſ.

ARCES, in *Geography*, a town of France, in the department of the Eaſtern Pyrenées, and chief place of a canton, in the diſtrict of Ceret, ſeven leagues ſouth-ſouth-weſt of Perpignan, and two ſouth-weſt of Ceret.

ARCESILAUS, in *Biography*, a Greek philoſopher, the founder of the Middle Academy, was a native of Æolis, and born in the firſt year of the 116th olympiad, or the 316th year before Chriſt. He followed his firſt preceptor, Autolycus the mathematician, to Sardis; but he afterwards went to Athens, where he ſtudied muſic under Xanthus, geometry under Hipponicus, and philoſophy under Theophraſtus, Ariſtotle, Polemon, and Crantor. With the latter, and alſo with Zeno the founder of the Stoic ſect, he formed an intimate friendſhip. Poetry was his favourite amuſement, and he was ſo familiarly acquainted with Homer and Pindar in particular, that he often cited in converſation pertinent paſſages from their works; and it was his practice every night before he went to ſleep, to read a portion of Homer. After having in early life been initiated in mathematics and polite literature, he was deſigned for the profeſſion of the law, but he rather choſe to devote himſelf to philoſophy. After the death of Crates, he took poſſeſſion of the academic chair, and his method of inſtruction was univerſally admired. However, the innovations which he introduced in the Platonic ſchool, gave riſe to a new ſchool, called, in reference to Plato's ſchool, the Second Academy; and with reſpect to a ſubſequent innovation by Carneades, the Middle Academy. See ACADEMY.

The ſchool of Arceſilaus was founded upon the principle of the uncertainty of knowledge; and it was inſtituted in oppoſition to the Dogmatiſts, and particularly the Stoics, whoſe doctrine was different from that of Plato. This philoſopher, under the ſanction of Socrates and Plato, and without explicitly avowing the doctrine of univerſal ſcepticiſm as taught in the ſchool of Pyrrho, maintained, that whatever certainty there may be in the nature of things, every thing is uncertain to the human underſtanding. He, therefore, taught his diſciples not with confidence to aſſert their own opinions, but to controvert thoſe of others; that truth has no certain characters by which it may be diſtinguiſhed from error; and therefore he ſuſpended his judgment, and diſputed merely with a view of convincing him-

A R C

ſelf that oppoſite opinions may be ſupported by arguments of equal weight. Hence his ſchool became a theatre of unprofitable contention, in which his diſciples were allowed to propoſe and to maintain their opinions; and then the maſter, by his ſkill in diſputation, and by his captivating power of addreſs, aſtoniſhed the audience by confuting them. Thus the point in debate ſeemed to be determined, till the ſame ingenuity was employed on the oppoſite ſide of the queſtion.

Arceſilaus has been compared to Tiberius Gracchus, as a diſturber of the peace, who endeavoured to overturn the eſtabliſhed philoſophy, without the merit of that political reformer; who attempted the correction of abuſes and errors; for he brought the world of ſcience into a worſe ſtate of confuſion than that in which he found it. Accordingly his doctrine of uncertainty alarmed not only philoſophers but civil magiſtrates; and he was conſidered as a common enemy to ſcience and to ſociety; and unqueſtionably his tenets ſeem neceſſarily to deſtroy the foundations of virtue, and to introduce uncertainty and indifference with regard to the obligations of morality. When Arceſilaus was once reproached by an enemy for living according to his principles, Cleanthes, though a Stoic, juſtified him, and averred, "that though he deſtroyed morals by his doctrine, he eſtabliſhed them by his conduct." "You flatter," ſaid Arceſilaus. "Is this flattery," replied Cleanthes, "to aſſert, that you ſay one thing and do another?" This, however, was a mere compliment, to which Arceſilaus was not entitled; for, according to the repreſentation of Diogenes Laertius, he was addicted to the moſt ſhameful intemperance and lewdneſs, and deſerved the character of the corruptor of youth; ſo that the pernicious tendency of his principles was exemplified in his own practice. He died, in the 4th year of the 134th olympiad, 241 years before Chriſt, though at the age of 75, a martyr to his licentious conduct; for the cauſe of his death was a delirium produced by exceſſive drinking. On many occaſions, however, he manifeſted a generous and liberal ſpirit. When one of his pupils expreſſed a predilection in favour of a Peripatetic philoſopher, named Hieronymus, Arceſilaus took him by the hand, and conducting him to his ſchool, requeſted the philoſopher to treat him in a manner ſuitable to his merit. When Cleanthes, who was the ſucceſſor of Zeno, the profeſſed adverſary of Arceſilaus, was affronted by one of his pupils, he would not reſtore him to his ſchool till he had made a ſatisfactory acknowledgment for the offence. Having lent ſome ſilver veſſels to a friend for an entertainment, when he found that he was poor, he would not allow them to be returned. Viſiting a ſick friend, whom he obſerved to be in poverty, he ſilently conveyed a purſe of gold under his pillow. When the ſick man diſcovered it, he ſaid with a ſmile, "This is one of the generous frauds of Arceſilaus." He is ſaid to have ſpent a great part of the ample income ariſing from an eſtate at Pitane, the place of his birth, in ſimilar acts of liberality. None of the writings of this philoſopher have deſcended to our times. During his life he was honoured, and after his death the Athenians paid reſpect to his memory by a magnificent funeral. Two Chriſtian fathers, viz. Numenius and Lactantius, have inveighed againſt his doctrine. Diogenes Laertius, l. iv. § 28, &c. Suidas. Athæn. l. vii. p. 276. Cic. Acad. Queſt. l. i. c. 5—12. 24. De Fin. l. ii. c. 1. l. v. c. 31. Euſeb. Præp. Evang. l. xiv. c. 6. 9. Lactant. Inſt. l. iii. c. 4. Gen. Dict. Brucker's Hiſt. Philoſ. by Enfield, vol. i. p. 244, &c.

ARCESINE, in *Ancient Geography*, a town formerly ſituate in the iſland Amorgus, one of the Cyclades.

ARCESIUM, a cavern of mount Ida, in the iſle of Crete.

ARCEUTHUS, a river of Syria, which watered the territory of Antioch, according to Strabo.

ARCEUTUM, is uſed in ſome *Ancient Law-Writers*, for a procuration due to a biſhop, abbot, or archdeacon, from their clergy, in time of entertainment.

ARCH, Arc, Arcus, in *Geometry*, a part of any curve line; e. gr. of a circle, an ellipſis, or the like. The arc of a circle is any part of its circumference. Such is A E B, *Plate* III. *Geometry*, *fig.* 35.

The baſe or line A B, that joins the two extremes of the arc, is called the CHORD; and A D, half of the chord biſected by the diameter at right angles, is the SINE of half the ſaid arc, viz. A E.

All angles are meaſured by arcs. For this purpoſe an arc is deſcribed, having its center in the point or vertex of the angle: and as every circle is ſuppoſed to be divided into 360 degrees; an arc is eſtimated according to the number of degrees which it contains. Thus an arc is ſaid to be of 30, of 80, of 100 degrees. However, the meaſure of angles by the arcs of a circle is founded upon the uniform curvature of the circle.

Arcs, *concentric*, are thoſe which have the ſame center.

Arcs, *equal*, are ſuch arcs of the ſame or equal circles, as contain the ſame number of degrees. Hence, in the ſame or equal circles, equal chords ſubtend equal arcs. And hence, again, arcs intercepted between parallel chords are equal.

A radius, C E, *fig.* 35, which biſects the chord in D, does alſo biſect the arc in E; and is perpendicular to the chord; and on the contrary. And hence the problem, to *biſect an arch*, is ſolved, by drawing a line C E from the center perpendicular to the chord in D. Equal arcs have equal chords, ſines, tangents, &c.

Arcs, *ſimilar*, or *like*, are thoſe which contain the ſame number of degrees of unequal circles. Such are the arcs A B and D E, *fig.* 36. or *fig.* 1. *Plate* VI. *Architecture*.

Two radii being drawn from the center of two concentric circles, the two arcs intercepted between them bear the ſame ratio to their reſpective peripheries, and their radii; and alſo the two ſectors to the areas of their reſpective circles. Similar arcs and other like curves are alſo like parts of the whole, or determined by like parts alike poſited.

Arc *of a circle*, the length of an, may be found by the following rule: viz. as 180 is to the number of degrees in the arc, ſo is 3.1416 times the radius to its length. Or, as 9 is to the number of degrees in the arc, ſo is .0174533 times the radius to its length. For, when the radius is 1, half the circumference is 3.141592 65. &c. conſequently

$\frac{3.14159265}{180 \text{ degrees}}$, &c. = .0174532925199, &c. = the length of an arc of 1 degree; hence $r \times .01745$, &c. = the length of 1° to the radius r, and, therefore, .01745, &c. $\times r \times$ number of degrees in any arc = the length of that arc: e. g. let the length of the arc A D B (*fig.* 37), whoſe chord A B is 6, the radius being 9, be required. By trigonometry, 9 (A C) : 3 (A P) :: 1 (radius of the tables) : $\frac{3}{9}$ = .3333333 = ſine of the angle A C P, or arc A D, to the radius 1; and the degrees in the table of ſines anſwering to the fine are 19.4712206, the double of which is 38.9424412, or the degrees in the whole arc A B. Then, by the rule, 38.9424 412 × .0174533 × 9 = 6.117063 = the length of the arc required. Dr. Hutton has given ſeveral other theorems,

with

with their demonſtrations, for finding the lengths of circular arcs in his "Treatiſe of Menſuration," p. 124, &c.: ſome of which are as follow. Let the radius of a circle be 1, any arc a, tangent t, ſine s, coſine c, and verſed ſine v: and we ſhall have,

$$a = t - \frac{1}{3}t^3 + \frac{1}{5}t^5 - \frac{1}{7}t^7 + \frac{1}{9}t^9 \text{ \&c.}$$

$$a = \frac{s}{c} - \frac{1}{3}\cdot\frac{s^3}{c^3} + \frac{1}{5}\cdot\frac{s^5}{c^5} - \frac{1}{7}\cdot\frac{s^7}{c^7} \text{ \&c.}$$

$$a = s + \frac{1}{2.3}s^3 + \frac{1.3}{2.4.5}s^5 + \frac{1.3.5}{2.4.6.7}s^7 \text{ \&c.}$$

$$a = \sqrt{2v} \times 1 + \frac{1}{2.3}\cdot\frac{v}{2} + \frac{1.3}{2.4.5}\cdot\frac{v^2}{2^2} + \frac{1.3.5}{2.4.6.7}\cdot\frac{v^3}{2^3} \text{ \&c.}$$

$a = \frac{3.14159}{180}$, &c. $d = .01745329$, &c. $\times d$, where d denotes the number of degrees in the given arc; $a = \frac{8c - C}{3}$ nearly, when C is the chord of the arc, and c the chord of half the arc, whatever be the radius.

To inveſtigate the length of the arc of any curve, put x = the abſciſſe, y = the ordinate of the arc z of any curve whatever, put $\dot{z} = \sqrt{\dot{x}^2 + \dot{y}^2}$; then, by means of the equation of the curve, find the value of $\dot{x}$ in terms of $\dot{y}$, or of $\dot{y}$ in terms of $\dot{x}$, and ſubſtitute that value inſtead of it in the above expreſſion $\dot{z} = \sqrt{\dot{x}^2 + \dot{y}^2}$; and hence, taking the fluents, they will give the length of the arc z in terms of x or y. See RECTIFICATION.

TABLE for finding the Length of Circular Arcs, Radius being Unity.

Deg.	Length.	Deg.	Length.	Min.	Length.	Sec.	Length.
1	0.0174533	60	1.0471976	1	0.0002909	1	0.0000048
2	0.0349066	70	1.2217305	2	0.0005818	2	0.0000097
3	0.0523599	80	1.3962634	3	0.0008727	3	0.0000145
4	0.0698132	90	1.5707963	4	0.0011636	4	0.0000194
5	0.0872665	100	1.7453293	5	0.0014544	5	0.0000242
6	0.1047198	120	2.0943951	6	0.0017453	6	0.0000291
7	0.1221730	150	2.6179939	7	0.0020362	7	0.0000339
8	0.1396263	180	3.1415927	8	0.0023271	8	0.0000388
9	0.1570796	210	3.6651914	9	0.0026180	9	0.0000436
10	0.1745329	240	4.1887902	10	0.0029089	10	0.0000485
20	0.3490659	270	4.7123890	20	0.0058178	20	0.0000970
30	0.5235988	300	5.2359878	30	0.0087266	30	0.0001454
40	0.6981317	330	5.7595865	40	0.0116355	40	0.0001939
50	0.8726646	360	6.2831853	50	0.0145444	50	0.0002424

In uſing the above table, take the degrees, minutes, and ſeconds from the firſt, third, and fifth columns, and againſt them are the correſponding lengths, the ſum of which is required: e. g. what is the length of an arc of 37° 42′ 58″?

30°	0.5235988
7°	0.1221730
40′	0.0116355
2′	0.0005818
50″	0.0002424
8″	0.0000388
the length required .	0.6582703

If the radius be not unity, the length may be found by proportion, thus, unity : radius :: the length here found : the length required.

See a table of circular arcs for each degree, minute, ſecond, and third, of the ſemiperiphery, in Hutton's Tables, p. 340. See a paper on an elementary manner of obtaining ſeries for expreſſing circular arcs, by Monſ. L'Huilier in the Phil. Tranſ. for 1796, pt. i. p. 142—163.

To find the center of gravity of an arc of a circle; ſee CENTER *of gravity*.

For the ſines, tangents, &c. of arcs, ſee SINE, TANGENT, &c.

ARCH, in *Aſtronomy*, has various denominations according to the circle to which it is applied.

ARCH, *Diurnal*, of the ſun is part of a circle parallel to the equator, deſcribed by the ſun in his courſe betwixt riſing and ſetting. The half of this comprehended between the meridian and horizon, is called the *ſemidiurnal arch*, and by means of this the time of his riſing and ſetting is eaſily aſcertained. Tables of ſemidiurnal arcs may be found in moſt of our aſtronomical almanacs or ephemerides. The term is alſo applied to other celeſtial bodies, as the planets and ſtars. His nocturnal arch is of the ſame kind, excepting that it is deſcribed between his ſetting and riſing.

The latitude and elevation of the pole are meaſured by an arch of the meridian; and the longitude, by an arch of a parallel circle.

ARCH *of progreſſion* or *direction*, is an arch of the ecliptic, which a planet ſeems to paſs over, when its motion is direct, or according to the order of the ſigns.

ARCH *of retrogradation*, is an arch of the ecliptic, deſcribed while a planet is retrograde, and moves contrary to the order of the ſigns.

ARCH *between the centers* is an *arch*, as AI (*Plate* I. *Aſtronomy, fig.* 11.). paſſing from the center of the earth's ſhadow, A, perpendicular to the moon's orbit, OB, and meeting her center at the middle of an eclipſe. See ECLIPSE.

If the aggregate of the arch between the centers AI, and the apparent ſemidiameter of the moon, be equal to the ſemiadiameter of the ſhadow, the eclipſe will be total without any duration; if leſs, total with ſome duration; and if greater, yet leſs than the ſum of the ſemidiameters of the moon and the ſhadow, partial.

ARCH *of poſition*, or angle of poſition, is the ſame with the horary angle. See POSITION.

ARCH *of viſion* is the ſun's depth below the horizon, at which a ſtar, before hid in his rays, begins to appear again.

TABLE exhibiting the *Arch of Viſion* of the PLANETS and FIXED STARS nearly.

Planets.	(°)	(′)	Fixed Stars. Magnitude	(°)
			1 -	12
Mercury, -	10	0	2 -	13
Venus, -	5	0	3 -	14
Mars, -	11	30	4 -	15
Jupiter, -	10	0	5 -	16
Saturn, -	11	0	6 -	17

However, the quantity of this arch is not always the ſame; but varies with the latitude, declination, right aſcenſion or deſcenſion, and diſtance of any planet or ſtar. With reſpect to Venus, it is ſometimes reduced to nothing, as ſhe is ſometimes viſible when the ſun is at a conſiderable elevation above the horizon. Riccioli. Alm. v. i. p. 42.

ARCH, in *Architecture*, is a concave ſtructure, raiſed or turned upon a mould, called the centering, in form of the arch of a curve, and ſerving as the inward ſupport of ſome ſuperſtructure. Sir Henry Wotton ſays, an arch is nothing but a narrow or contracted vault; and a vault is a dilated arch.

Arches are uſed in large intercolumnations of ſpacious buildings; in porticoes, both within and without temples; in public halls, as ceilings, the courts of palaces, cloiſters, theatres, and amphitheatres. They are alſo uſed to cover the cellars in the foundation of houſes, and powder magazines; alſo as buttreſſes and counterforts to ſupport large walls laid deep in the earth; for triumphal arches, gates, windows, &c.; and, above all, for the foundations of bridges and aqueducts, and they are ſupported by piers, butments, &c.

Arches are of ſeveral kinds, and are commonly denominated from the figure or curve of them, as circular, elliptical, cycloidal, catenary, &c. according to their curve, in the form of a circle, or ellipſis, cycloid, catenary, &c.

There are alſo other denominations of circular arches, according to the different parts of a circle, or manner of placing them; thus,

Semicircular arches, which are thoſe that make an exact ſemicircle, having their center in the middle of the ſpan or chord of the arch; called alſo by the French builders, perfect arches, and arches en plein centre. The arches of Weſtminſter bridge are ſemicircular.

Scheme arches, or ſkene, are thoſe which are leſs than ſemicircles, and are conſequently flatter arches, containing 120 or 90 or 60 degrees; &c.; they are alſo called imperfect and diminiſhed arches.

Arches of the third and fourth point, or Gothic arches, or, as the Italians call them, di terzo and quatro acuto, becauſe they always meet in an acute angle at top, conſiſt of two eccentric circular arches meeting in an angle above, and are drawn from the diviſion of the chord into three or four, or more parts at pleaſure; of this kind are many of the arches in churches and other old Gothic buildings.

Elliptical arches uſually conſiſt of ſemiellipſes, and were formerly much uſed inſtead of mantle-trees in chimnies, and are now much uſed, from their bold and beautiful appearance, for many purpoſes, particularly for the arches of a bridge, like that at Blackfriars, on account of their ſtrength, beauty, convenience, and cheapneſs.

Straight arches are thoſe which have their upper and under edges parallel ſtraight lines inſtead of curves; theſe are chiefly uſed over doors and windows, and have their ends and joints all pointing toward one common center.

The term arch is peculiarly uſed for the ſpace between two piers of a bridge, intended for the paſſage of water, boats, &c.

Arch of equilibration, is that which is in equilibrium in all its parts, having no tendency to break in any one part more than in another, and which is therefore ſafer and ſtronger than any other figure, the materials and all other circumſtances being alike.

An inveſtigation of the nature and property of arches of equilibration will be found in the following propoſitions and examples:

Problem I. (*Plate* VI. *Architecture, fig.* 3.) The nature of the curve ABD, forming an arch, being given to find the nature of the extrados or curve PSR, bounding the top of the wall APRD, ſupported by that arch, by the preſſure or weight of which wall all the parts of the arch are kept in equilibrio.—1ſt. Let ſeveral equal right lines AB, BC, CD, &c. (*fig.* 2.) placed in a vertical plane, be moveable round the angles A, B, C, D, &c. whilſt the points A, G at the baſe remain fixed and immoveable; through B, C, D, &c. draw the lines B*i*, C*m*, D*p*, &c. perpendicular to the horizon, and complete the parallelogram B*hik*, and make C*l* = B*k*, and complete the parallelogram C*lmn*. In like manner make D*o* = C*n* or I*m*, E*r* = *op*, F*t* = *rs*, and complete all the parallelograms in the figure as at firſt.——2d. Let ſeveral weights which are to one another as the lines B*i*, C*m*, D*p*, &c. lie reſpectively on the points B, C, D, &c.: now the force B*i* is equivalent to B*h*, B*k*, acting in the directions BA, BC; the force B*h* is deſtroyed by the reſiſtance of the point A, but B*k* endeavours to move the point B towards C; in like manner the force CM is equivalent to C*l* and C*n*; the force D*p* to D*o*, *op*, &c.; now the forces B*k*, acting towards C, and C*l*, acting towards B, being equal by conſtruction, deſtroy one another; and in like manner the forces C*n* and D*o*, D*q* and E*r*, E*v* and F*t*, &c. deſtroy one another; and the point G, being fixed, it is manifeſt the figure ABCD, &c. will not be moved by the incumbent weights B*i*, C*m*, D*p*, &c. but all its parts will remain in equilibrio.—3d. The force B*h* : force B*k* or C*l* :: fine $\angle$ *hi*B or *i*BC : S, $\angle$ ABi :: $\frac{1}{\text{S. ABi}}$: $\frac{1}{\text{S. }i\text{BC}}$ or $\frac{1}{\text{S. }m\text{CB}}$. Likewiſe the force C*l* : force C*n* or D*o* :: S. *m*CD or *p*DC : S. *m*CB :: $\frac{1}{\text{S. }m\text{BC}}$: $\frac{1}{\text{S. }m\text{CD}}$ or $\frac{1}{\text{S. }p\text{DC}}$, and ſo on; whence it is plain, in general, that any force C*l* is as $\frac{1}{\text{S. }\angle m\text{CB}}$; now ſince C*m* = $\frac{\text{S. C}lm \times \text{C}l}{\text{S. C}ml}$ = $\frac{\text{S. B C}x \times \text{C}l}{\text{S. }m\text{CD}}$, therefore the force C*m* is as $\frac{\text{S. BC}x}{\text{S. }m\text{CB} \times \text{S. }m\text{CD}}$. ——4. Now let the number of the lines AB, BC, CD, &c. be increaſed and their lengths diminiſhed ad infinitum, that the figures may obtain the form of a curve, and the preſſure will then act on all parts of it; and the angle BC*x* will then become the angle of contact, and the ſines of *m*CB and *m*CD become equal to the ſine of *m*C*x*; therefore drawing the tangent A*n* (*fig.* 3.), the preſſure on any point A to preſerve the equilibrium will be as the angle of contact at A directly, and the ſquare of the ſine of the angle *m*A*n* reciprocally; but the angle of contact is as the curvature, or reciprocally as the radius of curvature, therefore the preſſure is reciprocally as that radius, and the ſquare of the ſine of that angle *m*A*n*.—5. Cor. 1. If a weight like a wall *n*PSR, be incumbent on the arch ABD, ſtanding

ing in a vertical plane, and all the parts kept in equilibrio, then the weight Ag, on any point A, is as the curvature at A directly, and the cube of the fine of ATC reciprocally; AT being a tangent at the point A, meeting the axis BC produced in T: for the weight on the given part of the arch is as $\frac{C}{S.ATC|^3}$, C being the curvature at A, and the weight of the column $Agbr$ is as $Ag \times wr = Ag \times Ar \times S.ATC = Ag \times S.ATC$, becauſe Ar is given; therefore $Ag \times S.ATC$ is as $\frac{C}{S.ATC|^2}$, and Ag as $\frac{C}{S.ATC|^3}$, to keep the parts in equilibrio.——Cor. 2. If R be the radius of curvature in A, then the weight Ag is as $\frac{1}{R \times S.ATC|^3}$. ——Cor. 3. If BC $= x$, AC $= y$, BA $= z$, then Ag is as $\frac{-\dot{x}\ddot{y}}{\dot{y}^3}$, where $\dot{x}$ is conſtant; for $\dot{z} : \dot{y} ::$ AT : AC :: rad. 1 : S. ATC $= \frac{\dot{y}}{\dot{z}}$; therefore $Ag = \frac{\dot{z}^3}{R \times \dot{y}^3}$, and R may be found by ſuppoſing either $\dot{x}$ or $\dot{y}$ given. If $\dot{x}$ be given, $R = \frac{\dot{z}^3}{-\dot{x}\ddot{y}}$, therefore Ag is as $\frac{\dot{z}^3}{\dot{y}^3} \times \frac{-\dot{x}\ddot{y}}{\dot{z}^3} = \frac{-\dot{x}\ddot{y}}{\dot{y}^3}$.

Problem II. The nature of the curve ABD (*fig.* 3.) being given for the figure of an arch to find the height Ag of the wall inſiſting thereon, at every point A, ſo that all the parts ſhall remain in equilibrio. Draw the ordinate AC, and let BC $= x$, AC $= y$, Arch BA $= z$, BS the height of the wall at the vertex $= a$, R $=$ rad. curvature in A, draw the tangent AT, which will be found from the nature of the curve; find the S. angle ATC; then take Ag as $\frac{1}{R \times S.ATC|^3}$ for the height.

Example I. Let AB (*fig.* 4.) be the arch of a circle, radius $= r$, BC $= x$, cof. BC $= c$, BS $= a$, then $c =$ S. ATC, whence Ag is as $\frac{1}{rc^3}$ or as $\frac{1}{c^3}$ which at B is $\frac{1}{r^3}$, therefore $\frac{1}{r^3} : \frac{1}{c^3} :: a : Ag = \frac{ar^3}{c^3}$. Let BO $=$ ON, BS $= a$, (*fig.* 4.). Then as rad. r : cof. BA $= c ::$ BO : CO and $r^3 : c^3 ::$ BO^3 : CO^3, where $\frac{r^3}{c^3} = \frac{\text{BO}^3}{\text{CO}^3}$ and $\frac{ar^3}{c^3} = \frac{a\text{BO}^3}{\text{CO}^3} = \frac{\text{BS} \times \text{BO}^3}{\text{CO}^3} = Ag =$ BS when CO $=$ BO, and when CO $= o$, Ag is infinite; hence SgM is a curve running up to an infinite height towards M, the perpendicular NM being an aſymptote to it, and the curve is as accurately as repreſented in the figure, when the thickneſs BS at the top is about 1-10th of the ſpan diameter. But if a circular arch, and a right line at the top was *neceſſarily* required, the proportion of BS to the radius BO may be found, ſo as the arch may be *nearly* in equilibrium thus: —When Sg is a right line, then SQ in the figure muſt be nothing, or rather when the curve croſſes the horizontal line, then SQ is equal to nothing. Now to find that point from the general equation: $Ag = \frac{ar^3}{c^3} = \frac{\text{BS} \times \text{BO}^3}{\text{CO}^3} = \frac{\text{BS} \times \text{BO}^3}{\text{BO} - \text{BC}|^3}$. Put BC $= x$, then $\frac{ar^3}{c^3} = \frac{ar^3}{r-x|^3} = Ag = x + a$ when the curve croſſes the horizontal line, whence $ar^3 - a \times \overline{r-x|^3} = x \times \overline{r-x|^3}$, and by diviſion $a = \frac{x \times \overline{r-x|^3}}{r^3 - \overline{r-x|^3}}$. Now this value of a or BS evidently becomes $= o$, when the arch conſiſts of the whole ſemicircle; but when the arch is leſs than the ſemicircle, a will have a finite value; and between 60 and 120 degrees, many arches of equilibration of a certain thickneſs at the top may be found. Thus, if the half arch contain 30 degrees, then a will be $= \frac{1}{4}r$ very nearly. And if BA was an arch of 45 degrees, then a or BS $= \frac{1}{5}$ of the ſpan nearly. Farther, if BA were 55 degrees, then $a = .0992r$, which is between the ſixteenth and ſeventeenth part of the ſpan or chord: ſo that in each of theſe caſes, the points A and B would be in equilibrium; but then about the middle parts between B and A, or rather nearer to B than to A, the materials ſhould be a little lighter than at B and A, and the exact proportion in which their gravity ſhould be diminiſhed, might be eaſily found by calculation: thus, in the firſt caſe in particular (*fig.* 5.) the ſpecific gravity of the materials in the middle of the arch between B and A, that is, at 15 degrees from B, ſhould be to that at B or A, as 278 to 284; which is but a very inconſiderable decreaſe, and may be very well neglected. In the firſt two caſes, the thickneſs at the top would be too much; but in this latter one, when the whole arch is 110 degrees, the thickneſs is but juſt about that which the beſt architects now allow, and in greater arches the thickneſs would become too little; ſo that an arch of nearly about 110 degrees is the only part of a circle that can be uſed with much propriety.

Example II. Let NAB (*fig.* 6.) be an ellipſis, $t =$ NO, the ſemitranſverſe parallel to the horizon, $r =$ BO the ſemiconjugate, BC $= x$, CA $= y$, BS $= a$; then by the nature of the ellipſe, $r : t :: \sqrt{2rx - x^2} : y = \frac{t}{r}\sqrt{2rx - x^2}$; hence $\dot{y} = \frac{t \times \dot{x}}{r} \times \frac{r - x}{\sqrt{2rx - x^2}}$ and $\ddot{y} = \frac{-tr\dot{x}^2}{\overline{2rx - x^2}|^{\frac{3}{2}}}$ by making $\dot{x}$ conſtant. Then $Ag = \frac{-\dot{x}\ddot{y}}{\dot{y}^3} \times Q$, is $= \frac{tr\dot{x}^3 Q \times \overline{2rx - x^2}|^{\frac{3}{2}}}{t^3\dot{x}^3 \times \overline{r-x|^2}} = \frac{r^3}{t^3\dot{x}^3} \times \frac{\overline{2rx - x^2}|^{\frac{3}{2}}}{\overline{r-x|^2}} = \frac{rQ}{t^2 \times \overline{r-x|^2}}$; but when $x = o$, this expreſſion becomes $a = \frac{rQ}{t^2}$, and then $Q = \frac{at^2}{r}$, conſequently $\dot{y} = a \times \left|\frac{r}{r-x}\right|^3 = \frac{\text{BS} \times \text{BO}^3}{\text{CO}^3}$, the ſame as in the circle; but the elliptic arch may take a ſtraight line at top better than the circular one, when the longer axis is horizontal, becauſe the arch is flatter, or of a leſs curvature; and worſe than the circular, when the ſhorter axis is horizontal.

For the convenience of thoſe readers who may not be acquainted with the fluxionary or algebraical expreſſions, we ſhall give the calculation in numbers for the two laſt kinds of arches, viz. the circular and elliptical. Let ABD (*fig.* 5.) be a ſegment of a circle of 110° whoſe chord or ſpan AD may be 100, then the verſed ſine CB will be 26 nearly, and the radius AO or BO 61.04 nearly. Take BS $= 6.05$, which will be a little leſs than the 16th part of the ſpan AD, then $\frac{\text{AC}|^3}{\text{CO}|^3} \times$ BS will be equal to the height AG. Firſt ſuppoſe BC equal 5, and CO $= 56.04$, then AG, the height of the wall from the arch to the top, will be equal to 6.05 multiplied by 61.04 cubed and divided by

by 56.04, cubed equal to 7.8248: if BC be equal to 10, AG will be equal to 10.368, and ſo on, whatever number BC be taken.

For the ellipſis, let NABD (*fig.* 6.) be an ellipſis with the longer axis NH horizontal and ſemitranſverſe NO = 48.29 ſemi-conjugate BO = 41.04 feet: then if we ſuppoſe AD to be the ſpan of the arch ABD, its height BC will be 30 feet; and when AD = 83 nearly, let BS be taken = 6 feet. Then the general equation for any height AG of the wall is $\frac{BS \times BO^3}{CO^3}$. Suppoſe BC = 10, then CO = 31.04, and AG in this caſe is equal to $\frac{6 \times \overline{41.04}^3}{\overline{31.04}^3}$ = 13.86; again ſuppoſe BC = 20, then AG = $\frac{6 \times \overline{41.04}^3}{\overline{21.04}^3}$ = 44.53, and by cubing the value of CO for a denominator to the conſtant numerator, $6 \times \overline{41.04}^3$, the value of AG in every point of the arch may be readily found.

For the method of determining the figure of the extrados of the parabola, hyperbola, and catenarian, ſee Dr. Hutton's Principles of Bridges, ſect. 2. from page 31 to 40. Emerſon's Miſcellanies, p. 156, &c.

Problem III. Having the form of the extrados given to find the intrados; that is, having given the form of the line bounding the top of a wall ſupported by an arch, to find the figure of that arch, ſo that by the preſſure of the ſuperincumbent wall, the whole may remain in equilibrium. When the extrados is an horizontal line, Dr. Hutton and Mr. Emerſon have both determined the nature of the curve, and calculated tables for conſtructing it, where the height, the ſpan, and the thickneſs at the crown are given. Dr. Hutton ſuppoſes the ſpan NH = 100, height BO = 40, and the thickneſs BE at the crown = 6. Put a or BE = 6, b or NO = OH = 50, and r or BO = 40, x = BC, y = AC, (*fig.* 7.) The equation of the curve is thus expreſſed:

$$y = b \times \text{hyp. log. of } \frac{a + x + \sqrt{2ax + x^2}}{a} \Big/ \frac{a + r + \sqrt{2ar + r^2}}{a}.$$

Then the correſponding values of ED and DA, or horizontal and vertical lines, will be as in this table.

TABLE for conſtructing the curve of equilibration.

Value of DE.	Value of AD.	Value of DE	Value of AD.	Value of DE	Value of AD.
0	6.000	21	10.381	36	21.774
2	6.035	22	10.858	37	22.948
4	6.144	23	11.368	38	24.190
6	6.324	24	11.911	39	25.505
8	6.580	25	12.489	40	26.894
10	6.914	26	13.106	41	28.364
12	7.330	27	13.761	42	29.919
13	7.571	28	14.457	43	31.563
14	7.834	29	15.196	44	33.299
15	8.120	30	15.980	45	35.135
16	8.430	31	16.811	46	37.075

19	9.517	34	19.617	49	43.581
20	9.934	35	20.665	50	46.000

The chief properties of arches of different curves may be ſeen in ſect. 2. of Dr. Hutton's "Principles of Bridges," above quoted. It there appears that none, except the mechanical curve of the arch of equilibration, can admit of a horizontal line at top; that this arch is of a form both graceful and convenient, as it may be made higher or lower at pleaſure, with the ſame ſpan or opening; that all other arches require extrados that are curved, more or leſs, either upwards or downwards: of theſe, the elliptical arch approaches the neareſt to that of equilibration for ſtrength and convenience; and it is alſo the beſt form for moſt bridges, as it can be made of any height to the ſame ſpan, its hanches being at the ſame time ſufficiently elevated above the water, even when it is very flat at top. Elliptical arches alſo appear bolder and lighter, are more uniformly ſtrong, and are much cheaper than moſt others, as they require leſs materials and labour. Of the other curves, the cycloidal arch is next in quality to the elliptical one for theſe properties, and laſtly the circle. As to the others, the parabola, hyperbola, and catenary, they are quite inadmiſſible in bridges that conſiſt of ſeveral arches; but may, in ſome caſes, be employed for a bridge of one ſingle arch which may be intended to riſe very high, as in ſuch caſes they are not much loaded at the hanches. The weight of the arch, the preſſure on the abutment, &c. &c. will all be conſidered under the article BRIDGE.

ARCH, in *Building*, is a number of ſtones placed together over a hollow ſpace, in the form of ſome curve, as a part of a circle, of an ellipſis, a parabola, hyperbola, &c., having the joints ſo formed, that it is ſupported without falling, by the piers or abutments from which it ſprings. Of circular and elliptical arches, ſome conſiſt of ſemicircles or ſemiellipſes, others are compoſed of ſegments of theſe curves.

Arches are chiefly uſed for bridges, entrances to cities and large buildings, and in general for the covering of any very large opening in walls; as alſo for ſmaller apertures, as doors, windows, &c.

The decoration of arches is various according to the nature and deſtination of the building, but it generally conſiſts of mouldings ſurrounding the curve, called an archivolt.

For the application of arches to particular purpoſes, ſee BRIDGE, *Triumphal* ARCH, GATE, DOOR, WINDOW, DOME, VAULT.

ARCH, *triumphal*, is a gate or paſſage into a city, built of ſtone or marble, and magnificently adorned with architecture, ſculpture, inſcriptions, &c. ſerving not only to adorn a triumph at the return from a victorious expedition, but alſo to preſerve the memory of the conqueror to poſterity.

Theſe arches were at firſt very ſimple, being built of brick, ſuch as that of Romulus; or of roughly hewn ſtone, as that of Camillus; and they were alſo for a long time of a ſemicircular figure, and hence called "fornices" by Cicero. In proceſs of time they acquired a greater degree of magnificence; and they were conſtructed of the fineſt marble, and of a ſquare figure, with a larged arched gate in the middle, and two ſmall ones on each ſide, adorned with columns and ſtatues, and various figures executed in ſculpture. From the vault of the middle gate hung ſmall winged images of victory, with crowns in their hands, which they let down on the victor's head as he paſſed in triumph. This kind of magnificence commenced under the firſt emperors; ſo that Pliny (H. N. xxxiv. 6. § 12.) calls it "novicium inventum." During the time of the republic, arches were appropriate to generals who obtained victories over

over the enemies of Rome; and none were erected in honour of the dead. But when Auguſtus became emperor, this was one ſpecies of adulation that was rendered him; and the Roman ſenate propoſed to him to have a triumphal arch erected in honour of Nero Druſus who died in Germany. He approved the propoſal; and an arch of marble, adorned with trophies, was erected on the Via Appia. Caligula was the ſecond on whom this honour was conferred after his death by the Piſans, to whom he had ſent a colony. Germanicus was the third. This honour was afterwards extended to women; which Dion conſiders as an evidence of the degeneracy and ſervility of the Romans: it was granted to Livia after her deceaſe.

Antiquarians have reckoned 36 triumphal arches in Rome. The moſt celebrated of the ancient arches now remaining at Rome, are thoſe of Titus, of Septimius Severus, and of Conſtantine; of which we have figures given us by Des Godetz.

The arch of Titus, placed between the forum and the coliſeum, was erected, as ſome have thought, by the ſenate and Roman people, to Titus and his father Veſpaſian, in honour of their victories; but it was more probably dedicated to Titus after his death and apotheoſis, as the epithet "divo," applied to him in the inſcription ſtill extant, ſuggeſts; and its chief deſign ſeems to have been to commemorate the conqueſt of Judæa, and the deſtruction of Jeruſalem. The frieze of this arch, which is of the Compoſite order, is ſupported by two columns, and upon it is repreſented the triumphant proceſſion of Titus, including a figure of the river Jordan, with captives and animals, as well as inſtruments of ſacrifice, in ſculpture. On the inner ſides of the arch are two baſſo-relievos, one of which exhibits the emperor drawn in his triumphal car by four horſes; the lictors accompany the chariot; and victory follows, holding in her left hand a branch of palm, and in her right hand a crown of laurel over his head: the horſes are conducted by a figure repreſenting the city of Rome, with a helmet and ſpear; and ſhe is followed by magiſtrates, &c. bearing branches of laurel. The other bas-relief repreſents the table of ſhew-bread, the trumpets, the golden candleſticks with ſeven branches, the tables of the law, the ark of the covenant, and other utenſils, brought as ſpoils by the conqueror from the temple of Jeruſalem.

The arch of Septimius Severus was erected by the Roman people, as the inſcription intimates, in honour of his victory over the Parthians and other barbarous nations, that were enemies of Rome. This arch ſtands near the back part of the capitol; and though it is much ſunk in the earth and mutilated, ſeveral baſſo-relievos are ſtill diſtinguiſhable. On the two ſides of the vault of the grand arch are two winged victories bearing trophies, two genii with perfumes, flowers, and fruits, ſymbolical of the provinces ſubdued by Severus, and four rivers. Eight fluted columns, of the Corinthian order, ſupport the frieze that bears the inſcription. A ſtaircaſe of marble led to its ſummit, on which were placed Caracalla with his father and brother, in a triumphal chariot drawn by ſix horſes, and at their ſides ranks of ſoldiers who accompanied the triumph. The inſcription imports that this arch was erected in honour of Marcus Aurelius, as well as of S. Severus, "in acknowledgment of the reſtoration of the ſafety of the ſtate, and the aggrandizement of the Roman empire, by their valour and eminent virtues."

The arch of Conſtantine ſubſiſts almoſt entire, and is by much the fineſt of the three. It was erected by the ſenate and Roman people in honour of Conſtantine after his victory over Maxentius, and ſtands in the Appian Way at the junction of the Cœlian and Palatine mounts. The inſcription on both ſides of the architrave imports, that it was dedicated "to the emperor Cæſar Flavius Conſtantine Auguſtus, the greateſt, the pious, and the happy; becauſe, by a divine impulſe, the greatneſs of his courage, and the aid of his army, he avenged the republic by his juſt arms, and, at the ſame time, reſcued it from the tyrant and his whole faction." On one ſide of the arch are the words "Liberatori urbis," to the deliverer of the city; and on the other, "Fundatori quietis," to the founder of public tranquillity. Antiquarians have obſerved that ſome of the baſſo-relievos, and other carvings upon this arch, appear to have been borrowed from the forum of Trajan, and that they repreſent that emperor's victories over the Dacians. This was the caſe with reſpect to the eight mutilated ſtatues, whoſe heads Lorenzo de Medicis broke off and conveyed away to Florence. This theft might not, perhaps, have been ſo notorious to poſterity, if the artiſts of Conſtantine's time had not added ſome figures which make the fraud apparent, and by their manifeſt inferiority evince the great decline of the arts in the interval between the reigns of thoſe emperors. Although the decree for erecting this arch was, without doubt, paſſed immediately after the defeat of Maxentius, it appears from the monument itſelf, that the building was not finiſhed and dedicated till the tenth year of Conſtantine's reign, or the year of Chriſt 315 or 316.

Triumphal arches were not confined to Rome and its environs. Two arches, with ſtatues of the natural ſize, were erected on the Flaminian way, one on the bridge of Tiber, and the other at Rimini, in honour of Auguſtus, who made this way from Rome to Rimini; and another arch was conſtructed on the ſummit of mount St. Bernard in the Alps, in honour of the victory which Auguſtus obtained over the inhabitants of theſe mountains. The triumphal arch of Ancona was erected in honour of Trajan, the empreſs Plotina and her ſiſter Marciana. One of the gates of Orange is a triumphal arch of C. Marius, ſuppoſed to have been erected in honour of the victory obtained by him and Catulus over the Teutones, Cimbri, and Ambrones. The gates, Peyro at Montpelier, and of St. Denis, St. Martin, and St. Antoine, at Paris, may alſo be reckoned triumphal arches of the moderns.

In China, triumphal arches are very numerous. They are erected not only in all the cities, but on the mountains and eminences along the roads; and were originally deſigned for the commemoration of their illuſtrious heroes, ſuch as princes, generals, philoſophers, and miniſters of ſtate. The number is computed to exceed 1100, among which there are nearly 200 of exquiſite beauty and grandeur. Some few, leſs noble and beautiful, are erected to their moſt diſtinguiſhed females. The height of theſe arches is commonly between 20 and 25 feet, and they are decorated with figures of men, beaſts, and birds, placed in various attitudes, feſtoons and other ornaments, which are but indifferently carved; but in ſome the relievos are ſo bold, that they ſeem to be ſeparated from the work.

ARCH, *Mural*. See MURAL.

ARCH, in the *Scripture Hiſtory*. See ARK.

ARCH, or *Arco*, in *Geography*, a ſmall town of Germany in the Tyrol, ſeated on the Sarca, with a citadel ſtanding on a mountain. It is the capital of a country, founded in 1413 by the emperor Sigiſmund. It is diſtant ſix leagues ſouth-weſt from Trent, and twelve north-weſt from Verona.

ARCH, or ARCHI, formed of ἀρχὴ, *beginning*, whence ἀρχῶν, *princeps*, *chief*, is alſo a term without any meaning of itſelf, but which becomes very ſignificant in compoſition with other words; as it heightens and exaggerates them; and has the force of a ſuperlative, to ſhew the greateſt degree or eminence of any thing.

Thus we ſay, *arch*-treaſurer, *arch*-angel, *arch*-biſhop, *arch*-heretic, &c. to denote ſuch as have a pre-eminence over others. So alſo *arch*-fool, *arch*-rogue, &c. to expreſs folly and knavery in the utmoſt degree.

In Engliſh, we uſually cut off the final *i*, from *archi*, though with very ill effect, as the words with which it is joined ſound much harſher on that account, than they would do, were it preſerved entire, as it is in moſt other languages.

ARCHABIS, in *Ancient Geography*, a river of Aſia, in the territory of Colchis, which, according to Arrian, diſcharges itſelf into the Euxine ſea.

ARCHAD, or ACCHAD, was built by Nimrod after he had founded Babylon, from which it was not far diſtant. Bochart ſuppoſes that it was ſeated on the banks of the Argad, which paſſed by the walls of Sitace; and indeed he ſuggeſts that theſe were the ſame city under different names.

ARCHADIAPOLIS, an epiſcopal city of Aſia, mentioned in the fifth council of Conſtantinople.

ARCHLEA, the name of a city of Aſia, in the diſtrict of Eolis, according to Pauſanias.

ARCHEOGRAPHIA, the art of deſcribing or explaining ANTIQUITIES. See ANTIQUE.

ARCHÆOPOLIS, a city of Aſia Minor, in Ionia, according to Pliny, in whoſe time it was deſtroyed, after having been often rebuilt. It was alſo called Cobe, Sipylum, and Lebade.

ARCHÆOPOLIS, a town of the territory of Colchis, and metropolis of Lazica, ſeated, ſays Procopius, on a barren hill, and watered by a river that flowed from an adjacent mountain.

ARCHÆOTA, a keeper of ancient records.

ARCHÆUS. See ARCHEUS.

ARCHAISM, properly denotes a phraſe or diction now obſolete and out of uſe, though anciently deemed good, or paſſable.

ARCHAISM, *etymologic*, *archaiſmus etymologicus*, is when either an obſolete word, declenſion, or conjugation, is uſed.

ARCHAISM, *ſyntactic*, *archaiſmus ſyntacticus*, is an unuſual and obſolete conſtruction in diſcourſe.

ARCHAMA, in *Ancient Geography*, a town of Cappadocia, in the ſtate of Cilicia, according to Ptolemy.

ARCHANDROPOLIS, a city of Egypt, according to Herodotus and Stephan. Byz.; but not mentioned by Ptolemy, and probably not exiſting in his time.

ARCHANGEL, compounded of the Greek ἀρχος, *prince*, and ἀγγελος, *angel*, an intellectual ſubſtance or angel, placed in the ninth order among the bleſſed ſpirits which compoſe the celeſtial HIERARCHY. See ANGEL.

The ſcripture (ſays lord King, Prim. Church. p. 73.) mentions but two orders of angels; viz. archangels, preſiding over the angels; and the angels, obeying and attending on the archangels. Indeed, we have no account in ſcripture but of one exalted ſpirit, anciently ſtyled archangel (ſee 1 Theſſ. iv. 16.); though it is not improbable that as there are different degrees of glory in the celeſtial ſtate, there may be different ranks, and correſponding denominations and offices among theſe ſuperior beings.

ARCHANGEL, in *Botany*. See LAMIUM.

ARCHANGEL, *baum-leaved*. See MELITTIS.

ARCHANGEL, *yellow*. See GALEOPSIS.

ARCHANGEL, in *Geography*, a ſea-port town of Ruſſia, and capital of the government to which it gives name. This government is bounded on the north by the Frozen Ocean, on the eaſt by the government of Tobolſk, on the ſouth by the governments of Olonetz and Vologda, and on the weſt by the White Sea and the dominions of Sweden. It was formerly included in the government of Vologda, but ſeparated by a late partition of Catharine II. Accordingly it contains 7 diſtricts; viz. Archangel, on the Dvina, about 70 verſts from its mouth; Kolmogori, on the Dvina; Schenkurſk, on the river Vaga; Pinega, on the right ſide of the Dvina, where the river Pinega falls into it; Onega, on the river Onega, in Ruſſian Lapland; Kola, on the river Kola, near the bay of Kola, in the Frozen Ocean; and Meſen, on the river Meſen, falling into the Frozen Sea. The town of Archangel is ſeated on the river Dvina, near its mouth, where it forms the gulph of Archangel in the White Sea. It was diſcovered in 1553, on occaſion of the firſt enterprize of the Engliſh for opening a trade with Ruſſia, by Richard Chancellor, who, under Sir Hugh Willughby, had the command of a ſmall fleet of 13 ſhips, deſtined for diſcovering a north-eaſt paſſage to China and India. Two of theſe ſhips were forced by ſtreſs of weather into the bay of the river Arzina, in Ruſſian Lapland; and Sir Hugh Willughby, together with both crews, were frozen to death. Chancellor, diſcovering the country bordering on the White Sea, landed near the mouth of the Dvina, in a bay which he denominated the bay of St. Nicholas, from a convent near the preſent port of Archangel. Soon after this, the tzar Ivan Vaſſilievitch II. cauſed the harbour of the Archangel Michael to be conſtructed; granted ſeveral privileges to the Engliſh nation; and thus grew up at length the trading port Archangel: the commerce ſoon increaſed, and with ſome occaſional interruptions, Archangel continued the ſole port for the exports and imports of Ruſſia, until the building of St. Peterſburg, when Peter the Great removed the commerce of the White Sea, to the havens of the Baltic. From 1691 to 1701, the exports, on a yearly average, amounted to the value of 112,251 pounds ſterling; whereas the imports from England were eſtimated at only 58,884 pounds ſterling. The revenue of the crown at Archangel amounted annually to about 100,000 rubles; a ſum which, according to the value of money at that time, may be deemed very conſiderable. The principal articles of export were then potaſhes, caviar, tallow, wax, hides, hemp, feathers, tar, yarn, beef, rhubarb, ſilk (probably Chineſe and Perſian), cork, bacon, cordage, furs, briſtles, &c. all rough commodities. In 1752, Elizabeth again reſtored the ancient immunities of Archangel; and its preſent trade is not inconſiderable. To the former articles of exportation, ſeveral others of importance are added, ſuch as corn, linſeed, iron, flax, train-oil, ſail-cloth, and other coarſe linens, tobacco, &c. This port ſupplies the government of Archangel, and part of thoſe of Niſhnei-Novogorod, and Caſan, with European commodities, and draws in exchange from thoſe parts corn, flax, hemp, coarſe linen, cordage, ſails, maſts, tallow, which are moſtly conveyed by the Dvina: and it alſo forms a principal communication with the northern and weſtern parts of Siberia, whence fur-ſkins and iron are procured. A ſhip goes every year from Archangel to winter at Spitzbergen; and at leaſt one frequently goes to Novaya Zemlia, for the benefit of the fiſhery.

From a ſtatement of the port-duties, given by Mr. Tooke, for 1775, it appears that the imports of Archangel amounted to 281,747 rubles, 63 kop; its exports to 1,367,926 rubles, 38¾ kop; and duties to 144,961 rubles, 84½ kop. The water of the ſea near Archangel is ſo briny, that quantities of ſea-ſalt are prepared from it; though that of the White Sea in general contains proportionably but little ſalt. The fiſhery here, and on other parts of this ſea, is very conſiderable, particularly of ſtock-fiſh, herrings, whales, morſes, porpoiſes, ſea-dogs, &c. The dock-

dock-yards of Archangel are not in the town, but at the diſtance from it of five verſts, on an iſland in the Dvina, named Solombol, which is pretty large, and inhabited by people belonging to the yards. The ſhips are built in docks, and then launched from the ſtocks; and the timber of which they are conſtructed is that of the larch-tree, which is very cheap: a quantity ſufficient for a ſhip of 60 guns coſts there, if carefully and honeſtly purchaſed, ſomewhat more than 3000 rubles. The oak timber, which is uſed for particular parts of the veſſel, is brought thither from the precincts of Caſan.

In the government of Archangel, and particularly in the ſouthern parts, the breeding of cattle is carried on with great ſucceſs; and every where about the town there is a fine breed of large cows, brought originally from Holland, and which are not found in the leaſt to degenerate. In the diſtrict of Archangel is alſo found a good kind of poney, fleet and hardy; but the genuine breed begins to be rare.

Mr. Coxe informs us, that the moſt honeſt and intelligent perſons of the mercantile and trading order among the Ruſſians are the inhabitants of Archangel and its environs: moſt of them are able to read, write, and caſt accounts: many of them are much employed at Peterſburg by the members of the Britiſh factory, to ſuperintend their warehouſes, and they have the general character of induſtrious and faithful ſervants. This ingenious traveller traces the diſtinguiſhing character of the inhabitants of Archangel and its environs, to this town's having been, during a conſiderable period, the great emporium of Ruſſia; ſo that many of them, being connected with foreign merchants, who required great exactneſs in their dealings, were gradually trained to buſineſs. By a kind of local enthuſiaſm, and traditional inſtruction, they have continued to diſtinguiſh themſelves among their countrymen, by acquiring the rudiments of arithmetic, and by a diligent diſcharge of their truſt. Archangel is ſituated in N. lat. 64° 34′. E. long. 38° 55′.

ARCHANGELICA, in *Botany*. See ANGELICA.

ARCHANGELICÆ, in *Entomology*, a ſpecies of APHIS, found on the plant Angelica Archangelica, and deſcribed by Scopoli: it is black; beak and abdomen greeniſh. Gmelin.

ARCHANGELSKOI, in *Geography*, a town of Siberia, in the government of Irkutzk, at the conflux of the Tangui and the Oka, 116 miles north-eaſt of Udinſk. N. lat. 55° 20′. E. long. 101° 44′.

ARCHARD, in *Commerce*, a kind of green fruit, pickled in vinegar, and much valued throughout the Eaſt Indies.

The beſt are thoſe brought from Perſia, in bottles, much like ſmall cucumbers among us.

ARCHASIA, in *Entomology*, a ſpecies of PAPILIO found in Java. The wings are dentated, brown, with a common fulvous band, the firſt half of which is blue on the anterior wings. Gmelin. *Obſ.* This author is indebted to Fabricius for his deſcription, and by him this ſpecies is called ARCHESIA. It is the ſame ſize as Papilio Atalanta.

ARCHBISHOP, ARCHIEPISCOPUS, a metropolitan prelate, having ſeveral ſuffragan biſhops under him.

Archbiſhops were not known in the Eaſt till about the year 320; and though there were ſome ſoon after this who had the title, yet that was only a perſonal honour, by which the biſhops of conſiderable cities were diſtinguiſhed. It was not till of late that archbiſhops became metropolitans, and had ſuffragans under them.

Athanaſius appears to be the firſt who uſed the title archbiſhop, which he gave occaſionally to his predeceſſor Gregory Nazianzen, in like manner, gave it to Athanaſius; not that either of them was entitled to any juriſdiction, or any precedence, in virtue of it.

Among the Latins, Iſidore Hiſpalenſis is the firſt that ſpeaks of archbiſhops. He diſtinguiſhes four orders or degrees in the eccleſiaſtical hierarchy, viz. patriarchs, archbiſhops, metropolitans, and biſhops.

In the fourth century, when Conſtantine the Great modelled the eccleſiaſtical government according to the civil, new gradations of eminence and rank were introduced among the biſhops, correſponding to thoſe that were eſtabliſhed in the ſtate. Before this period, three prelates ſeem to have enjoyed a certain degree of pre-eminence above the reſt of the epiſcopal order; theſe were the biſhops of Rome, Antioch, and Alexandria; and to theſe the biſhop of Conſtantinople was added, when the imperial reſidence was transferred to that city. Theſe four prelates anſwered to the four prætorian prefects created by Conſtantine; and it is poſſible that in this century they were diſtinguiſhed by the Jewiſh title of patriarchs. After theſe followed the exarchs, who had the inſpection over ſeveral provinces, and anſwered to the appointment of certain civil officers who bore the ſame rule. In a lower claſs were the metropolitans, who had only the government of one province, under whom were the archbiſhops, whoſe inſpection was confined to certain diſtricts; but in this gradation the biſhops brought up the rear. Moſh. Eccl. Hiſt. v. i. p. 349. See BISHOP.

ARCHBISHOPRICK, ARCHIEPISCOPATUS, the dignity of archbiſhop, or the province under his juriſdiction.

There are now two archbiſhopricks in England; viz. of Canterbury and York; the prelates whereof are called *primates*, and *metropolitans*; with this only difference, that the former is called primate of *all* England, and the latter, ſimply, primate of England.

The latter yields likewiſe in prerogative and juriſdiction to the former. The archbiſhoprick of York extends over the counties of Northumberland, Durham, Cumberland, Weſtmoreland, Cheſhire, Lancaſhire, and the iſle of Man, beſides its proper and peculiar dioceſe of the greateſt part of Yorkſhire and Nottinghamſhire. That of Canterbury comprehends the other counties, and has its peculiar dioceſe, being a great part of Kent. The archiepiſcopal office is rather a dignity than a juriſdiction; and the primates rarely interfere in any dioceſes except their own. They are appointed by the king, in the ſame manner as the biſhops, by what is called a "congé d'elire."

The archbiſhop, beſide the inſpection of the biſhops and inferior clergy in the province over which he preſides, exerciſes epiſcopal juriſdiction in his own dioceſe. As archbiſhop, he, upon receipt of the king's writ, calls the biſhops and clergy of his province to meet in convocation; but he cannot aſſemble them without the king's writ. To him all appeals are made from inferior juriſdictions within his province; and, as an appeal lies from the biſhops in perſon to him in perſon, ſo it alſo lies from the conſiſtory courts of each dioceſe to his archiepiſcopal court. He is guardian of the ſpiritualities of any vacant ſee in his province, as the king is of the temporalities; and exerciſes eccleſiaſtical juriſdiction in it. He is entitled to preſent by lapſe to all the eccleſiaſtical livings in the diſpoſal of his dioceſan biſhops, if not filled within ſix months. He has likewiſe a cuſtomary prerogative upon conſecrating a biſhop, to name a clerk or chaplain to be provided for by ſuch biſhop; in lieu of which it is now uſual to accept an OPTION. He is ſaid to be *enthroned* when veſted in the archbiſhoprick; whereas biſhops are ſaid to be *inſtalled*.

Archbiſhopricks, as well as biſhopricks, may become void by death, deprivation for any groſs and notorious crime, and reſignation, which, on the part of an archbiſhop, muſt be made to the king himſelf. When an archiepiſcopal ſee is vacant, the dean and chapter are the ſpiritual guardians, ever ſince the office of prior of Canterbury was abolithed at the reformation.

The archbiſhop of Canterbury had anciently, viz. till the year 1152, juriſdiction over Iceland as well as England, and was ſtyled a *patriarch*, and ſometimes *alterius orbis papa*, and *orbis Britannici pontifex*. Matters were done and recorded in his name thus, *anno pontificatus noſtri primo*, &c. The firſt archbiſhop of Canterbury was Auſtin, appointed by king Ethelbert, on his converſion to Chriſtianity, about the year 598. He was alſo *legatus natus*. See LEGATE. He even enjoyed ſome ſpecial mark of royalty: as to be patron of a biſhoprick, which he was of Rochester; and to make knights, coin monies, &c.—He is ſtill the firſt peer of England, and the next to the royal family; having precedence of all dukes, and all great officers of the crown. It is his privilege, by cuſtom, to crown the king and queens of this kingdom. He may retain and qualify eight chaplains; whereas a duke is by ſtatute allowed only ſix.

He has, by common law, the power of probate of wills and teſtaments, and granting letters of adminiſtration.

He has alſo (by ſtat. 25 Hen. VIII. c. 21) a power to grant licences and diſpenſations in all caſes formerly ſued for in the court of Rome, and not repugnant to the law of God. He accordingly iſſues ſpecial licences to marry, to hold two livings, &c.; and he exerciſes the right of conferring degrees.

He is addreſſed with the title of *Grace*, and *Moſt Reverend Father in God*; and writes himſelf by *Divine Providence*; whereas biſhops only uſe by *Divine Permiſſion*.

He alſo holds ſeveral courts of judicature; as court of arches, court of audience, prerogative court, and court of peculiars.

The archbiſhop of York has the like rights in his province, as the archbiſhop of Canterbury. He has precedence of all dukes not of the royal blood; and of all officers of ſtate, except the lord high chancellor. He has alſo the right of a count palatine over Hexamſhire.

The firſt archbiſhop of York was Paulinus, appointed by pope Gregory about the year 622. He had formerly juriſdiction over all the biſhops of Scotland; but in the year 1470, pope Sextus the IV. created the biſhop of St. Andrews, archbiſhop and metropolitan of all Scotland.

ARCH-BUTLER, ARCHIPINCERNA, the great butler or ſkinker of the empire.

The king of Bohemia is archbutler: and his buſineſs as ſuch is to preſent the firſt cup at an imperial entertainment; but he is not obliged to officiate with his crown on.

His other prerogatives are, that he precedes all other temporal electors; walks in proceſſion immediately after the emperor, the empreſs and the electors of Mentz and Cologn following next; and in the electoral college he has the third voice, &c. He has for vicar or deputy the hereditary prince of Limbourgh.

ARCH-CHAMBERLAIN, ARCHICAMERARIUS, an officer of the empire; much the ſame with what in England we call *great chamberlain*.

The elector of Brandenburg is arch-chamberlain of the empire, being ſo appointed by the golden bull; and in that quality, he bears the ſceptre before the emperor, which he bears in his coat of arms, walking on the left hand of the elector of Saxony. At ſome ſolemnities he alſo ſerves on horſeback like other electors, carrying a baſon with a towel in his hands; which, alighting, he gets for the emperor to waſh. He may proceed with reſpect to his fiefs, principalities and lands, as with allodial eſtates; and at his own pleaſure impoſe new tolls, and erect mills on all the rivers. He has his vicar, or ſub-arch-chamberlain, who is prince of Hohenzollern, of the houſe of Brandenburg, and alſo bears the ſceptre in his arms.

ARCH-CHANCELLOR, ARCHICANCELLARIUS, a great chancellor who anciently preſided over the notaries, that is, the ſecretaries of a court.

This office chiefly obtained in France, under the two firſt races of their kings; and afterwards under the empire: as they had three ſeveral territories, Germany, Italy, and Arles; they had three arch-chancellors: and hence the three arch-chancellors ſtill ſubſiſting in Germany; the archbiſhop of Mentz being arch-chancellor of Germany, the archbiſhop of Cologn of Italy, and the archbiſhop of Treves of Arles.

The arch-chancellor of Germany is alſo denominated director, and alſo dean or decanus of the electoral college. To him it belongs to notify the demiſe of a Roman emperor to his co-electors, to appoint the diet, to adminiſter the oath of election to the whole body of electors or their envoys, to collect their voices, to proclaim the election, and alſo to anoint the elected emperor, when the coronation happens within his dioceſe. At the diet he bears the general directory, in which he acts without controul; and before him or his envoys all thoſe of the ſtates of the empire, as well as of foreign princes, legitimate themſelves. He names the vice-chancellor of the empire, or an aulic vice-chancellor, who is obliged to take an oath to him as well as to the emperor. He alſo appoints all the chancery officers of the empire, and has ſupreme juriſdiction over them, and alſo the inſpection of its archives. By him the emperor cauſes the aulic council of the empire to be viſited. The arch-chancellor of Italy has the ſecond voice at an election of a king of the Romans; and when the emperor is crowned at Aix-la-Chapelle, and in the archbiſhoprick of Cologne, the right of performing the coronation belongs ſolely to him.

The arch-chancellor of the holy Roman empire in Gaul and Arles is at preſent only a bare title, without any power belonging to it. At an election of a king of the Romans, he has the firſt voice, and conſtantly precedes the elector of Cologn.

Bern. de Mallincrot, in an expreſs treatiſe *De Archicancellariis Imperii Romani*, ſhews that theſe three archbiſhops were arch-chancellors before they were electors.—We alſo read of arch-chancellors of Burgundy, &c.

ARCH-CHANTOR, ARCHICHANTOR, the chief or preſident of the chantors of a church.

ARCH-*count*, *archicomes*, a title anciently given to the earl of Flanders, on account of his great power and riches.

ARCH-DEACON, ARCHIDIACONUS, a church officer veſted with eccleſiaſtical juriſdiction over the laity and clergy, next after the biſhop, either through the whole dioceſe, or only a part of it.

He is uſually appointed by the biſhop himſelf, and hath a kind of epiſcopal authority, originally derived from the biſhop, but now independent and diſtinct from his. He therefore viſits the clergy, and has a ſeparate COURT for puniſhment of offenders by ſpiritual cenſures, and for hearing all other cauſes of eccleſiaſtical cognizance.

The archdeacon, ſometimes alſo called *arch-levite*, was originally the firſt and eldeſt of the deacons who attended on the biſhop: whence his name.

But as the archdeacons, in their original inſtitution, had no

no relation to the diocefe, but only to the epifcopal fee, fo it was by feveral ſteps and degrees that they attained to the power they now enjoy. At their firſt inſtitution, their proper buſineſs was, to attend the biſhop at the altar; to direct the deacons and other inferior officers in their ſeveral duties, for the orderly performance of divine ſervice; to attend the biſhop at ordinations; and to aſſiſt him in the management of the revenues of the church: but without any thing that could be called juriſdiction in the preſent ſenſe of the word, either in the cathedral or out of it. Gibſon.

An archdeacon was not known before the council of Nice: his function has ſince become a dignity: and even ſet above that of prieſts; though anciently it was quite otherwiſe. The archdeacon was the biſhop's chief miniſter, for all external concerns, and particularly the adminiſtration of the temporalities. He took care that order and decency were obſerved in divine ſervice; looked to the ornaments and utenſils of the church; had the direction of the poor, and inſpection of the manners and behaviour of the people: for which reaſon he was called the *biſhop's heart and eye; oculus epiſcopi, & cor epiſcopi.* Theſe advantages ſoon gained him ſuperiority over prieſts, who had only ſpiritual functions. But he had no juriſdiction over them till the ſixth century; though by that time he was become ſuperior to the archimandrite, or rural dean.

In the tenth century, archdeacons were conſidered as having juriſdiction in their own right, or attached to their office; with a power of delegating it to others. But from that time meaſures were taken to leſſen their power, by increaſing their number.—He whoſe diſtrict lay in the capital city, took the quality of *great arch deacon.*

We have ſixty archdeacons in England: their office is to viſit every two years in three, to inquire into the reparations and moveables belonging to the church, reform abuſes in eccleſiaſtical matters, and bring the more weighty affairs before the biſhop: beſides which they have alſo a power to ſuſpend, excommunicate, and in many places to prove wills, and in ſome to inſtitute to benefices.

It is one part of the archdeacon's office to induct all clerks into their benefices within his juriſdiction; and, by the act of uniformity, he is now obliged to be in prieſt's orders.

Many archdeacons, in old foundations, have, by preſcription, their courts and officials, as biſhops have.

Archdeaconries are commonly given by biſhops, who do therefore prefer to the ſame by collation; but if an archdeaconry be in the gift of a layman, the patron doth preſent to the biſhop, who inſtitutes in like manner as to another benefice; and then the dean and chapter do induct him, that is, after ſome ceremonies, place him in a ſtall in the cathedral church to which he belongeth, whereby he is ſaid to have a place in the choir.

ARCH-*ſubdeacon, archiſubdiaconus*, the firſt or chief among the ſubdeacons, as the archdeacon is among the deacons. In ſome copies of the Roman ordinal, he is called *ſubarchidiaconus.*

ARCH-DRUID, ARCHIDRUIDA, the chief or pontiff of the ancient DRUIDS in a nation.

ARCHDUKE, ARCHIDUX, a duke veſted with ſome quality, pre-eminence, and authority, above other dukes.

The archduke of Auſtria is a very ancient title. There have alſo formerly been archdukes of Lorrain and Brabant. Auſtria was erected into a marquiſate by Otho I. in favour of his brother-in-law Leopold, or by Henry I. in 944, who is ſaid to have beſtowed it on Leopold, called the "illuſtrious," and the firſt that brought the Auſtrian countries as an inheritance to his poſterity, under that dignity; and it was raiſed into a duchy by Frederic I. in 1156; but we do not well know when, or why, the title archduchy was given it.—It is commonly maintained, that Frederic III. called the "Pacific," erected it into an archduchy for his ſon Maximilian, about the year 1477. Others ſay, that the title was conferred by the ſame emperor on Philip, the ſon of Maximilian; and that he was the firſt of the Hapſburg family diſtinguiſhed by the appellation of Archduke. However this be, it is certain, that it has been uniformly uſed ſince the fourteenth century, and that conſiderable privileges are annexed to it.

The principal privileges of this ſtate are, that the archduke ſhall diſtribute juſtice in his own dominions, without appeal: that he ſhall be judged to have received the inveſtiture of his ſtates, after having demanded it three times; and that he cannot be deprived of his countries, even by the emperor, and the ſtates of the empire: that no affair of the empire can be concluded without his participation; and that he have a power of creating counts, barons, and gentlemen, throughout the whole empire; which are privileges to which the other dukes of the empire are entire ſtrangers. Beſides, he is born privy-counſellor of the emperor; all attempts againſt his perſon are puniſhed as crimes læſæ majeſtatis; he is exempt from challenge to ſingle combat; may aſſiſt at the aſſemblies, or be abſent, at pleaſure; and he has the privilege of being exempt from contributions and public taxes; and ranks immediately after the electors. His ſubjects cannot be ſummoned out of his province, upon account of law-ſuits, or to give witneſs, or to receive the inveſtiture of fiefs: any lands of the empire may be alienated in his favour, even thoſe that are feudal; in the ſucceſſion to his ſtates, the right of birth takes place, and upon the failure of males, the females ſucceed according to the lineal right; and if no heir be found they may diſpoſe of their lands, as they pleaſe.

ARCH-*monaſtery, archimonaſterium*, an appellation ſometimes given to the greater monaſteries and abbies.

ARCH-*notary, archinotarius*, the *primicerius*, or chief of the notaries.

This office is ſuppoſed by ſome to have differed from the *arch-chancellor*, though wherein the difference conſiſted does not appear.

ARCHE, αρχη, is a Greek word, importing the *beginning.*

ARCHE, among *Phyſicians*, is the beginning or firſt period of diſeaſe.

ARCHE, L', in *Geography*, a town of France in the department of the Correze, and chief place of a canton, in the diſtrict of Brive, two leagues ſouth-weſt of Brive.

ARCHED *fountain.* See FOUNTAIN.

ARCHED *ſkene*, or *ſcheme*, in *Architecture*, is uſed to denote a flat *arch*, leſs than a ſemicircular one.

ARCHED *legs*, is an imperfection in a horſe, when being in his natural poſition, he has his legs bent forwards; ſo that his whole leg makes a kind of arch or bow.

This uſually ariſes from exceſſive labour, whereby the back-ſinews are made to ſhrink up, ſo that the legs remain arched, and naturally tremble after a little riding; though the diſorder is natural to ſome horſes.

ARCHEGETES, formed of αρχων, *chief*, and ηγεομαι, *to conduct*, in *Mythology*, a title of Apollo, under which he had an altar and worſhip in the iſle of Naxos. The coins of this iſland bore a figure of Apollo's head with this appellation. In the iſland of Malta, Hercules had the ſame title, whither his worſhip was brought from Tyre.

ARCHEION, a name given by the Greeks to the moſt retired and ſecret place of their temples, where were depoſited.

ſted the richeſt treaſurers pertaining to the deities, to whom they were conſecrated, and alſo other valuable articles which they were deſirous of preſerving ſecure. The Romans imitated the Greeks in this reſpect, and lodged their public treaſure in the temple of Saturn.

ARCHELAIS, in *Ancient Geography*, a town of Cappadocia. Pliny ſays, that it was a Roman colony, and that it was near the river Halys.—Alſo, a city of Judæa built by Archelaus, ſon of Herod the Great, before his exile. Ptolemy places it to the weſt of Jericho, and the Peutingerian tables fix its ſituation between Jericho and Scythopolis.

ARCHELAUS, in *Biography*, a Greek philoſopher, was born either at Miletus or at Athens. He was a diſciple of Anaxagoras at Lampſacus, occupied the chair of that philoſopher after his death, and may be conſidered as the laſt preceptor of the original Ionic ſchool. Afterwards he removed to Athens, and with him the Ionic ſchool was removed thither. Here he acquired diſtinguiſhed reputation by publicly teaching the doctrines of Anaxagoras concerning natural bodies; whence he was denominated the natural philoſopher. Among the tenets aſcribed to him are the following: that ſimilar parts were the material principles of all things, and that a ſuperintendant mind, by collecting and uniting theſe, formed natural bodies; that the univerſe is infinite; that heat is the cauſe of action, and cold of reſt; that the earth was originally a muddy maſs, from which living animals were produced and nouriſhed; and that animals have ſouls, differing in their powers according to the ſtructure of the bodies in which they reſide. In ethics, it was his fundamental principle, that there was in nature no eſſential diſtinction between right and wrong, but that it reſulted from poſitive inſtitution, and conſequently that all actions were indifferent, till human laws declare them to be good or evil. This doctrine, ſo ſubverſive of all moral obligation, gained little credit at the time when it was propounded; and it has had few advocates either in ancient or in modern times. Amongſt the ſcholars of Archelaus, who were numerous, Socrates was eminently diſtinguiſhed; and under him philoſophy aſſumed a new character. Diog. Laert. l. ii. § 17. T. ii. p. 89. Cic. Tuſcul. Queſt. l. v. c. 4. T. ii. p. 454. ed. Olivet. Plut. de Placit. Phil. l. i. c. 3. T. ii. p. 876. Auguſt. de Civ. Dei. l. xiii. c. 2. Suidas. Brucker's Hiſt. Phil. by Enfield, vol. i. p. 153.

ARCHELAUS, a Chriſtian divine, was biſhop of Meſopotamia, and flouriſhed under the emperor Probus, about the year 278. Of the author and authenticity of the work againſt the Manichees, intitled, "The Acts of the Diſputation of Archelaus with Mani or Manichee," aſcribed to him by Jerom and others, and ſaid to be written in the Syriac language, many different opinions are entertained. Photius, on the authority of Heraclean, biſhop of Chalcedon, aſcribes it to Hegemonius; and hence Cave and others have been induced to conſider Hegemonius as the tranſlator. Fabricius conjectures, that this author, whoſe age is unknown, publiſhed an abridgment of the work of Archelaus. Dr. Lardner, who with his uſual accuracy and impartiality has examined and weighed the evidence on this ſubject, inclines to the opinion of Beauſobre, who thinks, that this work was originally written in Greek, near the end of the third or beginning of the fourth century; and that it contains ſome truths diſguiſed and mixed with manifeſt falſehoods. It was edited from a manuſcript of the Latin tranſlation found at Caſſino, and from ſome fragments of the Greek in Cyril and Epiphanius, by Zacagni, in his "Collectanea Monumentorum Vet. Rom." in 1698. The writer's reſpect for the ſcriptures now commonly received, ſays Lardner, is manifeſt from his very numerous and frequent quotations of them as deciſive and of authority in all diſputed points of religion. Cave, Hiſt. Lit. vol. i. p. 144. Fabr. Bibl. Græc. l. v. c. i. § 31. T. v. p. 362. Lardner's Works, vol. iii. p. 368—374.

ARCHELAUS, king of Judæa properly ſo called, together with Samaria and Idumæa, was the ſon of Herod the Great by Martac his fifth wife, and appointed by his will to ſucceed him in the 1ſt year of Chriſt, or the 3d year before the vulgar æra. Notwithſtanding a conciliatory ſpeech made by the new king on his acceſſion to the throne, and ſome grants to the people, a tumult was raiſed, by which the paſchal ſolemnity for that year was interrupted, and 3000 of the mutineers loſt their lives. After the ſuppreſſion of this tumult, Archelaus proceeded to Rome, in order to obtain the ratification of his father's will, and a permanent eſtabliſhment in the kingdom. Upon his arrival he found his brother Herod Antipas, who was his competitor for the crown, together with ſeveral of his family who favoured Herod's pretenſions, not ſo much from love to him as from hatred to Archelaus. An embaſſy alſo of fifty of the principal perſons of Jeruſalem was ſent to Rome with a petition to Auguſtus, that they might be permitted to live according to their own laws under a Roman governor; and theſe deputies were joined by above 8000 Jews, that were reſident in the city. Archelaus, however, by his humility and addreſs, obtained the grant of half his father's kingdom, including Judæa Proper, Idumæa, and Samaria, under the title of Ethnarch, or governor of a nation, and alſo a promiſe of adding that of the king, as ſoon as he heard that his conduct merited that diſtinction. St. Matthew indeed (ch. ii. 22.) ſays, "that Archelaus did reign in Judæa;" and againſt this mode of expreſſion there can be no juſt objection, becauſe his father in his laſt will had appointed him his ſucceſſor with the title of king; and Joſephus (Antiq. l. 18.) calls him, notwithſtanding the limitation of Auguſtus's decree, the king that ſucceeded Herod, and he has uſed (De Bell. l. ii. c. 7.) the term reigning for the duration of his government. Archelaus immediately upon his return to Jeruſalem began to betray ſome offenſive tokens of his arbitrary and vindictive temper. He firſt depoſed Joazar, and afterwards his ſucceſſor Eleazar, from the high-prieſthood; and, in direct oppoſition to the Moſaic law, he repudiated his wife Mariamne, and married Glaphyra, the widow of his brother Alexander, though ſhe had ſeveral children. In other reſpects, his reign was tyrannical, and, Antipater excepted, he ſeems to have been the worſt of all Herod's ſons; and therefore in the tenth year of his government, A.D. 6, or 7, the chief of the Jews and Samaritans, not being able any longer to endure his cruelty and tyranny, preſented complaints againſt him to Cæſar. Auguſtus ſent for him and ſome of his chief accuſers to Rome, and having heard both the charge and the defence, condemned him to be baniſhed to Vienne or Vienna in Gaul, where he died, and all his goods to be confiſcated. Upon this, Judæa was reduced to a province of the empire and annexed to Syria; and Cyrenius, a conſular perſon, was ſent by Cæſar to make an aſſeſſment in Syria, and to ſeize the eſtate of Archelaus. From different ſtatements given by Joſephus in his war (De Bell. l. ii. c. 7. § 3.), Antiquities (l. xvii. c. 15. § 2.), and Life (§ 1.), there is reaſon to conclude, that Archelaus reigned nine years complete, and that the tenth year was current when he was baniſhed. And Dio (l. lv. p. 567.) places Archelaus's baniſhment in the 759th year of Rome. If Herod did not die till the beginning of A.U. 751, the ninth year of Archelaus's reign could not be completed in the 759th year of Rome: but if it be ſuppoſed that Herod died in the beginning of A. U. 750, Joſephus

ſephus and Dio will be found to agree. There is probably a reference to the recent hiſtory of Archelaus in our Lord's parable recorded by St. Luke, ch. xix. 12—15. Anc. Un. Hiſt. vol. iii. p. 207—218. Lardner's Works, vol. i. p. 14, 15. 290. 425.

Archelaus, king of Macedon, was the natural ſon of Perdiccas II; and though he obtained the crown by aſſaſſinating the lawful heirs, he determined to maintain it with valour and glory. With this view he fortified the principal towns of Macedonia, diſciplined its armies, and fitted out armed ſhips, which was a kind of force to which the Macedonians had not been accuſtomed. He alſo diſtinguiſhed himſelf as a patron of literature and of the arts, and ſome of the moſt learned men of Greece frequented his court; with them he converſed in the moſt familiar manner, and ſome of his ſayings at table are recorded amongſt the apophthegms of antiquity. Euripides lived with him on terms of peculiar intimacy; and this is the more ſurpriſing, if we credit the tradition that he refuſed to write a tragedy, at his requeſt, on ſome ſubject relating to himſelf, and offered this apology, that he did not with to repreſent the cruelties of a tyrant. When Socrates was invited by him, he declined paying him that reſpect, alleging, as Seneca ſays, "that he could not go to ſee a man from whom he might receive favours, without being able to return the like;" and it is ſaid, that Socrates cenſured the great expence which he beſtowed on his palace which was painted by Zeuxis, whilſt he had taken no pains to adorn his mind. Some have pretended that Ariſtophanes wrote his comedy of "the Clouds," from envy of Socrates, becauſe Archelaus took more notice of this philoſopher than of himſelf. Archelaus inſtituted ſacrifices and ſcenic games in honour of Jupiter and the nine muſes; and a day was devoted to each muſe. He alſo ſent chariots to the Olympic and Pythian games. The manner of his death and the duration of his reign are not preciſely aſcertained. It is generally ſuppoſed that he was aſſaſſinated by Craterus, the object of his laſcivious paſſion, in conſequence of an affront. According to Diodorus Siculus, he began his reign in the 3d year of the 93d Olympiad, 406 years before Chriſt, and reigned ſeven years. Others have extended it to fourteen, ſixteen, and even twenty-four years. Gen. Dict. Anc. Un. Hiſt. vol. iii. p. 269.

Archelaus, a famous ſculptor, the ſon of Apollonius, was borne at Priæne, a town of Ionia. The marble monument of the apotheoſis of Homer is aſcribed to him, and ſuch is its diſtinguiſhing excellence, that, independently of his poems, it would have inſured his immortality. It was dug up in 1658 in a field belonging to the princes of Colonna, where it is ſaid the emperor Claudius, in whoſe time it was executed, had a houſe of pleaſure.

ARCHEMORUS, in *Ancient Geography*, a river of Greece in the Peloponneſus, which ſeparated the territories of Sicyon from thoſe of Corinth. It is called Nemea by Strabo.

ARCHEMY. Archemy, is uſed by ſome to denote the art of trantmuting leſs perfect metals into the more perfect. In which ſenſe *archemy* differs from *alchemy*, as a part from the whole.

ARCHENDA, in the *Ancient Phyſic*, a kind of powder prepared of *alcanna* and leaves of the Egyptian ligustrum, wherewith the people ſmeared their feet after bathing, as a preſervative againſt ſweating and ſtench.

ARCHER, John, in *Biography*, an Engliſh phyſician, who practiſed in London in the reign of Charles the Second, author of a manual, "Every man his own phyſician," publiſhed in 1673; and though little noticed, it appears to have been not void of ingenuity. At the end of his works, he boaſts of three inventions, a vapour bath, of conſiderable efficacy in rheumatiſm, and various other diſeaſes; an oven "which doth with a ſmall faggot bake, diſtil, boil a pot, or ſtew, all with the ſame charge of fire, time, and labour;" and a chariot, ſo contrived, that the perſon ſitting in it may move it at pleaſure. It is not improbable that ſome of our modern inventors took hints from this book for their contrivances.

Archer, Edward, M.D. in *Biography*, was born in the borough of Southwark, in London, about the year 1719. He received his medical education partly at Edinburgh, and partly at Leyden, at which latter place he graduated in the year 1746, and gave for his theſis a diſſertation De Scorbuto. In the year 1748 he was elected phyſician to the ſmall-pox hoſpital in Cold Bath Fields, in the place of Dr. Poole, the firſt phyſician to that inſtitution; and in 1752 he was admitted licentiate of the college of phyſicians, London. In the year 1782, the committee of the ſmall-pox hoſpital, conſiſting of thirteen of the governors, prevailed on him to ſuffer a whole length portrait of him to be painted by Mr. Pine, for which they paid one hundred guineas, and placed it in the court-room as a mark of their reſpect, and of the high opinion they entertained of his abilities, and of his zeal for the inſtitution. This, though he then accepted, yet he was mindful to return it; and therefore ordered by his will, that each of the contributors ſhould be paid back the money they had advanced, with intereſt to the time of its being repaid. He alſo left 500*l.* to the hoſpital, where he reſided to the time of his death, which happened on the 28th of April 1789, having now been phyſician to the inſtitution forty-one years.

He was of an humane and benevolent diſpoſition, and poſſeſſing an ample fortune, was never ſolicitous about practice; and during the latter part of his life, entirely declined all buſineſs, excepting his attendance on the patients in the hoſpital. To this he might in part be inclined from his corpulence, and from the nature of the complaint, a dropſy in the cheſt, to which he at length fell a ſacrifice, and which muſt make all motion particularly troubleſome to him. He was a man of conſiderable learning, and had collected a magnificent and valuable library. This was ſold a few months after his death by Meſſrs. Leigh and Sotheby. He was buried at Woodford in Eſſex.

ARCHERS, a kind of militia or ſoldiery, armed with bows and arrows. The word is formed of *arcus*, *a bow*; whence *arcuarius*, and even *arquis*, and *arquites*, as they are alſo denominated in the corrupt ſtate of the Latin tongue.

Archers were much employed in former times; but they are now laid aſide, excepting in Turkey, and ſome of the eaſtern countries; where there are companies of *archers* ſtill ſubſiſting in their armies; and with which they did terrible execution at the battle of Lepanto. As an amuſing exerciſe and trial of ſkill, the occaſional practice of archery is ſtill continued in many parts of Europe, and even in our own country.

The name archer is ſtill retained even where the thing is loſt: thus in France, the officers who attend the lieutenants de police, and provoſts, to make captures, ſeizures, arreſts, &c. are called archers; though their arms be only halberds or carabines.—In this ſenſe they ſay, the archers of the *grand prevot de l'hotel*; of the *prevot des marchands*; the city *archers*; the *archers du guet*, or of the watch, &c.—Small parties of archers, called alſo *gens de marechauſſee*, have been employed to patrol on the great roads, to ſecure them againſt robbers.—The carriages of Lyons, &c. were always eſcorted

by a party of archers. To the diligence of theſe archers, or marſhal's men, it has been partly owing, that perſons have travelled in all parts of France in the utmoſt ſecurity; and that there have been fewer robberies on the highway in that whole kingdom in a year, than about London in a week. They have alſo their *archers des pauvres, archers of the poor*; whoſe office it is to ſeize ſuch beggars as they find in the ſtreets, and carry them to the hoſpitals.

ARCHERY, the art or exerciſe of ſhooting with bow and arrow.

Among the nations of antiquity, the bow was a principal implement of war. Its uſe may be traced to the very earlieſt times, and followed in the hiſtory of almoſt every country. In this article, however, we ſhall principally confine ourſelves to the practice of archery in England; where it was once carried to a degree of perfection that it is even yet unrivalled.

Our anceſtors uſed the bow for a double purpoſe: in time of war it was a dreadful inſtrument of ſlaughter; and in peace an object of amuſement. That both the Anglo-Saxons and the Danes were well acquainted with its uſe, is certain; and they muſt have derived their knowledge of it at an early period; as the Scandinavian ſcalds, when praiſing the heroes of their country, enumerate among their acquirements a ſuperiority of ſkill in handling the bow. Among the Saxons and the Danes, however, it ſeems only to have been uſed for the purpoſes of food or paſtime; and we are perhaps indebted to the Norman conqueſt for its introduction as a military weapon. The bow employed among the Saxons will be accurately deſcribed hereafter. That which the Normans uſed at the battle of Haſtings was the arbaleſt or croſs-bow; while no mention is made of archers on the ſide of Harold.

The exact time when ſhooting with the *Long* bow began is unſettled; and our chroniclers do not mention the uſe of archery as applied either to one bow or the other, till the death of king Richard the firſt in 1199, who was killed at the caſtle of Chaluz by an arrow, ſaid to have proceeded from a croſs-bow. From this time till that of Edward the ſecond, our notices of archery are ſcanty; the king's *baliſtarius*, or croſs-bow-man, is often mentioned, and it is in this reign that we met with *ſagittarius*, a term which perhaps has particular relation to the ſhooters with the long-bow. Many of the ſoldiers employed in the unſucceſsful expedition againſt Scotland in 1323 were of this deſcription, as well as thoſe who are ſent the next year to the relief of Aquitain. Under Edward III. the glory of the Engliſh long-bow was at its zenith; and that monarch appears to have been very anxious that its luſtre ſhould remain untarniſhed. In 1342 a precept was iſſued to the ſherives of moſt counties in England, for providing 500 white bows and as many bundles of arrows, for the then intended war againſt France. And the king afterwards ordered a letter of complaint to be directed to the ſherives of London, declaring that the ſkill in ſhooting with arrows was almoſt totally laid aſide for the purſuit of various uſeleſs and unlawful games; and commanding them not only to prevent ſuch idle practices in future, but to ſee that the leiſure time upon holidays was ſpent in the recreations of archery. The battle of Creſſy, in 1346, was attended by a circumſtance that ſeems to have a particular reference to the uſe of the long-bow among the Engliſh. Previouſly to the battle, a ſhower of rain ſo ſlackened the ſtrings of the Genoeſe croſs-bows, that they became almoſt unſerviceable; while the Engliſh were ſtill capable of annoying their enemies with ſucceſs. Both this victory, and that of Poictiers, ten years afterwards, were chiefly aſcribed by the Engliſh to their archers. The deciſive victory of Homildon, againſt the Scots, in 1402, was atchieved by them entirely: and the earl of Douglas found to his coſt, that the Engliſh arrows were ſo ſwift and ſtrong, and diſcharged with ſo much force, that no armour could repel them. In 1403, at the battle of Shrewſbury, where Hotſpur was ſlain, the archers on both ſides did terrible execution: and the victory of Agincourt, in 1417, was entirely owing to their ſkill. Yet, notwithſtanding the advantages which had evidently accrued to the Engliſh from the uſe of the long-bow, the French were ſtill attached to the arbaleſt: for which reaſon Henry V., as duke of Normandy, confirmed the charters and privileges of the Sahitarii, who had been long eſtabliſhed as a fraternity at Rouen. Under Edward IV. an ordinance was made, that every Engliſhman and Iriſhman dwelling in England, ſhould have a bow of his own height, to be made of yew, wych, hazel, aſh, or auburne, or any other reaſonable tree according to their power. Butts, alſo, or mounds of earth, as marks, were directed to be made in every townſhip, and the inhabitants to practiſe archery, under certain penalties. In the fourteenth year of the ſame king, it appears by Rymer's Fœdera, that one thouſand archers were to be ſent to the duke of Burgundy, whoſe pay is ſettled at ſix-pence a day: a circumſtance, which, conſidering the value of money at that time, proves very ſtrongly the great eſtimation in which Engliſh archers were ſtill held: and even afterwards, when the uſe of what we now call *Artillery* gained ground, that of the bow and arrow were by no means neglected. In the 19th of Henry VII. and the 6th and 25th of Henry VIII. the uſe of the croſs-bow was entirely forbidden, and by the laſt-mentioned ſtatute a penalty of ten pounds was to be inflicted on every one in whoſe houſe a croſs-bow might be found. Other ſtatutes, in the early part of Henry's reign, afford-d great encouragement to archery with the long-bow. One in his third year directs that every father ſhall provide a bow and two arrows for his ſon, when he ſhall be ſeven years old: and another was enacted in his 33d year to reduce the price of bows. Edward VI., as we learn from his own journal, was fond of archery; and in the ſucceeding reign, the ſtatutes of Henry VIII. for its promotion were much commended, with directions to enforce them. Under Elizabeth, James, and Charles I. other ſtatutes were ordained. In 1566 the price of bows was again regulated; and in 1571 it was enacted, that bow ſtaves ſhould be brought from the Hanſe towns and the eaſtward. Ten years after this, a ſociety of archers exiſted in London, who, from the fame which Arthur, elder brother to Henry VIII., had acquired at the long bow, were termed prince Arthur's knights. John Lyon, who founded Harrow ſchool in 1590, two years before his death, drew up rules for its direction, whereby the amuſements of the ſcholars were confined to "driving a top, toſſing a hand ball, running, and ſhooting;" the laſt mentioned diverſion is in a manner inſiſted on by the founder, who requires all parents to furniſh their children with "bow-ſtrings, ſhafts, and breſters, to exerciſe ſhooting." A ſilver arrow uſed, till within theſe few years, to be ſhot for by the young gentlemen of Harrow ſchool.

The laſt time the legiſlature interfered for the protection of archery, ſeems to have been in 1633, when Charles I. iſſued a commiſſion for preventing the fields near London being ſo incloſed as "to interrupt the neceſſary and profitable exerciſe of ſhooting;" as alſo to lower the mounds where they prevented the view from one mark to another. The ſame commiſſion directs that bridges ſhould be thrown

over the dikes, and that all ſhooting marks which had been removed ſhould be reſtored. During the grand rebellion, the practice of archery ſeems to have received no encouragement, but rather to have fallen into diſrepute. Sir William Davenant, in a mock poem, entitled "the long vacation in London," deſcribes the attorneys and proctors as making matches in Finſbury Fields:

"With loynes in canvas bow-caſe tied,
Where arrows ſtick with mickle pride;
Like ghoſts of Adam Bell and Clymme,
Sol ſets for fear they'll ſhoot at him."

Adam Bell and Clym of the Clough were noted outlaws, whoſe ſkill in archery rendered them as famous in the north of England, as Robin Hood and his contemporaries were in the midland counties. In 1676, Catharine of Portugal, queen of Charles II., by the contributions of ſir Edward Hungerford and others, preſented a ſilver badge, weighing 25 ounces, to the marſhal of the archers' fraternity, on which was repreſented an archer drawing the ſtring of a long-bow (in the proper manner) to his ear; with the following inſcription: "Reginæ Catharinæ Sagittarii." The ſupporters, two bowmen with the arms of England and Portugal. In 1682, there was a moſt magnificent cavalcade and entertainment given by the archers of Finſbury. Charles II. was preſent on this occaſion, but the day being rainy, he was obliged ſoon to leave the field. Archery had by this time degenerated. From the glory of Britiſh warriors, it dwindled to a mere manly recreation; and the very name of archer ſeemed forgotten, till, in 1753, targets were erected in Finſbury-fields, during the Eaſter and Whitſun holidays, when the beſt ſhooter was ſtiled captain for the enſuing year, and the ſecond, lieutenant. Of the original members of this ſociety, there were only two remaining when Mr. Barrington compiled his obſervations in the Archæologia. It is now incorporated with the archers' diviſion of the honourable the Artillery Company.

Archery, with the long bow, continues to be uſed as a manly exerciſe by the inhabitants of Geneva, and in many parts of Flanders; nor is it totally neglected in Great Britain. The moſt noted ſociety of this kind, now exiſting, is the Royal Company of Archers in Scotland, who aroſe about the time of James I. During the laſt century, in England, many ſmaller ſocieties had their origin, which have now dwindled. The chief that remain are the Archers' diviſion of the Artillery Company, the Toxophilites, and the Kentiſh bowmen.

How effectual the long-bow muſt have been before the uſe of fire-arms, need hardly be ſuggeſted; and the neglect into which it occaſionally fell muſt be ſolely attributed to the length of time that was required to train an expert archer, of which the preambles to many of our ſtatutes are ſufficient evidence. Why it continued in eſtimation ſo long after the uſe of gunpowder, will excite no aſtoniſhment in thoſe who remember, that, till the laſt century, muſkets were among the unwieldieſt inſtruments of war; they were never uſed without a reſt, had no bayonets, and could be diſcharged not near ſo frequently as at preſent. Strutt's Sports and Paſtimes. Archæol. vol. vii. p. 46, &c. Henry's Hiſt. Brit. Ellis's Hiſt. of Shoreditch. See Arrow, Artillery, and Bow.

Archery, in our *Ancient Cuſtoms*, a ſervice of keeping a bow for the uſe of the lord to defend his caſtle.

ARCHES, or *Court of* Arches. See Court *of Arches*.

Arches, in *Heraldry*, are borne in coat-armour, both double and ſingle; and they are drawn as ſpringing from, or ſupported by, pillars.

Arches, among *Navigators*, is particularly uſed for the Archipelago.

ARCHET, *French*; Arco, *Ital.*; the *bow* of a violin, tenor, or violoncello. In the hiſtory of muſic, great pains were taken in tracing the origin of this powerful engine in the hand of a great artiſt, which ſeems to have been utterly unknown to the ancients, as it can only be traced up to the middle ages; nor was it uſed with much dexterity till the ſeventeenth century. In muſic for the violin, tenor, or baſs, after the word *Pizzicato* occurs, the ſtrings are to be pinched or thrummed, till the *bow* is ordered to be reſumed, by the words *con arco*, with the bow. See Bow.

ARCHETYPE, Archetypus, compounded of αρχη, *beginning*, and τυπος, *type*, the firſt pattern or model by which any work is formed, or which is copied after, to make another like it. In this ſenſe the word coincides with original, or prototype; and ſtands oppoſed to copy.

Among minters, &c. archetype is peculiarly uſed for the ſtandard or original weight by which the other weights are to be adjuſted and examined.

Philoſophers, particularly the Platoniſts, talk of an *archetypal* world; meaning the world, ſuch as it exiſted in the Divine Mind, or in the idea of God, before the viſible creation.

ARCHEUNUCH, Archieunuchus, the chief of the eunuchs. The archeunuch was one of the principal officers in Conſtantinople under the Greek emperors.

ARCHEUS, an obſcure term, uſed chiefly among the *Ancient Chemiſts*, to expreſs ſome occult principle of life and motion, the cauſe of all the effects which we obſerve in nature; derived from αρχη, *principle*. As the chemiſts differ in their ideas of a vital cauſe, the term archeus becomes applied to very different things; though moſt of them conceive it of the nature of fire. Some uſe archeus to denote the fire lodged in the center of the earth, to which they aſcribe the generation of metals and minerals; and which they believe to be the principle of life in vegetables. Others by the word archeus mean a certain univerſal ſpirit diffuſed throughout the whole creation, the active cauſe of all the phenomena in nature. Others, inſtead of archeus, chooſe to call this the *anima mundi*; and others, the *Vulcan* or *heat* of the earth. They add, that all bodies have their ſhare of this archeus; and that when this is corrupted, it produces diſeaſes which they call *archeal diſeaſes*. They likewiſe attribute ideas to it; which for this reaſon they call *archeal ideas*. Helmont is a great aſſertor of the dogma of an archeus. It is likewiſe uſed to ſignify that peculiar fluid among the vegetable claſſes, which determines every particular plant to its odour, taſte, and other qualities.

ARCHI, in *Ancient Geography*, a town of Paleſtine, in the half tribe of Manaſſeh, beyond Jordan. Joſh. c. xvi. 2.

Archi, in *Geography*, a town of Italy, in the kingdom of Naples, and province of Abruzzo citra.

ARCHIAC, a town of France, in the department of the Lower Charente, and chief place of a canton in the diſtrict of Jonſac, five leagues ſouth of Saintes. The place contains 1533, and the canton 10,906 inhabitants: the territory includes 180 kiliometres and 16 communes. W. long. 0° 39', N. lat. 45° 34'.

ARCHIACOLYTHUS, an ancient dignity in cathedral churches; the miniſters whereof were divided into four orders, or degrees, viz. prieſts, deacons, ſubdeacons, and acolythi; each of which had their chiefs. The chief of the acolythi was called *archiacolythus*. Du-Cange.

ARCHIAS, Aulus Licinius, in *Biography*, a Greek

poet, lived about the year 60 before Chriſt, and is better known by the eloquent oration pronounced by Cicero for vindicating his right to the citizenſhip of Rome, than by the fragments of his works now extant. Cicero (pro Archia, apud oper. t. v. p. 397. ed. Olivet.) informs us, that he was a native of Antioch, and that his poetical talents, even in his youth, were generally acknowledged and admired in all the Greek cities of Aſia and Europe which he viſited. At Rome, where he arrived under the Conſulſhips of Marius and Catullus, about the year before Chriſt 102, he was firſt received by the Lucullan family, and afterward highly favoured by the Metelli, Catuli, Craſſi, and other perſons of the moſt diſtinguiſhed rank and character. Cicero ſpeaks in terms of high commendation of his powers, which probably conſiſted rather in facility and copiouſneſs of verſifying, than in the other ſuperior qualities of a poet; and he ſays, that by previous ſtudy and meditation, his performances were equal to thoſe of antiquity. Archias wrote a poem on the Cimbric war, and began another on the conſulate of Cicero, which was left unfiniſhed. Some of his epigrams, now extant, are preſerved in the "Anthologia."

ARCHIATER, Archiatrus, formed of ἀρχὴ, *principium*, *chief*, and ἰατρὸς, *medicus*, a *phyſician*, properly denotes the chief phyſician of a prince who retains ſeveral.

On the real ſignification of the term, or on the office and deſignation of the Archiater, authors are not agreed: ſome, as Hieronimus Mercurialis, conſidering it as a title given to the phyſician to the emperor or prince; others, as Alciatus, Meibomius, &c. as belonging to the principal phyſician in the country, who had ſome power or authority over the other phyſicians. It is remarkable that the word does not occur in Pliny, though he frequently mentions phyſicians both of his own and of earlier times, ſome of whom were ſaid to have been dignified with the title; and that Galen, who had the care of the health of Marcus Aurelius and his ſons, is no where called by it. Perhaps, as Le Clerc conjectures, "Hiſtoire de Medicine," p. 593, the office did not exiſt until after their time: for though, he obſerves, we find the title affixed to the works of writers who lived anterior to the time of Pliny, it may be that the copies we are in poſſeſſion of were written much later, and the tranſcribers may have honoured the authors with this title, to enhance the value of their works, and increaſe the ſale of their manuſcripts. However this may be, the office was under the later emperors held in great honour, and its authority and privileges ſanctioned by the laws. Le Clerc, who has written a long diſſertation on the ſubject, "Hiſt. de Med." p. 583, cites ſeveral laws concerning them: by theſe we find they had ſalaries appointed them, which were paid by the prince, or by the cities or provinces where they were eſtabliſhed. They were exempt from all taxes through the whole of the Roman empire; their perſons were protected; they were not obliged to entertain ſoldiers, &c. On the other hand, the Archiaters, not immediately in the ſervice of the court, were obliged to give aſſiſtance to all ſick perſons indiſcriminately, without exacting any fee for their attendance. They were alſo frequently ennobled and made counſellors of ſtate, an office or dignity not unfrequently at this preſent time beſtowed by many of the princes of Europe upon their phyſicians. Dr. Dimſdale, who went to Ruſſia in the year 1768, to inoculate the late empreſs and the grand duke, was made phyſician and actual counſellor of ſtate to her imperial majeſty, and baron of the whole Ruſſian empire.

ARCHIDAMUS, the ſon and ſucceſſor of Ageſilaus the Great, king of Sparta, commanded the Spartan army during the life of his father, before Chriſt 367, and obtained a victory over the Arcadians, without the loſs of a ſingle Lacedæmonian, whence this was called "the tearleſs battle." When Epaminondas afterwards attacked Sparta, he obliged the Theban general to retire. He ſucceeded his father in the throne in the year before Chriſt 361; and, in the ſacred war, ſuccoured the Phocæans. To a haughty meſſage received from Philip of Macedon, who was elated with his ſucceſs, Archidamus replied, that "if he would meaſure his ſhadow, he would find it no longer than before:" and when he was aſked how far the dominion of Sparta extended? his anſwer (indicating more his magnanimity than his ſenſe of juſtice) was, "as far as they can ſtretch their lances." His life was prematurely terminated in a combat near the city of Mandonium in Italy, between the Meſſapians and Tarentines, to whoſe aſſiſtance he was deputed by a public decree of his country, after a reign of fifteen years; and his character was diſtinguiſhed by valour and public ſpirit. His ſtatue was erected in the temple of Jupiter Olympius, an honour which none of the Spartan kings had enjoyed except himſelf, and which Pauſanias ſuppoſes was granted to him becauſe he died fighting againſt the Barbarians, and did not receive thoſe ſepulchral honours which had been given to all his predeceſſors. He was ſucceeded by his ſon Agis. Anc. Un. Hiſt. vol. v. p. 483.

ARCHIDAPIFER, or chief ſewer, is a great officer of the empire.

The elector of Bavaria is archidapifer.—The palatine of the Rhine at one time pretended this office was annexed to his palatinate, but he has ſince deſiſted. At the peace of Baden, the office was fully reſtored to Bavaria. At the coronation of the emperor he carries before him the monde of the empire, which by virtue of his office he alſo bears in his arms, ranks next to Bohemia, places on the imperial table the ſilver diſhes, and ſerves up the firſt courſe.

ARCHIDIUM, in *Ancient Geography*, a town of the iſland of Crete, according to Pauſanias, *in Arcad.*

ARCHIDONA, in *Geography*, a town of Spain, in the province of Andaluſia, with an ancient caſtle, two leagues eaſt of Antequera.—Alſo, a town of South America, in Peru, built by the Spaniards, in the province of Canela.

ARCHIEROSYNES, in the Grecian *Antiquity*, a high-prieſt veſted with authority over the reſt of the prieſts, and appointed to execute the more ſacred and myſterious rites of religion.

ARCHIGALLUS, in *Antiquity*, the high-prieſt of Cybele, or the chief of the eunuch-prieſts of that goddeſs, called Galli. This officer was always choſen from among the moſt diſtinguiſhed families.

ARCHIGENES Apameus, ſo called from Apamea, the place of his birth, in *Biography*, a phyſician of eminence in the time of the emperors Domitian and Trajan. Galen ſpeaks of him as deſerving high credit for his diligence and ingenuity, and cites ſeveral of his works with commendation. Haller gives an epitome of his doctrines, and though he commends his practice in the cure of many diſeaſes, yet, from his fondneſs for amulets and charms, places him among the empirics. That he was in high repute, however, cannot be doubted, Juvenal having mentioned him ſeveral times in his ſatires, and always with honour. "Ocyus Archygenem quære, atque eme quod Mithridates compoſuit."

Various fragments of his writings exiſt in the collections of Aetius and Amida. Beſides his writings on the ſubject of pharmacy, he alſo wrote treatiſes on local affections, on the cure of chronic diſeaſes, on the nature and types of fevers, on pulſes, &c. Le Clerc Hiſt. de la Med.

ARCHIGERONTES, in *Antiquity*, the chiefs or maſters

maſters of the ſeveral companies of artificers at Alexandria.

Some have miſtaken the archigerontes for the arch-prieſts, appointed to take the confeſſions of thoſe who were condemned to the mines.

ARCHIGUBERNUS, Archigubernета, or Archigubernites, in *Antiquity*, the commander of the imperial ſhip, or that which the emperor was aboard of.

Some have confounded the office of archigubernus with that of *præfectus claſſis*, or admiral, but the former was under the command of the latter.

Potter takes the proper office of the archigubernета to have been to manage the marine affairs, to provide commodious harbours, and order all things relating to the ſailing of the fleet, except what related to war. Vid. Diod. Sicul. 26. 51.

ARCHIL, *Argol*, *Archilla*, *Rocella*, *Lichen Roccella* of Linnæus, or *Orſeille*, is a moſs of a lightiſh or dark grey colour, which grows on the rocks in many parts of the Archipelago, and in the Canary and Cape de Verd iſlands; and, according to Linnæus's account, on the Weſtern Coaſt of England. It belongs to the third of Dillenius's genus of *coralloides*, and to the *lichenes fruticuloſi* of Linnæus. This moſs grows upright, partly in ſingle, partly in double ſtems, which are about two inches in height; when it is old, theſe ſtems are crowned with a button, ſometimes round and ſometimes of a flat form, which Tournefort very properly compares to the excreſcences on the arms of the Sepia. The dark red paſte formed of this moſs has in commerce the ſame name of Archil or Argol, and is much uſed in dying; that well-known ſubſtance called Lacmus, or Litmus, is alſo made of it. See Litmus. Thoſe who prepare it for the uſe of the dyer grind it betwixt ſtones, ſo as to bruiſe it thoroughly without reducing it to powder, and then moiſten it occaſionally with ſtrong ſpirit of urine, or urine itſelf, mixed with quicklime. Alkalies extract a violet colour. In a few days it acquires a purpliſh red, and at length a blue colour. The dyers ſeldom uſe this drug by itſelf, becauſe of its dearneſs and the periſhableneſs of its beauty; but they chiefly employ it to give a bloom to other colours, as pinks, &c. and this is done by paſſing the dyed cloth, or ſilk, through hot water lightly impregnated with the archil. However, the bloom thus communicated ſoon decays upon being expoſed to the air; though, M. Hellot ſays, that by adding a ſmall quantity of the ſolution of tin, the colour obtained from this drug changes towards a ſcarlet, and gives a durable dye. Prepared archil will readily yield its colour to water, to volatile ſpirits, and to ſpirit of wine; and it is accordingly uſed to colour the ſpirits of thermometers; but being confined from the air, the ſpirits loſe their colour, and as M. l'abbé Nollet obſerves, regain it upon being expoſed to the air. He repeated the experiment ſeveral times with ſucceſs. A ſolution of archil in water gives a durable ſtain of a beautiful violet or purpliſh blue colour to marble. M. du Fay informs us that he has ſeen pieces of marble ſtained with it, that preſerved their colour for two years, without any ſenſible change. It ſinks deep into the marble, and makes it more brittle. The dye yielded by this ſubſtance, it is ſuppoſed, was known as early as the days of Theophraſtus. Theophraſtus, Dioſcorides, and Pliny, give the name of "Phycos thalaſſion" or "pontion," to a moſs which grew on the rocks of different iſlands, and particularly on thoſe of Crete or Candia. This moſs had, in their time, been long uſed for dying wool, and the colour it gave, when freſh, was ſo beautiful, that it excelled the ancient purple, which was not red, as many ſuppoſe, but violet. Pliny ſays, that with this ſubſtance the dyers gave the ground or firſt tint to thoſe cloths which they intended to dye with the coſtly purple. Thus Hardouin and others underſtand the words "conchylis ſubſternitur," which the French dyers expreſs by the phraſe "donner le pied." This "phycos thalaſſion" is ſuppoſed by Dillenius to be our argol; for at preſent, no ſpecies is known which communicates ſo excellent a colour, and which correſponds ſo nearly with the deſcription of Theophraſtus. Beſides, it is ſtill collected in the Grecian iſlands, and it appears that it has been uſed there ſince the earlieſt ages. Tournefort found this moſs in the iſland Amorgos, now called Morgo; and in his time it was ſent to England and Alexandria, at the rate of 10 rix-dollars per hundred weight; and he adds, that it was common in the other iſlands. He alſo ſhews, from Suidas, Julius Pollux, and other ancient writers, that this iſland was once celebrated for a kind of red linens, which in commerce had the name of the iſland; and he conjectures that it was dyed with this moſs. Hence Beckman (Hiſt. Inventions, vol. i. p. 61.) concludes, that our argol was not unknown to the ancient Grecians; and he apprehends, that the Europeans, and firſt of all the Florentines, were made acquainted with this dye-ſtuff, and its uſe, in the beginning of the fourteenth century. To this purpoſe he obſerves, that among the oldeſt and principal Florentine families is that known under the name of the Oricellarii, Rucellarii, or Rucellai; one of whom, in the year 1300, carried on a great trade in the Levant, and returning with great wealth to Florence, firſt made known in Europe, the art of dying with argol; and from this uſeful invention the family received the name of Oricellarii, from which, in proceſs of time, was formed Rucellai. After that period, the Italians procured argol from the Levant for themſelves, and afterwards for all Europe. But ſince the diſcovery of the Canary iſlands, about the end of the fourteenth or beginning of the fifteenth century, the greater part of this ſubſtance has been procured from them. In the iſlands of Canary, Teneriffe, and Palma, this moſs belongs to the crown; and in 1730, it was let by the King of Spain for 1500 piaſtres. In the reſt of the iſlands it belongs to private proprietors, who cauſe it to be collected on their own account. About the end of the year 1730, the captain of an Engliſh veſſel brought a bag of argol from the Cape de Verd iſlands to Santa Cruz, by way of trial; and diſcovering his ſecret to ſome Spaniſh and Genoeſe merchants, they fitted out a ſhip in 1731 for theſe iſlands, whence they brought it in large quantities. The argol of the Cape de Verd iſland appears larger, richer, and longer than that of the Canaries, which, perhaps, is owing to its not being collected every year. Adanſon, in 1749, found the greater part of the rocks in Magdalen iſland, near Senegal, covered with this moſs. Although moſt of our argol is at preſent procured from the Canary and Cape de Verd iſlands, a conſiderable quantity is alſo brought from the Levant, from Sicily, and from the coaſt of Barbary; and ſome years ago the Engliſh merchants at Leghorn, cauſed it to be collected in the iſland of Elba, and paid for it a high price. Our dyers do not purchaſe raw argol, but a paſte made of it, which the French call "orſeille en pate." The preparation of it was for a long time kept ſecret by the Florentines: the perſon who is ſuppoſed to have firſt made it known was Roletti, a dyer at Florence. Some information concerning it was afterwards communicated by Imperati, and Micheli the botaniſt. In latter times this art has been much practiſed in France, England, and Holland. Many druggiſts, inſtead of keeping this paſte in a moiſt ſtate with urine, as they ought to do, ſuffer it to dry, and it has then the ap-

pearance of a dark violet-coloured earth, with ſome white ſpots interſperſed in it. See LITMUS.

Linnæus apprehends that there are ſeveral other common moſſes from which valuable colours might be extracted. The French dyers uſe a cruſtaceous moſs growing upon rocks in Auvergne, and prepared with lime and urine, as a ſucceda neum to the Canary archil. This Archil, called "Orſeille de terre," and "Orſeille d' Auvergne," contains fewer and weaker colouring particles. It is the *lichen parellus* of Linnæus, and is diſtinguiſhed from the *roccella* by its figure, as it grows only in a thin rind on the rocks. It is collected in Auvergne on rocks of granite and volcanic productions, and in ſome parts of Languedoc; the greater part of it comes from St. Flour. The uſe of it is very trifling; however the Dutch purchaſe it to make their lacmus or litmus, on account of its low price. This moſs has alſo been found in Northumberland; but it is not collected there for any purpoſe.

Archil is made in Corſica, at Lyons, &c. The archil of the Canaries is ſaid to be leſs charged with lime. Dr. Lewis's ed. of Neumann's Chem. Works, p. 438. Phil. Tranſ. vol. li. p. 652. Ray Hiſt. Plant. i. p. 74. Micheli Nova Plant. p. 78. See LICHEN.

ARCHILE, in *Ancient Geography*, a city of Africa, in the Pentapolis; ſituate, according to Ptolemy, at ſome diſtance from the coaſt.

ARCHILOCHIAN, a term in *Poetry*, applied to a ſort of verſes, whereof *Archilochus* was the inventor.

Theſe conſiſt of ſeven feet; the four firſt whereof are ordinarily dactyls, though ſometimes ſpondees; the three laſt trochees: for inſtance:

"Solvitur acris hyems grata vice veris et Favoni." HOR.

It is uſual to mix iambic verſes of ſix feet, abating a ſyllable, with Archilochian verſes; this Horace himſelf has done in the ode now cited.

Theſe verſes are called dactylic, on account of the dactyls at the beginning.

ARCHILOCHUS, in *Biography*, a Greek poet and muſician, was the ſon of Teleſicles, a perſon of high rank, and a native of Paros, one of the Cyclades. According to Herodotus, he was contemporary with Candaules and Gyges, kings of Lydia, who flouriſhed about the fourteenth olympiad or 724 years before Chriſt. Blair refers him to the year before Chriſt 686, and Prieſtley to the year 660. To him is aſcribed the invention of the iambic verſe, and his reputation ranked ſo high amongſt the Greeks and Romans, that Plutarch ſays of him, that there is no bard of antiquity by whom the two arts of poetry and muſic have been ſo much advanced as by Archilochus. According to this author, he was the inventor of dramatic melody, or the melody uſed in declamation, or that which, in modern language, might be termed "recitative to ſtrict meaſure," ſuch as the voice-part obſerves in many modern pieces of accompanied recitative; and from him we learn, that he performed the muſic to his iambic verſes in two different ways; reciting ſome of them to a partial accompaniment, and ſinging others, while inſtruments performed the ſame notes as the voice; and this, it is ſaid, was the method which the tragic poets afterwards adopted. Plutarch alſo attributes to Archilochus, the rhythmopoeia of trimeter iambics; the ſudden tranſition from one rhythm to another of a different time, as from iambic rhythm or triple time, to dactylic or common time; and the manner of accompanying thoſe irregular meaſures upon the lyre. Accordingly, if Archilochus was the firſt author of this mixture or tranſition from one rhythm to another, he might, with propriety, be ſtyled the inventor of lyric poetry, which required this mixture, and which, after his time, became a ſpecies of verſification wholly diſtinct from heroic. To Archilochus is likewiſe aſcribed the invention of epodes, conſidered as denoting ſmall lyric poems, compoſed of trimeter-iambics, of ſix feet, and dimeters of four feet, alternately; ſuch are thoſe of the fifth book of the odes of Horace. Archilochus is generally ranked among the firſt victors of the Pythic games; and Pindar ſays, that he wrote hymns in praiſe of the gods and heroes. One of them in praiſe of Hercules, gained for him the acclamations of all Greece; for he ſung it in full aſſembly of the Olympic games, and received in recompence from the judges, the crown of victory. This hymn, or ode, was afterwards ſung in honour of every victor at Olympia, who had no poet to celebrate his particular exploits. The names of Homer, and of Archilochus, were equally revered and celebrated in Greece, as the two moſt excellent poets produced by the nation. Cicero ranks him with poets of the firſt claſs, and in his "Epiſtles," (xi. 1 16. ad Atticum) he ſays, that the Grammarian Ariſtophanes uſed to ſay, that the longeſt poem of Archilochus was, in his eſtimation, the moſt excellent. Horace profeſſes in his ſatires, to be an imitator of the Grecian bard, as to his ſtyle and manner, but not in his malignity; and he ſays, (Art. Poet.) that he was armed by the violence of his reſentment with iambics;

"Archilochum proprio rabies armavit iambo."

Ovid likewiſe refers to Archilochus: Paterculus and Quinctilian beſtow great praiſes on his poetry. The latter (l. x. c. 1.) ſays of him, that he had an uncommon force of expreſſion, abounding with bold thoughts, and ſhort but keen and piercing ſtrokes, and that his ſtyle was ſingularly ſtrong and nervous. The eſtimation in which he was held among the Greeks may be inferred from the conduct of the Delphian oracle, which expelled from the temple of Apollo, Corax of Naxos, by whom he was killed, though he did it in open war. His ſatires, however, were not only unjuſtifiably ſevere, but offenſively licentious and indecent; and on this account his poems were prohibited at Sparta, as being more likely to corrupt the hearts and manners of young people, than to be uſeful in cultivating their underſtandings. Of the force of his ſatires, the following inſtance is frequently alluded to by the ancients. Lycambes, who had promiſed him his daughter in marriage, and who had violated his contract, together with his family, was rendered ſo infamous by a torrent of abuſe and defamation, that he terminated his life by the halter, and one, if not all of his daughters, followed his example. Indeed, the "rage of Archilochus" was proverbial in antiquity, which compared the provoking of this ſatyriſt to the treading upon a ſerpent. In the army, into which he entered, Archilochus incurred a degree of ignominy, which probably contributed to imbitter the reſentment, and malignity of his writings. When he ſaved his life by his cowardly retreat in the firſt battle in which he was engaged, he alleged in excuſe of his daſtardly conduct; "I have loſt my buckler, but I have ſaved my life; and it is much more eaſy to get a new buckler, than a new exiſtence." Some fragments of his writings may be found in the "Poetæ Græcæ" Genev. 1606 and 1614, 2 vol. folio. Nouv. Dict. Hiſtor. Burney's Hiſt. Muſic, vol. i. p. 363.

ARCHILEUTO, or ARCHILUTE, a large lute, differing little from the *Theorbo*, on which thorough-baſs uſed to be played in accompanying the voice. At the beginning of the laſt century, it was the favourite inſtrument all over Europe. *Arrigonini*, a famous luteniſt, was employed in all Handel's early operas. And the office of luteniſt remained till

till the laſt century in his majeſty's chapel at St. James's. Gilier was the laſt who occupied the place and performed the duty.

ARCHIMAGUS, in the *Ancient Perſian Religion*, the chief prieſt or head of the order of magi. The archimagus anſwered to the high-prieſt among the Jews, or the pope now among the Romaniſts, being the head of the whole religion. The archimagus reſided in the fire temple, a place held in the ſame veneration among them as the temple of Mecca among the Mahometans, every perſon of the ſect being under a kind of obligation to make a pilgrimage to it once in their lives. Zoroaſter is ranked as the firſt archimagus, and he erected the firſt temple in the city of Balch. Here it remained till the ſeventh century, when the followers of Zoroaſter, being driven by the Mahometans into Carmania, or Kerman, a ſouthern province of Perſia, another building of the ſame kind was raiſed, and there it hath continued to this day. The fire temple at Balch was rebuilt by Darius Hyſtaſpis, with a grandeur ſuitable to its dignity, as it was the patriarchal temple of the ſect; and from the name of its reſtorer it was afterwards called "Auzur Guſtaſp," i. e. the fire temple of Darius Hyſtaſpis. In order to preſerve its reputation, he aſſumed the office and title of archimagus, and as Porphyry informs us, he gave orders before his death, that among his other titles it ſhould be engraven on his monument, that he was "maſter of the Magians," which plainly implies that he bore this office among them. From hence it ſeems to have proceeded, that the kings of Perſia were ever after regarded as of the ſacerdotal tribe, and were always initiated into the ſacred order of the Magians, before they were inaugurated into the kingdom. Prid. Con. vol. i. p. 315. 322.

ARCHIMANDRITE, the ſuperior of a monaſtery; amounting to what we now call ABBOT.

Covarruvias obſerves, that the word literally denotes the chief or leader of a flock; in which ſenſe it may be applied to any eccleſiaſtical ſuperior, and accordingly we find the name ſometimes attributed to archbiſhops. But among the Greeks, by whom it is chiefly uſed, it is always reſtrained to the chief of an abbey. According to father Simon, *mandrite* is a Syriac term, ſignifying a ſolitary monk; and conſequently archimandrite is the chief of monks of this deſcription. In the Greek church, the archimandrite is the ſecond dignity under the patriarch.

ARCHIMEDES, in *Biography*, one of the moſt celebrated mathematicians of antiquity, was born at Syracuſe, according to Torelli, in the ſecond year of the 123d olympiad, correſponding to the 287th year before Chriſt; or, according to Rivaltus, who has taken conſiderable pains in aſcertaining the true æra of his birth, the ſecond year of the 122d olympiad, anſwering to the 291ſt year before Chriſt. If we may rely on the authority of Tzetzes, he lived 75 years; and Blair in his chronology, refers his death to the firſt year of the 142d olympiad, or the 212th year before Chriſt. Plutarch informs us, that he was nearly related, by his father, to Hiero the Syracuſan king, with whom he lived in habits of the moſt intimate friendſhip and intercourſe: but his mother was of obſcure origin; and this circumſtance may probably account for the degrading terms "humilem homunculum," which Cicero applies to him in the fifth book of his Tuſculan Queſtions, Oper. tom. ii. p. 474. ed. Olivet. Unallured by thoſe proſpects of preferment which his connection with Hiero might have preſented, Archimedes devoted himſelf, with uncommon aſſiduity and ſingular ſucceſs, to the ſtudy of geometry, in his youth; and in his maturer years he travelled into Egypt, whither the Greeks generally reſorted in the purſuit of ſcience. After an abſence of ſeveral years, which he ſpent in the ſociety of Conon, and other eminent men, and during which time he exhibited very promiſing indications of his future fame, he returned to his own country, where he indefatigably proſecuted that courſe of application to mathematical and mechanical ſciences, which led to the diſquiſitions and diſcoveries recorded in his works. Such, indeed, were the ardour and intenſeneſs of his application, that he proſecuted his ſtudies, to the neglect of both food and ſleep, and improved the minuteſt circumſtance that occurred into an occaſion of making very important and uſeful diſcoveries. At the bath, it is ſaid, he frequently drew geometrical figures in the aſhes, or when, according to the cuſtom, he was anointed, upon his own body. Of the ardour of his mind in the purſuit of ſcience an inſtance occurs under the article HIERO's *Crown*; and was alſo manifeſt in his well-known declaration, pronounced in conſequence of his accurate acquaintance with the powers of the lever, "Δος που στω, και πασαν την γην κινησω," i. e. "Give me a place upon which to ſtand, and I will move the earth." Such was the pleaſure he derived from having diſcovered the proportion between the ſphere and its circumſcribed cylinder, that as a memorial of this diſcovery, he requeſted his friends to place upon his tomb a cylinder containing a ſphere, with an inſcription expreſſing the proportion of the one to the other. Cicero, when he was quæſtor in Sicily, about 140 years after the death of Archimedes, diſcovered this monument in a neglected ſtate, and over-run with briars and brambles, which he ordered to be cleared away. Vid. Opera ubi ſupra. As an evidence to Hiero of the aſtoniſhing effect of mechanical powers, Archimedes is ſaid to have drawn towards him, by means of pulleys and pullies, a galley manned and loaded, which lay in the ſhore. But his mechanical knowledge was applied to more ſubſtantial uſe, at the time when Syracuſe was beſieged by the conſul Marcellus; for he thus contrived to arreſt the efforts of the beſiegers for eight months. Plutarch (in Marcell.) and Livy (l. xxiv. c. 34.) inform us, that, whether the veſſels of the enemy were nearer to the walls of the city, or more diſtant from them, Archimedes annoyed them. When they approached the rampart, he ſuſpended long beams, which probably acted like levers, and ſtruck the galleys with a force that ſunk them; by means of grappling hooks at the extremities of other levers, he raiſed up veſſels in the air, and then daſhed them to pieces againſt the walls or projecting rocks. Whilſt they were more remote, he uſed inſtruments which threw large ſtones, that demoliſhed the ſhips or the machines employed in the ſiege. For the uſe he made of his burning mirrors, ſee BURNING-*Glaſs*.

Beſides other inventions which Diodorus Siculus (l. v.) aſcribes to Archimedes, he mentions that of the cochleon, or ſcrew pump, which he communicated to the Egyptians. Livy alſo (l. xxiv. c. 23.) records his diſtinguiſhed excellence as an obſerver of the heavenly bodies and his talent for the contrivance and conſtruction of warlike machines. His ingenuity in the ſolution of problems was, in Cicero's time, become proverbial, for in a letter to Atticus (l. xiii. ep. 28.), he alludes to the "προβλημα Αρχιμηδειον," or "Archimedian problem," as one that was of ſingularly difficult ſolution. His machine for exhibiting the motions of the celeſtial bodies is either referred to or more expreſsly mentioned by the Latin poets. To this purpoſe Silius Italicus (l. xiv. v. 341. p. 717. ed. Drakenb.) extols him:

"Vir fuit Iſthmiacis decus immortale colonis,
Ingenio facile ante alios telluris alumnos,
Nudus opum; ſed cui cœlum terræque paterent."

Claudian alſo, in his epigram on this invention of Archimedes, expreſſes himſelf in the following ſtrong terms:

"Jupiter,

" Jupiter, in parvo cum cerneret æthera vitro," &c. In English thus:

" When in a glaſs's narrow ſphere confin'd,
Jove ſaw the fabric of th' Almighty mind,
He ſmil'd and ſaid; 'Can mortals' art alone
Our heavenly labours mimic with their own?
The Syracuſan's brittle work contains
Th' eternal law that through all nature reigns.
Fram'd by his art, ſee ſtars unnumber'd burn,
And in their courſes rolling orbs return;
His ſun through various ſigns deſcribes the year,
And every month his mimic moons appear.
Our rival's laws his little planets bind,
And rule their motions by a human mind.
Salmoneus could our thunder imitate:
But Archimedes can a world create.'

Ovid (Faſt. vi. 277.) mentions the ſame machine:

" Arte Syracoſiâ ſuſpenſus in aëre clauſo
Stat globus, immenſi parva figura poli."

Plutarch (in Vit. Marcelli, Oper. t. ii. p. 307.) expreſsly ſays of Archimedes, after recounting the machines which he had employed during the ſiege of Syracuſe, that in the conſtruction of them "he gained the reputation of a man endowed with divine rather than human knowledge;" but it is to be regretted that, as he adds, "no account of them was left in writing."

Amongſt the various objects of mathematical ſpeculation to which his attention and inventive faculties were directed, one of the principal was the menſuration of the conic ſections. Unleſs we except the lunes of Hippocrates of Chios, he was the firſt who ſquared a curvilineal ſpace: he alſo reduced the quadrature of the circle to the determination of the ratio between the diameter and the circumference; and though unable to obtain the preciſe value of it, he aſſigned an uſeful approximation to it by the numeral calculation of the perimeters of the inſcribed and circumſcribed polygons. See CIRCLE, DIAMETER, and QUADRATURE. He determined the relation between the circle and ellipſe; and likewiſe attempted the hyperbola, though from the nature of the caſe he was not likely to ſucceed. He alſo found the proportion of the area of the ſpiral to that of the circumſcribed circle, and that of their ſectors; he determined the relations of ſpheres, ſpheroids, and conoids to cylinders and cones, and of parabolas to rectilineal planes, whoſe quadratures were already known. In all his mathematical inveſtigations, he imitated the example of his predeceſſor, Euclid; and, like him, he was cautious in admitting any principles that were not ſtrictly geometrical and unexceptionable.

No friend of ſcience can forbear lamenting the premature death of this ſingularly eminent mathematician and philoſopher, as well as the time and manner in which it happened. After he had been inſtrumental in protracting the ſiege of Syracuſe for eight months, the city was at length taken by ſtorm and devoted to the ſword. Marcellus, indeed, reſpecting the character even of an enemy ſuch as Archimedes was, had iſſued orders that his houſe and perſon ſhould be inviolate; but he was ſurpriſed and put to death, ſays Livy (l. xxxv. c. 31.), by a ſoldier who was ignorant of his perſon and character, while he was intent on figures which he had deſcribed in the duſt, and was altogether negligent of his own ſafety. The account of the manner of his death given by Plutarch (ubi ſupra) is ſomewhat different. He ſays, that Archimedes being in his muſeum, was ſo abſorbed in his attention to his diagram, that he was aſſaulted by one of the ſoldiers before he knew that the city was taken, and that he refuſed to accompany him to Marcellus till he had finiſhed his problem, upon which the enraged ſoldier diſpatched him with his ſword. However this be, Marcellus, it is ſaid, lamented his death, paid reſpect to his memory by directing and ſuperintending his funeral, and reſtrained the victorious army from offering any violence to his relations.

Of the numerous works of Archimedes many of them are loſt, but the moſt valuable, as we have reaſon to believe, are preſerved. Torelli has arranged and enumerated them in the following order: 1. "De Planorum Æquilibriis, liber primus, cum commentariis Eutocii Aſcalonitæ." 2. "Quadratura Paraboles." 3. "De Planorum Æquilibriis, liber ſecundus, cum commentariis Eutocii Aſcalonitæ." 4. "De Sphæra et Cylindro, liber primus, cum commentariis Eutocii Aſcalonitæ." 5. "De Sphæra et Cylindro, liber ſecundus, cum commentariis Eutocii Aſcalonitæ." 6. "Circuli Dimenſio, cum commentariis Eutocii Aſcalonitæ." 7. "De Helicibus." 8. "De Conoidibus et Sphæroidibus, cum Torelli commentario, in Prop. 12." 9. "Arenarius." 10. "De iis quæ in humido vehuntur, liber primus." 11. "De iis quæ in humido vehuntur, liber ſecundus." 12. "Lemmata." 13. "Opera Mechanica, ut cujuſque mentio ab antiquis ſcriptoribus facta eſt." Theſe latter works, with the Author's deſcriptions of them, are loſt; they are as follow: 1. "An artificial ſphere for exhibiting the celeſtial motions. 2. "Archimedes's method of inveſtigating the mixture of gold and ſilver in Hiero's crown, mentioned by Vitruvius." 3. "His pneumatic and hydraulic engines, mentioned by Tzetzes, Pappus, and Tertullian." 4. "Archimedes's ſcrew, the ſtructure and uſe of which are well known." 5. "The helix, by means of which, according to Athenæus, he launched a large ſhip belonging to Hiero." 6. "A ſingular kind of locket, the account of which is imperfect." 7. "The triſpaſton, by which large weights might be raiſed by a very ſmall power." 8. "Various warlike machines, conſiſting of tormenta, baliſtæ, catapultæ, ſagittarii, ſcorpiones, &c. which, according to Polybius, Livy, and Plutarch, were uſed in the defence of Syracuſe." 9. "His burning-glaſſes, by the combination of which he is ſaid to have ſet fire to the Roman ſhips."

When Conſtantinople was taken at the middle of the fifteenth century, ſuch writings of Archimedes as exiſted, together with the commentary of Eutocius, eſcaped the ravages of the conquerors, and were brought thence into Italy. Here they were found by the famous John Muller, better known by the appellation of Regiomontanus, who carried them into Germany, and they were ſoon afterwards, viz. in 1544, publiſhed in folio at Baſil, in Greek and Latin, by Hervagius, with a preface by Thomas Gechauff. A Latin tranſlation was publiſhed at Paris in 1577, by Paſcalius Hemellus. An edition was publiſhed in folio, by Commandine at Venice, in 1588. The edition of Rivaltus, in Greek and Latin, in folio, with new demonſtrations and notes, and a life of Archimedes, was publiſhed at Paris in 1615. At the cloſe of this edition is annexed an account of the other works of Archimedes that have been loſt. Maurolycus publiſhed an edition in folio, at Meſſina, in 1671; another by Borelli, was publiſhed at Palermo in 1685; and a Latin edition was publiſhed by Dr. Barrow in 4to. at London in 1675, with new illuſtrations and demonſtrations. The laſt, moſt ſplendid and complete edition in folio, was printed at the Oxford preſs in 1792; this edition was prepared for the preſs by the learned Joſeph Torelli of Verona, with a new Latin tranſlation, Eutocius's commentary, with a preface and notes; an account of the life and writings of Torelli, by Clemens Sibiliati, is prefixed, and a large appendix is added conſiſting of two parts, the firſt being a commentary on the paper of Archimedes, relating to bodies floating in fluids, by the Rev. Abram Robertſon of Chriſt-Church College Oxford, who had the whole care of this edition; and

and the ſecond, a large collection of various readings in the MS. copies of Archimedes's works, preſerved at Florence and Paris, collated with the edition of Baſil. The works of Archimedes form a principal part of the valuable collection of Greek mathematicians, publiſhed in folio at Paris, in 1693, entitled "Mathematici veteres." Of diſtinct parts of the works of Archimedes we have various editions. The book "De dimenſione circuli," was publiſhed in folio, at Paris, in 1561; at Leipſic, in 1602; and in octavo, at Oxford by Dr Wallis, in 1676; and in the third volume of Wallis's works, in 1699. This work, together with the book "De ſphæra & cylindro," appeared at Paris in 1561; the book "De planis equiponderantibus," was publiſhed in quarto at Paris, in 1565; "De conoidibus et de ſpheroidibus," at Palermo, in 1685; "De iis quæ in humido natant, &c." with the commentary of Commandine, in quarto, at Bologna, in 1565; and the "Arenarius," by Wallis, at Oxford, octavo, in 1676; of which an Engliſh tranſlation by G. Anderſon, was publiſhed in London, octavo, in 1784, with notes and illuſtrations. Torelli Pref. Rivalti Pref. Fabr. Bib. Græc. l. iii. c. 22. t. ii. p. 543, &c.

ARCHIMEDES's *Screw*. See SCREW *of Archimedes*.

ARCHIMEDES's *Burning-glaſs*. See BURNING-*glaſs*.

ARCHIMIME, ARCHIMIMUS, αρχη, and μιμος, *mimic*, is the ſame thing in effect with archbuffoon or mimic.

The *archimimes*, among the Romans, were perſons who imitated the manners, geſtures, and ſpeech, both of people living, and of thoſe who were dead.

At firſt they were only employed on the theatre; but were afterwards admitted to their feaſts, and at laſt to their funerals; where they walked after the corpſe, counterfeiting the geſtures and behaviour of the perſon who was carried to the funeral pile, as if he were ſtill alive.

ARCHINARA, in *Ancient Geography*, a town of India, on the other ſide of the Ganges, according to Ptolemy.

ARCHIPELAGO, in *Geography*, a ſea interrupted by a great number of iſlands.

The word is formed by corruption of *Ægeopelagus*, q. d. *Ægean ſea*, which again is formed of Αιγαιον Πελαγος, a name originally given it by the Greeks, but for what reaſon is not agreed on. See *Ægean Sea*.

The moſt celebrated Archipelago, and that to which the name uſed to be appropriated, and whence all other groups of iſlands have derived it, is that between Greece, Macedonia, and Aſia; in which are the iſlands of the Ægean ſea; which is called the *White Sea*, in contradiſtinction to the Euxine, which they call the *Black Sea*. This part of the Mediterranean ſea is bounded on the north by Romania, on the eaſt by Natolia, on the weſt by Livadia and the Morea, and on the ſouth by the iſle of Candy. It divides, as far as it extends, Europe from Aſia. All the iſlands contained in it, ſome of which lying on the coaſt of Natolia are called Aſiatic, and the others European, lie between about the 35th and 40th degrees of north latitude, and 23d and 27th degrees of eaſt longitude. Some of them are called Cyclades, becauſe they form as it were a crown and circle round the iſle of Delos; the others are called Sporades, as being diſperſed without any order between Aſia and the iſle of Candia.

The modern geographers mention other Archipelagos, as that of Lazarus near the coaſts of Malabar and Malacca; the Archipelago of Mexico; and that of the Caribbees, wherein are many iſlands; that of the Philippines, called by ſome the "great Archipelago," containing ſeveral iſlands, and all thoſe of the Moluccas, of Celebes, &c. Theſe Aſiatic iſlands form a large group uſually denominated the "oriental Archipelago," and extending from 13° S. lat. to 22° 4′ N. lat. that is 35 degrees, or 21,000 geographical miles, while the length from 95° E. long. to 132°, gives 37° not far from the equator, nearly correſponding with the breadth. The "northern Archipelago" conſiſts of four groups of iſlands between the eaſt coaſt of Kamtſkatka in Aſia and the weſt coaſt of America: the firſt, called Saſignan, comprehends five iſlands; that called Khao contains eight iſlands; and both theſe are now called Aleutian iſlands. The third group includes ſixteen iſlands, called Andreanoffſki Oſtrova; and the fourth, the Lyſſie Oſtrova, or Fox iſlands, which are ſixteen in number. "Broughton's Archipelago," is a cluſter of iſlands, rocky iſlets, and rocks, on the north-weſt coaſt of America, ſo called by Vancouver, after the name of their diſcoverer, and lying in about 50° 50′ N. lat. and W. long. 126° 20′. The "dangerous Archipelago," or "labyrinth," is a name given to a group of iſlands diſcovered in the Pacific Ocean, eaſtward of Otaheite, by Quiros, Schouten, and Le Maire, Roggewein, Byron, Wallis, Carteret, Bougainville, Cook, Edwards, Bligh, Vancouver, Broughton, and Wilſon, and ſo called from the intricacy and difficulty which they occaſion to the navigation. They are diſperſed from 14° to 27° of S. latitude, and as far as 25° eaſtward from Otaheite. The name was firſt given to ſome of theſe iſlands by Bougainville in 1768. To four of theſe iſlands Captain Cook, in 1760, gave the names of Reſolution, in S. lat. 17° 24′. W. long. 141° 39′; Doubtful iſland in S. lat. 17° 20′. W. long. 141° 38′; Furneaux iſland in S. lat. 17° 5′ and W. long. 143° 16′; and Adventure iſland in S. lat. 17° 14′, and W. long. 144° 30′. All the inhabitants of theſe iſlands appear to be of the ſame race with the Society iſlanders, but are ſomewhat darker in their complexions, and more ferocious in their manners. "Archipelago of the great Cyclades" is the cluſter of iſlands firſt diſcovered by Bougainville in 1768, and called by captain Cook, who paſſed them in 1774, *New* HEBRIDES. "King George III.'s Archipelago" is a name given by Vancouver to a large group of iſlands, forming various channels, and lying on the north-weſt coaſt of America between 56° 10′, and 58° 15′ N. lat. and about 135° and 136° W. long. The exterior coaſt of this Archipelago from Cape Croſs to Cape Edward has ſeveral openings that appeared likely to afford ſhelter, but the rocks and iſlets, ſome producing trees, and others altogether barren, that extend to the diſtance of three or four miles from the ſhore, muſt render the entrance of ſuch harbours unpleaſant and dangerous, till they are better known. That which ſeemed to be the eaſieſt of acceſs was northward of Cape Edward, in lat. 57° 44′, and was conſidered by Vancouver as Portlock's harbour. Cape Edgcumbe on this coaſt is ſituated in lat. 57° 2′, and W. long. 135° 34½′. This cape forms the north-weſt point of a ſpacious opening that branches into ſeveral arms, and is called by Mr. Dixon, Norfolk Sound. One of the northern branches of the ſound communicates with the land on which mount Edgcumbe ſtands, named by Captain Cook the Bay of Iſlands, and makes the intermediate part of the ſea-coaſt an iſland. The ſouth extremity of this Archipelago in lat. 56° 10′. and W. long. 134° 22½′, conſtitutes a remarkable promontory that terminates in a high bluff rocky cliff, and becomes, on its eaſtern ſide, a narrow point of land, named by captain Colnett, Cape Ommaney; and the opening between this and Cape Denſion, he called Chriſtian Sound. Vancouver's Voyage, vol. iii. p. 267. A cluſter of iſlands, or a ſingle iſland, about twenty leagues in length, and lying between 53° and 54° N. lat. and about 130° W. long. was called by Vancouver, "Pitt's Archipelago." On the north of this group was Chatham's Sound,

Sound, on the eaſt Grenville's canal, on the weſt Banks's iſland, and to the ſouth Nepean ſound, as they are ſeverally denominated in one of Vancouver's charts. Other collections of iſlands under this appellation will be noticed in the courſe of this work.

ARCHIPHERACITÆ, miniſters in the Jewiſh ſynagogues, appointed to read and interpret the Perakim, or titles and heads of the law, and the prophets.

The archipheracita was not the ſame with the archiſynagogus, as Grotius and others have miſtakenly imagined; but rather the chief or principal of thoſe appointed to read, explain, and profeſs the law, in their ſchools.—And hence the name which is formed of ἀρχὴ, *chief*, and the Hebrew or Chaldee, פֶּרֶק, *diviſion*, or *chapter*.

ARCHIPPA, in *Ancient Geography*, a town of Italy, in the territory of the Marſi, ſaid to be ſwallowed up by the Fucine lake.

ARCHIPPUS, in *Entomology*, a ſpecies of Papilio (Dan. Felt Linn.) that inhabits South America. The wings are repandated, fulvous, veined with black: the margin black, dotted with white; fulvous ſpots at the tip of the anterior ones. Fabricius. Obſ. This author believes it is the ſame inſect as Cramer deſcribes under the name Papilio *Plexippus*. Gmelin thinks Papilio *Archippus* of Cramer, f. A. B. is Papilio *Miſippus* of Fabricius.

ARCHIPRESBYTER. See Arch-priest.

ARCHIS, in *Ancient Geography*, a town of Aſia, in Armenia Prima.

ARCHISTRATEGUS, the generaliſſimo or captain-general of an army. See Strategus.

ARCHISYNAGOGUS, in the *Jewiſh Hiſtory*, the chief or ruler of the ſynagogue.

Theſe are ſometimes alſo called the angels or princes of the ſynagogues: the Jews called them *chazanin*, i. e. *wiſe*.

Archiſynagogi were perſons of authority in each ſynagogue, who preſided in aſſemblies held therein, invited thoſe to ſpeak whom they judged capable of it, and decided all diſputes, relating to money, &c. They had a power to have thoſe whipped who were convicted of acting contrary to the law; alſo a right of excommunicating, or caſting out of the ſynagogue, thoſe whom they found to merit this puniſhment. Their number was different according to the extent of the city, or the number of perſons that came to the ſynagogue; in ſome there were ſeventy, in others eight or ten, and in others not above one. Vitringa de Synagog.

ARCHITECT, a perſon ſkilled in architecture, or the art of building; who forms plans and deſigns for edifices, conducts the work, and directs the ſeveral artificers employed in it.

The word is derived from ἀρχὸς, *princeps*, and τεκτων, *faber*, *workman*, q. d. the principal workman.

The moſt celebrated architects are Vitruvius, Palladio, Scamozzi, Serlio, Vignola, Barbaro, Cataneo, Alberti, Viola, Inigo Jones, De Lorme, Petrault, S. Le Clerc, ſir Chriſtopher Wren, and the earl of Burlington.

Vitruvius enumerates twelve qualities requiſite to conſtitute a good architect; that he be docile and ingenious; well educated; ſkilled in deſigning, in geometry, optics, arithmetic, hiſtory, philoſophy, muſic, medicine, law, and aſtronomy.

Cloſe application to the ſtudy of ancient maſters, and the remaining works of the ancients, together with judgment and taſte to ſelect and properly to apply the hints which ſuch examples afford, joined to a peculiar genius for the ſtudy of this art, are abſolutely neceſſary to render an architect eminent in his profeſſion.

ARCHITECTOGRAPHIA, the deſcription of ancient buildings, temples, theatres, arches, pyramids, baths, gates, aquæducts, tombs, and the like.

ARCHITECTONIC, that which builds a thing up regularly, according to its nature and intentions.

ARCHITECTURE, Architectura, the art of erecting buildings of any kind.

Amongſt the various arts cultivated in ſociety, ſome are only adapted to ſupply our natural wants, or aſſiſt our infirmities; ſome are inſtruments of luxury merely, and calculated to flatter our pride, or gratify our deſires: whilſt others tend at once to ſecure, to accommodate, delight, and give conſequence to the human ſpecies.—Architecture is of this latter kind; and when viewed in its full extent, may truly be ſaid to have a very conſiderable part in almoſt every comfort or luxury of life. The advantages derived from houſes only are great, they being the firſt ſteps towards civilization, and having certainly great influence both on the body and mind. Secluded from each other, inhabitants of woods, of caves, or wretched huts, expoſed to the inclement viciſſitudes of ſeaſons, and the diſtreſſing uncertainty of weather, men are generally indolent, dull, and abject, with faculties benumbed, and views limited to the gratification of their moſt preſſing neceſſities; but wherever ſocieties are formed, and commodious dwellings are found, in which well ſheltered they may breathe a temperate air, amid the ſummer's heat or winter's cold; ſleep, when nature calls, at eaſe and in ſecurity; ſtudy unmoleſted; converſe, and taſte the ſweets of ſocial enjoyments; there they are ſpirited, active, ingenious, and enterpriſing; vigorous in body, ſpeculative in mind: agriculture and arts improve, they flouriſh among them; the neceſſaries, the conveniencies, and ſoon even the luxuries of life, become there abundant. Mere ſtrength however, even the ſteadieſt perſeverance, obtains with difficulty the deſired produce; but inventions facilitate and ſhorten labour, multiplying productions ſo, as not only to ſupply domeſtic wants, but likewiſe to treaſure up ſtores for foreign markets. Architecture then ſmooths the way for commerce; ſhe forms commodious roads through marſhes or other grounds naturally impracticable, fills up vallies, unites, or levels mountains; throws bridges over deep or rapid rivers, turns aſide or deadens the fury of torrents; conſtructs canals of navigation, builds ſhips, and contrives ports for their ſecure reception in the hour of danger: facilitating thus the intercourſe of nations, the conveyance of merchandize from people to people. A well-regulated commerce is ever the ſource of wealth; and luxury has ever been attendant on riches. As the powers of gratification increaſe, fancy multiplies wants; till at length, indolence or pleaſure, vanity and ſuperfluity, fears and reſentments, give birth to a thouſand ſuperfluous, a thouſand artificial cravings; the greater part of which could not be gratified, without the aſſiſtance of architecture; for ſplendid palaces, magnificent temples, coſtly dwelling-houſes, and amphitheatres, theatres, baths and porticos, triumphal arches and bridges, mauſoleums, and an endleſs number of ſimilar inventions, are all either neceſſary inſtruments of eaſe and pleaſure; or ſtriking teſtimonies of wealth, of grandeur and pre-eminence; either preſent or paſt. Nor are there any other objects, whether neceſſary or ſuperfluous, ſo certainly productive of their deſign; ſo permanent in their effects, or beneficial in their conſequences; fine furniture, rich dreſſes, brilliant equipages, numerous domeſtics, are only ſecondary attractions at firſt; they ſoon feel the effect of time; and their value fluctuates, or dies with the faſhion of the day. While the productions of architecture command general attention; are monuments laſting beyond the reach of modes; and record to lateſt poſterity the conſequence, virtues, atchievements, and munificence of thoſe they

they commemorate. The immediate and moſt obvious advantages of building are, employing many ingenious artificers, many induſtrious workmen and labourers of various kinds; converting materials of little value into the moſt ſtately productions of human ſkill; beautifying the face of countries; and multiplying the conveniencies and comforts of life. But theſe, however great, are not the moſt conſiderable: that numerous train of arts and manufactures, contrived to furniſh and adorn the works of architecture, which occupies thouſands, and conſtitutes many lucrative branches of commerce; that certain concourſe of ſtrangers, to every country celebrated for ſtately ſtructures; who extend your fame, adopt your faſhions, give reputation, and create a demand for your productions; are conſiderations of the higheſt conſequence: in ſhort, the advantages of building extend to the remoteſt ages, and at this day, the ruins of ancient Rome, in a great meaſure, ſupport the ſplendor of the preſent; by the number of travellers who flock from all nations, to viſit the ancient remains and modern magnificence of that famous city; and who, in the courſe of a few centuries, have there expended incredible ſums of money, by long reſidence; and in the purchaſe of old pictures, antique ſtatues, buſts, baſ-reliefs, urns, and other curious productions of art: of which, by ſome extraordinary good management, there is a treaſure never to be exhauſted. Nor is architecture leſs uſeful in defending, than proſperous in adorning and enriching countries; ſhe guards their coaſts with ſhips of war, ſecures their boundaries, fortifies their cities, and by a variety of artful conſtructions, controls the ambition and fruſtrates the attempts of foreign powers; curbs the inſolence, and averts the danger, and the horror of internal commotions. Thus architecture, by ſupplying men with commodious habitations, procures that health of body and vigour of mind, which facilitate the invention of arts: and when, by the exertion of their ſkill or induſtry, productions multiply beyond domeſtic wants, ſhe furniſhes the means of tranſporting them to other markets; and whenever by commerce they acquire wealth, ſhe points the way to employ their riches rationally, nobly, benevolently; in methods honourable and uſeful to themſelves and their deſcendants; which add ſplendor to the ſtate, and yield benefit both to their contemporaries and to poſterity: ſhe farther teaches them to defend their poſſeſſions, to ſecure their liberty and lives, from the attempts of lawleſs violence, or unreſtrained ambition. An art ſo variouſly conducive to the happineſs of man, to the wealth, luſtre, and ſafety of nations, naturally commands protection and encouragement: in effect, it appears, that in all civilized times, and well regulated governments, it has been much attended to, and promoted with unremitting aſſiduity; and the perfectioning of other arts has ever been a certain conſequence; for where building is encouraged, painting, ſculpture, and all the inferior branches of decorative workmanſhip, muſt flouriſh of courſe; and theſe have an influence on manufactures, even to the minuteſt mechanic productions; for deſign is of univerſal benefit, and ſtamps additional value on the moſt trifling performances, the importance of which, to a commercial people, is obvious; it requires no illuſtration. Let it not however be imagined that building, merely conſidered as heaping ſtone upon ſtone, can be of great conſequence; or reflect honour, either on nations or individuals: materials in architecture are like words in phraſeology; having ſeparately but little power; and they may be ſo arranged, as to excite ridicule, diſguſt, or even contempt; yet when combined with ſkill, expreſſed with energy, they actuate the mind with unbounded ſway. An able writer can move even in ruſtic language, and the maſterly diſpoſitions of a ſkilful artiſt will dignify the meaneſt materials; while the weak efforts of the ignorant, render the moſt coſtly enrichments deſpicable. To ſuch, the compliment of Apelles may juſtly be applied; who, on ſeeing the picture of a Venus magnificently attired, ſaid to the operator, "Friend, though thou haſt not been able to make her fair, thou haſt certainly made her fine." See the preface to ſir W. Chambers's Treatiſe on Civil Architecture.

Architecture is divided into CIVIL, MILITARY, and NAVAL *Architecture*, for which ſee theſe ſeveral heads.

ARCHITHALASSUS PRIMUS, in *Conchology*, a name given by Argenville to the ſhell called by Linnæus *Conus ſummus*.

ARCHITRAVE, in *Architecture*, the lower diviſion of an entablature, or that part which reſts immediately on the column.

In the moſt ancient buildings, which were probably of timber, the architrave was the beam which extended from column to column to ſupport the roof, whence the name, which is from αρχος, *chief*, and *trabs*, *a beam*.

In all the ancient examples of the Doric order ſtill exiſting in Greece, ſuch as thoſe at Athens and Corinth, and alſo thoſe at Pæſtum, and in Sicily, it has only one facia, and is of great height, being nearly equal to the diameter of the column. In the Doric order of the theatre of Marcellus at Rome, it has only one facia, but is much lower, being only equal to half a diameter of the column. The moderns, ſuch as Vignola, Scamozzi, &c. have generally confined it to this proportion nearly, but have divided it into two facias, taking the idea from ſome ancient examples of the Doric order in Italy.

In ſome of the ancient examples of the Ionic order in Greece, ſuch as the temple on the Iliſſus near Athens, it has only one facia, which is quite plain, and of conſiderable height; while in others, ſuch as the temple of Minerve Polias at Athens, and that of Bacchus at Teos, it is divided into three facias, and has the upper mouldings enriched. In the Ionic order of the temple of Fortune, and at the theatre of Marcellus at Rome, it alſo has three facias. The moderns have generally given it two facias.

In the Corinthian and Compoſite orders, both the ancients and moderns have divided it into three facias, generally enriching the mouldings.

The practice of architects differs exceedingly in the proportions of the architrave, as in all the other parts of the orders. Character and propriety, however, ſeem to require, that in the maſſy and grave orders, ſuch as the Doric and Ionic, this member, which repreſents a part ſubject to great preſſure, ſhould have a proportionate degree of ſtrength; while in the gayer Corinthian and Compoſite, its appearance ſhould be lighter and more ornamented.

In Gothic architecture there is no architrave, and this forms one of the moſt ſtriking differences between this ſpecies of architecture and the Grecian. In the latter there is always a horizontal architrave over the columns, whereas from the tops of Gothic columns arches always ſpring. The Egyptian architecture is alſo characteriſed by horizontal architraves.

ARCHITRAVE *Cornice*. See CORNICE.

ARCHITRICLINUS, in *Antiquity*, the maſter or director of a feaſt, charged with the order and economy of it, the covering and uncovering of the tables, the command of the ſervants, and the like.

The word architriclinus properly imports the chief or maſter of a triclinium or dining-room. His office properly differed from that of modimperator, or arbiter bibendi, as the latter was appointed by the gueſts; the architriclinus, by the perſon who gave the feaſt.

The architriclinus was sometimes also called *servus triclinarcha*, and by the Greeks προγευστης, i. e. *prægustator*, or *fore taster*. Potter also takes the architriclinus for the same with the SYMPOSIARCHA.

ARCHITYPE. See ARCHETYPE.

ARCHIVAULT, in *Architecture*, the inner *contour* of an arch; or a band or frame adorned with mouldings, running over the faces of the arch-stones, and bearing upon the imposts. See this represented in the lines that bound the arch over E. See BASILIC.

The word is French, *archivolte*, where it signifies the same thing, formed of *arcus volutus*.

It is different in the different orders. In the Tuscan, it has only a single face; it has two faces crowned in the Doric and Ionic; and the same mouldings with the architrave in the Corinthian and Composite.

ARCHIVE, or ARCHIVES, a chamber or apartment wherein the records, charters, and other papers and evidences of a state, house, or community are preserved, to be consulted occasionally.

The words come from *arca*, *a chest*; or the Greek αρχειον, which Suidas uses in the same sense. In some Latin writers we meet with *archarium*.

We say the archives of a college, of a monastery, &c. The archives of ancient Rome were in the temple of Saturn; the archives of the court of chancery are in the Rolls office. In the code we meet with *archivum publicum vel armarium publicum, ubi acta & libri exponebantur. Cod. de fid. instrum. auth. ad hæc.* xxx. q. 1.

ARCHIVIST, *archivista*, a keeper of an archive.

Under the emperors, the archivist was an officer of great dignity, held equal to the proconsuls, vested with the quality of a count, styled *clarissimus*, and exempted from all public offices and taxes. Among the ancient Greeks and Persians, the trust was committed to none but men of the first rank; among the Franks, the clergy, being the only men of letters, kept the office among themselves. Since the erection of the electoral college, the archbishop of Mentz has had the direction of the empire.

ARCHIZUPANUS, a title given to the prince or despot of Servia. The word is compounded of αρχι, and ζουπανος, *governor*. In an epistle of pope Innocent II. he is called *Magnus Jupanus*.

ARCH-MARSHAL, ARCHIMARISCALLUS, the grand marshal of the empire.

The elector of Saxony is arch-marshal of the empire; and in that quality he goes immediately before the emperor, bearing a naked sword, at the diet, and on other solemn occasions. He bears in his arms two swords placed crosswise. During the holding of the diets, he has jurisdiction over all electoral and other officers of the states of the empire, and also in criminal matters. His hereditary marshals are the counts of Pappenheim, who, by virtue of their office, bear the electoral swords of Saxony in their arms.

ARCH-MINISTER, derived from the Greek αρχος, and the Latin *minister*, the prime minister of a prince, or state. Charles the Bald having declared Boson his viceroy in Italy under the title of duke, made him also his first minister under that of arch-minister.

ARCHON, αρχων, literally signifying a *commander*, in *Antiquity*, the chief magistrate of the city and commonwealth of Athens.

After the Athenians had abolished monarchy, they created archons, who were obliged to render an account of their administration to the people. Some of these were annual, and others perpetual. Medon, the son of Codrus, was the first of the latter; and Creon of the former, who entered upon his charge in the first year of the twenty-fourth Olympiad, or the 684th year before Christ. The occasion of their institution was this: Codrus, king of Athens, having devoted himself for the good of his people, in the war with the Heraclidæ; his sons, Medon and Nileus, disputed the crown betwixt them: the Athenians took this occasion of dissolving their monarchy, and, in lieu of kings, created perpetual governors, under the name of archons. Medon, son of Codrus, was he who first had this charge, being appointed in the year 1070 before Christ; but required to render an account of his administration. He held it for twenty years, and his twelve descendants in regular succession (from him called *Medontidæ*) enjoyed it for 287 years. But a perpetual magistracy seemed to this free people too lively an image of royalty, the very shadow whereof they resolved to abolish. Accordingly, the administration of an archon, which had before been perpetual, they reduced, in the first year of the seventh Olympiad; or 753d year before Christ; or, according to Blair, the third year of the sixth Olympiad, or 754th year before Christ; to ten years: and, about seventy years after, to one year: with a view of recovering as oft as possible the authority into their own hands, which they never transferred to the magistrates but with regret. The first of the decennial archons was Charops, brother of Alcmæon and son of Æschylus; and the last was Eryxias, who closed the race of Codrus. The chief magistrates of Athens, distinguished by this common appellation, were nine in number; though the name archon belonged, by way of eminence, to the chief of the nine, who was also called *eponymus*, επωνυμος, because the year was denominated from him. His jurisdiction comprehended both ecclesiastical and civil affairs. He determined all causes between men and their wives, parents and children, and disputes relating to wills, dowries, and legacies: he had the charge and direction of orphans, minors, tutors, and guardians. He had also the first cognizance of several public actions. He kept a court of judicature in the odeum to decide in trials relating to provisions and similar matters. He appointed επιμεληται, or curators, who took care of the due celebration of the feasts called Διονυσια, *dionysia*, and θαργηλια, *thargelia*, and of the regulation of stage plays. He was punished with death if convicted of drunkenness during the time of his office. The second archon was called βασιλευς, or *king*: to him pertained the superintendance of the religious ceremonies and feasts: he decided all disputes between the priests and families sacred by inheritance, as the Ceryces and Eteobutadæ: he punished all impiety and profanation of the holy mysteries or temples: he offered public sacrifices for the prosperity of the commonwealth: he had also some concern in secular affairs, as he took accusations of murder, and referred them to the Areopagites, among whom he had a right of suffrage; but during the trial, he laid aside the crown which was the badge of his office. His court of judicature was in the royal portico. It was required, that his wife, called βασιλισσα, *basilissa*, should be a legitimate citizen of Athens, and a virgin. The third was the *polemarchos*, so called from πολεμος, *war*, and αρχειν, *to command*: to him belonged the care of strangers and sojourners, and the conduct of war; and he took care that the offspring of those who died in the service of their country should be maintained from the public treasury. These magistrates were assisted by the Παρεδροι, or assessors, who were admitted into office in the same mode, and under the same restrictions. The other six were called *thesmothetæ*, from θεσμος, *law*, and τιθημι, *I establish*. They formed a tribunal for judging concerning seductions, calumnies,

nies, bribery, &c. and for ſettling diſputes between the citizens and ſtrangers, and all controverſies in trade. They ratified all contracts and leagues, directed and guarded the eſtabliſhment of laws, and formed a kind of barrier between the other magiſtrates and the people: they preferred the appeals to the people, publicly examined ſeveral of the magiſtrates, and took the votes in the aſſemblies, and they proſecuted thoſe who attempted to miſlead the unwary into any act injurious to the commonwealth. They uſed to perambulate the city in the night, and to correct thoſe who committed any diſorder. The whole body had the power of life and death; they had a joint commiſſion for conſtituting ſome magiſtrates and depoſing others, when, upon inquiry into their conduct, and by the ſuffrages of the people, they were declared unworthy of their offices; they had alſo authority to aſſemble the people; and they were exempted from all taxes and contributions for building ſhips of war, in recompence of their ſervice. They wore garlands of myrtle; and any perſon who ſtruck them, when they wore their garlands, was puniſhed with ἀτιμία, *infamy*. They were elected by lot, and previouſly to induction into their office, they underwent a twofold trial, one in the forum, called *docimaſia*; and the other in the ſenate houſe, denominated an *acriſis*; and in theſe trials, they were aſked, who were their anceſtors? whether by three deſcents they were Athenian citizens? whether they were related to Apollo Patrius or Jupiter Hercæus? to what tribe and ward they belonged? whether they had been dutiful to their parents, had ſerved the appointed time in the wars, had the eſtate which the law required, and were perfect in all their limbs? They were then conducted into the royal portico, where an oath was required of them, that they would adminiſter juſtice without partiality, and never be corrupted by bribes. This cuſtom was eſtabliſhed by Solon, who alſo enacted that terrible law which condemned to death the archon who, after loſing his reaſon in the pleaſures of the table, ſhould dare to appear in public with the enſigns of his dignity. Potter's Arch. Græc. vol. i. p. 71.

Under the Roman emperors, ſeveral other Greek cities had two archons for chief magiſtrates, which were the ſame with the *duumviri* in the colonies and *municipia*.

ARCHON is alſo applied, by ſome authors, to divers officers, both civil and religious, under the eaſtern or Greek empire. Thus, biſhops are ſometimes called archontes; and the ſame may be ſaid of the lords of the emperor's court. We alſo read of the archon of the antimenſia, archon of archons, grand archon, archon of churches, archon of the goſpel, archon of the walls, &c.

ARCHON, LOUIS, in *Biography*, an antiquary, chaplain to Louis XIV., was born at Riom in Auvergne, in 1645, and died at Rome in 1717. His "Hiſtory of the chapel of the kings of France," in 2 vols. 4to. abounds with curious reſearches. Nouv. Dict. Hiſtor.

ARCHONTICI, in *Church Hiſtory*, a ſect which aroſe towards the cloſe of the ſecond century; thus called from the Greek ἀρχοντες, q. d. *principalities*, or *hierarchies of angels*; becauſe they held the world to have been created not by the ſupreme God, but by certain ſubordinate powers, called archontes, or angels. The archontici were a branch of VALENTINIANS.

ARCHONTIUM, ἀρχοντιον, denotes a dignity of the Greek church.

ARCHOUS, in *Ancient Geography*, the name of a river in Aſia, ſituate in Aſſyria. Alſo, a place of Aſia in Meſopotamia, weſt of the Tigris, and near the wall of Semiramis.

ARCHPRIEST, ARCHPRESBYTER, a prieſt, or preſbyter, eſtabliſhed in ſome dioceſe, with a pre-eminence over the reſt.

Anciently, the arch-prieſt was the firſt perſon after the biſhop: he was ſeated in the church next after the biſhop; and even acted as his vicar, in his abſence, as to all ſpiritual concerns.

In the ſixth century, there were found ſeveral arch-prieſts in the ſame dioceſe; from which time ſome will have them to have been called *deans*.

In the ninth century, they diſtinguiſhed two kinds of cures or pariſhes: the ſmaller governed by ſimple prieſts; and the baptiſmal churches by arch-prieſts; who, beſide the immediate concern of the cure, had the inſpection of the other inferior prieſts, and gave an account of them to the biſhop, who governed the chief, or cathedral church in perſon.

There are arch-preſbyters ſtill ſubſiſting in the Greek church, veſted with moſt of the functions and privileges of *chorepiſcopi*, or rural deans.

ARCH-PRIOR, was a name ſometimes given to the maſter of the order of TEMPLARS.

ARCH-TREASURER, *archithеſaurarius*, the great treaſurer of the German empire.

This office was created with the eighth electorate, in favour of the elector Palatine, who had loſt his former electorate, which was given to the duke of Bavaria by the emperor Ferdinand II. who took it away from Frederick V. elector Palatine, after the battle of Prague, where he was defeated in maintaining his election to the crown of Bohemia. Since the treaty of Weſtphalia, the elector Palatine has been arch-treaſurer. The elector is protector through all Germany of the order of St. John, can raiſe noblemen and gentlemen to the degree of counts, and alſo admit as bondmen, in places ſubject to his juriſdiction, all thoſe that are illegitimately born, and other perſons of foreign countries, on condition of their binding themſelves to the duties of the electorate, and to the payment of a certain tribute and mortuaries.

The dignity of arch-treaſurer was conteſted between the elector of Brunſwick, now king of Great Britain, who claimed it in virtue of his deſcent from the elector Frederic, and the elector Palatine. This elector ſtill ſtyles himſelf arch-treaſurer, till another ſuitable arch-office be aſſigned him. He enjoys the ultimate ſucceſſion in the biſhoprick of Oſnaburg, together with ſome other rights and privileges. His electoral juriſdiction extends to the territories of Hanover, and to thoſe of Zell. Although the illuſtrious houſe of Hanover was raiſed to the electoral dignity by the emperor Leopold, in 1692, it obtained neither voice nor ſeat in the electoral college till the year 1708.

ARCHYTAS, in *Biography*, a Pythagorean philoſopher and diſtinguiſhed mathematician of Tarentum, was a contemporary with Plato, who interpoſed for his reſcue from death, under the tyranny of Dionyſius of Sicily; and the eighth preceptor of the Pythagoric ſchool, in ſucceſſion from Pythagoras. Accordingly, he flouriſhed about the ninety-fifth Olympiad, or 400 years before Chriſt. Such was the celebrity of this philoſopher, that among his diſciples are reckoned Philolaus, Eudoxus, and Plato. Archytas was in ſuch high eſteem among his countrymen for wiſdom and valour, that he was choſen ſeven times general of their armies, and chief magiſtrate of Tarentum, in direct oppoſition to an eſtabliſhed law; and in the exerciſe of his office he invariably recommended himſelf by his moderation, and alſo by his affability and condeſcenſion. As a ſpeculative philoſopher, he followed the doctrine of Pythagoras: and Ariſtotle is ſaid to have borrowed from him the general arrangements known under the appellation of the "Ten Categories." To Archytas, this great philoſopher was alſo indebted for many of his ethical principles and maxims; and more eſpecially for the notion which he repeatedly inculcates, that

virtue conſiſts in avoiding extremes. Virtue, according to Archytas, is to be purſued for its own ſake, in every condition of life; and he taught, that all exceſs is inconſiſtent with virtue; that the mind is more injured by proſperity than by adverſity; that there is no peſtilence ſo pernicious to human happineſs as pleaſure; and that the love of it is a deſtructive diſeaſe of the human mind. To his ingenuity, as a mathematician, we owe, according to Eutocius, the method of finding two mean proportionals between two given lines, and the duplication of a cube; and we derive, from his ſkill in mechanics, the invention of the ſcrew, and crane, and various hydraulic machines; to ſay nothing of his flying pigeon, or winged automaton. See AEROSTATION. The aſtronomical and geographical knowledge of Archytas is celebrated by Horace in a beautiful ode, recording alſo his death, which was occaſioned by a ſhipwreck on the coaſt of Apulia, where his unburied corpſe was found:—

"Te maris et terræ, numeroque carentis arenæ
Menſorem cohibent, Archyta,
Pulveris exigui prope litus parva Matinum
Munera; nec quidquam tibi prodeſt
Aërias tentaſſe domos, animoque rotundum
Percurriſſe polum, morituro."
Lib. I. Od. 28.

"Archytas, what avails thy nice ſurvey
Of ocean's countleſs ſands, of earth and ſea?
In vain thy mighty ſpirit once could ſoar
To orbs celeſtial, and their courſe explore;
If here, upon the tempeſt-beaten ſtrand,
You lie confin'd, till ſome more liberal hand
Shall ſtrew the pious duſt in funeral rite,
And wing thee to the boundleſs realms of light."
FRANCIS.

As to his moral diſpoſition and conduct, Archytas was diſtinguiſhed by modeſty and ſelf-command; and in his language he is ſaid to have ſhewn a degree of regard to decency, not often found among the ancients. He never chaſtiſed a ſervant, or puniſhed an inferior in wrath. To one of his dependents, who had offended him, he ſaid, "It is well for you that I am angry; otherwiſe I know not what you might expect." None of the writings of Archytas are extant, except a metaphyſical work, entitled, "Περὶ τῶν πάντων φύσεως," or "On the univerſe," in which he diſtributes all things into ten claſſes or categories; written in the Doric dialect, and publiſhed in Greek and Latin at Venice, in 1571, 8vo. Several fragments "on Wiſdom," and "on the good and happy Man," have been preſerved by Stobæus, and edited by Gale, apud Opuſc. Mythol. p. 673. Laertius, l. viii. c. 79—86. Val. Max. l. iv. c. 1. Strabo, l. vi. Aul. Gell. l. x. c. 12. Ælian, l. vii. c. 14. l. xii. c. 19. l. xiii. c. 55. l. xiv. c. 19. Suidas. Fabr. Bibl. Græc. l. ii. c. 13. § 1. t. i. p. 493. Brucker's Hiſt. Phil. by Enfield, vol. i. p. 410.

ARCIADES, in *Ancient Geography*, a river of Italy in Brutium, near Rhegium.

ARCILAUS, a town of Spain in Bœtica, ſituate, according to Ptolemy, in the territory of the Turduli.—Alſo, a town of Hiſpania Tarragonenſis, called *Archiſana*, in the territory of the Baſtitani, according to Ptolemy.

ARCILEUTO. See ARCHILEUTO.

ARCINA, in *Ancient Geography*, a town placed by Ptolemy in Dacia.

ARCINELLA, in *Conchology*, a ſpecies of CHAMA found in the American ocean. It is grooved, muricated, and marked with excavated dots; hinge with a ſeſſile callus. Gmelin. The breadth is about two inches, and the length nearly the ſame; it is white, with the ſpines rarely of a roſe colour; within it is yelloviſh; the margin crenated; poſterior excavation cordated, warted, rugoſe, and large, with an appendage in general on one ſide.

ARCIROESSA, in *Ancient Geography*, a town of Aſia upon the Euxine ſea.

ARCIS *ſur Aube*, in *Geography*, a town of France, in the department of the Aube, and principal place of a diſtrict, five leagues north of Troyes. The place contains 2,520, and the canton 9,386 inhabitants: the territory comprehends 377½ kiliometres and 21 communes. N. lat. 48° 33′, E. long. 4° 2′.

ARCISA, a town of Italy in the Milaneſe, 11 miles weſt of Como.

ARCIVÆ *aves*, in *Antiquity*, birds which gave bad omens, either by their flight, noiſe, or manner of eating.

They were called *arciva*, ſometimes alſo *arcula*, *quia arcebant ne quid fieret*, prevented or forbad things being done.

ARCO, in *Geography*. See ARCH.

ARCOBRIGA, in *Ancient Geography*, a town of Spain in the country of the Celtiberians, between Segontia and Bilbilis.—Alſo, a town of Spain, in Luſitania, according to Ptolemy.

ARCONATO, in *Geography*, a town of Italy in the duchy of Milan, 18 miles W. from Milan.

ARCONCEY, a town of France, in the department of the Côte d'Or, and chief place of a canton in the diſtrict of Arnay le Duc, five miles N. from Arnay le Duc.

ARCOS *de la Frontera*, a town of Spain, in the country of Seville, ſeated on a ſharp rock near the river Guadalete, and fortified by both art and nature; anciently *Arcobriga*: 40 miles S. S.W. from Seville. N. lat. 36° 49′. W. long. 4° 55′.

ARCOS, a town of Spain in Old Caſtile, on the river Xalon, and at the foot of a mountain in the road from Siguenza to Saragoſſa, two leagues eaſt from Medina-Celi.

ARCOS *de Valdevez*, a ſmall town of Portugal, in the province of Entre-Minho and Douro. It is the ancient *Arcobriga Luſitanica* of Ptolemy.

ARCOT, a city of Hindoſtan and capital of the Carnatic, is ſeated on the river Paliar, at 56.6 geographical miles in horizontal diſtance from Madras, according to the meaſurement of major Rennell, and in N. lat. 12° 51′ 30″, E. long. 79° 28′ 15″. It appears to be a place of great antiquity, becauſe it is taken notice of by Ptolemy as the capital of the Soræ, or Sora—mandalum; whence by corruption is derived Choro-mandel. Arcot is a pretty large city, and its citadel is eſteemed a place of ſome ſtrength for an Indian fortreſs. The defence of this place by Clive, in 1751, eſtabliſhed the military fame of this nobleman. The Nabob of Arcot, or of the Carnatic, is an ally of the Eaſt India Company, and his dominions commence on the ſouth of the Guntoor Circar, and extend along the whole coaſt of Coromandel to Cape Comorin. See CARNATIC. The revenue of the nabob is ſtated at about a million and a half ſterling per annum; out of which he pays a ſubſidy of 160,000 *l.* per annum, to the Eaſt India Company, towards the expence of their military eſtabliſhment. Rennell's Memoir, Pref. p. 137.

ARCS, LES, a town of France in the department of the Var, and the chief place of a canton, in the diſtrict of Draguignan, 10 miles from Frejus.

ARCTANES, in *Ancient Geography*, a people of Epirus.

ARCTAPELIOTES, in *Coſmography*, the wind which blows at the 45th degree from the north toward the eaſt. In this ſenſe, *arctapeliotes* amounts to the ſame with that we call the north-eaſt wind.

ARCTIC, in *Aſtronomy*, an epithet given to the north pole, or the pole raiſed above our horizon. It is called the arctic pole, on account of the conſtellation of the *Little Bear*, in Greek called ἄρκτος, the laſt ſtar of the tail whereof nearly points out the North Pole.

ARCTIC *circle*, is a leſſer circle of the ſphere, parallel to the

the equator, paſſing through the north pole of the ecliptic, and 23° 28′ diſtant from the north pole, from whence its name. This and its oppoſite, the antarctic, are called the two polar circles; and may be conceived to be deſcribed by the motion of the poles of the ecliptic, round the poles of the equator, or of the world. The arctic circle is the boundary of the north frigid zone.

ARCTICA, in *Conchology*, a ſpecies of MYA that inhabits the north ſeas. The ſhell is ſtriated; and keeled with two ſub-ſpinous ridges; hinge without teeth, Müll. Gmelin, &c. This is Mya teſta ſtriata, valvulis carinis duabus ſpinuloſis ſæpe obſoletis, cardine obſolete dentato. *O.* Fabr. Fn. Groen. The length of this ſhell is from one line and an half to ſeven lines; of a pale yellow colour; within, milky white. It reſembles an Arca; the anterior part is impreſſed and rather flattiſh; very obtuſe in front; and behind, ſhorter, and rather ſharp.

ARCTICA, a ſpecies of ARGONAUTA that inhabits the Greenland ſeas. The ſpecific character is conciſe. Shell perforated; keel entire. Gmelin. This is Clio helicina of Pallas. In ſpring and autumn it is ſeen ſwimming on the ſurface of the water; is very fragile, finely grooved, and about three lines and an half in diameter.

ARCTICA, in *Ornithology*, a ſpecies of ALCA, known in England by the name of *puffin*. The bill is compreſſed, ſharp-edged, with four grooves; orbits of eyes and temples white; with a ſharp-pointed, and ſomewhat triangular protuberance upon the upper eye-lid; Linnæus, Pallas, Brünnick, Gmelin, &c. This bird is called *Pica Marina* by Aldrovandus, *Pſittacus Marinus* by Marten, *Ipatka* by Kratchenn, *Macareux* by Buffon, and *Puffin* by Pennant, Latham, and Donovan, Brit. Birds, &c. The length from the point of the bill is twelve inches, breadth twenty-one; weight twelve ounces. The bill is an inch and a quarter long, and is of a ſingular ſhape, much compreſſed on the ſides, and nearly an inch and a half deep at the baſe, from whence both mandibles tend to a point, which is a little curved: acroſs the upper mandible are four oblique furrows; on the under, three; half of the bill next the point is red; that next the baſe is blue grey; and at the baſe is a ſort of riſing cere, full of minute holes; in the noſtrils is a long and narrow ſlit on each ſide, near the edge of the upper mandible, and parallel to it; the irides are grey; the edges of the eye-lids crimſon; on the upper a callous protuberance of a triangular ſhape; and on the under one, another callofity, but of an oblong form; the top of the head, hind part of the neck, and all the upper part of the plumage are black, paſſing round the throat in a collar; the ſides of the head, chin, and all the parts beneath, are of the pureſt white; the legs are orange; in ſome birds there is a great portion of a duſky mixture on the cheeks, and a patch of the ſame on each ſide of the under jaw, and theſe have been ſuppoſed to be the females. They vary exceedingly in regard to the bill, according to age; in the firſt year it is ſmall, weak, deſtitute of any furrow, and of a duſky colour; in the ſecond, larger, ſtronger, and lighter coloured, with a faint veſtige of a furrow at the baſe; but in thoſe of a more advanced age the colours are brighter; hence theſe birds are ſuppoſed not to be perfect, or at leaſt not to breed, till the third year; eſpecially as not a ſingle one has ever been obſerved at Prieſtholm which had not the bill of an uniform growth.

Theſe birds are frequent upon ſeveral of the rocky coaſts of England, as Prieſtholm Iſle, the Needles, Iſle of Wight, Beachy Head, &c. They are common in Ireland alſo, and in North Britain; inhabit Iceland and Greenland; frequent Carolina in America in winter; were met with by our late voyagers in Sandwich Sound, where the natives ornament the fore parts and collar of their ſeal-ſkin jackets with the beaks of them; and in Oonalaſhka, where they make gowns of their ſkins. On the coaſt of Kamtſkatka, and the Kurile iſlands they are common, even on the Penſchinſki Bay almoſt as far as Ochotka; the nations of the two firſt wear the bills about their necks faſtened to ſtraps, and, according to the ſuperſtition of theſe people, their ſhaman or prieſt muſt put them on with a proper ceremony, in order to procure good fortune.

The puffins arrive at their breeding places about the rocks of Prieſtholm the firſt week in May, and endeavour to diſlodge the rabbits to ſave the trouble of making holes for themſelves. Except in this reſpect, and the tenderneſs they have for their young, they are conſidered as a ſtupid race of birds. The female lays but one egg, which is of a white colour; the young are hatched in the beginning of July, and about the middle of Auguſt they take flight. The young that are late hatched become the prey of the falcons and hawks that live on theſe rocks, for the old ones leave the place, to a ſingle bird. Notwithſtanding their neglect of the young at this time, on every other occaſion they ſhew great attention to them. They will ſuffer themſelves to be taken by the hand, and uſe every means of defence in their power to ſave them; and if laid hold of by the wings, will give themſelves moſt cruel bites on any part of their body within reach, as if actuated by deſpair; and when releaſed, inſtead of flying away, will often hurry again into the burrow to their young. They feed on ſprats, crabs, ſea-weeds, &c. and the fleſh is exceſſively rank, though the young, when pickled, are admired by ſome people.

A variety of this ſpecies is deſcribed by Dr. Latham from a ſpecimen in the collection of Sir Joſeph Banks, that was met with at Bird iſland between Aſia and America. The length is ſixteen inches; the bill is two inches long, much the ſame colours as the laſt, but not ſo deep at the baſe; crown of the head, as far as the nape, aſh colour; ſides of the head white; throat, neck, and all the upper parts of the body, wings, and tail, black; breaſt and under parts, white; legs, orange. The other ſex has the bill more ſlender; the crown of the head, black brown; ſides of the head white, paſſing bakwards almoſt to the nape; thighs aſh-coloured; and is in other reſpects like the former ſpecies.

ARCTICUS, a ſpecies of COLYMBUS. The head is hoary white; under the throat violaceous black, with a white interrupted band. Gmelin. This is Colymbus (Arcticus) capite colloque cinereis, gutture nigro-violaceo, dorſo nigro maculis quadrangularibus albis; Brunnick. Colymbus Arcticus, Lumme, of Willughby. Colymbus Arcticus, Hymber. Gunner Act. Nidroſ. Mergus gutture nigro of Briſſon. Hirundinis aquaticæ ſpecies exotica, Beſl. muſ. Lumme, of Worm. muſ. &c. Lumme ou petit plongeon de la mer du nord, of Buffon. Speckled Loon, of Edwards: and Black-throated Diver, of Pennant and Latham.

The length of this bird is two feet; bill near an inch long, ſlender and black; the forepart of the head and throat black; hind part of the head and neck, aſh-colour, ſides of the laſt, white ſpotted with black: on the forepart of the neck a large patch of black, five inches in length, changing to purple and green in different lights; the back and upper parts black: ſcapulars marked with ſquare ſpots of white; wing-coverts the ſame, but the ſpots are round; breaſt and belly white; quills duſky; tail ſhort and black; legs black, with a caſt of red on the inſide.

This bird is common in the northern parts of Europe, as Norway, Sweden, and Denmark. Frequent in the inland lakes of Siberia, eſpecially thoſe of the Arctic regions: alſo in Iceland, Greenland, and the Ferro iſles; and likewiſe,

at

at Hudſon's Bay in America. It is ſuppoſed to cry and be very reſtleſs againſt rain; hence the Norwegians think it impious to deſtroy this ſpecies; but the Swedes, leſs ſuperſtitious, dreſs the ſkins, which, like all of this genus, are exceeding tough, and uſe them for gun-caſes, and facings for winter caps. Vide Latham, &c.

ARCTIUM (ἄρκτιον, Dioſcor.), in *Botany*, Burdock. Lin. gen. 923. Schreb. 1253. Juſſ. 173. Claſs, *Syngeneſia Polygamia æqualis*. Nat. Ord. *Compoſitæ capitatæ. Cinarocephalæ*. Juſſ. Gen. Char. *Cal.* common, globoſe, imbricate; ſcales lanceolate, ending in long ſubulate prickles, reflex and hooked at the end. *Cor.* compound, tubular, uniform; corollules hermaphrodite, equal. Proper, monopetalous, tubular; tube ſlender, very long; limb ovate, quinquefid; diviſions linear, equal. *Stam.* filaments five, capillary, very ſhort; anther cylindric, tubular, the length of the corolla, five-toothed. *Piſt.* germ oblong, with a villoſe top. *Style*, filiform, longer than the ſtamens. *Stigma* bifid, reflex. *Per.* none. *Calyx* converging. *Seeds* ſolitary, vertically pyramidal, with the two oppoſite angles obliterated, gibbous on the outſide. *Down* ſimple, ſhorter than the ſeeds. *Rec.* chaffy, flat; chaffs ſetaceous. Eſſ. Gen. Char. *Cal* globular, the ſcales at the end hooked, inflected.

Species 1. A. *Lappa*, common burdock or clot-burr; "leaves cordate unarmed petioled." Curt. Lond. faſc. 4. 55. Woodv. Med. Bot. 15. Bardana major. Ger. Pharm. Lond. &c. Root biennial, fuſiform. Stem three or four feet high, erect, branched, round, grooved. Leaves alternate, large, rough, undulated. Flowers in panicles, terminal. The outer ſcales of the calyx by their hooks lay hold of animals, cloaths, or any ſoft ſubſtance with which they come in contact. Corolla purple. It is common on the ſides of roads, flowering in July and Auguſt. There is a woolly-headed variety of this ſpecies: it alſo varies much in the ſize of the heads. *Medicinal properties.* The pharmacopœias direct the root for medical uſe; it has no ſmell, but taſtes ſweetiſh and mixed as it were with a ſlight bitteriſhneſs and roughneſs. Its virtues, according to Bergius, are cleanſing, diuretic, and diaphoretic. It has been employed in chronic caſes, as ſcurvy, rheumatiſm, gout, lues venerea, and pulmonic complaints. We have never had an opportunity of obſerving the effects of this root, except as a diuretic, and in this way it has proved very effectual in dropſies. The ſeeds alſo poſſeſs a diuretic quality, and have been given with advantage in the doſe of a dram, in calculous and nephritic complaints; and in the form of emulſion, as a pectoral. The root is generally uſed in decoction, which may be made by boiling two ounces of the freſh root in three pints of water, two of which, in dropſical caſes, ſhould be taken in the courſe of twenty-four hours. Woodv. Med. Bot. p. 42. 2. A. *Perſonata*, cut-leaved burdock. "Leaves decurrent, ciliate, ſpiny; root-leaves pinnate; ſtem-leaves oblong-ovate." Carduus perſonata, Jac. auſt. 4. 25. t. 348. Root biennial, woody. Stem two feet high, angular leaves on the ſtem, tomentoſe beneath, ſerrate, ſpined at the edges. Lower leaves petioled, conſiſting of three or four pairs of pinnas, with a very large leaf at the end. Flowers in terminal bunches on tomentoſe peduncles, armed with little ſpines. Scales of the calyx reflex at the point, but not hooked; florets ſix or ſeven, of a violet purple colour. A native of Switzerland, Auſtria, Sileſia, and Siberia; flowering in July and Auguſt. Introduced here in 1776 by J. N. de Jacquin, M.D. 3. A. *Carduelis*, "leaves pinnatifid prickly;" ſtem upright, prickly, grooved, about a cubit high; leaves ſtem-claſping, deeply laciniate; calyces terminating, peduncled, with linear briſtle-ſhaped ſcales ſpreading and bending inwards. A native of the mountains in Upper Carniola, and in Sileſia. Theſe plants are ſeldom admitted into any but botanic gardens, where they may be readily increaſed from ſeed.

ARCTOMYS *Paleſtinorum*, in *Zoology*, the name of an animal of the rat kind, but very large, being of a middle ſize between the rat and the rabbit; it lives in caves, and feeds on vegetables, and is a fierce and bold creature. It uſes its fore-feet as hands, and has a cuſtom of ſitting on the buttocks, and in this poſture looks very like a bear. Ray.

ARCTONESUS, or ARCONESUS, in *Ancient Geography*, a deſert iſland in the Ægean ſea. Alſo, a town of Aſia, near Halicarnaſſus, according to Strabo and Pliny.

ARCTONNESSUS, a town of Cyzicum, according to Steph. Byz.

ARCTOPHYLAX, from ἄρκτος, *bear*, and φυλάττω, *I guard*, in *Aſtronomy*, a conſtellation, otherwiſe called BOOTES.

ARCTOPUS, (ἄρκτου πους, Bear's-foot), in *Botany*, Lin. g. 1465. Schreb. 1601. Juſſ. 225. Claſs, *polygamia dioecia*. Nat. Ord. *Umbellatæ*.

Eſſ. Gen. Char. Male, *Umbel*, compound. *Involl.* five-leaved. *Cor.* five-petalled. *Stam.* five. *Piſt.* two abortive. Female (or androgynous), on a diſtinct plant. *Umbel* ſimple. *Involl.* four-parted, ſpiny, very large, containing very many male floſcules in the diſk, and four female ones in the ray. *Male*, pet. five. *Stam.* five. *Fem.* pet. five. *Styles* two. *Seed* one, bilocular, inferior.

Species 1. *A. echinatus*, prickly-leaved Arctopus. A handſome plant from the Cape of Good Hope; introduced in 1774, by Mr. F. Maſſon. The leaves are crowded, ſinuate, and ciliate with ſpines on the upper ſurface diſpoſed ſtarwiſe at the ſinuſes; flowers terminating among the leaves. It has the general appearance of Eryngo.

ARCTOSTAPHYLOS. See VACCINIUM.

ARCTOTHECA. See GORTERIA and ARCTOTIS.

ARCTOTIS, in *Botany* (from ἄρκτος, *a bear*, on account of the ſhagginеſs of the plant). Lin. g. 991. Schreb. 1340. Juſſ. 190. Claſs, *ſyngeneſia polygamia neceſſaria*. Nat. Ord. *Compoſitæ; corymbiferæ*. Juſſ. Gen. char. *Cal.* common, roundiſh imbricate; lower ſcales more lax, ſubulate; middle ovate; inmoſt oblong, ſcarioſe, rounded, and concave at the end. *Cor.* compound, radiate; corollules hermaphrodite, very many in the diſk; females ligulate, near twenty, longer than the diameter of the diſk; proper of the hermaphrodites funnel-ſhaped; border quinquefid; ends reflex, equal; of the females ligulate, lanceolate, very finely three-toothed; tube very ſhort. *Stam.* of the hermaphrodites; filaments five, capillary, very ſhort; anther cylindric, tubular, five-toothed, the length of the corolla. *Piſt.* of the hermaphrodites, germ ſcarcely viſible; ſtyle cylindric, a little longer than the corolla; ſtigma ſimple: of the females, germ ovate-four-cornered, villoſe, crowned with its proper calycle; ſtyle filiform; ſtigmas ovate, oblong, thickiſh, erect. *Per.* none. *Cal.* unchanged. *Seeds* in the hermaphrodites none; in the females, ſolitary, roundiſh, villoſe, crowned with a calycle, uſually of five leaves; leaflets ovate, ſpreading. *Rec.* villoſe or chaffy, flattiſh. *Obſ.* In ſome of the ſpecies the female floſcules of the ray are barren, and the floſcules of the diſk fertile, while in others the former are fertile, and the latter barren. The leaflets of the calycle alſo vary from four to eight.

Eſſ. Gen. Char. *Rec.* villoſe or chaffy; down with a five-leaved crown. *Cal.* imbricate, with ſcales ſcarioſe at the end.

Species 1. A. *calendulacea*, marygold-flowered Arctotis.

Of

Of this ſpecies we find the following varieties, viz, α. A. *calendula*, with "radiant florets twelve-fold, nearly entire." β. A. *hypochondriaca*, with radiant florets trifid, the middle inflected." γ. A. *triſtis*, with "radiant florets four-parted." δ. A. *coruſcans*, with "radiant florets three parted, the exterior one trifid. ε. A. *ſuperba*, with "radiant florets barren, five parted; leaves runcinate and rather tomentoſe." Of the firſt, the peduncles are villoſe, nodding, beſet with red briſtles; ray yellow, purpliſh underneath, twiſted during the night; the corollules of the diſk black on the outſide, and with black anthers; the outer ſcales of the calyx ſpreading, ſubulate, ſhort, hiſpid. Cultivated in 1752, by Miller. The ſecond is ſuppoſed to be the ſame as A. *ſulphurea* of Gaertner. The third has ſpreading hirſute ſtems, with runcinate thick ſerrate leaves; diſk of the flower black, with yellow florets, black at top; ray with four or five parted yellow florets, lead-coloured beneath. The fourth variety has not been deſcribed. Of the fifth the peduncles are villoſe, with hyaline briſtles, decumbent in the night, but never nodding; ray greeniſh underneath, converging during the night; corollules of the diſk yellow; anthers yellow. Theſe are all annual, and, as well as all the other plants of this genus, are natives of the Cape of Good Hope. 2. A. *ſerrata* "radiant florets barren; leaves lanceolate, undivided, tooth-ſerrate;" ſtems upright, ſimple, woody, ſubpubeſcent; leaves ſeſſile, ſcarcely pubeſcent, ſomewhat crowded; peduncles terminating, many very long; calyx ſcarioſe, yellow; corollas yellow; crown of the ſeeds white. 3. A. *tenuifolia*, "radiant florets barren; leaves linear, undivided, naked;" ſtems herbaceous, few; leaves filiform or linear, naked; peduncles long, ſolitary, naked, filiform; bracte ſmall, filiform; calyx imbricate; ray yellow; perennial. 4. A. *grandiflora*, "radiant florets fertile; leaves pinnatifid, toothletted, cobwebbed, three-nerved;" ray very large; petals ſtraw-coloured, with a tinge of red underneath, yelloviſh near the baſe, with a dark purple mouth; biennial. Introduced in 1774. Diſcovered by Maſſon. 5. A. *plantaginea*, plantain-leaved arctotis; "radiant florets fertile;" leaves lanceolate-ovate, nerved, toothletted, ſtem-claſping; leaves tomentoſe underneath; diſk barren; perennial; flowers appear from June till Auguſt. Cultivated by Miller in 1768. 6. A. *argentea*, ſilvery Arctotis; "radiant florets fertile; leaves lanceolate-linear, entire tomentoſe;" flowers yellow, appearing in Auguſt; biennial. Found by Maſſon, and introduced in 1774. 7. A. *anguſtifolia*, "leaves oblong, toothed;" florets of the diſk barren; receptacle very wooliy. β. A. *ſpontanea*, a variety in which the whole plant is white, ſtems creeping, and leaves lyrate with two teeth on each ſide. 8. A. *aſpera*, rough arctotis; "radiant florets fertile;" leaves pinnate-ſinuate, villoſe, diviſions oblong, toothed; ſtem ſtiff, perennial, villoſe, with purple ſtreaks; leaves white underneath; corollas of the ray yellow, with red ſtreaks beneath. There is a variety of this with narrow leaves and orange-coloured flowers. Cultivated in 1731, by Mr. Miller. The preceding eight ſpecies have the receptacle villoſe, but in thoſe which follow it is chaffy. 9. A. *paradoxa*; chamomile-leaved arctotis; "radiant florets barren; chaffs coloured, longer than the diſk; leaves bipinnate, linear;" chaffs elongate, coloured, almoſt the length of the ray; whence the flower appears to be a double one. Gaertner has removed this together with the twelfth and thirteenth ſpecies to a genus named Urſinia. This ſpecies was introduced here by Maſſon in 1774. It flowers in Auguſt. 10. A. *ſcarioſa*, ſouthernwood-leaved Arctotis; "radiant florets barren; chaffs equalling the florets of the diſk; leaves decompound;" ſtem ſhrubby; all the calycine leaflets obtuſe, ſcarioſe, ſcrew-ſhaped, ſquarroſe, ſpreading. It flowers from April till Auguſt, and was introduced in 1774, by Mr. Maſſon. 11. A. *paleacea*, chaffy arctotis; "radiant florets barren; chaffs equalling the florets of the diſk; leaves pinnate, linear;" ſtem ſhrubby, branching; peduncles axillary, long; with few linear ſimple leaves; calyx and corolla yellow, like a chryſanthemum; ray ſimple, barren. It was cultivated in 1768, by Miller. The flowers appear from April till Auguſt. 12. A. *dentata*, fine-leaved arctotis; "radiant florets barren; leaves pinnate; pinnas pinnatifid, indented;" ſtem branching; leaves alternate, ſomewhat rigid, and villoſe; pinnas recurved; peduncles long, one flowered; flowers ſmall, with the ray purple beneath; annual; flowers appear in July. Introduced by Mr. Haneman, in 1787. 13. A. *anthemoides*; "chaffs ſhorter than the florets; leaves ſupra-decompounded, linear." This plant, as its name imports, reſembles chamomile; ray barren, violet coloured. 14. A. *tenuifolia*; "radiant florets barren; leaves linear, undivided, ſmooth;" ſtem branching, browniſh, ſmooth; leaves linear, the length of the finger, ſmooth; peduncles very long, one-flowered; calyx hemiſpherical, ſmooth, with the inner ſcales ſcarioſe and white; flowers yellow. 15. A. *acaulis*, dwarf arctotis; "peduncles radical; leaves lyrate;" about ſix inches high. Flowers large, yellow, and appear from April to July. Cultivated by Miller, in 1759.

Propagation and Culture. Theſe plants are all natives of the Cape of Good Hope. The annual ſorts may be raiſed from ſeed, ſown in the ſpring, either in a warm border of light earth, about the middle of April, or in a moderate hot-bed, towards the end of March. In favourable ſeaſons the former will be the ſtrongeſt plants; but in cold ſeaſons they will ſeldom ripen their ſeeds. The latter muſt be tranſplanted, when they are fit, into pots; and as ſoon as they are well-rooted, enured gradually to the open air; they require much water in dry weather: they may alſo be propagated by cuttings or ſlips from the roots. The ſhrubby ſorts are propagated by planting cuttings in a bed of light freſh earth in any of the ſummer months, obſerving to ſhade them from the heat of the ſun, until they have taken root, and alſo to frequently refreſh them with water. In ſix weeks after planting they will be rooted ſufficiently to be tranſplanted into pots, which are to be placed in a ſhady ſituation, until the plants are new rooted; after which they may be expoſed to the open air, till the latter end of October (or later, according to the ſtate of the weather), when they muſt be removed into the green houſe. While they continue in the houſe they ought to have an open and dry ſituation, and be frequently ſupplied with water. They will alſo require to be ſhifted into other pots, two or three times every ſummer; and the pots ſhould be often removed to prevent the plants from ſtriking their roots through the holes into the ground. Several of theſe grow to the height of four or five feet, and as they ſend off ſeveral branches, they require to be frequently pruned. They are ſeldom without flowers, unleſs the winter be ſevere, which renders them very valuable, making a fine variety in the green-houſe or cape-ſtove; and when placed out in the ſummer, they produce flowers in great abundance. See Miller's Dict. by Martyn.

ARCTOTIS. See GORTERIA.

ARCTOUS, in *Entomology*, a ſpecies of PAPILIO (Dan. Feſt.) that inhabits New Holland. The wings are very entire, and brown; both above and beneath is an ocellar bipupillated mark on the anterior ones; and another on the poſterior ones, which is very faintly pupillated above. Fabricius, &c.

ARCTURUM *infra*, a ſmall ſtar of the ſeventh or eighth magnitude, to the ſouth of *arcturus*; obſerved by Mr. Flamſteed, and ſo named by him, whoſe place is not determined in the Britiſh Catalogue.

ARCTURUS, in *Aſtronomy*, a fixed ſtar of the firſt magnitude, in the conſtellation of ARCTOPHYLAX, or BOOTES.

The

The word is formed of αρκτος, and ουρα, *tail*, q. d. *bear's tail*; as being very near it.

This ſtar was known to the ancients, as in the following verſe of Virgil:

"Arcturum, pluviaſque hyades, geminoſque triones."

See alſo Job ix. 9. xxxviii. 32. Some critics have doubted whether the Hebrew word עיש, or עש, *aiſh*, d notes this ſtar. For various opinions concerning its meaning, ſee Schultens, in Job, vol. i. p. 2 9.

Mr. Hornſby concludes, that Arcturus is the neareſt ſtar to our ſyſtem viſible in the northern hemiſphere, becauſe the variation of its place, in conſequence of a proper motion of its own, is more remarkable than that of any other of the ſtars; and by comparing a variety of obſervations reſpecting both the quantity and direction of the motion of this ſtar, he infers that the obliquity of the ecliptic decreaſes at the rate of 58″ in one hundred years; a quantity which nearly correſponds to the mean of the computation framed by Mr. Euler and M. de la Lande, upon the principles of attraction. Phil. Tranſ. vol. lxiii. p. i. N° 14.

ARCTURUS, in *Botany*. See CELSIA.

ARCTUS, αρκτος, in *Aſtronomy*, a name given by the Greeks to two conſtellations of the northern hemiſphere; by the Latins called URSA *Major* and *Minor*, and by us the *Greater* and *Leſſer* BEAR.

ARCTUS, in *Entomology*, a ſpecies of CANCER, that inhabits the ſeas in moſt parts of the world. Its ſpecific character is thus concifely defined: ſcales of the antennæ ciliated, with ſpines. Fabricius and Gmelin. *Obſ.* To this may be added, that the front is retuſe, and armed with about ten unequal ſpines; the thorax oblong, and aculeated, and the poſterior part of it, together with the upper part of the body, tuberculated, brown, and ſpotted with yellow. This is called Poliquiquyixe, by Maregrave.

ARCUALIA OSSA, in *Anatomy*, a name uſed by ſome for the *oſſa ſyncipitis*, by others for the *oſſa temporum*.

ARCUALIS *ſutura*, among *Surgeons*, denotes the coronal SUTURE.

ARCUANA, in *Entomology*, a ſpecies of PHALÆNA (Tortrix) found in Europe. The wings are pale yellow; on the anterior pair are three curved black bands, and a ſpot of the ſame colour; with a black ſpot in the diſk, having three ſilvery dots upon it. Fabricius and Gmelin. *Obſ.* Linnæus deſcribes it as Phalæna Tortrix alis luteis, faſciis tribus arcuatis, macula nigra tripunctata lincoliſque duabus argenteis. Syſt. Nat. Fn. Su. &c.

ARCUANUS, in *Ichthyology*, a ſpecies of CHAETODON, found on the Indian and Arabian ſea coaſts. The tail is bifid; twelve ſpines in the dorſal fin, and body faſciated with brown. This ſpecies inhabits the ſhores among the coral rocks, and feeds on marine worms; it is ſilvery, back cinereous, with a deep brown or black band on the head, another on the breaſt, and a third extending from the dorſal to the anal fin. The fleſh of this kind is eatable.

The head is large; front, and iris of the eye, white; gape narrow: jaws equal; teeth minute, and wedged; branchioſtegious aperture ample; operculum ſimple, mucronate in the middle; ventral fins long, black; anal fin black; dorſal fins cinereous.

ARCUARIA, in *Entomology*, a ſpecies of PHALÆNA (Geometra). The wings are fuſcous, with a thin ſtreak, and a lunated ſpot of white near the poſterior margin. Gmelin. Inhabits Europe.

ARCUATA, a ſpecies of COCCINELLA. This is of an ovate form; wing-caſes red, with four dots, two bands and a dot at the apex black. Inhabits China. Fabricius. It is of the middle ſize; the body black, and head whitiſh; thorax black, whitiſh in front and on the ſides.

ARCUATA, a ſpecies of CASSIDA, that inhabits Rio Janeiro. It is whitiſh, with a common black diſk; border oval, ring, and arched mark behind, yellowiſh. This is about the middle ſize; and the breaſt and abdomen are black.

ARCUATA, a ſpecies of LEPTURA, in the Linnæan ſyſtem, that inhabits Europe. The thorax is rounded; ſhells with four yellow bands, the firſt formed of three ſpots; the others curved downwards. Linn. and Donov. Brit. Inſ. Gmelin has removed this, and ſome others of the Lepturæ, to the Cerambyx genus; it is therefore CERAMBYX ARCUATUS of that author, and is arranged in the diviſion *Callidium*.

ARCUATA, a ſpecies of CICADA (foliacea, Gmelin. Membracis, Fabricius) This inſect inhabits Surinam. It is black brown; thorax compreſſed above, with a yellowiſh arch. Degeer, and Gmelin.

ARCUATA, a ſpecies of CIMEX, (oblongus, Gmelin). It is black; beak arched; wing-caſes whitiſh, with a white ſpot, and black arched mark; four of the thighs clavated and red. Degeer. Inhabits Surinam, and is the ſize of the common houſe-fly, muſca domeſtica. Gmelin.

ARCUATA, a ſpecies of PHALÆNA, (noctua). The wings are whitiſh; the curved mark in the middle, and marginal ſpot behind are black. Fabricius. This moth inhabits Tranquebar, and in ſize and appearance ſomewhat reſembles Phalæna albicoſtis.

ARCUATA, a ſpecies of VESPA, that inhabits New Holland, and is deſcribed by Fabricius. The body is black, variegated with yellow; the petiole connecting the thorax and abdomen is incurvated, and marked with four yellow ſpots.

ARCUATA, a ſpecies of MUSCA, found in Germany. It is teſtaceous; with two ſpots and a black curve at the apex of the wing; and a white dot at the tip. Fabricius. This greatly reſembles Muſca ſtylata. Gmelin alſo deſcribes another inſect under the name Muſca arcuata (in the ſubdiviſion SYRPHUS). It is black, with long antennæ; thorax ſpotted on the ſides with yellow, and four curved belts of the ſame colour on the abdomen.

ARCUATA, in *Ornithology*, a ſpecies of FRINGILLA, that inhabits the Cape of Good Hope, and is deſcribed by Dr. Latham as being of a cheſnut colour above, beneath white; head and lower part of the neck black; collar and ſtripe behind the eyes white. This is alſo FRINGILLA *arcuata* of Gmelin, but his ſpecific character is certainly leſs expreſſive than that of the preceding author; it is likewiſe *Paſſer Capitis Bonæ Spei*, of Briſſon; *Croiſſant*, of Buffon; *Moineau du Cap de Bonne Eſpérance*, of the ſame author; *Pl. enl.* and creſcent finch of Latham, Gen. Syn.

It is the ſize of a houſe-ſparrow; length ſix inches; bill black; head and neck before as far as the breaſt are alſo black; at the eye begins a ſtreak of white, which paſſes down on each ſide of the neck, and growing broader, paſſes round the fore-part like a creſcent; hind part of the neck pale brown; back, ſcapulars, and leſſer wing-coverts, cheſnut; the middle coverts black, tipped with white; the greateſt coverts and quills brown, edged with grey; tail deep brown; legs brown.

ARCUATION, from *arcus*, *a bow*, is uſed by ſome writers in *Surgery*, for an incurvation of the bones; ſuch as we ſee in the caſe of rickets, &c.

ARCUATION, in *Gardening*, a term formerly applied to the practice of raiſing trees by layers. Switzer obſerves that in his time, it was the general method of producing ſuch trees as could not be raiſed from ſeeds; as the lime, alder, willow, &c. See LAYERS, and LAYING.

ARCUATUS, in *Entomology*, a ſpecies of SCARABÆUS, found in Saltſburg. It is black, and gloſſy; ſhield rufous

in front; wing-cafes ftriated with punctures; future, marginal dot at the bafe, and abbreviated band inflected towards the future, reddifh; breaft obfcure; abdomen yellowifh; palpi, antennæ, and legs ferruginous. Moll. naturh. Br. 1160. n. 7. Gmelin.

ARCUATUS, in *Ichthyology*, a fpecies of CHÆTODON, that inhabits Brafil. The tail is entire; eight fpines in the dorfal fin; and four white arched bands acrofs the body. Gmelin. This is *Chætodon fufcus arcubus 5 nigris* of Muf. ad Fr.; *Guaperva* of Marcgrave; *Acaraunna exigua nigra*, &c. of Willughby. The length is about four inches. *See* ACARAUNA.

ARCUATUS, in *Ornithology*, a fpecies of TURDUS, that inhabits China; and was firft defcribed by Dr. Latham under the name of the *Crefcent Thrufh*. Gmelin gives us this fpecific character. Above chefnut; the eye-brows, lore, chin, and vent, white; cheeks, and crefcent on the throat, white; tail rounded; towards the tip black; apex white. But as this author is indebted to Dr. Latham's account of this bird, his character fhould have read "cheeks and crefcent on the throat black." In the Index Ornithologicus the character runs thus;—rufo-fufcus, corpore fubtus fuperciliis lorifque albis, cervice jugulo pectoreque rubentibus, genis lunulaque fub gula nigris.

The length is eleven inches; bill lead-coloured, pale at the tip; upper parts of the body reddifh brown; over the eye a white line; lore and chin white; cheeks black paffing in a crefcent on the fore part of the neck; on the middle of the back part behind the eye, a patch of loofe white feathers; the hind part of the neck, and the breaft reddifh; belly reddifh white; vent plain white; tail long; legs lead-coloured; claws white.

ARCUBALISTA, in the *Military Art*, a kind of *baliſta*, probably made after the faſhion of a bow.

It is mentioned by Vegetius; but the defcription of it omitted by him, as too well known then, though now hard to be guefſed at.

Thofe who fought with this weapon were called *arcubaliſtarii*, fometimes *manubaliſtarii*.

ARCUCCIO, ARCUTIO, a machine made of board, covered with pieces of hoops like the tilt of a waggon: ufed in Italy to prevent children from being overlaid and fmothered by nurfes, or others.

Every nurfe in Florence is obliged to lay her child in an arcutio, under pain of excommunication.—See a figure and defcription of the arcutio, given by Mr. St. John, in Phil. Tranf. N° 442. Abridg. vol. vii. part iv. p. 46.

ARCUDIO, PETER, in *Biography*, a learned Italian; was born in the ifland of Corfu, and flourifhed in the feventeenth century. Having ftudied in the college of the Greeks at Rome, where he made great proficiency in literature, he fo much recommended himfelf by his zeal for the holy fee, that he was fent to Ruffia by Pope Gregory XIV. and by pope Clement VIII., in order to induce that nation to fubmit to the Roman pontiff; but in the courfe of twenty years, during which he remained in the country, his utmoft efforts were only fufficient for obtaining fome indulgences for thofe who obferved the Romifh ritual. After his return he diftinguifhed himfelf by his endeavours to refute the Proteftants on the fubject of the Sacraments; and for this purpofe he publifhed a work, intitled "On the harmony of the weftern and eaftern churches in the adminiftration of the feven facraments," printed at Paris in 1672, 4to. Among his other works were, "On the exiftence of Purgatory," printed at Rome in 1632, 4to.; "On the fire of Purgatory," Rome 1637, 4to.; and "A collection from the Greek theologians on the proceffion of the holy fpirit," Rome 1630, 4to. In all his performances he difcovers talents and erudition, and at the fame time ftrong traces of paffion and bigotry. They are written in Greek; but without any pretenfion to Attic elegance. Arcudio was an indefatigable ftudent, and his fole amufement was derived from his library. He died at Rome about the year 1632 or 1633. Nouv. Dict. Hiftor. Fabr. Bib. Græc. l. v. c. 43. § 12. t. x. p. 417.

ARCUEIL, in *Geography*, a town of France, one league from Paris.

ARCULARIA, in *Conchology*, a fpecies of BUCCINUM in the fection *Cullofa*, (that in which the pillar lip is dilated and thickened). It inhabits the Indian fea, and is thus defcribed by Gmelin: fhell plaited, and crowned with papillæ. This fhell is fometimes white, cinereous, or brown, with a white ftripe: and is *Arcularia major* of Rumphius, and *Buccinum fafciolatum* of Cronovius.

ARCULPHUS, in *Biography*, a theologian of France, flourifhed about the year 690. Having vifited, on account of religion, the Holy Land, Conftantinople, Alexandria, and other places, he was thrown by a ftorm, on his return to France, on the coaft of Britain, and hofpitably entertained by Adammon, an abbot. To him Arculphus communicated the refult of his travels; and the account which he obtained from him in converfation formed three volumes, which were publifhed under the title of "Libri de Situ Terræ Sanctæ," at Ingolftadt in 1619. Cave. Hift. Lit. t. i. p. 599.

ARCUS, in *Entomology*, a fpecies of PAPILIO (Dan. Feft.) The wings are very entire, and blue; anterior ones fpotted with white; a large black fpot, terminating in another of white near the margin of the pofterior ones. This kind inhabits Surinam. *Obf. Papilio Arcus* of Efper is a different infect; viz. *Papilio Alcon* of Gmelin.

ARDA, a fpecies of TERMES, that inhabits Africa. We are chiefly indebted to Mr. Smeathman, who difcovered them in Sierra Leona, for the hiftory of thefe deftructive creatures. In their economy they greatly refemble *Termes fatale*, and *deſtructor*; for like them they attack and devour proviſions, clothes, and furniture, and indeed they are in fuch numbers, and fo rapacious, that where they fettle, few things can efcape them. They can perforate a piece of timber of the greateft magnitude, and in a few hours leave nothing but a thin outer fhell of it. The nefts are cylindrical, and from two to three feet high; they are formed of brown clay intermixed with grafs, and various other vegetables, and have a vaulted dome at top, with a prominent entire margin furrounding it. The *larvæ* are the labourers, and have a pale head; moniliform antennæ; no eyes; jaws fhort and toothed; thorax and abdomen ovate; are of a cinereous lead colour; and the legs pale. The *Pupæ*, are the foldiers to protect them; their head is large and teftaceous, elevated and gibbous in front, and obtufely ovated behind; the jaws project, and are forked, black; antennæ moniliform teftaceous, as long as the head; no eyes; thorax fmall; abdomen ovated, cinereous lead-colour; legs teftaceous. *Imago*, or perfect infect, is black; margins of the fegments of the body white; wings incumbent, black, all the legs pale teftaceous. Fabricius. The character of this fpecies, according to the laft-mentioned author, is thus defined, black; fegments of the abdomen white at the tips; legs pale. Gmelin adopts this Fabrician defcription.

ARDA, in *Geography*, a town of European Turkey, in Romania, 60 miles fouth of Filippopoli.—Alfo a river of European Turkey, which runs into the Mariza, 10 miles north of Trajanopoli.

ARDABIGANA, in *Ancient Geography*, a country of Aſia, between Aſſyria and Perfarmenia, according to Procopius.

ARDACHAT, in *Geography*, a place in Armenia, fo called from the name of Artaxias, denominated in the eaft Ardechier; in which are feen fome ruins of the ancient ARTAXATA.

ARDACHER, or ARDAGGER, a town of Germany, in the arch-duchy of Auſtria, near the Danube, ten miles ſouth-weſt of Ips.

ARDAGH, in the county of Longford in Ireland, ſo called from its elevated ſituation, at preſent an inſignificant village, but formerly of ſo much conſequence as to have given name to a barony, and to have been a biſhop's ſee. The church is one of the moſt ancient in Ireland, but cannot be called a cathedral. The ſee was founded in the middle of the fifth century. In 1658, it was united to the biſhoprick of Kilmore; from which it was ſeparated in 1741, and has been ſince held in commendam by the archbiſhops of Tuam. Collectanea de reb. Hibernicæ.

ARDAL, a town of Norway, 24 leagues north of Chriſtiania.

ARDAMON, or ARDAMA, from ἄρδω, *I water*, in *Antiquity*, a veſſel of water placed at the door of a perſon deceaſed till the time of burial, as a token that the family was in mourning, and to ſerve to ſprinkle and purify perſons as they came out of the houſe.

ARDANIS, in *Ancient Geography*, a town of Africa, in Marmarica, according to Ptolemy.

ARDASSES, in *Commerce*, the coarſeſt of all the ſilks of Perſia; and, as it were, the refuſe of each kind. In this ſenſe, they ſay, the *legis*, the *houſets*, the *chouſs*, and the *payas ardaſſes*, to ſignify the worſt of thoſe four ſorts of Perſian ſilk.

ARDASSINES, in *Commerce*, called in France *ablaques*; a very fine ſort of Perſian ſilks, little inferior in fineneſs to the *fourbaſtis*, or rather *cherbaſſis*; and yet it is little uſed in the ſilk manufactures of Lyons and Tours, becauſe that kind of ſilk will bear hot water in the winding.

ARDATOF, or ARDATOV, in *Geography*, one of the thirteen diſtricts of the government of Niſhnei Novogorod in Ruſſia, ſituate on the river Teſh, falling into the Occa.—Alſo, a town of this diſtrict, ſixty miles S. S. W. of Niſhnei-Novogorod. N. lat. 50° 20'. E. long. 43° 4'.—Alſo, a diſtrict of the government of Simbirſk, ſituate on the Alator.—Alſo, a town of this diſtrict, ninety-two miles weſt of Simbirſk. N. lat. 54° 45'. E. long. 45° 44'.

ARDAXANUS, in *Ancient Geography*, a river of Illyria near Liſſus, according to Polybius.

ARDEA, a town of Perſia, according to Ptolemy, and Ammianus Marcellinus.

ARDEA, a very ancient town ſituate on an eminence ſouth-weſt of Lavinium; at the time of the arrival of Æneas, it was the capital of the Rutuli, governed by Turnus. The Romans eſtabliſhed a colony in this place in the year 311. The territory of Ardea was marſhy and unhealthy. In its vicinity was a temple dedicated to Venus.

ARDEA, in *Ornithology*, a genus of the fourth order GRALLÆ. The bill is ſtraight, pointed, long, ſlightly compreſſed, with a furrow extending from the noſtrils towards the tip; noſtrils linear; tongue acuminated; feet four-toed. Gmelin. Dr. Latham gives another character for this genus, viz. a long, ſtrong, ſharp-pointed bill; noſtrils linear; tongue pointed; toes connected by a membrane, as far as the firſt joint; the middle claw of ſome of the ſpecies pectinated.

Gmelin divides his genus into five ſections; and the following are the characters of thoſe ſections, with the ſpecies reſpectively referred to each.

* *Criſtatæ;* roſtro vix capite longiore (creſted; bill ſcarcely longer than the head.)—Pavonina & Virgo.

** *Grues;* capite calvo, (cranes; head bald) canadenſis grus, americana, antigone, & gigantea.

*** *Ciconiæ*, orbitis nudis (ſtorks; orbits naked,) ciconia, maguari, & nigra.

**** *Ardeæ;* ungue intermedio introrſum ſerrato, (herons; middle claw ſerrated inwardly,) dubia, torquata, nycticorax, griſea, jamaicenſis, caledonica, cayennenſis, purpurea, major, cinerea, garzetta, leucogaſter, ruſeſcens, egretta, agami, cocoi, johannæ, hoactli, hohu, herodias, ludoviciana, violacea, cærulea, rubiginoſa, hudſonias, comata, erythrocephala, ohula, cyanocephala, candidiſſima, caſtanea, ſquaiotta, galatea, ferruginea, erythropus, ſtriata, vireſcens, ſtellaris, botaurus, ſolomenſis, marſigli, danubialis, undulata, braſilienſis, tigrina, lineata, flava, bononienſis, alba, nivea, helias, ſacra, atra, purpurata, ſpadicea, æquinoctialis, cracra, leucocephala, rufa, ſinenſis, virgata, cana, carunculata, malaccenſis, cinnamomea, pumila, badia, philippenſis, novæ guineæ, cyanopus, maculata, gardeni, ſenegalenſis, exilis & minuta.

***** roſtro in medio hiante, (bill, gaping in the middle.) pondiceriana, coromandeliana & ſcolopacea. Which ſee reſpectively.

ARDEA, *exotica aurita*, Petiver Gaz. 68. t. 43. f. 2. This is the Linnæan *Colymbus criſtatus*.

ARDEÆ, in *Natural Hiſtory*, the ſpecific name of that kind of ECHINORHYNCHUS which infeſts ardea cinerea, (the common heron.) It is ſtriated, and has the proboſcis clavated. Goeze. Gmelin, &c. *Obſ.* The body is conic behind, and ſituated on each ſide in the middle.

ARDEBIL, or ARDEVIL, in *Geography*, a town of Perſia, in the province of Aiderbeitzan, or Aderbijan; ſituate in the midſt of a large plain, and ſurrounded by mountains which form a kind of amphitheatre. It was formerly a ſtrong city, and had conſiderable trade; but it was plundered and burnt by the troops of Jenghiz Kham, about the year of the Hegira, 619. A. D. 1222. Its grand ſquare, called "Meidan," has a caravanſera, and various conveniences for merchants, who frequent the city, from Turkey, Tartary, Hindoſtan, and other countries; and near it is a bazar or market, in which are ſold the moſt valuable merchandize of the produce and manufactures of the country, as well as other articles, European and Aſiatic. The tomb of Scheik Sefi, a celebrated ſaint, is an inviolable aſylum, frequented by pilgrims from all parts of Perſia. Caravans are frequently paſſing through this town from and to Conſtantinople and Smyrna. N. lat. 37° 20'. E. long. 47° 5'.

ARDEBIL, LITTLE, a town of Perſia, in the province of Fariſtan, 18 leagues north of Schiras.

ARDECAN, a town of Perſia, in the province of Irak, 43 leagues eaſt of Iſpahan.

ARDECHE, one of the departments of France, derives its name from a river of the Vivarais, which riſes near Vals, and diſcharges itſelf into the Rhone, near Pont St. Eſprit. This department is one of the ſeven formed of Languedoc, Cominges, Nebouzan, and Riviere Verdun. It is bounded on the north by the departments of the Dromé, Iſere, and Lower and Upper Loire; on the eaſt by that of the Dromé, which is ſeparated from it, from one extremity to the other, by the Rhone; on the ſouth, by the department of Gard; and on the weſt by the departments of Lozere and Upper Loire. Its ſuperficies is about 1,077,929 ſquare acres, or 550,004 hectares; the population conſiſts of about 273,255 perſons; and it is divided into three communal diſtricts. The chief town is Privas.

ARDEE, or ATHERDEE, a ſmall town in the county of Louth in Ireland, much declined in importance. Near it is a mount of great magnitude called Caſtle-guard. It is artificial and encompaſſed with a double ditch. It is now all planted with wood, and has a very romantic appearance. The perpendicular height of the mount from the bed of its foundation, is nearly ninety feet, and the depth of the main trench betwixt thirty and forty. The circumference at the top is not leſs than 140; and round the foundation it is upwards of 600 feet. There appear, from foundations yet remaining, to have been two concentric octagonal buildings upon

upon the ſummit of it. The Danes are ſuppoſed to have been the original authors of this and ſimilar mounts; the deſign of which, whether for defence, or for burial places, or for holding aſſemblies of the people, has not been aſcertained. Latitude, from obſervation of Dr. J. Hamilton, 53° 50′ 30″.

ARDELICA or ARIOLICA, now *Peſchiera*, in *Ancient Geography*, the place in Italy, at the conflux of the lake Benacus with the river Mincius, where Attila had an interview with Leo the Great, and the deliverance of Italy was purchaſed by the immenſe ranſom or dowry of the princeſs Honoria.

ARDELL, MAC, JAMES, in *Biography*, an eminent engraver, was born either in Ireland or in England, of Iriſh parents, and reſided chiefly in London, where he died, June 2, 1765. Baſan calls him "one of the beſt engravers in Mezzotinto that England ever produced." His works are chiefly portraits, from the moſt celebrated painters of his time. His beſt engravings are ſaid to have been from Vandyke. Two moſt beautiful prints from this maſter are, "Time clipping the wings of Love," and "Moſes in the ark of bulruſhes."

ARDEN, or ARDON, in *Geography*, a county of Swiſſerland, and one of the baiſiwicks of the Valais.

ARDENBURGH, a town of Flanders, and formerly one of the moſt conſiderable maritime towns of the country; but now much decayed; four leagues N. E. of Bruges, and two S. E. of Sluys.

ARDENELLA, a town of Hindooſtan, in the country of Coimbetore, forty miles ſouth of Seringapatam.

ARDENNES, a foreſt of France, of ancient fame for events of chivalry, extends from Rheims to Tournay, and in the north-eaſt to Sedan. Its extent, however, has been very variouſly aſſigned. From this foreſt one of the departments of France derives its name. It is one of the four compoſed of the former Champagne, Charleville, Sedan, Carignan or Mouſon, Philippeville, Marienbourg, Givet, and Charlemont. It is bounded on the north by the department of Sambre and Meuſe, and of Jemappe; on the eaſt, by thoſe of Sambre and Meuſe, of the Foreſts, and of the Meuſe; on the ſouth, by thoſe of the Meuſe, the Marne, and the Aiſne; and on the weſt, by thoſe of the Aiſne and of the Jemappes. Its ſuperficies is about 1,029,189 ſquare acres, or 525,281 hectares: the population conſiſts of 253,902 perſons; and it is divided into five communial diſtricts. Its chief town is Mezieres.

ARDENSAN, a town of Aſia, in the province of Aladulia, thirty-eight miles north-weſt of Arzingan.

ARDENT, ARDENS, from *ardere, to burn*, ſomething hot, and as it were burning.

ARDENT *fever* is a burning FEVER, otherwiſe called CAUSUS.

ARDENT *ſpirits* are thoſe diſtilled from fermented vegetables; thus called becauſe they will take fire and burn; ſuch as brandy, ſpirit of wine, rum, arrack, &c.

ARDENTES, in *Middle Age Writers*, an appellation given to thoſe afflicted with the *ignis ſacer*, or ERYSIPELAS. They are thus called, as ſeeming to be ſcorched or burnt with the diſeaſe.

Hence alſo the abbey of St. Genevieve at Paris is called *domus ardentium*, becauſe, as it is ſaid, great numbers were cured of that diſtemper at the ſhrine of this ſaint, in the reign of Louis VI.

ARDEOLA, and ARDEOLA *Naevia*, in *Ornithology*, the names by which Briſſon calls the Linnæan ARDEA *minuta*.

ARDERN, JOHN, in *Biography*, contemporary with Guido of Chauliac, acquired conſiderable reputation for his ſkill in the practice of ſurgery and medicine. He was ſettled at Newark in the year 1349, when the plague broke out, and continued there until the year 1370, when the fame of his practice occaſioned him to be called to London, where he was employed by perſons of the firſt rank and conſequence. He was ſucceſsful in the cure of fiſtula in ano, having very much improved the method of performing the operation for that complaint, which, before his time, was effected either by the actual cautery, or by ſawing through the rectum with a thread, which muſt have been a very painful operation. His treatiſe on fiſtula in ano, the only part of his large work that has been printed, was tranſlated and publiſhed by John Read in the year 1588. He invented a new inſtrument for giving glyſters, upon which he valued himſelf much, and with reaſon, as it ſeems to have been productive of much profit to him, "having gained much credit (he ſays) for his ſkill in injecting them an hundred times, and in diſtant places:" whence we learn the practice of giving them was little uſed or underſtood in this country at that time. He was very careful to make a good bargain with his patients, before he entered on the cure; "to ſtipulate for as large a ſum as he could get, and to take ſecurity for the payment;" a practice, Aikin obſerves, that prevailed in France at the beginning of the laſt century. We are told in the eloge of M. Mareſhal, publiſhed in the memoirs of the Royal Academy of Surgery, that when he was appointed firſt ſurgeon to Louis the Fourteenth, in the year 1703, he generouſly threw into the fire obligatory bonds from his patients, to the value of 20,000 livres. Friend's Hiſt. of Phyſic, vol. ii. p. 325. Aikin's Biog. Mem. of Med.

ARDERO, in *Geography*, a town of Italy in the kingdom of Naples, and province of Calabria Ultra, ſeven miles ſouth of Gierace.

ARDERS, in *Agriculture*, a term provincially applied to ſignify fallowings or repeated ploughings of land.

ARDES, in *Geography*, a narrow peninſula in the county of Down in Ireland, formerly a county of itſelf. It lies between Strangford lough and the North Channel, and is reckoned tolerably fertile. The people of the whole diſtrict, in general, are fiſhermen, ſailors, and farmers, by turns. There are ſome weavers, and the women in general ſpin; but there are no bleach-greens, for want of water. The collecting of ſea-wrack, for kelp, is alſo found a profitable employment.

ARDES. See ARDRES.

ARDESIA. See *Iriſh* SLATE.

ARDFERT, in *Geography*, though now a ſmall decayed village, was formerly the principal town of the county of Kerry in Ireland, and, till the union, retained the privilege of returning two members to parliament. It is alſo a biſhop's ſee, which includes the whole county of Kerry and a ſmall part of Cork. It is ſuppoſed to have been founded in the fifth century; and was at an early period ſo incorporated with Aghadoe as to form but one dioceſe, which was ſometimes called the biſhoprick of Kerry. In the civil wars of 1641, the cathedral was demoliſhed, and the town in a great meaſure deſtroyed. Soon after the reſtoration, in 1663, it was annexed to the ſee of Limerick, and has ever ſince continued united to it. There are ſeveral ruins in the neighbourhood of the church, which is very old; and a round tower, one of the loftieſt in the kingdom, built of a dark kind of marble, fell in 1770, tumbling at one craſh into a heap of ruins. Ardfert is near the ſea, and is 144 miles S. W. from Dublin. Dr. Smith's account of Kerry. Dr. Beaufort's Memoir.

ARDGLASS, a decayed town of the county of Down, in Ulſter, Ireland; about ſeven miles from Downpatrick, ſituated on a ſmall harbour of the ſame name. It was, in

the reign of queen Elizabeth, a place of considerable trade; and gave the title of earl to a branch of the Cromwell family. The duties of its port were let to farm so lately as the beginning of Charles the first's reign. The customs here are very considerable. There is a long range of building, called by the inhabitants, the New Works; though they have no tradition of its design or use. It extends 234 feet in length, but is only 20 broad. It has three towers in front joined to it, one at each end, and one in the center. There are also the remains of several other castles, towers, and gates; and within the N. E. point of the harbour, there is a curious natural cave, with a large entrance on the shore. Tour through Ireland.—Dublin, 1780.

ARDIA, or ARDEIA, in *Ancient Geography*, a river of Illyria, according to Stephan. Byz. and Strabo.

ARDIERE, in *Geography*, a river of France, which runs into the Saone, in the principality of Dombes.

ARDILA, a river which rises in Spain, and discharges itself into the Guadiana, near Moura, in Portugal.

ARDISIA, in *Botany*. Lin. g. Schreb. 1731. Swartz. prodr. 48. called also *Anguillaria* and *Badula*. Juss. 420. Class, *pentandria monogynia*. Gen. Char. *Cal.* perianth one-leafed, five-cleft; clefts subulate, upright, coloured, permanent. *Cor.* one-petalled; tube short, the length of the calyx; border five-parted; parts lanceolate, acute, spreading, at length reflex. *Stam.* filaments five, subulate, upright; anthers acute, upright, bifid at the base, converging at top round the style. *Pist.* germ superior, ovate, very small; style subulate, longer than the stamens, upright, at length ascending; stigma simple, acute, permanent. *Per.* berry roundish, large. *Seed* single, roundish, covered with a hard, brittle bark, like a nut.

Eff. Gen. Char. *Cal.* five-cleft. *Cor.* one-petalled, five-parted; reflex. *Stigma* simple. *Berry* roundish, one-seeded.

Species 1. A. *excelsa*, laurel-leaved ardisia; anguillaria bahamensis. Gærtn. fruct. 1. 372. "Racemes axillary, simple; leaves obovate, cartilaginous, serrate at the edge; clefts of the corolla almost twice as long as the leaflets of the calyx; stamens inserted into the corolla." This tree is a native of Madeira, where it was discovered by Masson, and introduced here in 1784. 2. A. *zeylandica;* "flowers terminating panicled, leaves ovate, subpetioled, entire; stem arboreous;" leaves thick, oval, entire, evergreen, shining, very smooth, alternate, almost sessile, attenuated at the base; flowers at the tops of the branches, in numerous racemes, wheel-shaped, with a long tube of a red colour; berry smaller than that of the preceding species. A native of Ceylon. 3. A. *tenuifolia.* Swartz. prodr. Sloane jam. 2. 98. t. 205. f. 2. "Flowers panicled; leaves elliptical, entire, nerved; stem arboreous." This tree rises to about 30 feet high, having an ash-coloured smooth bark; leaves very smooth, of a dark green, four inches long, on short foot-stalks; flowers purplish. A native of Jamaica. 4. A. *coriacea;* "flowers panicled; leaves oblong, entire, veinless, coriaceous." 5. A. *serrulata;* "flowers panicled; leaves ovate-lanceolate, acuminate, wrinkled; stem shrubby, pubescent." 6. A. *lateriflora;* "racemes lateral, or axillary compound; flowers umbelluled; leaves oblong, acuminate, entire; stem shrubby." 7. A *parasitica;* "racemes axillary, simple; leaves sessile, lanceolate-ovate, marked with lines; stem shrubby." The four last-mentioned species are natives of the West Indies, and are hitherto only known from Swartz's catalogue.

ARDISTAMA, in *Ancient Geography*, a town of Asia, in Galatia, according to Ptolemy.

ARDMORE HEAD, in *Geography*, a noted promontory on the south coast of Ireland, in the county of Waterford, a little to the east of Youghall bay. N. lat. 51° 56′, W. long. 7° 42′. Near this is the village of Ardmore, an ancient episcopal see, and thought to have been a Danish settlement. Its round tower is still in existence. The name Ardmore, signifies a great eminence. Smith's Waterford and Collectan. de Reb. Hib.

ARDOIS, a mountain in Nova Scotia, between Windsor and Halifax, 13 miles N. W. from the latter; reckoned the highest land in the province, and affording a fine prospect of all the high and low lands about Windsor and Falmouth, and the distant country bordering the bason of Minas.

ARDONA, a town of Italy, in the kingdom of Naples, and province of Capitanata, 12 miles north of Ascoli.

ARDOR *ventriculi*, a heat of the stomach, usually expressed by the term HEART-*burn*, or CARDIALGY.

ARDOTIUM, in *Ancient Geography*, a town of Illyria, far from the sea, in the territory of the Liburnians, according to Ptolemy.

ARDOYE, in *Geography*, a town of France, in the department of Lys, and chief place of a canton in the district of Bruges. The place contains 5,875, and the canton 12,165 inhabitants: the territory includes 77½ kiliometres and 4 communes.

ARDRAH, or ARDER, in *Geography*, a kingdom of Africa, on the Slave coast, bordering on Whydah. This kingdom extends for a considerable distance into the northern and interior country, abounds with populous towns and villages, and is in general fertile and well cultivated. The inhabitants are warlike. It is bounded on the west by the Rio Volta, on the east by the kingdom of Benin proper, on the south by the ocean, and on the north-north-west by the kingdoms of Oyeo and Alghemi or Ulcaim. To the south, or sea coast, Ardrah is very confined; and as it extends northward, widens into the form of a triangle. The coast, commencing four leagues east of Great Popo, and ending at Acqui, comprehends the space of twenty-five leagues, if the province of Jachen, which has a prince of its own, tributary to Ardrah, be included. Bosman and Barbot divide it into Great and Little Ardrah; comprehending under the latter the whole maritime coast, and under the former the interior country. Little Ardrah ascends up the country as far as Offra; and Great Ardrah includes the petty state of Torri. From Whydah to Little Ardrah, the coast is low and flat, but rises by a gentle ascent towards Jachen. North of Jachen, are Offra, Great Foro, and Assem, the capital of Ardrah. The other principal towns are Iajo and Ba. Iajo or Iago has two gates to the south, and is washed by the river on the north, that falls into the Rio de Formosa, or river of Benin, at Ba, where the Dutch have a small fishery. Between all the cities are great roads, and canals are cut from one river to another, which, by the canoes that traverse them, indicate wealth and industry. The vallies of Ardrah are pleasant, and produce wheat, millet, yams, potatoes, lemons, oranges, cocoa-nuts, and palm-wine. In the low and marshy grounds near the sea, they make salt by evaporation of the stagnated water; and with this they carry on a considerable trade with Alghemi and Oyeo, by the great canal of Ba, which is the finest in the kingdom. The air is, in general, unwholesome. The vulgar, who can neither read nor write, use a small cord tied in knots, to each of which they affix certain ideas, and thus they convey their sentiments to a distance. The manners, dress, and religion of the Ardrans resemble those of the inhabitants of WHYDAH; and polygamy is equally allowed in both countries. The inhabitants of the sea-coast are employed in fishing, and manufacturing salt; and those of the interior country in husbandry. But they have no ploughs nor instruments of agriculture; the whole labour being performed with the spade and mattock. Instead of a public burying-place, the inhabitants of Ardrah are interred in a family-vault constructed in their own houses.

As

As to the government of Ardrah, it is monarchical and deſpotic. The court is numerous and ſplendid; and the chief-prieſt is ſecond in dignity, and prime miniſter in temporals as well as in ſpirituals. The crown is hereditary; and its revenues ariſe from heavy capitations on the natives and foreigners, the ſale of ſlaves, duties on foreign trade, taxes upon markets and the neceſſaries of life, and the confiſcation of the eſtates of governors. Diſobedience to the king's commands incurs the puniſhment of beheading; and the conſequence is, that the wives and children of the offender become the ſlaves of the crown. Inſolvent debtors are ſold at the pleaſure of the creditors; and the violation of the marriage-bed is puniſhed with ſervitude. The goods proper for importation to Ardrah, are large white beads, glaſs or cryſtal ear-rings, gilt hangers, iron bars, ſailors' knives, copper bells, guns, copper and braſs baſons, coloured taffeties, ſtriped printed ſilks, coloured handkerchiefs, long white horſe tails, looking glaſſes, large umbrellas, brandy, china, Indian ſilks, gold and ſilver in duſt, with Engliſh and Dutch coins. Mod. Un. Hiſt. vol. xiii. p. 359—374.

ARDRE, a river of France, which joins the Loire at Nantes.

ANDRES, a town of France, in the department of the Straits of Calais, and chief place of a canton in the diſtrict of Calais. On an open plain between Ardres and Guiſnes, was the celebrated interview of Henry VIII. of England with Francis I. king of France, in 1520. The two kings and their attendants diſplayed their magnificence with an emulation and profuſe expence, which procured it the name of "the field of the cloth of gold." Feats of chivalry, parties of gallantry, and ſuch exerciſes as were reckoned in that age manly or elegant, rather than ſerious buſineſs, occupied both courts during eighteen days that they continued together. After the wreſtling between the French and Engliſh was concluded, in which the latter gained the prize, the two kings retired to a tent, and when they had drank together, the king of England ſeized the king of France by the collar, ſaying to him, "My brother, I muſt wreſtle with you;" and he endeavoured once or twice to trip up his heels; but the king of France, who was a dexterous wreſtler, twiſted him round, and threw him on the earth with prodigious violence. The king of England wiſhed to renew the combat, but was prevented. Robertſon's Ch. V. v. ii. p. 110. ——Alſo a town of France, in the department of Puy de Dome, and chief place of a canton in the diſtrict of Iſſoire, on a ſmall river which runs into the Allier, nine miles ſouth-weſt of Iſſoire. The place contains 1636, and the canton 10,582 inhabitants; the territory includes 300 kiliometres and 16 communes.

ARDROSSAN, the name of a ſmall promontory on the weſt coaſt of the county of Ayr, terminating in a ridge of rocks running out into the ſea, twelve miles W. N. W. of Ayr.

ARDSALLIS, a village in the county of Clare, Ireland, near which is the abbey of Quin, the whole building of which, including the cloiſters, dormitories, halls, &c. as well as the chapel, is ſtill in a ſtate of tolerable repair, except the roof. The buildings are in a good ſtyle of Gothic architecture, well contrived and neatly executed.

ARDSCHIR, or ARTAXERXES BABEGAN, in *Biography*, and *Ancient Hiſtory*, a Perſian king, and founder of a new dynaſty, under the appellation of Saſſanides; was deſcended, as his enemies ſay, illegitimately from an obſcure family; or, by the flattery of his adherents, from a branch of the ancient kings of Perſia, reduced to an humble ſtation. If we credit the former, his mother was the wife of a tanner, whoſe name was Babec, and his father a common ſoldier, of the name of Saſſan: from the former, Artaxerxes obtained the ſurname of Babegan; and from the latter, all his deſcendants have been ſtiled Saſſanides. However this be, he was well educated, and ſerved with great reputation in the armies of Artaban, the laſt king of the Parthians: but being driven into exile and rebellion by royal ingratitude, he fled into Perſia proper, where it is ſaid his grandfather had been governor, and took up arms, in order to aſſert his right to the throne, as lineal heir of the monarchy, and alſo to reſcue Perſia from the yoke of the Parthians, under which they had groaned above five centuries, ſince the death of Darius. The Parthians were defeated in three great battles; and in the laſt of them their king Artaban was ſlain; ſo that in conſequence of it, the ſpirit of the nation was for ever broken. Ardſchir then aſſumed the ſovereignty, with the title of "King of Kings," which had been enjoyed by his predeceſſor; and his authority was ſolemnly acknowledged in a great aſſembly held at Balch in Khoraſan. This great revolution, which eſtabliſhed the empire of the Saſſanides over Perſia, till the invaſion of the Arabs and the fatal influence of which was ſoon experienced by the Romans, happened in the fourth year of Alexander Severus, 226 years after the Chriſtian æra. Ardſchir having aſcended the throne, extended his conqueſts, and ſwayed the royal ſceptre with ſingular reputation. Whilſt he was active and enterpriſing in war, he cultivated the arts of peace, and adminiſtered the government with equal firmneſs and lenity. He reformed exiſting abuſes, built new cities, promoted agriculture, diſtributed the people into claſſes, under appropriate inſtructors and magiſtrates, and aboliſhed the frequency of capital puniſhments, agreeably to the maxim which he adopted, "that the ſword ought not to be employed when the cane would anſwer the purpoſe." He likewiſe reſtored the Magian religion in its purity, and ſuppreſſed idolatry and ſchiſm. The articles of the national faith were eſtabliſhed by a committee of ſeven Magi, ſelected from an aſſembly of 80,000, convened from all parts of his dominions. Ardſchir, not content with his victories over the Scythians and Indians, engaged in a more perilous conteſt with the Romans, under Alexander Severus; but in his endeavour to regain thoſe provinces of Aſia, which had formerly belonged to the Perſian empire, he loſt the flower of his army, and was obliged to withdraw into his own territories. His domeſtic ſecurity was interrupted by the daughter of his predeceſſor Artaban, whom he married. Retaining her family hatred againſt him, ſhe made an attempt to poiſon him; but her deſign being diſcovered, ſhe was condemned to ſuffer death, but reſpited on the plea of pregnancy, till ſhe was delivered of a ſon, afterwards called Sapor, who ſucceeded his father in the kingdom. One circumſtance ought to be mentioned, which much redounds to his honour, and this was his practice of keeping a record or journal, in which all his actions were impartially noted down; and this journal was read to him daily. He likewiſe drew up a ſet of maxims, intitled "Rules for living well," adapted to all conditions of ſociety, which were publiſhed by one of his ſucceſſors. They are evidently the dictates of wiſdom and benevolence. "When the king renders juſtice (ſays Ardſchir), the people pay him with love and obedience." "The worſt of princes is he who excites fear in the good, and hope in the bad." "The royal authority muſt be ſupported by military force; this force muſt be maintained by money; money can only ſpring from the culture of the land; and this cannot flouriſh without juſtice and good order." Ardſchir, according to the moſt probable account, cloſed his life about the year 240; after a reign of 14 years. D'Herbelot. Bib. Or. p. 115. Gibbon's Hiſt. vol. i. p. 317. n.

ARDUBA, in *Ancient Geography*, a city of Dalmatia, which was taken by Tiberius.

ARDUINA, in *Botany*, a plant ſo named in honour of Pietro Arduini, curator of the œconomical garden at Padua. Lin. g. Schreb. 304. Lycium. Mill. fig. t. 300. Claſs, *Pentandria monogynia*. Nat. Ord. *Contortæ. Apocineæ* Juſſ. Gen. Char. *Cal.* perianth five-parted, erect, acute, ſmall, permanent. *Cor.* one-petalled, funnel-ſhaped; tube cylindrical, a little curved inwards at the top; border five-parted, acute, ſpreading. *Stam.* filaments five ſimple, ſhorter than the tube, and inſerted into the lower part of it; anthers oblong, within the throat of the corolla. *Piſt.* germ. ſuperior, ovate; ſtyle filiform, the length of the tube; ſtigma bifid, thickiſh. *Per.* berry globular-oval, two-celled. *Seeds*, ſolitary, oblong, hard.

Eſſ. Gen. Char. *Cor.* one-petalled; ſtigma bifid; berry two celled. *Seeds*. ſolitary.

Species 1. A. *biſpinoſa*, two-ſpined arduina; *Lycium cordatum*. Mill. t. 300. A ſhrubby plant, about four or five feet high. It is armed with ſtrong ſpines, which appear in pairs or double pairs upon the ſame foot-ſtalks, immediately below the leaves. The leaves are heart-ſhaped, about an inch long; they continue green all the year, and are placed oppoſitely in pairs. The flowers are ſmall, white, fragrant, in cluſters at the ends of the branches, and appear in July and Auguſt. It is a native of the Cape of Good Hope, and was cultivated by Miller, in 1760.

Propagation and Culture. It may be increaſed by cuttings planted in July, and ſhaded from the ſun; when they have taken root, they ſhould be removed into ſmall pots, and placed in the ſhade, till they have taken root again; they may then be removed to a ſheltered ſituation till autumn, when they muſt be put into a green-houſe, or under a hot-bed frame; this plant being too tender to live in the open air. See Miller's Dict. by Martyn.

ARDUINNA, in *Entomology*, a ſpecies of Papilio deſcribed by Fabricius. The wings are indented fulvous, with black ſpots; the poſterior ones, beneath, white, with two fulvous bands, and ſpeckled behind with black. This is *papilio arduinna* of Eſper, and inhabits Ruſſia. *Obſ.* In the Fabrician arrangement, it belongs to the ſection *Satyri*.

ARE, in *French Meaſure*, is a ſuperficial unit, or a ſquare, the ſide of which is 100 metres in length, or 10,000 ſquare metres; and the rectilineal metre being 3 feet 11.44 lines, the are will be 94831 ſquare feet. The tenth of an are, called deciare, is a ſuperficies 100 metres long, and 10 broad, or 1000 ſquare metres=9483.1 ſquare feet; and the centiare, equal to 100 ſquare metres, is 948.31 ſquare feet. See Measure.

ARE, or A-la-mi-re, in *Muſic*, denotes a ſound in the ſcale of Guido, which is expreſſed by the abbreviation A in the muſical ſcale or gammut, and implies the ſound in the firſt ſpace, and on the fifth line, in the baſe; the third ſound below each tenor cliff; and that in the ſecond ſpace, and on the ſixth line, in the treble. This is the ſound to which all inſtruments are tuned at an opera concert, or other muſical performance. But A in the Italian muſical language, when it precedes a ſubſtantive, has the power of *in*, as A *battuta*, A *capella*. See the articles.

AREA, in general, denotes any plain ſurface, whereon we walk, &c.

The word is Latin, importing more properly a threſhing floor; and is derived from *arere, to be dry*.

The area, or threſhing floor, among the Romans, was ſometimes paved with flint ſtones, but uſually laid with clay, conſolidated with great care, and ſmoothed with a large and heavy roller. Virg. Georg. i. 278.

Area, in *Architecture*, denotes the ſpace or ſcite of ground, on which an edifice ſtands. It is alſo uſed for inner courts, and thoſe portions of ground.

Area, in *Geometry*, denotes the ſuperficial content of any figure.

Thus, if a figure, e. gr. a field, be in form of a ſquare, and its ſide be 40 feet long, its area is ſaid to be 1600 ſquare feet: or it contains 1600 little ſquares, each a foot every way. Hence to find the area of a triangle, ſquare, parallelogram, rectangle, trapezium, rhombus, polygon, circle, or other figure, is to find the magnitude or capacity thereof in ſquare meaſure.—To do which, ſee the article Triangle, &c. To find the area of fields and other incloſures, they firſt ſurvey or take the angles thereof, then plot them on paper, and thus caſt up their contents in acres, roods, &c. after the uſual manner of other plain figures. The areas of all ſimilar figures are in the duplicate ratio; or as the ſquares of their like ſides, or of any like linear dimenſions.

The law by which the planets move round the ſun is this; that a line, or radius, drawn from the centre of the ſun to the centre of the planet, always ſweeps or deſcribes elliptic areas proportional to the times. Thus the ſun being ſuppoſed in S, and a planet in A, (*Plate* I. *Aſtronomy, fig.* 12.) and letting it proceed in any given time to B; in ſuch progreſs, its radius AS will have deſcribed the area ASB. Suppoſe again the planet to be arrived to P, then the elliptic ſpace PSD being made equal to the other ASB, the planet will move through the arc PD in the ſame time as through the arc AB. This law of the planetary motions, diſcovered by Kepler, lies at the foundation of aſtronomy. Sir I. Newton demonſtrates, that whatever bodies do obſerve ſuch law in their motions about any other body, do gravitate towards ſuch body.

Area is alſo uſed, in *Medicine*, for a diſeaſe which makes the hair fall. The area is a general kind of depilation; and is diſtinguiſhed into two ſpecies, *Alopecia* and *Ophiaſis*.

Area, in *Optics*. See Field.

AREALU, in *Botany*. See Ficus Religiosa.

AREAS, D', an iſland, in *Geography*, lies on the weſt coaſt of the gulf of Mexico, in N. lat. 20° 45', and W. long. 92° 40'.

AREATA, in *Entomology*, a ſpecies of Phalæna, in the *Geometra* family, that inhabits Surinam. The wings are ſnowy white, with a marginal brown ſpot on the anterior pair, and four approximate ſtreaks of the ſame colour on the poſterior ones. Fabricius. Gmelin. Obſ. This is Phalæna *area* of Cramer.

AREATUS, a ſpecies of Scarabæus (*Cetonia* ſection of Gmelin) found in Virginia. It is black and downy, with the diſk of the wing-caſes rufous. Fabricius.

AREB, a kind of imaginary money, uſed in the dominions of the great mogul.

Four arebs are equal to one crou, or 100 lacs; one lac to 100,000 rupees.

AREBICO, in *Geography*, a town of the iſland of Porto Rico, ten leagues from the town of St. John.

AREBO, or Arbon, a town of Africa, and capital of Benin, ſituate about ſixty miles from the mouth of the river Formoſa, to which ſhips of burthen may ſail by means of the branches of that river, and collateral creeks. Arebo is repreſented as a large and populous city, and the centre of the commerce of Benin. The Engliſh and Dutch had formerly a ſettlement, with agents and factors in this place; but the Engliſh have neglected theirs, and carried on little or no trade to Arebo for ſeveral years paſt. The city and adjacent country are under the government of a viceroy and council. N. lat. 6° 0'. E. long. 5° 5'.

ARECA, in *Botany*, a genus of palms. Schreb. 1696. Gærtn. 7. Juſſ. 3. Claſs, *palmæ, monoecia enneandria*. Gen. Char. male flowers. *Cal.* ſpathe bivalve; ſpadix branched; proper

proper perianth three-leaved. *Cor.* petals three, acuminate, rigid. *Stam.* filaments nine, the three outer longer than the others. Female flowers, in the ſame ſpadix; proper perianth and petals the ſame as in the male. *Per.* berry ſubovate, fibroſe, ſurrounded at the baſe with the imbricate calyx. *Seed*, ovate.

Eſſ. Gen. Char. *Cor.* three-petalled; male nine-ſtamened; female a drupe with an imbricate calyx.

Species 1. A. *catechu*, "fronds pinnate; leaflets folded back, oppoſite, end bitten." A. *faufel.* Gærtn. fr. 1. 19. *Pinanga*, Rumph. Amb. 1. 26. t. 4. *Cauuga*, Rheed. Mal. i. p. 9. t. 5—8. This palm grows to the height of forty or fifty feet; trunk ſtraight, round, about ſix or eight inches in diameter, and covered with a ſmooth aſh-coloured bark marked with parallel rings. The fronds ſpring forth in pairs, decuſſated, encircling at their baſe the top of the trunk, and forming an oblong head larger than the trunk itſelf; they are about ſix or ſeven, unarmed, reclining, ſix feet long, on a ſtipe four feet in length. From the axils of the fallen fronds iſſue the ſheaths which incloſe the flowers and fruits. Theſe ſheaths are ſimple, ſharpiſh, white, coriaceous, thin, ſtreaked, deciduous, nearly two feet in length, ſix inches broad, and defended by a wide involucre, formed of the dilated baſe of the frond involving the ſpadix and ſpathe; ſpadix axillary, branched, reclining; ſpikes linear, containing male and female flowers confuſedly mixed; flowers white, very ſmall, triangular, ſmelling ſweet but faintly morning and evening; the calyx of the male is three-leaved, but that of the female ſix-leaved, imbricate and unequal. The fruit, according to Gærtner, is a berried drupe, or berry, having a thin cuticle and a thick filamentous pulp; ſhell very thin, brittle, white, with arched red veins; ſeed of a rounded conical form. A native of the Eaſt Indies. The Indian drug formerly called terra japonica, and now catechu, was very generally conſidered to be an extract prepared from the ſeeds of this palm; and hence Linnæus in his Mat. Med. has referred the catechu to the areca here deſcribed; but it is well known at preſent that this drug is manufactured from a ſpecies of mimoſa. The trivial name of catechu, as tending to miſlead, ſhould therefore be aboliſhed here, and confined to the mimoſa. The fruit of the areca (betel-nut) is in general uſe by the Indians, who cut it into ſlices, and preſent it with a portion of terra japonica and ſhell-lime to their gueſts in all viſits, wrapped in the leaf of a ſmall tree called paun. It is chewed like tobacco, and tinges the ſaliva of a red colour, hence the following lines in Miſc. Nat. Cur.

"Quis foliis credat commixta calce tenellis,
Cum fructu hoc Indos veſci, unde ore cruento
Purpureum ejiciunt ſuccum, tam dentibus atris
Horrendum arringunt, et dentibus ore minantur?"

2. A. *oryzæformis*, "fronds pinnate; leaflets ſmooth, three-nerved." Gærtn. fr. 1. 20. A. *ſylveſtris*. Lour. Cochinch. 568. *Pinanga oryzæformis*, Rumph. Amb. 1. 40. t. 5. f. c. This is a ſlender palm, growing to the height of ten feet; fronds more than three feet in length, without prickles; ſtipes triangular, dilated at the baſe, coriaceous, embracing the ſtem and fructification; leaflets two feet long, oppoſite, triplicate, diſtant, either pointed, or end bitten; ſpathe membranaceous, white, ſtiff; ſpadix ſpiked; ſpikes linear, with the flowers regularly diſpoſed, one female between two males; calyx of the male three-leaved, with ſubulate unequal leaflets; corolla three-petalled, almoſt cloſed; anthers twenty-four, linear, without filaments; calyx of the female permanent; its leaflets broad, obtuſe; germ oblong-ovate; ſtyle none; ſtigma three-cleft; berry ovate, red, ſcarcely larger than a grain of wheat; pulp or rind thin, fibroſe, ſmooth, adhering to the ſeed, ſo that the cell is not inveſted with its proper coat, as in the preceding ſpecies; ſeed ovate, conical, hollowed, at the baſe within which is a very minute teat; it is ſolid, horny, and half an inch in length. A native of Cochinchina, Amboina, &c. Its fruit, though much ſmaller than that of the preceding, is alſo uſed in pauns. Although this palm has the habit and fruit of the areca, yet the ſtamens and poſition of its flowers ſhew it to be very nearly allied to the caryota. 3. A. *oleracea*, cabbage-tree; "leaflets quite entire." Jacq. Amer. 278. t. 170. pict. 135. *Palma altiſſima*. Mill. Sloane, Browne. The cabbage-tree is the higheſt of the American palms. Some authors ſay that it frequently riſes to above 200 feet in height, with a trunk no bigger that a man's thigh, and covered with a coat which is impenetrable to a muſket ball. Modern writers, however, deſcribe it from thirty to one hundred feet. It is very different from the Eaſt Indian areca. The ſheaths of the leaves are very cloſe, and form the green top of the trunk, a foot and a half in length. Below this come out green ſhining ſpathes, which fall off when the branching ſpadix burſts forth. The calyx is one-leafed, cut to the middle into three ſegments. The fruits are oblong, obtuſe, berries of a blue purple colour, and about the ſize of an olive, containing a ſtone or nut which is oblong, membranaceous, ſmooth, brittle, incloſing a very hard cartilaginous kernel. Within the leaves, at the top of the palm, is found a white heart of eight or nine inches in circumference, which is called cabbage, and which is eſteemed a great luxury by the inhabitants, who eat it either raw as ſallad, or fried with butter, as well as boiled, and compare its taſte to that of artichoke. The ſeeds of this beautiful tree were firſt carried to Jamaica by admiral Knowles, when governor of the iſland, and it has ſince been cultivated with great care. It is there planted for its beauty, and ſeldom or never cut down for the cabbage or for any other purpoſe. The Weſt Indian cabbage-tree was introduced into the king's garden at Kew by Hinton Eaſt, eſquire, in 1787. There is alſo a ſpecies of palm, called by Solander *Areca Sapida*, which grows ſpontaneouſly in New Zealand, and abounds in Norfolk iſland: but the fructification of it is not known. Martyn's Miller's Dict.

Areca, in *Ancient Geography*, a town of Syria, in the Commagine, not far from Antioch, at the foot of mount Taurus.

Areca, or *Karek*, in *Geography*, an iſland of Aſia, on the eaſt coaſt of the gulf of Perſia, between Abuſchiehr and Bender Rigk, one league ſouth-weſt of Ormus, about three leagues in circumference. It contains only a ſingle village; but the aqueducts cut in the rocks, which ſtill remain, ſhew it to have been more populous in proportion to its extent. The Dutch attempted to eſtabliſh a factory and build a fort here, but they were expelled by the Arabs under the conduct of Mir Mahanna, in the year 1765.

ARED, Arad, or *Arud*, one of the two principal diſtricts of the province of Neged or Nedsjed in Arabia; the other being called Kerje or Kerdsje. This diſtrict borders on Hejar or Lahſa to the eaſt, and contains a diſtrict called Haniſa, anciently celebrated and ſtill known under the ſame name. Its dependencies are Aijæne or Aijana, a town which produced Abud al Wakheb the new prophet, and Munſoha. Niebuhr mentions other towns of Ared, among which is Jebrin on the confines of Lahſa. See Arad.

AREIRA, in *Botany*. See Schinus.

AREKEA, ſee Arkeeko.

ARELATE, Arelatus, now *Arles*, in *Ancient Geography*, a city of Gaul, ſituate to the left of the Rhone, at the place where it divides itſelf into three branches, near its

its mouth, and belonging to the Salyii. At this city Cæfar, when he determined to lay fiege to Marfeilles, fitted a fquadron of twelve long veffels; and Strabo fpeaks of this place as a commercial emporium. Pomponius Mela fpeaks of it as one of the richeft cities in Gallia Narbonenfis; and Pliny, Suetonius, and Strabo reprefent it as a colony. The colonies conducted thither under the father of Tiberius were detachments of the fixth legion, whence it was called "Colonia Sextanorum." When the Roman province was divided into Narbonenfis and Viennenfis, Arelati belonged to the latter: and in the time of Conftantine, it was extended, by means of a bridge, from the left to the right fide of the Rhone; and this emperor celebrated on it the Circenfian and Olympic games, in 3[illegible]4. The emperors Valentinian and Honorius honoured it with many fignal privileges, whence the poet Aufonius called it "the Rome of the Gauls." It became at length the feat of a prætorian prefect, and was in reality the chief city of the Gauls. Whilft its civil ftate was improved by its population and commerce, and the diftinguifhed patronage of the Roman emperors, its ecclefiaftical power was alfo augmented by the activity of its bifhops. By the council of Turin, in 397, it was erected into a metropolis; the fine arts likewife flourifhed in this city; and the fertility of its territory gave it the appellation of "Thelina," from the Greek word θηλη, the breaft. The amphitheatre of this city, though it was never completed, is ftill one of the fineft monuments of antiquity belonging to the Gauls. By an infcription it appears, that the fhows of the gladiators were exhibited in this place. See Arles.

ARELI, in *Botany*. See Nerium.

AREM, or Al-Arem, a vaft mound or dam, which formed a ftupendous refervoir above the city Saba, whofe rupture caufed an inundation, famous in eaftern writers. Sale's Prel. Difc.

The word *arem* is Arabic, and literally fignifies any mound, or dam, for the containing of water.

AREMBERG, in *Geography*, a town of Germany, in the circle of the lower Rhine, and capital of a duchy to which it gives name, fituate on the Ahr in the Eiffel, fixteen miles S.S.W. of Bonn, and twenty-fix fouth of Cologn. N. lat. 50° 32′. E. long. 6° 34′.

AREMBUS, in *Ancient Geography*, a town of India, on this fide of the Ganges, according to Ptolemy.

ARENA, among the Romans, fometimes fignified the fame with an amphitheatre; viz. a place where the gladiators had their combat. The word is Latin, and fignifies *fand*; becaufe the place was always ftrewed with fand or faw-duft, to prevent the gladiators from fliding, and to conceal from the view of the people the blood fpilt in the combat. Properly fpeaking, arena was only the pit or fpace in the middle of thofe places where the athletæ and gladiators performed. The arena was the fame thing with regard to the gladiators, that the campus, or field, was to foldiers and armies; viz. the place where they fought.—He who fought in the arena was called arenarius. Nero is faid to have ftrewed the arena with gold-duft.

Arena, in *Architecture*, is the middle or body of a temple, and comprehends the whole fpace between the antæ and the extreme wall of the building.

Arena Giuseppe, in *Biography*. See Giuseppe.

Arena, in *Geography*, a river of Sicily, which runs into the fea near the town of Mazara.—Alfo a town of Italy, in the kingdom of Naples, and province of Calabria ultra, fixteen miles eaft of Nicotera.

Arena, is alfo a port in the ifland of Puna, in Guiaquil bay on the weftern coaft of South America, eight leagues E.N.E. from Santa Clara, where all fhips bound into the bay take pilots.

ARENACEA, in *Entomology*, a fpecies of Phalæna, in the *Bombyx* family. The wings are yellowifh: the firft pair fprinkled with black fpecks above. Inhabits the Cape of Good Hope. Gmelin.

ARENACUM, or Arenatium, in *Ancient Geography*, *Aert* or *Arth*, the name of a Batavian fort conftructed on the Rhine, not far from the place where this river feparates to form the Vahal. Tacitus informs us, that Aquileius affembled an army in this place to attack the Batavi.

ARENÆ, or Ar[illegible], a people of Afia Minor in Lydia, in the vicinity of Thyatira.—Arenæ was alfo a place of Spain in Bætica, on the coaft of the Turdetani, extending from the mouth of a fmall river, where was feated Onoba, to the moft eaftern part of Bœtis.

[illegible] (from *arena, fand*), in *Botany*, fandwort. [illegible] 579. Schreb. 774. Gærtn. t. 130. Juff. 301. [illegible] *trigynia*. Nat. Ord. *Caryophyllei*. Gen. Char. [illegible] five-leaved; leaflets oblong, acuminate, fpreading, permanent. *Cor.* petals five, ovate, entire. *Stam.* filaments ten, fubulate, five, alternately interior; anthers roundifh. *Pyf.* germ ovate; ftyles from erect reflex; ftigmas thickifh. *Per.* capfule ovate, covered, one-celled, three or fix-valved. *Seeds* very many, kidney-fhaped. *Obf.* The number of ftamens is not conftant.

Eff. Gen. Char. *Cal.* five-leaved, fpreading; petals five, entire. *Capf.* fuperior, one celled, many-feeded.

Species 1. A. *peploides*, fea fandwort, or chick-weed. Hudf. With. Eng. Bot. t. 189. Flor. Dan. t. 624. "Leaves ovate, acute, flefhy;" calyx obtufe, nervelefs, Smith; root creeping, long, perennial; ftems proftrate, branched, angular, fmooth; leaves oppofite, feffile, ovate, acute, recurved, fmooth, entire; flowers white, appearing in June and July; capfule roundifh, three-valved; feeds large, black, obovate. Common on the fea-coaft. 2. A. *tetraquetra*, fquare fandwort; "leaves ovate, keeled, recurved, imbricate four ways;" ftems almoft upright, and very numerous, fhorter than the flowering ftems; flowers marked with lines, in a head, upon terminating bifid peduncles. A native of the Pyrenean mountains, flowering in July. Introduced into Kew garden in 1776, by Dr. Ortega. *β. gypfophila aggregata*, Lin. fp. 581. Amæn. Acad. 3. 23. Allion. pedem. n. 1718. t. 89. f. 1. Schreb. Act. Nov. Acad. N. C. 4. 140. A variety with "pointed recurved leaves, and aggregate flowers." 3. A. *biflora*, two-flowered fandwort: leaves obovate, obtufe; ftems procumbent, peduncles two-flowered, lateral; its leaves refemble thofe of wild thyme, roundifh, even; two linear bractes at the divifion of the peduncle, and alfo on the other pedicel. A native of the high Alps of Savoy and Switzerland near the melting fnow. 4. A. *lateriflora*, fide-flowering fandwort; "leaves ovate, obtufe; peduncles lateral, two-flowered. Its ftem is fhort, fmall, fimple; leaves fmooth, on fhort footftalks; peduncles fingle, long, bifid, axillary; corolla longer than the calyx. Difcovered by Gmelin in Siberia. 5. A. *trinervia*, plantain-leaved fandwort. Hudf. With. Curt. Lond. fafc. 4. t. 31. Flor. Dan. 429. "Leaves ovate, acute, petiolate, nerved," with the keel of the calyx rough, and obfcurely trinerved, Smith; root fibrous, annual, ftems about a fpan high, flender, erect, branched, round, hairy, and befet with leaves; leaves three or five-nerved, ciliated; peduncles one-flowered, long; flowers fmall, white; leaflets of the calyx lanceolate, acute, keeled, trinerved, rough on the back, and at the edges membranaceous and ciliated; petals obovate, fcarcely the length of the calyx; capfule ovate, with an hexifid mouth; feeds fmall, fmooth, black. This, like

like the firſt, is a Britiſh ſpecies; it grows in woods and wet ſhaded ſituations, flowering in May and June. 6. A. *ciliata*, ciliate ſandwort. Flor. Dan. 346. Jacq. Vind. 75. "Leaves ovate, nerved, ciliate, acute;" leaves ſeſſile, pointed, ciliate at the baſe; corolla twice the ſize of the calyx; leaflets of the calyx oval, pointed, nerved; the ſtamens are placed on a circle of nectariferous glands. See Villars' Dauph. 620. According to Linnæus, it is a native of mount Abraham in the Rhætian Alps (Griſons); and Villars ſtates it to grow on the high mountains of Dauphiné. In the Kew catalogue, however, we are told that it is a native of Iceland, whence it was introduced by Sir Joſeph Banks in 1773. 7. A. *balearica*, majorca ſandwort. L'Heritier, Stirp. Nov. 29. t. 15. "Leaves ovate, ſhining, rather fleſhy; ſtem creeping; peduncles one-flowered." A perennial growing in tufts, creeping and taking root at the joints; leaves oppoſite, petioled, acuminate, entire, nerveleſs, beſet with ſhort hairs; peduncles terminating, ſolitary, long, erect, one-flowered; flowers large, white, with two oppoſite, ſeſſile, lanceolate bractes. A native of Majorca and Minorca. 8. A. *multicaulis*, many-ſtalked ſandwort; *alſine*, Hall. helv. n. 6. t. 17. "Leaves ovate, nerveleſs, ſeſſile, acute; corollas larger than the calyx;" leaves more or leſs ciliate; flowers very large. Some botaniſts conſider this as a variety of the *ciliata*, and Villars thinks it a variety of the *ſerpyllifolia*. 9. A. *ſerpyllifolia*, thyme-leaved ſandwort. Hudſ. With. Curt. Lond. faſc. 4. t. 32. Flor. Dan. 977. "Leaves ovate, ſubſeſſile, rough; calyx hirſute and common, only five-nerved;" root fibrous, ſmall, annual; ſtems many, about ſix inches high, ſpreading, rigid, branched, round, pubeſcent, dichotomous at the top; leaves ſmall, ovate, pointed, entire, obſcurely nerved; peduncles erect; flowers ſmall, white; petals ſhorter than the calyx; leaflets of the calyx, ovate, acute, hirſute, thoſe that are exterior five-nerved, interior three-nerved; capſule ovate, ſix-parted at the mouth; ſeeds of a yelloviſh brown, ſubrugoſe. A common Britiſh plant; growing on walls, and dry barren or ſandy ſituations. It flowers in June or July. 10. A. *triflora*, three-flowered ſandwort; "leaves lance-ſubulate, ciliate;" branches moſtly three-flowered; petals marked with lines, obtuſe; its ſtems are numerous, about four inches high, diffuſed, round, pubeſcent; leaves like thoſe of juniper; peduncles terminating, three-flowered; bractes two, ovate, ciliate; petals obovate, twice the length of the calyx, white, marked with lines; piſtil ſhorter than the ſtamens. A native of the ſouth of Europe, on rocks, perennial. 11. A. *montana*, mountain ſandwort; "leaves linear, lanceolate, rugged; ſtems barren, very long, procumbent." Its leaves form a tuft about the root, briſtle-ſhaped, ſpreading, of a ſhining green; thoſe on the ſtem are ſhorter than the internodes, ſtem-claſping; flower-ſtems half a foot high, hairy, bearing two or three flowers at the top on long peduncles; calyx three-ſtreaked, with the leaflets ſeparate; petals twice as long as the calyx, white, marked with lines, ovate, and ſlightly emarginate; fruit long, ſubcylindric. Linnæus remarks that the flowers are very large, and the fruit pendulous. A native of the ſouth of France, Spain, and the Col de Tende. 12. A. *rubra*, purple ſandwort. Hudſ. With. *ſpergula purpurea*. Raij. Syn. 351. "Leaves linear, pointed; ſtipules membranaceous, ſheathing;" ſeeds compreſſed, angular, roughiſh, Smith. Its root is ſmall, fuſiform, branched, annual; ſtems proſtrate, divaricate, branched, round, ſmooth; leaves linear, very narrow, acute, with a ſharp point, glaucous or whitiſh, nearly the length of the internodes; ſtipules from under the leaves, oppoſite, ſtem-claſping, rigid, white, acute, jagged; panicles terminal, dichotomous; flowers of a bluiſh fleſh-colour; the diviſions of the calyx lanceolate, hirſute, with dry edges; petals ſhorter than the calyx; capſule ovate, three-valved; ſeeds many, brown, angular, rough, with little tubercles. A Britiſh plant growing in ſandy fields, and flowering in July and Auguſt. 13 A. *marina*, ſea ſandwort. Flor. Dan. t. 740. A. *media*. With. A. *rubra*, β. ſp. pl. 606. Light. Hudſ. 193. (*media*) β. A. *media*. ſp. pl. excluſis ſynonymis. Alſine ſpergulæ facie media. Ray. Syn. 351. "Leaves ſemicylindrical, fleſhy, ſmooth; ſtipules ſcarioſe, ſheathing; ſeeds compreſſed, marginated, ſmooth." Smith. Its root is ſpindle-ſhaped, annual; ſtems proſtrate, very ſmooth; ſtipules ſimilar to thoſe of the rubra; flowers larger, of a pale fleſh or purpureſcent colour; capſule three-valved, longer than the calyx; ſeeds in β having a dilated membranous white ſtriated margin. This ſpecies and the rubra are found ſometimes to approach as cloſely to the ſpergula as to the arenaria. A Britiſh plant, grows in paſtures and ſandy grounds waſhed by the ſea, flowering in June and July. 14. A. *bavarica*, Bavarian ſandwort. "Leaves ſemicylindric, fleſhy, obtuſe; petals lanceolate; peduncles terminal; moſtly binate." Its ſtems are proſtrate, with many ſlender divided branches, and a pair of leaves at each joint; theſe leaves are oblong, narrow, and of a pale green; petals white, acuminate, ſometimes fringed and purpliſh; ſeeds minute, compreſſed, black, ſhining; perennial. A native of Bavaria, Monte Baldo, and Little St. Bernard. 15. A. *gypſophiloides*, "leaves linear, ſhort, at the root briſtly; panicle ſubpubeſcent; petals lanceolate;" root perennial; ſtem erect, jointed, a ſpan high; ſtem leaves largeſt, and longer than the internodes; panicle terminating, brachiate, dichotomous; petals three times as long as the calyx. A native of the Levant. 16. A. *ſaxatilis*, rock ſandwort; *alſine*, Gmel. ſib. iv. p. 157. t. 63. f. 2. "Leaves ſubulate; ſtems panicled; leaflets of the calyx ovate, obtuſe;" root perennial; ſtems exceedingly numerous, forming a very thick tuft half a foot high, and very full of flowers. A native of France, Germany, Swifferland, &c. 17. A. *verna*, vernal ſandwort. Hudſ. With. Lightf. Eng. bot. 512. "Leaves ſubulate, rather obtuſe; ſtem panicled; petals obovate, longer than the calyx, three-nerved; nerves diſtant, equal, Smith." Root perennial, long, much branched; ſtems numerous, five or ſix inches high, round, ſomewhat pubeſcent and viſcid, branched at the baſe, and panicled above; leaves erecto-patent, ſubulate, rather obtuſe, three-nerved beneath, and above channelled, connate, and ſpreading at the baſe; bractes ovate, three-nerved, ſhort; peduncles, erect, pubeſcent; leaflets of the calyx acute, hairy, three-nerved; margins membranous; petals longer than the calyx, obovate, obtuſe; anthers fleſhy; capſule longer than the calyx; cylindrical, three-valved; ſeeds almoſt kidney-ſhaped, rough, compreſſed. It grows on mountains in England, Scotland, and Wales, flowering from May till Auguſt. 18. A. *hiſpida*, hiſpid ſandwort; "leaves ſubulate, hiſpid underneath:" this bears much affinity to ſpurry: ſtems ſimple, with ſcattered hairs; leaves oppoſite, flat, with a few hairs underneath; panicle firſt dichotomous, then branching, with alternate peduncles. A native of Montpellier. 19. A. *juniperina*, juniper ſandwort, Smith. Icon. ined. 2 t. 35. "Leaves ſubulate, thorny; ſtems erect, calyx ſtriated; capſules oblong;" root perennial; ſtems numerous, half a foot high, ſlightly pubeſcent; leaves ſpreading, connate at the baſe, three-nerved, almoſt triangular, mucronate; root leaves very ſhort, blunt, without prickly points; flowers in terminal panicles, on ſmooth, filiform, one-flowered peduncles; bractes acute, three-nerved, with a ſcarioſe waving edge; leaflets of the calyx lanceolate, mucronate, three-nerved; petals obovate, lanceolate, obtuſe, white, ſcarcely twice as long as the calyx, ſtreaked; capſule

capſule three-valved, obtuſe, ſhining; ſeeds ſmall, compreſſed, roundiſh, black; native place unknown. 20. A. *tenuifolia*, fine-leaved ſwardwort. Huds. With. Eng. Bot. 219. Fior. Dan. 389. *Alſine tenuifolia*, Ray Syn. 350. "Leaves ſubulate, acute; ſtem panicled; capſules erect, three-valved; petals lanceolate, ſhorter than the calyx;" its root is ſmall, annual; ſtems erect, commonly ſmooth, panicled, dichotomous; leaves three-nerved, connate, and dilated at the baſe; peduncles capillary, erect; flowers ſmall, white; leaflets of the calyx lanceolate, acuminate, three-nerved, membranaceous at the edges; petals very ſmall, lanceolate, obtuſe, half the length of the calyx; ſtamina very ſhort; capſule cylindrical, three valved; ſeeds ſmall, nearly of the ſhape of thoſe of the A. *rubra*. It flowers in June, and grows in barren ſandy fields, eſpecially in Cambridgeſhire, Norfolk, Worceſterſhire, and Oxfordſhire. 21. A. *laricifolia*, larch-leaved ſandwort; "leaves briſtly; ſtem nakediſh above; calyx rather ſhaggy;" root perennial; ſtems many, half a foot high, harſh, and rough; peduncles roughiſh, one-flowered; calyx marked with lines, pubeſcent; petals ovate, large, marked with lines, twice the length of the calyx; fruit long, cylindric. A native of France, Swiſſerland, &c. but not of Britain; the A. *laricifolia* of Withering being, according to Dr. Smith, a variety of the A. *verna*. 23. A. *ſtriata*, ſtraited ſandwort. Allion pedem. n. 1712, t. 26. f. 4. Villars' Dauph. t. 47. "Leaves linear, erect, preſſed to the ſtem; calyx oblong, ſtriated." Allioni and Villars differ much in their repreſentations of this ſpecies, and we have not the means of deciding which is right. It is a native of Swiſſerland. 23. A. *faſciculata*, cluſter-flowering ſandwort. Jacq. Auſt. 2. t. 182. *Stellaria rubra*, Scop. Carn. n. 538. t. 17. "Leaves ſubulate;" ſtem erect, ſtiff; flowers in cluſters; petals very ſhort; root annual; ſtem four inches high, pubeſcent; leaves linear, acuminate, erect, ſubcylindrical; flowers in bunches, dichotomous, on very ſhort pedicles; leaflets of the calyx long, ſubulate, ſtriated; petals very ſmall, ovate, white; capſule half the length of the calyx. A native of the ſouth of France, &c. introduced here by Mr. Zier in 1787. 24. A. *grandiflora*, great-flowered ſandwort. Allion. pedem. n. 1711. t. 10. f. 1. "Leaves ſubulate, flat, ſtiff; radical leaves crowded; ſtems one-flowered." A native of the ſouth of France, Swiſſerland, &c. Gouan remarks, that Linnæus and Allioni have made their deſcriptions from dwarf plants. His deſcription of the plant conſequently differs much from theirs. See Gouan illuſt. p. 30. 25. A. *auſtriaca*, auſtrian ſandwort. Jacq. Auſt. 3. t. 70. Allion. ped. n. 1708. t. 64. f. 2. "Stems under ſhrubby, proſtrate, thin, herbaceous, and erect; leaves ſubulate; flowers twin; petals emarginate;" perennial. Stems dichotomous or trichotomous; leaves linear, ſubvilloſe, pointed, connate at the baſe; ſtems, peduncles, and calyx villoſe; capſule five-valved, ſhorter than the calyx; ſeeds browniſh. A native of the mountains of Auſtria, Swiſſerland, and Piedmont. 26. A. *liniflora*, flax-flowered ſandwort. Jacq. Auſt. 5. t. 445. "Stems erect, branched below, under ſhrubby; leaves ſubulate; flowers twin;" perennial. Stems ſhort, diſtorted, perennial; branches annual, ſimple, erect; peduncles ſubpubeſcent, terminal, generally two; leaflets of the calyx lanceolate, two ſtreaked; petals obovate, white. A native of the ſouthern countries of Europe. 27. A. *recurva* Allion. ped. n. 1713. t. 89. f. 3. Ger. prov. 405 n. 7. t. 15. f. 1. "Radical leaves heaped, recurved, ſubulate; ſtem ſimple, bearing about three flowers;" perennial. Stems three inches high, ſimple; leaves towards the root aggregate, (in tufts,) briſtle-ſhaped; ſtem-leaves ſetaceous, unequal, flattiſh above, with the edges rolled back, two-ſtreaked. A native of Provence and Alpine mountains. 28. A. *obtuſa*. Allion. ped. 1714. t. 64. f. 4. "Leaves linear, flat, obtuſe; calyx viſcid;" perennial. Stems procumbent, branched; leaves connate, ſoft, green; branches uſually terminating by two flowers on long peduncles; leaflets of the calyx ovate-lanceolate, green; petals entire, ſcarcely larger than the calyx; fruit conical, five-valved. A native of the high Alps of Swiſſerland. 29. A. *lanceolata*. Allion. ped. n. 1715. t. 26. f. 5. "Leaves lanceolate, three-nerved, acute; calyx lanceolate, three-nerved;" root perennial, dark coloured, tough, creeping; ſtems filiform, in a tuft, branched, creeping, beſet with fine hairs; leaves lanceolate, acute, with three raiſed nerves; corolla ſpreading, large; ſtamens alternately ſhorter, longer than the petals; anthers ſmall, purple; fruit conical, five-valved. This and many other ſpecies of the genus are involved in much confuſion, from which they cannot eaſily be extricated. 30. A. *dianthoides*, Smith ic. ined. t. 16. "Leaves linear, ſcabrous at the edge; flowers capitated; bractes ventricoſe, longer than the peduncles." *Alſine, &c.* Tournef. cor. 17. Root woody, perennial; ſtems a foot high, ſix or ſeven jointed; leaves connate; ſtem claſping, acute, ſerrulate, and rough at the edges; flowers monoecious, in a head or terminal ſpike, on ſhort filiform peduncles, fenced with the bractes; petals obovate with claws; three times as long as the calyx. Found in Armenia by Tournefort. 31. A. *cucubaloides*, Smith ic. ined. t. 17. *Alſine orient. &c.* Tourn. cor. 17. "Leaves linear, ſcabrous at the edge; panicles dichotomous, pubeſcent; petals obovate;" root perennial; ſtems a foot high, round, ſmooth; leaves connate; ſtem claſping, acute; panicle ſpreading, terminating, viſcid; flowers the ſize and appearance of thoſe of common flax; bractes acute, ſcariofe at the edge, only one fourth of the length of the peduncles; leaflets of the calyx ovate, acute, keeled, ſtriated, viſcid, pubeſcent; petals white, with ſubpellucid ſtreaks; five of the ſtamens longer than the others; capſule one-celled, ventricoſe, ſhining, cloathed with the calyx; ſeeds numerous. Found in Armenia by Tournefort.

Propagation and Culture. The greater part of theſe plants are natives of Europe, and moſt of them affect mountainous ſituations. They have neither ſize nor brilliancy to be generally cultivated in gardens; many of them, however, are neat elegant plants. The perennial ſorts may be eaſily increaſed by ſlips, or parting the roots; but both theſe and the annual ſorts may be propagated from ſeeds. They require no other care than what is neceſſary for all hardy vegetables. Martyn's Miller's Dict.

ARENARIA, in *Ancient Writers*, is uſed for ſand-pits, or ground out of which ſand is dug. Vitruvius.

ARENARIA, in *Conchology*, a ſpecies of HELIX of the minute kind, found on the ſandy ſhores of Armenia. This ſhell is whitiſh, gloſſy, with extremely thin longitudinal ſtriæ; ſpire reverſed and hemiſpherical. Spengl. Gmelin. &c.

ARENARIA, a ſpecies of SERPULA that inhabits India and Africa. The ſhell is articulated, entire, diſtinct, and flattiſh beneath. Gmelin. It is white or whitiſh, and ſometimes marked with pale brown undulated rays; the inſide is ſmooth, outſide cancellated; the ſtriæ about one hundred in number, and frequently nodulous. The ſhell is twiſted ſpirally. *Obſ.* Gmelin doubts whether it may not be a Teredo inſtead of Serpula.

ARENARIA, in *Entomology*, a ſpecies of VESPA that lives in the ſands in America. This inſect is black; thorax ſpotted with yellow; abdomen faſciated on each ſegment with a ſix-dentated yellow band; the firſt linear, and interrupted. Fabricius, Gmelin, &c. *Obſ.* Gmelin has another ſpecies of Veſpa, under the ſame ſpecific name, viz. *ſphex arenaria*

arenaria of Linnæus: Fn. Suec. which he removes to this genus. It is black, with four yellow bands on the abdomen and two yellow dots on the firſt ſegment. This is found in Denmark and Sweden, and belongs to the ſection of the Vespa, genus *Crabro*, in Gmelin's arrangement.

Arenaria, a ſpecies of Formica found in the moveable ſands in Barbary. This is a large kind; has a great ovate head, and ſubgloboſe pubeſcent abdomen. The ſpecific character is this, black; thorax impreſſed behind and furniſhed with two ſpines; ends of the legs piceous. Fabricius and Gmelin.

Arenaria, in *Ornithology*, the name given by Briſſon to the bird called by Linnæus and Gmelin, *Tringa Interpres*; and *Turnſtone* or *Sea Dotterel*, by Engliſh writers.

Arenaria, a ſpecies of Tringa that inhabits the ſandy ſhores of Europe and the Caſpian ſea. The beak and legs are black; body grey, beneath white; lores grey. This is calidris griſea minor of Briſſon, Gmelin, &c.

ARENARII, in *Antiquity*, gladiators who combated with beaſts in the *arena* or amphitheatre. The *arenarii* were ſlaves of the loweſt rank, ſo that, though manumitted, they were not capable of being Roman citizens. They were the ſame with what were otherwiſe called Bestiarii.

ARENARIUM, in *Eccleſiaſtical Writers*, denotes a cæmetery or burying-ground. The *arenaria* were properly a kind of pits, or holes under ground, wherein the ancient Chriſtians not only buried their dead, but held their religious aſſemblies, in times of perſecution. Baron. Annal. and Du-Cange.

ARENARIUS, in *Entomology*, a ſpecies of Curculio reſembling C. liguſtici, but only about half the ſize of that inſect. The head is hoary; thorax granulated, and with the legs, black; wing-caſes connate, grey, and ſtriated with punctures. Herbſt. apud Fueſsli: inhabits Berlin.

Arenarius, a ſpecies of Cimex, very common in the northern parts of Europe. It is black; wing-caſes cinereous; wings white. Linnæus, Fabricius. *Obſ.* This belongs to the ſection *oblongus* in Gmelin's arrangement.

Arenarius, in *Ornithology*, a ſpecies of Tetrao, called by Latham the ſand grous. The collar, belly, and vent are black; two middle tail-feathers rather tawny, the reſt faſciated with brown and grey, and white at the tip. Pallas Nov. Comm. Gmelin, &c.

According to Dr. Latham, this bird is bigger than a partridge; length, more than nineteen inches; bill, blue-grey; tip black; head pale aſh-colour; crown and nape clouded yellowiſh-grey; chin deep yellow, terminated by a triangular black mark about the middle of the neck; the feathers of the throat and neck ſingularly truncated, and gloſſy like thoſe of a dove; the upper parts of the neck and body teſtaceous white; each feather ſurrounded with a brown border, encircling an oval yellowiſh ſpot; on the lower part of the neck a creſcent of black; the breaſt is white; belly, vent, and thighs, black; wings hoary, with a deep yellow ſpot on the ſecondaries; quills browniſh, obliquely white at the baſe; the tail has ſixteen feathers; the two middle ones pointed and yellowiſh, croſſed with brown lines; the others brown with grey lines; the tips white; legs ſlender, feathered to the toes, and are ſhort, naked, and callous beneath; claws black; behind is a ſpur, which turns inwards, and is prominent and pointed. The female is rather bigger; of a paler yellowiſh colour throughout; dotted on the head, neck, and throat, with black, and faſciated with the ſame on the back; the markings are leſs diſtinct than in the male, but it much reſembles it.

This ſpecies is found only in the middle of the deſerts extending towards the Caſpian ſea. It is very common about Aſtrachan in ſummer, and paſſes the winter in Perſia. Their food is the ſeeds of various kinds of aſtragali, and particularly of the ſpecies Alopecuroides, Cicer, and Phyſodes. They are ſeen in pairs in June; and as they drink much water, are obliged to frequent thoſe parts of the deſert where it is found. It is ſaid they go to the pools three times in the day, when they are ſo eager that they do not mind the ſportſman, though at other times they are very ſhy. They are no where more common than about the ſalty fountains at Barlu chuduk; fly like pigeons; and have a ſhrieking though not unpleaſant cry. The eggs are bigger than thoſe of a pigeon, and white.

ARENAS Islands, in *Geography*, are iſlands that lie 20 leagues north from Cape Condeceedo, or the North-weſt point of Campeachy bay in the gulf of Mexico.—Alſo four iſlands, ſituate on the coaſt of Terra Firma, on the north coaſt of the Spaniſh main or South America, before the bay of Bamba, weſt from St. Martha river and harbour; and ſheltering the bay from all winds.

ARENATA, in *Entomology*, a ſpecies of Phalæna, in the *Geometra* family. It is of the middle ſize, and inhabits Tranquebar. The wings, above, are without ſpots, beneath, ſpeckled and ſtreaked with brown. Fabricius.

ARENATION, a term that has been uſed by ſome phyſicians to denote a kind of dry bath, in which the patient only ſits with his feet in dry ſand.

ARENDÆ, in *Ancient Geography*, a town of Lycia, according to Ptolemy.

ARENDATOR, or Arrendator, is a term uſed in Livonia, Eſthonia, and ſome other parts of the Ruſſian empire, for a farmer of the farms, or a perſon who contracts with the crown for the rents of the farms; and the crown arendator is one who rents an eſtate belonging to the crown. The term "Arende" denotes both the eſtate that is let out, and the ſum for which it is let. Arende-corn, is corn paid as rent by admodiation.

ARENDONCK, in *Geography*, a town of Brabant, belonging to the French department of Deux Nèthes, and chief place of a canton in the diſtrict of Turnhout, two leagues eaſt of Turnhout. The place contains 2482, and the canton 6,662 inhabitants: the territory includes 237½ kiliometres and 6 communes.

ARENDSEE, a town of Germany, in the circle of Upper Saxony and old mark of Brandenburg, ten miles weſt of Seehauſen.

ARENE, or Aerné, in *Ancient Geography*, a town mentioned by Pauſanias (Meſſen. c. 2.); and, according to him, founded by Arpharæus, the grandſon of Perſeus, but he does not give its ſituation. Stephanus of Byzantium mentions two cities of this name, one in Meſſenia, and the other in Triphylia.

ARENIUM, a place of Italy, upon the Via Flaminia, near the Adriatic gulf.

ARENOSA, in *Conchology*, a ſpecies of Murex, found on the ſandy ſhores of India. The whorls of the ſpire are decuſſated with ribs, the firſt of which is large, and the three outermoſt ones ſmooth; beak, acute; aperture, oval; and the lip toothed exteriorly. Gmelin, &c. This is a minute ſhell.

Arenosa, in *Entomology*, a ſpecies of Sphex, found in Germany. It is black and hairy; ſecond and third ſegment rufous; wings as long as the body. Fabricius, Gmelin, &c.

Arenosa, in *Natural Hiſtory*, a ſpecies of Madrepora, that inhabits ſome parts of Africa. It is white; the ſtars contiguous, flattiſh; rather large and ochraceous. Brander, &c.

Arenosus, in *Entomology*, a ſpecies of Scarabæus, in the ſection *Trox* of Gmelin. The thorax is ſomewhat

canaliculated; wing-cafes, ftriated; body obfcure. Fabricius. Inhabits Saxony; and refembles fcarabæus fabulofus, but is not more than half its fize.

ARENSBERG, in *Geography*, a town of Germany, in the duchy of Weftphalia, fortified with a caftle; the capital of a county incorporated with the electorate of Cologn. It is fituated on the Roer, and divided into the old and new town; 48 miles north-eaft of Cologn, and 40 S. S. E. of Munfter. N. lat. 51° 23'. E. long. 7° 41'.—Alfo, a town in the circle of Weftphalia, and county of Schauenburg, 5 miles north of Rinteln.

ARENSBURG, a fea-port town and diftrict on the fouth fide of the ifland of Oefel in the Baltic fea, feparated from Ambrook ifland by a bay, and belonging to the government of Riga or Livonia.

ARENSWALDE, a town of Germany, in the circle of Upper Saxony and new mark of Brandenburg, 94 miles north-eaft of Berlin, and 50 north-north-eaft of Kuftrin. N. lat. 53° 10'. E. long. 15° 28'.

ARENTIA, in *Ancient Geography*, a river of Italy, near the frontiers of Etruria and Liguria. It fprung to the north-eaft of Luna, and difcharged itfelf into the fea near Carara.

ARENUSA, in *Geography*, a town of Italy, in the kingdom of Naples, and province of Calabria ultra, 16 miles W. of St. Severina.

AREOLA, or AREOLA *mamillaris*, in *Anatomy*, the coloured circle which furrounds the nipple. See BREAST.

AREOLA, in *Conchology*, a fpecies of BUCCINUM, that inhabits the Mediterranean, and India. This fhell is fometimes fmooth; fometimes ftriated; and the ftriæ are larger, or fmaller in different fpecimens: its fpecific character is thus defined by Linnæus and Gmelin; fhell fomewhat ftriated, with four bands of fquare fpots; aperture dentated; beak recurved. This is *areola* of Rumphius, and *faburon* of Adanfon. The length is three inches.

AREOLA, a fpecies of TROCHUS defcribed by Chemnitz and Gmelin. It is convex, and ftriated tranfverfely; white, with fquare reddifh fpots; umbilicus crenulated; the whorls of the fpire are feparated by a white ftreak. Its native country is not afcertained.

AREOLA, in *Natural Hiftory*, a fpecies of MADREPORA without ftalk; undulations dilated, and in fome places doubled, with narrow truncated margin. This is madrepora fimplex fubpedunculata, ftella crifpato laciniofa lamellis crenulatis, of Pallas, and madrepora (areolata) conglomerata, anfractibus dilatatis, diffepimentis exefis fubinæqualibus, ambulacris duplicatis hinc dilatatis, lamellis denticulato crenulatis of Solander and Ellis. Petiver calls it corallium album fungoides ovale; and Sloane, fungus lapideus undulatus. It is amaranthus marinus of Valent; morille of Molin.; cariophilloides of Argenville; mycedium cavatum undulatum of Hill: and cerebrites of Knorr. It inhabits India and South America.

AREOLATA, in *Conchology*, a fpecies of PATELLA, refembling P. magellanica, but is more depreffed, and broader at the bafe; and by the direction of the ftriæ which crofs each other, is divided into triangular fpaces; the longitudinal ftriæ are about twenty-one in number; the habitat is unknown. Gmelin defines its fpecific character in thefe words; fhell pyramidal and reddifh grey, with very thin circular ftriæ, croffed by others which are longitudinal; vertex violet.

AREOLATA, in *Ichthyology*, one of the varieties of perca fummana, an Arabian fifh defcribed by Forfk. Fn. Arab.—Gmelin thus mentions it, areolata γ Perch, body whitifh-cinereous, with yellowifh-brown fpots. See PERCA SUMMANA.

AREOMETER. See ARÆOMETER.

AREON, in *Ancient Geography*, a torrent which difcharged itfelf into the Perfian gulf, near a place called *Gogana*.

AREONESUS, an ifland of the Euxine fea, called by Pomponius Mela, *Aria*. The inhabitants were deemed excellent archers.

AREOPAGUS, or ARÆOPAGUS, in *Antiquity*, a fovereign tribunal at Athens, famous for the juftice and impartiality of its decrees; to which the gods themfelves are faid to have fubmitted their quarrels.

Authors are divided, as to the reafon and origin of the name: feme imagine areopagus the proper name of the court of juftice, which was fituate on a hill near the citadel in Athens; and that in this court the fenate of that illuftrious city aflembled.—Others fay, that areopagus was the name of the whole fuburbs of Athens, wherein ftood the hill on which the court was built; and the name areopagus feems to countenance this laft opinion; for it fignifies literally, the hill or rock of Mars; from παγος, *hill*, and αρειος, *belonging to Mars*. In effect, the denomination might either arife hence, that the areopagus was built in a place where had been a temple of Mars; or, becaufe the firft caufe pleaded there was that of this god, who was accufed of killing Halirrhotius the fon of Neptune, and tried here before twelve gods, and acquitted by a majority of voices; or, finally, becaufe the Amazons, whom the poets feign to have been the daughters of Mars, when they befieged Athens, pitched their tents, and offered facrifices to the god of war in this place.

This tribunal was in great reputation among the Greeks, fo that it was denominated "the moft facred and venerable tribunal;" and Socrates fays that it was deemed fo facred, that if thofe who had been vicious were elected into it, they immediately gave up their former practices, and conformed to the rules of the fenate, becaufe they could not refift the authority of example, but were conftrained to appear virtuous. The Romans themfelves had fo high an opinion of it, that they trufted many of their difficult caufes to its decifion. Demofthenes fays, that in his time neither plaintiff nor defendant had any juft reafon to be diffatisfied with their proceedings. Innocence, fummoned to appear before it, approached without apprehenfion; and the guilty, convicted and condemned, retired without daring to murmur. Authors are not agreed about the number of the judges who compofed this auguft court. Some reckon thirty-one, others fifty-one, and others five hundred; in reality, their number feems not to have been fixed, but to have been more or lefs in different years. By an infeription quoted by Volaterranus, it appears they were then three hundred. At firft, this tribunal only confifted of nine perfons, who had all difcharged the office of archons, had acquitted themfelves with honour in that truft, and had likewife given an account of their adminiftration before the *logiftæ*, and undergone a very rigorous examination. Thofe who were admitted members of this aflembly were ftrictly watched, and their conduct was fcrutinized and judged by the court to which they belonged, without partiality. Trivial faults did not efcape cenfure. A fenator, it is faid, was puniftied for having ftifled a little bird, which from fear had taken refuge in his bofom: he was thus taught, that he who has a heart fhut againft pity fhould not be allowed to have the lives of the citizens at his mercy. The members of this auguft aflembly were not allowed to wear crowns, or to obtain any marks of honour conferred by the people, as a recompence for their fervices; nor were they allowed to folicit any; but they were rewarded by a bounty from the public, which they called χρεας; and they had alfo three oboli for every caufe in which judgment was given.

The

The areopagites were judges for life.—They never ſat in judgment but in the open air, and that in the night time; to the intent that their minds might be more preſent and attentive; and that no object, either of pity or averſion, might make any impreſſion upon them. However, ſome maintain, that the building in which the areopagites aſſembled, was not wholly uncovered; and they obſerve, that among the ruins, large ſtones have been found, whoſe joints are in the ſame angle with the pediment that muſt have been uſed for a covering. Mr. Spon, who examined the antiquities of that illuſtrious city, found ſome remains of the areopagus ſtill exiſting in the middle of the temple of Theſeus, which was heretofore in the middle of the city, but is now without the walls. The foundation of the areopagus is a ſemicircle, with an eſplanade of 140 paces round it, which properly made the hall of the areopagus. There is a tribunal cut in the middle of a rock, with ſeats on each ſide of it, where the areopagites ſat, expoſed to the open air. At firſt they only took cognizance of criminal cauſes; but in courſe of time their juriſdiction became of greater extent. This court is recorded as the firſt that ſat upon life and death; and the trial of wilful murder ſeems to have been the original deſign of its inſtitution. In later ages, all incendiaries, aſſaſſins, conſpirators, deſerters of their country, treaſons, and moſt capital cauſes in general, fell under its cognizance. The opinion which the ſtate entertained of the wiſdom, gravity, and ſanctity of its members, gained for them an unlimited power; inſomuch that, according to Solon's regulation of this aſſembly, the inſpection and cuſtody of the laws, the management of the public funds, the guardianſhip of young men, and the education of youth according to their rank, were committed to them. Their power extended to perſons of all ages and ſexes, to puniſh the idle and profligate, and to reward the ſober and virtuous, according to their own pleaſure. For this purpoſe they were empowered, by entering and examining private houſes, to condemn every uſeleſs perſon as dangerous, and every expence not proportioned to the means of the citizen as criminal. Beſides they took cognizance of religious matters, blaſphemy, contempt of holy myſteries, the erection and conſecration of temples and altars, and the introduction of new ceremonies: nevertheleſs, they interfered in public affairs only in caſes of emergency or danger. As this aſſembly exhibited the greateſt firmneſs in puniſhing crimes, and the niceſt circumſpection in reforming manners; as it never employed chaſtiſement till advice and menaces were ſlighted; it acquired the eſteem and confidence of the people, even whilſt it exerciſed the moſt abſolute power. Its meetings were held three times in every month, viz. on the 27th, 28th, and 29th days, but on any urgent buſineſs, the ſenators aſſembled in the royal portico.

The Court was divided into ſeveral committees, each of which took cognizance of ſeparate cauſes, if the multiplicity of buſineſs would not allow time for them to be brought before the whole ſenate: and this was done by lots, that the cauſes might not be prejudged. In crimes that concerned religion or the ſtate, the power of this court was limited to preparing the matter for a trial; and it then made its report to the people, without coming to any concluſion. The accuſed then had it in his power to offer new pleas in his defence; and the people named orators to conduct the proſecution before one of the ſuperior courts.

Trials in the Areopagus were preceded by tremendous ceremonies. The two parties, placed amidſt the bleeding members of the victims, took an oath, which they confirmed by dreadful imprecations againſt themſelves and families. They called to witneſs the Eumenides, who, from a neighbouring temple dedicated to their worſhip, ſeemed to liſten to the invocation, and prepare to puniſh the perjured. They then proceeded to the trial; requiring all pleadings to be conducted in the ſimpleſt terms, without exordium, epilogue, or appeal to the paſſions. After the queſtion had been ſufficiently diſcuſſed, the judges ſilently depoſited their ſuffrages in two urns, one of braſs called the urn of death, and the other of wood called the urn of mercy. This mode of giving votes was afterwards abandoned, and they were delivered in public, by caſting their calculi or flints upon two tables, one for thoſe that acquitted, and the other for thoſe condemned: when the numbers were equal, an inferior officer added, in favour of the accuſed, the ſuffrage of Minerva, ſo called, becauſe, according to an ancient tradition, this goddeſs being preſent in the court of areopagus at the trial of Oreſtes, gave her caſting vote to turn the ſcale of juſtice. In ſome cauſes the ſentence of this court was not final; but an appeal might be made to the courts to which they reſpectively belonged.

This court is ſaid by ſome, as by Plutarch and Cicero, to have been inſtituted by Solon; but others carry it much higher, and aſſert it to have been eſtabliſhed by Cecrops, about the year before Chriſt 1556, or by Cranaus, one of his ſucceſſors; maintaining alſo, that Solon only made ſome new regulations in it, increaſed its power and privileges, and made it ſuperior to the ephetæ, another celebrated court inſtituted by Draco.—In effect, Demoſthenes himſelf, in his oration againſt Cteſiphon, owns himſelf at a loſs on the point: "The inſtitutors of this tribunal (ſays he), whatever they were, whether gods or heroes," &c.

This court preſerved its authority uncorrupted and entire till the time of Pericles, who, not having borne the office of archon, could not be admitted into it; and therefore employed all his art and intereſt to undermine it. This at length he ſo effectually did, that his contempt of it ſerved to leſſen its dignity: and from that time the ſame exceſſes and vices which were practiſed in the city gained ground among the areopagites themſelves, until by degrees they loſt all their former power and eſteem.

When the apoſtle Paul was ſummoned to appear before the court of areopagus, under a charge of being "a ſetter forth of ſtrange gods," (ſee Acts, xvii.) and conſequently of having violated the law that ſubſiſted at Athens, which made it capital to introduce or teach any new gods, his conduct exhibited an admirable union of wiſdom and fortitude. In ſuch a caſe an impoſtor would have retracted his doctrine to ſave his life; and an enthuſiaſt would have loſt his life, without trying to ſave it by innocent means. St. Paul did neither the one nor the other: he availed himſelf of an altar which he had found in the city, inſcribed, "To the unknown God;" and pleaded that he did not propoſe to them the worſhip of any new god, but only explained to them one whom their government had already received; "whom therefore ye ignorantly worſhip, him I declare unto you:" by this he avoided the law, and eſcaped being condemned by the Areopagus, without departing in the leaſt from the truth of the goſpel, or violating the honour of God. "An admirable proof, in my opinion," ſays Lord Lyttleton, (on the Converſion of St. Paul, in Miſc. Works, vol. ii. p. 60.) "of the good ſenſe with which he acted, and one that ſhews there was no mixture of fanaticiſm in his religion." See ALTAR.

AREOPOLIS, in *Ancient Geography*, a city of Arabiæ Petræa, ſituate on the river Arnon, and called alſo Ar and Rabbath-Moab.

AREOSTYLE. See ARÆOSTYLE.

AREOTICS. See ARÆOTICS.

AREQUIPA, or ARIQUIBA, in *Geography*, is one of the largeſt

largeſt cities in Peru South America; and was founded by Don Franciſco Pizarro, in 1539. It ſtands in the valley of Quilca, about twenty leagues from the ſea, in a fertile country. Near it is a dreadful volcano. The air is very temperate, and the beſt in the country; but it has been four times laid in ruins by earthquakes. It is very populous, and well built, contains a convent and two nunneries, and had a college of Jeſuits. It has a biſhoprick in Lima, and lies 290 miles ſouth by eaſt from that city. S. lat. 16° 40'. W. long. 75° 30'.

ARES, a town in Germany in the county of Tyrol, eleven miles ſouth-weſt of Tyrol.

ARES, a term framed by Paracelſus, to expreſs a hidden diſpoſer, in the three principles of things, from which each being receives its proper form and ſubſtance, and aſſumes its own ſpecific nature, not that of any other being. Paracelſus diſtinguiſhes the *ares* into *archeical*, which is *natural*; and *chemical*, which is artificial. See ARCHÆUS.

ARESCHE, in *Geography*, a town of France, in the department of Jura, and chief place of a canton in the diſtrict of Arbois, ſix miles eaſt of Arbois.

ARESKUTAN, is the name of a ſolitary mountain of Jamtland, in Norway, about four or five Swediſh miles from the higheſt Alps which ſeparate Norway from Sweden; and it is ſaid to be 6162 Engliſh feet above the neareſt rivers.

ARESTI, FLORIANO, in *Biography*. See FLORIANO.

ARESTINGA, an iſland of the Indian ocean, towards Kerman and the town of Dulcinda, ſuppoſed to be the Liba of Ptolemy.

ARETALOGI, in *Antiquity*, a ſort of philoſophers, chiefly of the cynic or ſtoic tribe, who having no ſchool or diſciples of their own, haunted the tables of great men, and entertained them in their banquets with diſputations on virtue, vice, and other popular topics. Pitiſcus Lex. Theſe are ſometimes alſo denominated *circulatores philoſophi*. Calvin. Lex. Jur.

ARETÆUS of *Capadocia*, in *Biography*, an early Greek writer, practiſed medicine at Rome, but at what period is not exactly known. That he lived after the time of Andromachus, phyſician to the emperor Nero, is evident from his mentioning the Theriaca, a medicine invented by that writer, and that he did not live long after that time, Haller conjectures from the purity of his ſtyle. Dioſcorides, who lived a little before the time of Galen, quotes Aretæus. Hence we may infer that he flouriſhed ſome time between the reigns of Veſpaſian and Adrian. Eight of his books, on the cauſes, ſigns, and method of treating acute and chronical diſeaſes, have been preſerved, but all of them, as it appears, mutilated and imperfect; Ætius having quoted ſeveral paſſages from his works, which are not found in the copies that have come to our hands. The works, however, are in high eſtimation, as well for the accuracy with which the diſeaſes are deſcribed, as for the judicious practice recommended in curing them. Aretæus was a bold and deciſive practitioner, and made much uſe of hellebore and other draſtic medicines. He is one of the earlieſt writers who recommends cantharides for raiſing veſications on the ſkin. The tranſlation of the works into Latin by Junius Paulus Craſſus, was publiſhed in 8vo. at Venice in 1552, and continued in uſe, being frequently republiſhed, until 1723, when Dr. Wigan of Oxford made a new verſion. This was publiſhed in folio, with the Greek text in the oppoſite page, and enriched with a preface, notes, and critical diſſertations. A Greek edition by Jacobus Goupylus, was printed at Paris in 1554, 8vo.; and reprinted by H. Stephens. A Greek and Latin edition was publiſhed by Heniſchius, in 1603, fol. It has been ſince edited by Boerhaave in 1731, with additional notes and obſervations; and again by Haller in 1771, with further emendations. An Engliſh tranſlation of Aretæus from the original Greek, was publiſhed by Dr. Moſſat in 1785, 8vo. Caſtellina Vitæ Illuſt. Medic. Haller Biblioth. med. pract.

ARETE, the daughter of Ariſtippus of Cyrene, was a female of talents and learning, entitling her to a place in the catalogue of philoſophers. She flouriſhed about 360 years before Chriſt, profeſſed and taught the doctrine of her father, and preſided over the Cyrenaic ſchool after his death. Laert. l. ii. § 86. Clem. Alex. Strom. l. iv. p. 523. Brucker's Hiſt. Phil. by Enfield, vol. i. p. 188.

ARETE, in *Entomology*, a ſpecies of PAPILIO (*Nymph.* Gme.) The wings are entire, brown, with a ruſous band; on the poſterior pair both above and beneath a ſtreak of whitiſh dots. Fabricius. Inhabits Auſtria.

ARETHAS, in *Biography*, biſhop of Cæſarea, was the author of a commentary upon the Revelation, collected, according to Mill, from that of his predeceſſor Andrew, and from the works of Irenæus, Hippolytus, Gregory Nazianzen, Cyril of Alexandria, and others. Cave, Mill, Lardner, and others, refer this writer to the middle of the ſixth century; but Caſimire, Oudin, and Fabricius, are of opinion that he lived in the tenth century. Dr. Lardner obſerves that he cites moſt or all the books of the New Teſtament, and hence infers, that he received all the ſame books which we acknowledge; he alſo quotes Solomon's ſong. Cave. H. L. t. i. p. 520. Lardner's works. vol. v. p. 274.

ARETHON, in *Ancient Geography*, a navigable river of Epirus, which had its ſource in Athamania, and diſcharged itſelf into the Ambracian gulph near Ambracia. Ptolemy calls this river Arachthus. Livy, l. xxxviii.

ARETHUSA, in *Botany*, a genus of plants belonging to the natural order *Orchideæ*. Lin. g. 1014. Schreb. 1373. Juſſ. 65. *Orchidion*. Mitch. 19. Claſs, *gynandria diandria*. Gen Char. *Cal.* ſpathe leafy, perianth none. *Cor.* ringent, petals five, oblong, ſubequal, two placed more outward than the others; all converging into a helmet. Nectary one-leafed, tubular at the baſe, within the bottom of the corolla, two-parted; lower lip reflex, broad, wrinkled, the length of the petals, hanging down forwards; upper lip linear, very tender, faſtened to the ſtyle, lobed at the top. *Stam.* filaments two, very ſhort, ſitting on the top of the piſtil; anthers ovate, compreſſed, covered with the folding of the inner lip of the nectary. *Piſt.* germ oblong, inferior; ſtyle oblong, incurved, cloathed with the inner lip of the nectary; ſtigma funnel-ſhaped. *Per.* capſule oblong-ovate, one-celled, three-valved, gaping at the angles. *Seeds*, numerous, chaffy.

Eſſ. Gen. Char. Nectary tubular, within the bottom of the corolla; lip faſtened to the ſtyle.

Species, 1. A. *bulboſa*, bulbous rooted arethuſa, "root globoſe; ſcape-ſheathed; ſpathe two leaved." It grows in watery places, as bogs, &c. in Virginia, Carolina, and Canada. Introduced here 1784, by Mr. William Young. 2. A. *ophioglooſſoides*, adders-tongue leaved arethuſa. Helleborine virg. &c. Pluk. Alm. t. 93. f. 2. Cypripedium. Gron. virg. 1. 110. Hort. Cliff. 430. "root fibrous, leaf of the ſcape oval; ſpathaceous; leaflets lanceolate." A native of the ſame places as the preceding ſpecies. 3. A. *divaricata*, lily-leaved helleborine or arethuſa. *Serapias*, Gron. virg. i. p. 184. helleborine lilii folio, &c. Cateſb. car. i. t. 58. "root ſubpalmate; leaf of the ſcape and leaflet of the ſpathe lanceolate; outer petals riſing." It grows in the ſame countries and ſituations as the firſt and ſecond ſpecies. 4. A. *capenſis*, cape arethuſa, ſupp. 405.; "bulb round; ſtem two-leaved; ſimple, one-flowered; leaves two, alternate, ſheathing, awl-ſhaped." Found at the cape of Good Hope by Thunberg. 5. A. *villoſa*, villoſe arethuſa, ſupp. 405.; "bulb round; leaves ovate, ciliate, pubeſcent.' This was

alſo

alſo diſcovered at the Cape by Thunberg. 6. A. *ciliaris*, ciliated arethuſa; orchis burmanniana, ſyſt. ed. 13; "root fleſhy; leaf kidney-ſhaped, orbiculate; lip ciliate;" bulb villoſe, double; ſcape ſix or ſeven inches high; leaf one, ſubradical, heart-ſhaped, nerved, ſtem claſping; flower one, nodding; germ hairy, the length of the petals; upper petals rather erect, lanceolate; two lower longer, lanceolate, enſiform; horn of the nectary moon-ſhaped, ſhorter than the germ; lip large, ſubtripartite, ciliated, middle diviſion bifid; raments ſetaceous, longer than the lip itſelf; column of the ſtamens riſing half the length of the petals. Found at the Cape, by Sparrman; introduced in 1787, by Mr. Maſſon. 7. A. *biplumata*, two-feathered arethuſa, Smith, ic. ined. t. 23.; "ſcape ſheathed; ſpathe cowled; the two lower petals elongated, bearded on the upper ſide;" ſtem ſimple, erect, a foot high; radical leaves linear-lanceolate, equitant at the baſe; ſtem-leaves ſix or ſeven, membranaceous, acute, ſheathing, alternate; flower terminal, ſolitary, erect, purple: germ inferior, obconical, ſmooth: three outer petals of the corolla longer, irregular: the upper ſomewhat vaulted, acute, naked; the two lower ones ſubulate, broad at the baſe, bearded on the upper ſide near the top with club-ſhaped hairs, or ſtipulate glands; the two inner petals ſhorter, oppoſite, ſomewhat rhomb-ſhaped, acute, netted with purple veins; roots faſciated or in bundles.

Propagation and Culture. The three firſt are hardy and will endure the rigour of our climate. The three next muſt be kept in the conſervatory or cape-ſtove. The laſt muſt be preſerved in the bark ſtove. But none of theſe plants have yet been introduced into England, except the firſt and ſixth. Conſidering their places of growth, in bogs and watery places, it will be no eaſy matter to preſerve them long with us. See Martyn's Miller's Dict.

ARETHUSA, in *Entomology*, a ſpecies of PAPILIO (*Nymphalis*, Gm.). The wings are dentated, above brown, with a band ſpotted red; the anterior with a ſingle ocellus on each ſide. Inhabits Germany, and is very like the Semela.

ARETHUSA, in *Ancient Geography*, a town of Aſia, in Syria, ſituate on the river Orontes, ſouth-eaſt of Epiphania, between this town and Emeſa, and diſtant from Antioch, according to Antonine's Itinerary, 16,000 paces. It was a biſhop's ſee ——Alſo a town of Macedonia, in the diſtrict called Amphaxitis.——Alſo, a town of Judæa, mentioned by Joſephus, and reſtored by Pompey to its original inhabitants.

ARETHUSA, a lake of Aſia, in the greater Armenia, ſouth of the mountain Niphates, and not far from the ſource of the Tigris, which traverſes it. According to Pliny (H. N. l. vi. c. 27.) it exhaled nitrous vapours.——Alſo a fountain of Greece, in Bœotia, not far from the city of Thebes.——Alſo, a fountain in the iſland of Eubœa.——Alſo, a fountain of Magna Græcia, in Brutium, now the gulf of Squilaci, according to Caſſiodorus.——Alſo, a fountain of the iſle of Ithaca, called Cypara, according to Stephanus Byz. ——Alſo, a famous ſpring in the iſland of Sicily, near Syracuſe. For an account of the fable relating to this fountain and Alpheus, ſee ALPHEUS. Virgil refers to it in his 10th Eclogue.

"Extremum hunc, Arethuſa, mihi concede laborem—
Sic tibi, cum fluctus ſubterlabêre Sicanos,
Doris amara ſuam non intermiſceat undam."

"Thy ſacred ſuccour, Arethuſa, bring,
To crown my labour: 'tis the laſt I ſing.
So may thy ſilver ſtreams beneath the tide,
Unmixed with briny ſeas, ſecurely glide."

The water of this fountain, formerly celebrated for its ſoftneſs and ſweetneſs, is now brackiſh, and fit for no purpoſe but waſhing linen. It is defended from the ſea by a wall, and almoſt hidden by houſes on every ſide. Rubbiſh has choaked up its ſalutary ſpring; the waves have found a paſſage through the rocks, ſplit by repeated earthquakes; and not a fiſh is to be ſeen in it. After an earthquake it has been left dry; and at other times its waters have been tainted by ſubterraneous effluvia. Its fountain-head probably lies among the neighbouring hills.

ARETHUSA, in *Mythology*, was one of the Heſperides.

ARETHUSUS, in *Entomology*, a ſpecies of PAPILIO. (Dan. Feſt. Gmel.) The wings are very entire, black, with blue ſpots; poſterior pair dotted with ſanguineous red beneath. Fabricius. *Obſ.* This is *papilio arethuſa* of Cramer; and *papilio laodamia* of the ſame author is ſuppoſed by Gmelin to be a variety (β) of this ſpecies likewiſe.

ARETHYREA, ARETHUREA, in *Ancient Geography*, a name given by Homer to a ſmall country of Peloponneſus, near Achaia.

ARETIA, in *Botany*, ſo called by Haller, in honour of B. Aretius, a clergyman of Berne in the fifteenth century, the teacher of botany to the famous Geſner; Haller, helv. t. 8. f. 1. Lin. gen. n. 195. Rich. 108. Schreb. 256. Juſſ. 96. Claſs, *pentandria monogynia*. Nat. Order of *preciæ; lyſimachiæ* Juſſ. 96. Gen. Char. *Cal.* perianth, one leafed, bell-ſhaped, ſemiquinquefid, bluntiſh, and permanent. *Cor.* monopetalous, ſalver-ſhaped, tube ovate, length of the calyx, contracted at the neck; limb five-parted; diviſions obovate: *Stem.* filaments five, conic, in the middle of the tube very ſhort; anthers erect, ſharpiſh, within the throat of the corolla. *Piſt.* germ roundiſh; ſtyle filiform, length of the tube; ſtigma flat-headed. *Per.* capſule, one-celled, five-valved. *Seeds* five, Jacq.; three and five, Reich.

Eſſ. Char. *Cor.* ſalver-ſhaped, five-cleft, tube ovate; ſtigma flat-headed; capſ. one-celled, globular, with about five ſeeds.

Species, 1. A. *helvetica*, imbricated aretia; diapenſia helvetica, Lin. Spec. 203. Mant. 205. Jacq. vind. 303. androſace diapenſia, Villars' Dauph. ii. 472. "leaves imbricate, flower ſubſeſſile; root perennial, with inumerable ſtems forming thick tufts, covering the rocks where it grows, each branch terminated by one flower; fruit roundiſh with angles; ſeeds longer, darker, and in number fewer than in primula and androſace, and germ containing rudiments of five ſeeds two or three of which are abortive. A native of the weſtern Alps of Swiſſerland, and of Dauphiné. 2. A. *alpina*, linear-leaved A. Androſace cauleſcens, &c. Amæn. Acad. andr. aretia, Villars' Dauph. "leaves linear, ſpreading, flowers pedunculated;" tufts of leaves, linear, harder, and wider than the other; fruit often abortive, with ſometimes ten or twelve ſeeds in dry airy ſituations. Haller enumerates three varieties; (α) harder and the leaves almoſt ſmooth; fruit round, compreſſed, five-valved; (β) more tender, leaves more villoſe, not ſpreading ſo much, and ſhorter; flower roſe-coloured with the leaves and calyx covered with a cloſe white ſcale; (γ) flowers purple; theſe are found on different parts of the Swiſs Alps; the ſecond on Mount St. Bernard, Simplon, &c.; the third in the Griſons, and valley of St. Nicholas. Villars gives three varieties, which he ſuſpects to be diſtinct ſpecies: (*a*) hoary, with the hairs of the leaves branching, flowers white, often terminating: (*b*) hirſute, hairs of the leaves branching, flowers purpliſh, axillary, (*c*) hirſute, hairs of the leaves ſimple, flowers white, with a purple eye: the ſecond forms fine tufts of red flowers on Mount St. Bernard, 1260 toiſes above the level of the ſea, and carries vegetation to the height of nearly 1700 toiſes, not much leſs than two miles. This ſpecies occurs alſo in Auſtria: this and the foregoing were introduced in

1775, by Dr. Pitcairn and Fothergill. 3. A. *vitaliana*, grafs-leaved aretia; viteliana perennis, &c. Seſt. epiſt. t. 10. f. 1. ſedum alpinum, &c. colum. ecphr. 2. t. 65. f. 1. Raii. hiſt. 1044. 1. Sanicula alpina, &c. Pluk. Alm. t. 108. f. 6. "leaves linear, recurved; flowers ſubſeſſile;" a ſmall plant, always lying on the ground; root perennial, with diſtinct tufts, forming roſes like the ſedum; corolla deep yellow, with a long tube, with five large glands in the opening; fruit round and ſmall, with five kidney-ſhaped ſeeds. Native of the Pyrenées, the High Alps, between the Valais and Italy, and in Dauphiné; introduced here in 1787, by Monſ. Cels.

Theſe are all ſmall perennial alpine creeping plants; the little ſtems are covered with leaves; the flowers are axillary, and almoſt ſolitary.

Propagation and Culture. Theſe plants are preſerved in gardens with difficulty. They require a ſhady ſituation: and the ſeeds, if preſerved, ſhould be ſown as ſoon as poſſible. They may be alſo propagated from offſets or ſlips, and by parting the roots. Martyn's Miller's Dict.

ARETINI, in *Ancient Geography*, a people of Italy, in Etruria. Pliny diſtinguiſhes them into three claſſes, viz. Aretini veteres, Fidentes, and Julienſes; and their territory was divided into three different diſtricts.

ARETINO, Francis, in *Biography*, ſee *Francis* Accolti.

Aretino, Guido. See Guido.

Aretino, John, ſurnamed *Tortellius*, a grammarian, flouriſhed about the middle of the fifteenth century, and was librarian and chamberlain to pope Nicholas V. He was the author of a grammatical work "De poteſtate literarum," and of a life of Athanaſius; and though not very much diſtinguiſhed by literary attainments, he never diſhonoured learning by fierce and injurious diſputes. The treatiſe of Laurentius Valla, "De latinâ elegantiâ," was dedicated to him. Voſſ. de Hiſt. Lat. l. iii. c. 7. Gen. Dict.

Aretino, Leonard, a learned hiſtorian, derived his name from Arezzo, where he was born of the family of Bruni, in the year 1370. Having acquired under the inſtruction of Emanuel Chryſoloras an accurate acquaintance with the Greek language, he was diſtinguiſhed as one of the firſt reſtorers of Greek literature in Italy. By his reputation for talents and learning, aided by the good offices of his friend Poggius, he obtained the office of ſecretary of the briefs under Innocent VII. which he enjoyed during this and the four ſucceeding pontificates. When pope John XXIII. whom he accompanied to the Council of Conſtance in 1415, was depoſed, he returned to Florence, and devoted his leiſure to the gratification of his taſte in the purſuits of literature, and in the compoſition of various works. He was afterwards employed in ſeveral embaſſies on the behalf of the republic of Florence, of which he was chancellor; and by his economy, or rather parſimony, he amaſſed a large fortune. He died at Florence in 1444; his funeral was magnificently celebrated at the public expence, and whilſt his funeral oration was pronounced, the orator, by order of the magiſtrates, crowned the coffin with laurel. Aretino was regarded as one of the firſt men of his age for genius and learning, and as one of thoſe who formed the epocha of the revival of literature. The Latin inſcription on his tomb in the church di St. Croce, is to this purpoſe: "Since Leonardo paſſed out of life, hiſtory mourns, eloquence is mute; and it is ſaid, that neither the Grecian nor Roman muſes could refrain from tears." His works, both as original compoſitions and tranſlations, are very numerous: to the former claſs may be referred "The hiſtory of ancient Greece," 8vo. Venice, 1543; "An attempt to ſupply in part the defect of the ſecond Decad of Livy," in two books, 4to. Augſburg, 1537; "An hiſtory of the tranſactions of his own times in Italy, from 1378 to 1440," 4to. Lyons, 1539; "Hiſtory of Florence," fol. 1746; "On ſtudies and letters," republiſhed by Naude in 1642; and "Epiſtles," republiſhed at Florence, with notes, and the life of the author, by Mehus, 8vo. 1741, which work is much valued for the hiſtorical information which it contains. His latin tranſlations are ſeveral of Plutarch's lives, and Ariſtotle's ethics and politics; the latter of theſe tranſlations was dedicated to Duke Humphrey of Glouceſter, and the copy preſented to him by the tranſlator, moſt elegantly illuminated, is now in the Bodleian library at Oxford. His "Hiſtory of the Goths," publiſhed, to his diſhonour as an original work, but diſcovered to be a tranſlation of the Greek of Procopius; and "Three books of the Punic war," publiſhed in 8vo. in 1537, another plagiariſm, as the work is for the greateſt part a tranſlation from Polybius, though the author denies this in his preface. Eraſmus, ſpeaking of Aretino's Latin ſtyle, ſays, "that his works are written neatly and with eaſe, and ſometimes are even Ciceronian; but his language wants ſtrength, and his Latinity is not always pure." Voſſ. de Hiſt. Lat. l. iii. c. 5. Gen. Dict. Nouv. Dict. Hiſt.

Aretino, Peter, denominated "the ſcourge of princes," was the natural ſon of Louigi Bacci of Arezzo, and born in the year 1492. His education was mean, and his knowledge did not extend even to the learned languages. The reputation which he acquired as a writer, was principally owing to the virulence of his ſatire. His career in this way commenced with attacks on the clergy; and he then proceeded to ridicule princes and ſovereigns, whom by this kind of talent he held in ſuch awe, that ſome of the firſt potentates in Europe, and particularly Charles V. and Francis I. became his tributaries. When the former came from his unfortunate and ill-concerted expedition into Africa, he purchaſed the ſilence of this profligate ſatiriſt by the preſent of a chain of gold that coſt 100 ducats: "a trifling gift indeed," ſaid Aretino, "for ſo great a folly!" So arrogant did his ſucceſs make him, that he cauſed to be iſſued a medal, bearing on one ſide "the divine Aretino;" and on the other, a figure of himſelf, ſeated on a throne, receiving the envoys of princes. Some of the Italian princes, however, leſs complaiſant than theſe two kings, found the threat of cudgelling the ſatiriſt a more effectual mode of ſilencing him than pecuniary bribes. Aretino, when it ſerved his intereſt, was no leſs profuſe in his adulation than in his abuſe; and whether he praiſed or blamed, his object was perſonal emolument. His works in proſe and verſe were very multifarious; but their diſtinguiſhing characteriſtics were far-fetched conceits and coarſe jeſts, blended with ſome ingenious turns, and expreſſed in pointed and forcible language. They have now ſunk, together with his ill-earned fame and influence, into merited oblivion. The performances which have entailed the chief diſgrace on his memory by their licentiouſneſs and indecency, were his "letters and ſonnets, accompanying the ſixteen poſtures," engraved by Marco Antonio of Bologna from the deſigns of Julio Romano; and his "Regionamenti," or diſcourſes of a ſimilar caſt, in three parts. Although his writings abound with indecent levities ſufficiently culpable, they contain no avowal of irreligious principles; and therefore the charge of atheiſm brought againſt him, muſt have been founded on his ſatirical and unwarrantable abuſe of the clergy. It may appear inconſiſtent and even aſtoniſhing that this licentious author was alſo employed in writing the lives of St. Catharine of Sienna and of St. Thomas Aquinas, and compoſing penitential hymns and other devotional pieces; but he thus contrived to ſeparate religion from

good

good morals. Aretino died at Venice in 1556, at the age of 66 years. An Italian wit wrote an epitaph for him, the turn of which was, "that he calumniated every one but God, whom he ſpared only becauſe he did not know him." Gen. Dict. Nouv. Dict. Hiſtor.

ARETOLOGY, Aretologia, that part of moral philoſophy which treats of virtue, its nature, and the means of arriving at it.

AREVA, in *Ancient Geography*, now the *Adaja*, a river of Spain in the country of the Arevaci. See Adaja.

AREVACI, a people of Spain, who inhabited the interior part of the country to the ſouth-eaſt of the Vaccæans, from the ſource of the river Nareva to the mountains in which was the ſpring of the Durius or Duero.

AREVALILLO, in *Geography*, a river of Spain, which runs into the Adaja, a little above Arevalos.

AREVALOS, a town of Spain, in Old Caſtile, on the confines of Leon, between the rivers Adaja and Arevalillo, ſix leagues S.E. of Medina del Campo.

AREUS, in *Ancient Geography*, a ſmall river on the coaſt of Aſia, in Bithynia.

AREZIBO, in *Geography*, a town of the iſland of Porto Rico, three leagues from St. John.

AREZZO, anciently Arretium, or Aretium, a town of Italy, in the duchy of Tuſcany, the ſee of a biſhop, ſuffragan of the archbiſhop of Florence, but exempt from his juriſdiction. It lies on a declivity in the midſt of a fertile plain, producing grain, wine, and oil. In the time of the Romans, it was one of the twelve principal cities of Etruria; but it was over-run and deſolated by Sylla, becauſe in the Social war it was leagued with the enemies of Rome; and he conducted thither the inhabitants who were denominated Aretini Novi. For ſome time it formed an ariſtocratic republic; afterwards it became incorporated with the territory of the Florentines; and at length was transferred to the dominion of the Medicis, with the reſt of Tuſcany. This city was the native place of Mæcenas, Guido Arezzo, Aretin, and Petrarch. It is ſituated thirty-four miles ſouth-eaſt of Florence, and twenty-five E. N. E. of Sienna. N. lat. 43° 28′. E. long. 11° 50′.

ARFARA, one of the ſmaller of the Shetland iſlands.

ARFAS, in *Ancient Geography*, a town of Judæa, in the half-tribe of Manaſſeh, on the other ſide of the Jordan. According to Joſephus, it was the boundary of Trachonitis to the eaſt.

ARFEUILLE, in *Geography*, a town of France, in the department of the Allier, and chief place of a canton, in the diſtrict of Cuſſet, four leagues eaſt of Cuſſet, and four ſouth of Donjon.

ARG, a river of Germany, in Suabia, paſſes to Wangen, and diſcharges itſelf into the lake of Conſtance. It is the Argus of the Latins.

ARGA, a river of Spain, riſes in the Pyrenées, in the frontiers of Lower Navarre, traverſes Pampeluna, and joins the Arragon over againſt Villa-Franca.

Arga, or *Algiar*, a ſmall town of Arabia Petræa, in the government of Medina, ſeated on the Arabic gulf, and weſt of Medina, to which it is conſidered as a ſea-port. Some call it Egra, and others ſuppoſe it to be the ſame with Dsjar.

Arga, a branch or rib of the Altay mountains which paſſes weſtward to the river Yus.

ARGADES, in *Ancient Geography*, a river of Aſia, in Sitacene, mentioned by Ælian, Hiſt. Anim. l. xvi.—Alſo, a tributary town of Attica, noticed by Herodotus, and by Plutarch called Ergades.

ARGADINA, a ſmall town of Aſia in Margiana, according to Ptolemy.

ARGÆUS, a mountain of Aſia, being the higheſt in Cappadocia, with its ſummit always covered with ſnow, according to Strabo.

ARGAIS, an iſland of the Mediterranean ſea, on the coaſt of Aſia Minor, in Lycia, according to Steph. Byz.

ARGAL, or Argol, the hard lees ſticking to the ſides of wine-veſſels; more frequently called tartar.

ARGALI, in *Zoology*, a name ſynonymous with Muſimon, Ovis Ammon, Wild ſheep, Mouflon, &c. See Ammon. It is the ſame animal from which it is believed all the varieties and domeſticated kinds of that uſeful creature, the common ſheep, have originated, and is found in a ſtate of nature in the Alpine regions of the great continent of Aſia.

Linnæus, in the twelfth edition of the Syſtema Naturæ, places it in the genus Capra, from which it has been inferred, that he thought it rather the parent of the Goat, than the ſheep; and Briſſon ſeems to be of the ſame opinion. "Hircus (Capra orientalis) cornibus ſupra rotundatis, infra planis, ſemicirculum referentibus." Briſſ. regn. an. p. 71. n. 12. Dr. Shaw, who has entered more minutely into the hiſtory of this creature than the generality of writers, obſerves with his uſual caution and diſcrimination, that, in fact, the two genera, Capra and Ovis, are ſo cloſely allied that the line of ſeparation is not very eaſily diſcoverable; but that whether we conſider the figure or manners of the preſent animal, it ſeems rather to be the parent or ſtock of the ſheep than the goat race.

The celebrated Buffon has enlarged with equal elegance and inaccuracy on the hiſtory of the common ſheep, and has ventured to advance one opinion at leaſt which proves the fallacy of theoretical obſervations in a ſtriking point of view:—after conſidering the weakneſs and ſtupidity of this animal in a domeſticated ſtate; reflecting that he is without defence; that he has for his enemies all devouring animals; and can alone find ſafety in flight; he is tempted to think, that from the beginning it was a creature confided to the care of man; that it was dependent upon his help, and could not have continued to ſubſiſt without it; and of this he is perſuaded, becauſe wild ſheep were never found in the deſert. The hiſtory of the Argali, conſidered as the parent of theſe creatures, proves this to be at beſt a viſionary idea; and thoſe who have ſeen the ſheep of the domeſticated kinds that are permitted to rove amongſt the mountains, well know with what addreſs theſe creatures guard to the beſt of their means againſt every enemy, and will not therefore give implicit credit to the reſt of his obſervations. The Argalis have a far wider range, and are perfectly in a ſtate of nature; they are endowed with greater ſtrength and activity; and their mode of life proves them to be neither that helpleſs or defenceleſs race we might be led to imagine;—they contribute to the comfort, but *can* live independently of the foſtering protection of man.

To Dr. Pallas we are indebted for much valuable information reſpecting the Argali; it was obſerved by him throughout the vaſt chain of mountains that extends through the middle of the Aſiatic continent, to the caſtern ſea; and on the teſtimonies of Steller, Cetti, Gmelin, and others, varieties of it, differing only in a few ſlight particulars of ſize and colour according to the climate, are found in Kamtſkatka, the Kurile iſles, and California; and alſo in Barbary, Sardinia, Corſica, and the mountainous parts of Greece.

The character of the ſpecies is taken from the ſtructure of the horns, which are arcuated, ſemicircular, and flat beneath, and the dew-laps being lax and hairy. From Pallas, Gmelin, Shaw, &c. it appears that the argali is about the ſize

of the fallow-deer; of a ferruginous aſh-colour, intermixed with grey above, and white tinged with grey beneath; the face whitiſh, and behind each ſhoulder not unfrequently a duſky ſpot; the body is large, neck long, legs ſlender but ſtrong, and the hinder ones longeſt; the tail is remarkably ſhort, ſcarcely exceeding three inches in length, and is brown at the tip: the horns in full-grown animals are extremely large, placed at the top of the head, and ſtand cloſe at their baſe, riſing firſt upwards, and then bending down and twiſting outwards as in the common ram. The body is covered with hair inſtead of wool, in which particular conſiſts its chief difference from the general aſpect of a ſheep; but it is woolly at the rudiments of the hair: the face, and about the tip of the noſe eſpecially, becomes whiter in winter; the back more ferruginous, and the hair rather more rough, wavy, and curled. The female is ſmaller than the male; and her horns are ſmaller and leſs curved. The horns of the old males grow to a vaſt ſize, and have been found of the length of two Ruſſian yards, meaſured along the ſpires, and weighing fifteen pounds each.

Like that analogous creature the goat, the argali entirely prefers the alpine regions in ſummer, and are ſeen in that ſeaſon feeding on the ſcanty herbage that covers the higheſt mountains; in ſpring and autumn they are obſerved in the little vallies between the loftier precipices, and deſcend to the bottoms as winter approaches. They go in ſmall flocks or parties, produce their young in the middle of March, and have one, and ſometimes two at a birth. When firſt born, they are covered with a ſoft, grey, curling fleece, which changes to hair towards the end of ſummer.

"The argali," ſays Dr. Shaw, "is a very timid animal; and when cloſely purſued does not run in a directly progreſſive courſe, but obliquely from ſide to ſide, in the manner of other ſheep, aſcending the rocky mountains with great agility, and, like the wild goat, going over the narroweſt and moſt dangerous paſſes with perfect ſafety. The males are ſaid to fight frequently among themſelves, and will ſometimes precipitate each other down the rocks in their conteſts. Their chaſe is dangerous and difficult, but it is an important object with ſome of the Aſiatics, ſince the animal furniſhes a great number of neceſſary articles; the ſkin being uſed for clothing, and the fleſh for food. Dr. Pallas informs us, that the fleſh of the lamb is excellent; that of the old animals good, but more particularly when roaſted."

"In Corſica, the argali is known by the name *muſro*; where it is ſo wild as to be rarely taken alive, but is ſhot by the hunters, who lie in wait for it among the mountains. When the young are taken, however, which is ſometimes the caſe when the parent is ſhot, they are obſerved to be very readily tamed. The Corſican argali, or moufflon of Buffon, is of a darker colour than the Aſiatic kind."

The bearded ſheep and Siberian goat of Pennant's quadrupeds, Dr. Shaw conjectures to be a variety of the argali; a ſpecimen of it was brought into England from Barbary in 1561, and is deſcribed by Caius or Dr. Kay, who named it tragelaphus, on a ſuppoſition of its being the ſame with the tragelaphus of Pliny; and the following account of it is given by Mr. Pennant.

"Sheep with the hair on the lower part of the cheeks, and upper jaws extremely long, forming a divided or double beard, with hairs on the ſides and body ſhort; on the top of the neck longer, and a little erect; the whole under part of the neck and ſhoulders covered with coarſe hairs, not leſs than fourteen inches long; beneath the hairs, on every part, was a ſhort genuine wool, the rudiments of a fleecy clothing; the colour of the breaſt, neck, back, and ſides a pale ferruginous; tail very ſhort; horns cloſe at their baſe, recurvated, twenty-five inches long, eleven in circumference in the thickeſt place, diverging and bending outwards, their points being nineteen inches diſtant from each other."

ARGAN, in *Botany*. See SIDEROXYLON.

ARGANA, in *Geography*, a town of Aſia, in the government of Diarbekir, under the dominion of the Turks. It is ſeated on an eminence, in a principality of the ſame name, abounds with vineyards, and furniſhes exports of good wine. N. lat. 37°. E. long. 39° 14'.

ARGANCY, a town of France, in the department of the Moſelle, and chief place of a canton in the diſtrict of Metz, 3 leagues S. of Thionville, and 1½ N. of Metz.

ARGAND's LAMP. See LAMP.

ARGANTA, in *Geography*, a town of Spain, in New Caſtile, and dioceſe of Toledo.

ARGANTE, in *Entomology*, a ſpecies of PAPILIO. (*Dan. Gaud.* Gmel.) The wings are rounded, and fulvous beneath, ſpeckled with ferruginous. Fabricius. This inſect inhabits Braſil. *Oſ.* This muſt not be confounded with *Papilio Arganthe* of Cramer, that being *Papilio Canthus* of Fabricius and Gmelin.

ARGANTAMAGUS, in *Ancient Geography*, now *Argenton*, a place of Gaul, between Fines and Erno lorum.

ARGANTONIUS MONS, a mountain of Aſia, in Myſia, near the town of Pruſa. Strabo ſays, that in his time the inhabitants of Pruſa held a feſtival, during which they ran upon this mountain, and called Hylas; probably in reference to Hylas, the friend of Hercules, who was carried off from this mountain by the nymphs.

ARGARADAUCA, a town of Aſia, in Media. Ptolemy.

ARGARI, a place of India, in the peninſula on this ſide of the Ganges, according to Ptolemy; whence probably was derived the name of the Argaric gulf, on which it was ſituated. This gulf was oppoſite to the iſland of Taprobana, and between the promontories of Colliis and Calligicum.

ARGAROSSA, in *Geography*, a river of Savoy, which runs into the Iſere, 3 miles north-weſt of Monſtier.

ARGASCH, a town of Ruſſia, in the government of Simbirſk, 64 miles W. S. W. of Simbirſk. N. lat. 55°. E. long. 47° 4'.

ARGE, in *Entomology*, a ſpecies of PAPILIO, (*Nymph. Gem.* Gmel.) The wings are indented, white, ſtreaked with black; a ſingular ocellar ſpot on the anterior wings, and five on the poſterior ones. This inhabits the deſerts of Ruſſia, Eſper. Gmelin, &c.

ARGE, in *Geography*, a town of Aſia, in the Arabian Irak, ſeated on the Tigris, 175 miles north-weſt of Baſſora.

ARGE, a river of Lithuanian Pruſſia, which runs into the Nemonin, 4 miles north-weſt of Wipe.

ARGE', in *Mythology*, ſiſter of Hebé and Vulcan, was born of Jupiter and Juno, when this god diſguiſed himſelf under the form of a cuckoo, and deceived his wife.

ARGEA, or ARGEI, in *Antiquity*, human figures made of ruſhes, thrown annually by the Veſtals, from the pons Sublicius, into the river Tiber, on the day of the ides of May.

This ceremony we learn from Feſtus and Varro; the latter of whom, however, ſays, they were caſt by the prieſts, unleſs by *ſacerdotibus* we ſuppoſe he meant *prieſteſſes*. He adds, that the number of figures was thirty. Plutarch, in his Roman queſtions, inquires, why they were called *argea?* There are two reaſons aſſigned: the firſt, that the barbarous nation who firſt inhabited theſe parts call all the Greeks they could meet with into the Tiber; for *Argians* was a common name for all Grecians; but that Hercules perſuaded them to quit ſo inhuman a practice, and to purge themſelves of the crime, by inſtituting this ſolemnity.—The ſecond, that Evander, an Arcadian, and a ſworn enemy of the *Ar-*

gians, to perpetuate that enmity to his poſterity, ordered the figures of *Argians* to be thus caſt into the river. Ovid ſpeaks of this ceremony in his Feſt. v. 621:

> " Sum quoque priſcorum virgo ſimulacra virorum
> Mittere roboreo ſcirpea ponte ſolet."

ARGEADES, in *Ancient Geography*, one of the nations comprehended under the name of Macedonians, according to Appian; and the appellation *Argeates* is expreſsly given to certain kings who reigned in Macedonia, and who came originally from Argos, in a verſe cited by Pauſanias (l. vii. c. 8.); and Herodotus alſo ſpeaks of theſe firſt Macedonians who came from Argos.

ARGELES, in *Geography*, a town of France, in the department of the eaſtern Pyrenées, and chief place of a canton in the diſtrict of Ceret, near the Mediterranean ſea; 12 miles ſouth of Perpignan. The place contains 1,360, and the canton 7,775 inhabitants: the territory includes 235 kiliometres and 12 communes.

ARGELLEZ, or ARGELÈS, a town of France, and principal place of a diſtrict in the department of the Higher Pyrenées, ſeven leagues S. S. E. of Pau. The place contains 810, and the canton 9,910 inhabitants: the territory includes 477½ kiliometres and 30 communes. N. lat. 45°. W. long. 0° 13'.

ARGEMON, or ARGEMA, in *Medicine*, an ulcer about the iris of the eye, comprehending part of the white, and part alſo of the black.

The argemon appears of a red colour, on the outſide of the iris, and white within it. When it ſpreads far, and eats deep, it ſometimes occaſions the uvea to fall.

ARGEMONE, Ἀργεμώνη, Dioſc. from Ἀργέμη, a diſorder of the eye, which this plant is ſaid to cure, in *Botany*. Lin. gen. n. 649. Schreb. 882. Tourn. 121. Gært. t. 60. Juſſ. 236. Claſs, *polyandria monogynia*. Nat. Ord. of *Rhoeadeæ*. *Papaveraceæ* of Juſſ. Gen. Char. *Cal.* perianth three-leaved, roundiſh; leaflets roundiſh, with a point, concave, caducous. *Cor.* petals, ſix, roundiſh; ſtem erect, ſpreading, larger than the calyx. *Stam.* filaments numerous, filiform, length of the calyx; anthers oblong, erect. *Piſt.* germ ovate, five-angled; ſtyle none; ſtigma thickiſh, obtuſe, reflex, quinquefid, permanent. *Per.* capſule ovate, five-angled, one-celled, half-valved. *Seeds* numerous, very ſmall; receptacles linear, faſtened to the angles of the pericarp, not gaping. *Obſ.* The half-valved capſule diſtinguiſhes this from "Papaver." The ſecond ſpecies is three-valved; the third four-valved; and the firſt ſix-valved.

Eſſ. Char. *Cor.* ſix-petalled. *Cal.* three-leaved. *Capſ.* half-valved.

Species 1. A. *mexicana*, prickly argemone, or poppy; papaver ſpinoſum of Bauh. Cluſ. Mor. Ger. Carduus of Park. Ray. "Capſules ſix-valved; leaves ſpiny." Annual, riſing to the height of two or three feet, with ſtems armed with prickles; valves of the capſule varying in number, as well as the petals, from four to ſix; common in Mexico, and all the iſlands of the Weſt Indies, where it is a troubleſome weed in their cultivated lands; firſt brought into Europe by the Spaniards, under the title of "figo del inferno," or devil's-fig; now found wild in ſome of the ſouthern countries of Europe; cultivated by Gerard in 1597, and flowering in July and Auguſt. It abounds with a milky glutinous juice, turning, in the air, into a fine bright yellow, and not diſtinguiſhable from gamboge; ſaid to be efficacious, in ſmall doſes, in dropſies, jaundice, and cutaneous eruptions; deemed to be very deterſive, and uſed in diſeaſes of the eyes; the infuſion is ſudorific and reſolutive; the ſeeds are a ſtronger narcotic than opium, and frequently adminiſtered in the ſugar-colonies in diarrhœas and bloody fluxes, working by ſtool and vomit. In the Weſt Indies it is called the yellow thiſtle. 2. A. *armeniaca*, papaver orientale, &c. Tournef. "Capſules three-valved;" diſcovered by Tournefort in Armenia. 3. A. *pyrenaica*; "Capſules four-valved, ſtem naked;" approaching much in habit to "papaver alpinum." A native of the Pyrenées.

Propagation and Culture. The ſeeds of the firſt ſpecies muſt be ſown in a bed of light earth, in the ſpring, where they are to remain, and the plants thinned to the diſtance of four inches; when they have ſhed their ſeeds, a ſupply of plants, for ſeveral years, will not be wanting. The two other ſorts have not been cultivated. Martyn's Miller's Dict.

ARGEMONE. See PAPAVER.

ARGEMONION, a name given by ſome of the late Greek writers, to the plant called SARCOCOLLA by the other writers of their times.

ARGENCES, in *Geography*, a town of France, in the department of the Calvados, and chief place of a canton in the diſtrict of Caen, 5 leagues W. of Liſieux, and 2½ E. S. E. of Caen.

ARGENCHUM, in *Ancient Geography*, a foreſt of Gallia Aquitanica, near the place where Rochelle is now ſituated.

ARGENFELS, in *Geography*, a town and caſtle of Germany, in the diſtrict of the Lower Rhine, 17 miles N.N.W. of Coblentz.

ARGENNOS, in *Ancient Geography*, the name of one of the three iſlands called Trogiliæ, ſituate in the Ionian ſea, on the coaſt of Aſia Minor.

ARGENNUM, a promontory of Aſia Minor, in Ionia, near the iſland of Haloneſus. Strabo and Ptolemy.—Alſo, a promontory on the eaſtern ſide of Sicily, now *Capo S. Aleſſio*.—Alſo, a promontory on the eaſtern ſide of the iſle of Leſbos.

ARGENOMESCUM, a town of Hiſpania Tarragonenſis, in the territory of the Cantabri. Ptolemy.

ARGENS, or ARGENTZ, in *Geography*, a river of France, which diſcharges itſelf into the Mediterranean.

ARGENS, JOHN BAPTIST DE BOYER, *Marquis de*, in *Biography*, was the ſon of the ſolicitor-general to the parliament of Aix in Provence, and born in that city in 1704. He took up arms againſt the inclination of his father, at the age of fifteen; but on his return from Conſtantinople, he was conſtrained to enter himſelf at the bar. Being diſguſted with this profeſſion, he again embarked in the military ſervice, in 1735. Diſabled from purſuing it by a fall from his horſe, he ſupported himſelf for ſome time in Holland by his pen. Upon the acceſſion of Frederic, king of Pruſſia, he was appointed to be his chamberlain; and continued twenty-five years at Berlin; where he married, and maintained the character of a good huſband, friend, and maſter. At length he returned to his native city, and lived there as a philoſopher till the year 1771, when he died ſuddenly on a viſit to his ſiſter, the baroneſs de la Garde, near Toulon.

The marquis d'Argens formed himſelf upon the model of Bayle, and adopted thoſe free ſentiments with regard to religion and morals, which have been much in vogue on the continent from the time of Bayle and Monteſquieu. With talents inferior to thoſe of Bayle, he poſſeſſed an ardour of mind, which led him to make conſiderable acquiſitions in literature and ſcience; ſo that he underſtood ſeveral languages, had ſome acquaintance with chemiſtry and anatomy, and was a tolerable painter. As a writer, his ſtyle is diffuſe and deſtitute of energy; and his works, though they manifeſt erudition and reflection, are rendered diſguſting and offenſive by the licentiouſneſs of morals, and the perpetual attacks on religion and its eſtabliſhments, which are their characteriſtic features. The principal of theſe are, his "Jewiſh, Chineſe, and Cabaliſtic Letters," which, with the "Philoſophy of

Good Senſe," compoſe twenty-four volumes in 12mo. publiſhed in French under the title of "The Works of the Marquis d'Argens," in 1768; a great number of romances, ill deſigned and negligently written, including "Memoirs of himſelf," of no great importance and value; "Tranſlations from Greek into French of Ocellus Lucanus, Timæus Locrenſis, and the Diſcourſe of Julian on Chriſtianity;" and "Secret Memoirs of the Republic of Letters," printed in Holland in 4 vols. 12mo.; and at Paris, in ſeven. The Jewiſh and Chineſe letters are now the moſt known; but his other works have ſunk into oblivion. Nouv. Dict. Hiſtor.

ARGENSON, in *Geography*, a ſmall town of France, in the mountains of Dauphiny and dioceſe of Gap, two leagues from Aſpres; uſually called St. Pierre d'Argenſon.

ARGENT, a town of France, in the department of the Cher, and chief place of a canton in the diſtrict of Sancerre, one league and a half north of Aubigny. The place contains 1,042, and the canton 3,714 inhabitants: the territory includes 277½ kiliometres and 4 communes.

ARGENT, in *Heraldry*, ſignifies white, or ſilver, and is ſo called in the blazoning of the arms of gentlemen, knights, and baronets; but for ſovereigns and princes it is termed *luna*; for dukes, marquiſes, earls, viſcounts, and barons, *pearl*. By engravings it is repreſented plain. The word is French, derived from the Latin *argentum*, *ſilver*; this colour being ſuppoſed the repreſentation of that metal; whence the Spaniards call this field, *campo de plata*, *ſilver field*.

ARGENTA, in *Ancient Geography*, a town of Theſſaly, mentioned by Livy.

ARGENTAC, in *Geography*, a river of Albania in European Turkey, which runs into the Adriatic, ſix miles north of Durazzo.

ARGENTAL, a town of France, in the department of the Correze, and chief place of a canton in the diſtrict of Tulles, four leagues ſouth-eaſt of Tulles. The place contains 2,574, and the canton 9,789 inhabitants: the territory includes 155 kiliometres and 11 communes. N. lat. 45° 5′. E. long. 1° 47′.

ARGENTALIS, in *Entomology*, a ſpecies of PHALÆNA (*Pyralis*, Gmel.) found in Germany and Piedmont, about the ſize of PHALÆNA *purpuralis*. It is cinereous brown, with three waved ſilvery ſtreaks on the firſt pair of wings, and two on the ſecond. Fabricius and Gmelin.

ARGENTAN, in *Geography*, a town of France, and principal place of a diſtrict in the department of the Orne, four leagues ſouth of Falaiſe, and ſix and a half north of Alençon. The manufactures of this place conſiſt of lace, linen cloth, and light ſtuffs. It is the Argentomum or Argentomagum of the ancients. The place contains 5,618, and the canton 9,409 inhabitants: the territory includes 135 kiliometres and 15 communes. N. lat. 48° 44′. W. long. 0° 8′.

ARGENTINUM, in *Ancient Geography*, a town of Italy, in the territory of the Brutii, noticed by Livy.

ARGENTARIA, a town of Germany, near which the emperor Gratian defeated 30,000 Germans. Ptolemy calls it Argentuaria and Argentovaria. It was ruined by Attila about the fifth century.

ARGENTARIA *Creta*, *ſilver chalk*, in *Natural Hiſtory*, a name given to an earth, not properly a chalk, but a kind of tripela. It is a very beautiful earth, of a looſe friable texture, and perfectly pure white. It is dug in Pruſſia, and is much eſteemed for cleaning plate. It has alſo been found in France, and of late in Ireland.

There are many white chalks of various hues, which are dug in Germany, America, Italy, and other countries. That dug in the duchy of Mantua in Italy, is much uſed by painters, and at Rome vulgarly called *geſſo*.

ARGENTARIUS is frequently uſed, in *Roman Writers*, for a money-changer or banker.

The argentarii were monied people, who made a profit either by the changing or lending of money at intereſt. Theſe had their tabernæ, or offices, in the forum Romanum, built there as early as the reign of L. Tarquinius Priſcus. The argentarii and fœneratores were much hated on account of their covetouſneſs and extortion. Du-Cange and Pitiſcus.

ARGENTARIUS, in *Writers of the Middle Age*, an officer entruſted with the cuſtody of money.

In this ſenſe argentarius amounts to the ſame with the Greek αργυροφυλαξ, and our *caſhier*. Du-Cange.

ARGENTARIUS *Miles*, in our *Old Writers*, an officer of the exchequer, whoſe buſineſs it was to carry up the bag of money from the lower exchequer to the higher, in order to its being examined or told. Spelman.

ARGENTARII is alſo applied, in the *Civil Law*, to thoſe who adorned military arms with ſilver or gold.

In which ſenſe the word amounts to the ſame with BARBARICARII.

ARGENTARIUS *Mons*, in *Ancient Geography*, *Monte Argentaro*, a mountain of Etruria, in Italy, forming a promontory near the town of Loſa.

ARGENTARO is a cape of Tuſcany, ſouth of Orbitello, and caſt of the iſle of Giglio. N. lat 41° 55′. E. long. 14° 29′.

ARGENTATA, in *Entomology*, a ſpecies of PHALÆNA, (*Geometra*, Gmel.) The wings are yellow at the tips, with two ſilvery ſtreaks on the anterior pair, and a quadruple black ſpot on the poſterior ones. This is a native of China. Gmelin and Fabricius. The anterior wings are ſilvery at the baſe, with a large triangular brown ſpot; lower pair ſilvery, and yellow at the tip; and the four contiguous ſpots upon them have a braſſy gloſs.

ARGENTATA, a ſpecies of APIS found in Barbary. It is downy, cinereous; abdomen black; margin of the ſegments white beneath, with ſilvery hairs. Gmelin, &c.

ARGENTATA, a ſpecies of MUSCA, about the ſize of MUSCA *faſciata*; it inhabits Saxony. The ſcutel is ſlightly bidentated; body black; abdomen covered with ſilvery down, with yellow lateral ſpots. This belongs to the genus *Stratiomys* in the Fabrician ſyſtem, and muſt not be confounded with the following inſect.

ARGENTATA, a ſpecies of MUSCA, that inhabits Europe. The colour is cinereous; with four black lines on the thorax; abdomen grey, changeable; front ſilvery on each ſide. Gmelin, &c.

ARGENTATA, a ſpecies of ARANEA. The abdomen is white, with the poſterior part brown; the margin with ſix dentations. This is a large inſect, and inhabits South America. Gmelin.

ARGENTATA, in *Ichthyology*, a ſpecies of SCIÆNA, that inhabits the Arabian ſhore. The ſcales on the upper parts are blackiſh, with the margins and apex ſilvery; on the lower parts pale rufous, with paler margins. Gmelin. There is a large blue curved patch under the eye, which extends towards the mouth; inferior lip longeſt; lower lateral teeth in a row of larger ones, and behind theſe a row of ſmaller ones; poſterior gill-covers terminating in an acute angle; fins reddiſh brown, dorſal one glaucous, with a pale rufous margin; ſpines of the anal fin becoming gradually longer and larger.

ARGENTATA, in *Zoology*, a beautiful little creature of the SIMIA genus, a native of South America; named by Buffon *Mico*; and by Pennant, *the fair Monkey*. It is tailed and beardleſs; white; face red; and tail brown. Gmelin. This creature is not much larger than a ſquirrel, meaſuring only

only about ſeven or eight inches from the noſe to the rudiment of the tail; and the tail itſelf is twelve inches long. The whole animal is covered with hairs of a beautiful fine ſilvery white; except the face and ears, which are red, and the tail, which is of a deep brown. It is thus deſcribed by Briſſon: cercopitheeus ex cinereo albus argenteus, facie auriculiſque rubris ſplendentibus, cauda caſtanei coloris. Quadr. p. 142. 12.; and is SIMIA *argentata* of Schreber.

ARGENTATI MILITES, in *Antiquity*.—Livy, lib. vi. ſpeaks of *argentati milites*, as diſtinguiſhed from *aurati*. Aquinas ſuppoſes theſe to have been ſimilar to the *argyraſpides* and *chryſalpides*; but the deſcriptions do not quadrate. Livy only repreſents the *argentati* as clothed in white linen coats. Aquin. Lex. Mil.

ARGENTATUS, in *Entomology*, a ſpecies of CURCULIO, very frequent on oaks, nettles, nut-trees, &c. in England and other parts of Europe. Its ſpecific character is ſimply this: the whole body ſilvery green. Gmel. &c. The colour of the ſhell itſelf is black, but being wholly covered with beautiful minute ſcales of a fine ſilvery green colour, the inſect appears entirely of that colour before the ſcales are rubbed off. This ſpecies is Curculio femoribus omnibus denticulo notatis, corpore viridi oblongo, of Fn. Suec. 459. Curculio ſquamoſus viridi auratus, of Geoffroy; Curculio urticæ, of Degeer Inſ.; and Curculio argentatus of Donov. Brit. Inſ. &c. *Obſ.* Gmelin has given another ſpecies of CURCULIO under the ſame ſpecific name, viz. CURCULIO *argentatus*, of a ſilvery green, with the antennæ and ſhanks of the legs rufous, and the thighs brown and clavate; a native of Europe. This inattention of Gmelin is the ſource of endleſs confuſion; it is no unuſual circumſtance to find in his arrangement two or even more very different ſpecies under the ſame ſpecific name in thoſe genera that are extenſive; ſometimes indeed, to avoid confuſion, he places them in different families, but in the preſent inſtance, we find both in the ſame family: ** *Breviroſtres*, † *femoribus dentatis*.

ARGENTATUS, in *Ichthyology*, a ſpecies of SPARUS that inhabits the rivers in Japan, and is diſtinguiſhed by having a black ſpot behind the gills. It is covered with ſilvery ſcales, and is about ſix inches in length; and has two noſtrils before the eyes. Gmelin, &c.

ARGENTATUS, a ſpecies of *Centrogaſter* that inhabits the rivers in Japan. It is ſilvery, with a large brown ſpot on the nape, and a blackiſh one on the dorſal fin. This fiſh is about three inches and a half in length, and the tail is forked. Gmelin, &c.

ARGENTATUS, in *Ornithology*, a ſpecies of LARUS, called by Dr. Latham the ſilvery gull, and it is alſo the ſilvery gull of the Arctic zoology. It is white; the head and neck ſtriated with cinereous: primary quill feathers black above, beneath grey, and white at the tips. Gmelin, &c.—This bird inhabits Norway.

Dr. Latham notices a ſpecies of *Gull* very much like this in the Leverian Muſeum. The length is near ſixteen inches; bill an inch and a half long; quills as in the other; but the two firſt have the ends tipped with white for near an inch, inſtead of a ſmall ſpot; and ſix of the prime quills had the ends black; the bill and legs are pale, but as the bird had been in ſpirits ſome time, nothing certain could be ſaid about them. Vide Gen. Syn.

ARGENTEA, in *Conchology*, a ſpecies of VENUS, of a ſomewhat oblong ſhape, ſmooth, and ſilvery, with black lines united into bands. This ſhell inhabits the ſhores about Cadiz.

ARGENTEA, a ſpecies of PATELLA. This ſhell is ſmooth, thick, and ſomewhat ſilvery, with eleven brown rays; margin ſilvery; tip pale yellow; bottom like ivory, with a double white ring. It is a rare ſhell, about two inches in length; and the native country unknown. Vide Schroet. and Gmelin.

ARGENTEA, in *Entomology*, a ſpecies of CANTHARIS, found in Africa, and deſcribed by profeſſor Thunberg. The thorax is flat, and with the wing-caſes are green; the abdomen is ſilky ſilvery. To this is added, that the head is black; vent and legs yelloviſh; feet brown.

ARGENTEA, a ſpecies of SPHEX that inhabits Coromandel. It is black and gloſſy; front villous and ſilvery; wings white, and brown at the tip. This is a large inſect. Fabricius and Gmelin.

ARGENTEA, a ſpecies of ARANEA that inhabits the deſerts of Ural, and is deemed a poiſonous creature by the Calmucks. The thorax is depreſſed, orbiculated, white, with two black ſtripes; abdomen ovate, lobed, ſilvery, with two pair of dots in the middle, and four rows behind. Lepech. it. i. p. 316. This inſect ſpins a perpendicular web; the legs are long, black, and annulated with yellow. Gmelin.

ARGENTEA, in *Ichthyology*, a ſpecies of PERCA that inhabits America, and is thus very concifely defined by Linnæus and Gmelin: noſtrils tubular; there is a large black ſpot on the ſpinous part of the dorſal fin.

ARGENTEA, a ſpecies of SCIÆNA. It is ſilvery, ſpotted above with black; beneath immaculate. Forſk. Fn. Arab. The crown is ſcaly; two elevated lines between the noſtrils; iris ſilvery above, brown; teeth numerous, ſetaceous, movable, the outer row largeſt; dorſal fin connected, and ſpotted with black; the firſt rounded, the other linear; ventral and anal fin pale rufous, pointed at the ends; tail ſomewhat bifid.

ARGENTEA, in *Natural Hiſtory*, a ſpecies of SERTULARIA that inhabits the European and American ſeas; and is called by Ellis *the ſquirrel's tail*; it is alſo CORALLINA comis ad inſtar caudæ vulpinæ ſparſis of Mercat.; and MUSCUS marinus minor, denticulis alternis bijugis of Moriſ. Hiſt. Pl. &c. According to Linnæus, Solander, Gmelin, &c. its ſpecific character is this: denticles nearly oppoſite, and pointed, veſicles oval; branches alternate and panicled.

ARGENTEA, *Aſhem*, in *Ancient Geography*, a town ſituate at the northern point of the iſland of Jabadii. Ptolemy.

ARGENTEAU, in *Geography*, a deſolated town of the Netherlands, in the duchy of Limburg, two leagues weſt of Dalem.

ARGENTEOLA, or ARGENTIOLUM, in *Ancient Geography*, a town of Spain, in Aſturia. Ptolemy.

ARGENTELLA, in *Entomology*, a ſpecies of PHALÆNA (*Tinea*, Gmel.) It is entirely ſilvery, except the antennæ, which are annulated with brown. Linn. Fabr. This is *tinea perlella* of Wien. Schmetterl. p. 134. The larva is gregarious, glabrous, brown, and feeds on the nettle. Degeer, &c.

ARGENTERO, in *Geography*, a mountain of European Turkey, between Bulgaria and Macedonia.

ARGENTEUIL, a town of France, in the department of the Seine and Oiſe, and chief place of a canton, in the diſtrict of Verſailles, eight miles N. W. of Paris. The place contains 4,726, and the canton 16,557 inhabitants: the territory includes 67½ kiliometres, and 11 communes.—Alſo, a town of France, in the department of the Yonne, three leagues from Tonnerra.

ARGENTEUM Os, in *Natural Hiſtory*. See Os *Argenteum*.

ARGENTEUS, in *Coinage*. See DENARIUS.

ARGENTEUS, in *Entomology*, a ſpecies of SCARABÆUS, found in England, and the interior of Auſtria. It is black, beneath ſilvery, and ſhining; margin of the ſhield and wing-caſes

caſes teſtaceous. Fabricius and Gmel. *Obſ.* In the Fabrician ſyſtem it belongs to the *Melolontha* genus; and in that of Gmelin to the ſection of *Scarabæi melolonthæ*. It is the ſame ſpecies as Scopoli and Poda call *Scarabæus argenteus*.

ARGENTEUS, a ſpecies of CULEX, very common in Barbary. It is about the ſize of the common Engliſh gnat; the back is covered with ſilvery ſcales; and the legs are faſciated. Vide Poiret Journ. de Phyſ. 1787. Apr. p. 245.

ARGENTEUS, in *Ichthyology*, a ſpecies of CHAETODON, found in the Indian ſea. The tail is biſid, with eight ſpines in the dorſal fin, and two ſpines inſtead of ventral fins. Amœn. Ac. The ventral ſpines are ſhort, and the firſt dorſal fin ſcarcely viſible. Gmelin.

ARGENTEUS MONS, in *Ancient Geography*, *Sierra de Almaraz*, a mountain of Spain, from which the river Bœtis ſprings. Strabo.

ARGENTEUS *Codex*, in *Biblical Hiſtory*, a manuſcript of the four goſpels, is ſo called from its ſilver letters, and is ſuppoſed to be a copy of the Gothic verſion made by Ulphilas, the apoſtle of the Goths, in the fourth century. It is of a 4to. ſize; the leaves, which are vellum, parchment, or papyrus, are ſtained with a violet colour; and on this ground the letters, which are all capitals, were afterwards painted in ſilver; except the initial characters, and a few paſſages, in gold. Mr. Coxe, from a cloſe inſpection, was convinced that each letter was painted, and not formed, as ſome have aſſerted, by a hot iron upon leaves of gold and ſilver. Moſt of the ſilver letters are become green by time; but the golden letters are ſtill in good preſervation. This codex is mutilated in ſeveral places; but what remains is, for the moſt part, perfectly legible. It was firſt diſcovered in 1597, in the library of the Benedictine abbey of Werden in Weſtphalia, whence it was brought to Prague, and at the capture of this city in 1648, ſent as a valuable preſent to Chriſtina of Sweden. It afterwards came into the hands of Iſaac Voſſius, either by ſtealth, or as a preſent from the queen; and on the death of Voſſius, it was purchaſed by Count Magnus Gabriel de la Gardie for two hundred and fifty pounds, and preſented to the univerſity of Upſal, where it now remains. Three editions of it have been given to the public: the firſt was iſſued at Dort in 1665, by T. Junius, who borrowed the MS. from Voſſius; and accompanied with obſervations and a gloſſary, by Thomas Marſhall. That printed at Amſterdam in 1672, is the ſame with this, having only a new title-page, date, and place of impreſſion. The ſecond edition, publiſhed at Stockholm, in 1672, by the learned Stiernhelm, differs from that of Junius, by having the text in Latin, and not in Gothic characters. Benzelius, firſt librarian of the univerſity of Upſal, and afterwards archbiſhop, collated the MS., rectified miſtakes, and made a literal tranſlation into the Latin tongue. Theſe collations and tranſlation, together with various obſervations, were tranſmitted to Mr. Edward Lye, of Oxford, who publiſhed a third edition in 1750, from the Clarendon preſs; this is eſteemed, by thoſe who have compared it with the original codex, a complete work. Two opinions have divided the learned concerning the original tongue of the codex argenteus; the firſt opinion, that it is written in the language and character uſed in the fourth century by the Goths of Mœſia, anceſtors of the preſent Swedes, and is a true copy of the verſion made by Ulphilas, is ſtrongly ſupported by Junius, Stiernhelm, David Wilkins, Benzelius, and Lye. The ſecond opinion, viz. that it is a tranſlation in the Frankiſh idiom, is as warmly defended by Hickes, la Croze, Wetſtein, and Michaelis. Mr. Coxe inclines to the former opinion, which is confirmed in an ingenious treatiſe of Ihre; by which it appears that ſeveral ſpecimens of the Oſtrogothic tongue have been lately diſcovered in Italy, which perfectly reſemble both the characters and language of the verſion in the codex argenteus. However this be, as the Gothic and Frankiſh idioms were dialects of the Teutonic or German, this MS. muſt be conſidered as the moſt ancient ſpecimen extant of that language. Thoſe who attribute the verſion to Ulphilas, refer its date to the fourth century; and thoſe who deem it to be a Frankiſh tranſlation, allow it to have been copied in the reign of Childeric, between 564 and 587. Beſides, its high antiquity is proved from the doxology at the end of the Lord's prayer, Matt. vi. 13. which is not found in any of the moſt ancient verſions; and alſo from the interpretation of many paſſages in a ſimilar manner with ſeveral of the Latin tranſlations, which are antecedent to the vulgate of St. Jerom. Another fragment of this curious MS. containing a few chapters of St. Paul's epiſtle to the Romans, was found at Wolfenbuttle, and is now preſerved in the library of that town. Of this fragment Ihre publiſhed a new and important edition, at Upſal, in 1763. Michaelis's Introduction to the New Teſtament, by Marſh, vol. ii. p. 133—153. Coxe's Travels, vol. iv. p. 173—180. ed. 1802.

ARGENTHAL, in *Geography*, a ſmall town of Germany, in the circle of the Upper Rhine, and duchy of Simmern, forty miles eaſt of Treves, and four ſouth-eaſt of Simmern.

ARGENTICOMUS, among *Ancient Aſtrologers*, denotes a kind of ſilver-haired comet, of uncommon luſtre, ſuppoſed to be the cauſe of great changes in the planetary ſyſtem.

ARGENTIER, JOHN, in *Biography*, born at Caſtelnovo in Piedmont, in 1514, acquired conſiderable celebrity, though his talent was rather that of teaching the art than practiſing, as he was well verſed in the theory of medicine, and had read and commented on moſt of the old writers, but his memory was ſo defective, that he was rarely able to apply the obſervations he had made for the benefit of his patients. He taught medicine at Naples, Piſa, and laſtly at Turenne, where he died in 1572, aged 58 years. His works were collected and publiſhed at Venice, in two vols. in folio, 1592; and have been ſince twice printed. He prided himſelf much in having diſcovered ſome errors in the works of Galen, whoſe doctrines he frequently oppoſed. Haller. Bib. Med. Pract. Eloy. Dict. Hiſt. de la Med.

ARGENTIERA, a volcanic iſland of the Archipelago, formerly called Cimolus, or Cimolis, one of the Cyclades, which is about eighteen miles in circumference, and derives its name from a mine of ſilver that was for a long time worked in it with ſucceſs; but it is now unknown. The ſoil is extremely dry, and deſtitute of ſprings; nor is there any water here but what is collected in ciſterns, or brought from Milo, an iſland at a little diſtance: the hills, vales, and the whole country ſtript of trees, do not offer a ſingle ſhade to defend from the ſun. The Venetians, during their war with the Turks, cut down all the olive-trees, and did irreparable damage to the iſland; nor do the preſent inhabitants dare to make freſh plantations, leſt they ſhould draw on themſelves heavier impoſitions. Such is the miſtaken policy of the Ottoman government; if its ſubjects manifeſt any induſtry, it is immediately taxed, and ſtifled in its birth. Argentiera preſents nothing but rocky hills, deſtitute of verdure, and vales producing worthleſs ſhrubs and thorny thickets. The vales are generally covered with a white and fat clay, called by the ancients *Terra Cimolia*, or *Cimolia Creta*, a kind of Fuller's earth, which the inhabitants employ inſtead of ſoap to waſh their linen. See CIMOLIA *Terra*. Though the ſoil is barren, the induſtrious iſlanders make it produce for them a ſubſiſtence.

ſubſiſtence. They cultivate barley, and a little wheat, which they ſow at the beginning of autumn, the rainy ſeaſon, and reap in March; a ſmall quantity of cotton, and a few vines. But their grapes are not ſufficient for making wine, which they procure from the neighbouring iſlands, particularly from Milo. Their olive and mulberry trees are very few. They rear hogs, poultry, and ſome few goats and ſheep; but as to the latter, they are chiefly ſupplied from Milo: and the country affords them quails, hares, and partridges in abundance. Their beaſts of burden are aſſes; in the uſe of which they have no ſuitable accoutrements. The women ſpin cotton, and knit ſtockings, whenever the labours of the country allow; and the men employ themſelves in fiſhing and navigation. Excellent fiſh are taken round the iſland, eſpecially the rouget (the ſurmulet, *mullus* Linnæi), a fiſh well known and highly eſteemed for its delicate flavour on all the coaſts of the Mediterranean. The tribe of Greeks which inhabits this iſland, is compoſed of two hundred perſons, according to Olivier; two hundred families, as Sonnini reports; or, as others ſay, about five hundred perſons; who have no Turkiſh officers reſident amongſt them, but have an annual viſit from the captain pacha, who, beſides levying an impoſt of 15 or 1600 piaſtres, which they find it difficult to pay, exacts preſents to a conſiderable amount, ſo as to reduce the inhabitants to miſery. Cotton is almoſt the only article that produces for them any money; their cotton ſtockings ſupply the Europeans; and the mariners purchaſe their hogs, poultry, and eggs. The dreſs of the Greek women of Argentiera is peculiar: they ſwell out their legs by wearing ſeveral pairs of ſtockings, and appear as if they were booted, which they conſider an eſſential part of dreſs: their garments do not deſcend above two inches below the knee, and theſe are ſo contrived as to ſpoil their ſhape, and render it impoſſible to form any idea of the beautiful proportions with which they were formed by nature. The neck is concealed under a corſet, quilted, and ſtiffened with whale-bone; a piece of velvet, ſattin, or cloth trimmed with gold or ſilver net-lace, or ſet by a ſimple embroidery, adorns their whole front; and in their gala dreſs, two wide ſleeves are fixed to the corſet, and fall on each ſide to the middle of the thigh. In ſummer the whole arm is covered only by the ſleeve of the ſhift, the head is enveloped with a handkerchief which paſſes under the chin. In other reſpects they are cheerful, lively, and handſome. Savary.

The only inhabited place in the iſland is ſeated on the ſummit of a mountain of rocks, to which the acceſs is very difficult. The houſes are few, miſerably conſtructed, and filled with flies; but it is ſurrounded by high walls, and ſecured by two gates. Their dwellings, which may be rather called huts or dens than houſes, are covered by a roof, conſiſting only of a ſort of wooden hurdle, on which earth is ſpread and beaten. The ſuperſtitious Greeks rely on heaven, more than on the ſtructure of their habitations, for their ſecurity. Accordingly, on the eve of the feſtival of the exaltation of the holy croſs, it is an ancient cuſtom to ſweep and nicely clean the flat roofs of the houſes; and towards evening, when the bells of the churches begin to ring, the inhabitants draw upon them large croſſes, which figures are, in their eſtimation, the moſt effectual means of preſerving the tops of their houſes from being penetrated by the rains. The ſingle ſtreet of which this wretched town or village conſiſts, unpaved, is, in the rainy ſeaſon, a long heap of deep mud; and the water, finding its way into the rooms of the ground floor, which are almoſt ſubterraneous, renders their habitations equally unwholeſome and inconvenient. The ſmall church or chapel of the Capuchins, ſerves for the catholics of Argentiera; and a ſecular prieſt, born in the iſland of Scio, and educated at Rome, performs divine ſervice in this chapel, and aſſumes the title of the grand vicar or nominal biſhop. The town is of very modern conſtruction, having been erected ſo lately as the year 1646, by ſome Greek fugitives from the iſland of Siphanto, who are ſaid to have brought with them an image of the Virgin; and built houſes, where this image had ſtopped with them, and preſerved them from the attacks of their enemies. Several Greek churches or chapels are built behind the village, all of which have little bells above their portals, which are frequently in motion. About half a league from this town, Olivier found fragments of bricks and potter's ware, which indicated the poſition of the ancient town; and upon digging in this ſpot, he diſcovered ſome rude figures of baked earth, ſuch as a toad, a ſphynx, and a cock, and alſo a ſmall vaſe with a handle in the Etrurian ſtyle. He alſo perceived canals in the bank of lava, probably for the purpoſe of affording a paſſage to boats, caves for ſhelter from the rain and ſun, and other caverns, which might have been places of habitation or interment at different epochs which hiſtory has not recorded.

This iſland is nothing but a group of volcanic ſubſtances, and exhibits every where indications of a great combuſtion. In ſeveral places the rocks are calcined; pozzolana was found here by Olivier, and the hot waters which iſſue from a rock near the ſea, in the north-weſt part of the iſland, atteſt the exiſtence of a ſubterraneous fire in full activity. The heat of theſe waters is ſuch, that a perſon cannot hold his hand in them, and an egg is in an inſtant boiled hard. The Greeks reckon them efficacious for curing rheumatiſm, ſciatica, and other diſorders of that nature, by means of linen cloths ſteeped in them and applied to the parts affected. Near theſe waters is the mouth or centre of an ancient volcano, which, for a long time, exhaled infectious vapours, whence the modern Greeks have called it "vromo limno," or ſtinking lake. This gulf is now a lagoon of the ſea, which no longer yields any bad ſmell. To the north of this lake are ſeveral grottoes or caverns cut in the rock, which ſeem to have ſerved as habitations. Sonnini obſerved in this place a great number of thruſhes of the large ſpecies, together with blackbirds, linnets, pettychaps, partridges, woodcocks, &c. In the north-north-eaſt quarter of the iſland is a diſtrict called "Kedros," becauſe it is furniſhed with the ſpecies of tall junipers ſo denominated by the modern Greeks, being a variety of the "juniperus oxicedrus" of Linnæus. They yield no gum in this iſland; but the Greeks make uſe of the oil, which they draw from the ſtem and branches, for the cure of the itch. The environs of "Praſe," on the ſide of Kedros, furniſh a great quantity of wild artichokes; which the inhabitants gather and eat with avidity. The moſt common ſhrub on the iſland is the lentiſk, the fruit of which yields on expreſſion an oil, which is fit only for burning, though the poor uſe it in their food, and it is applied as a topical remedy for rheumatic pains. Saffron alſo grows on the mountains, and between the rocks of the iſland; and it is ſold in the markets by the weight of eggs. The road-ſtead of Argentiera, moſt frequented by the ſhips which navigate in the Archipelago, is formed by the iſle of Milo to the ſouth-weſt, by that of Argentiera to the north, and by the ſmall iſlands of San Georgio and of Polivo to the eaſt. Trading veſſels anchor between the iſlands of Argentiera and San Georgio, and are here ſheltered from the wind and ſea. But this anchorage has not a ſufficient depth of water for ſhips of war and large veſſels, which paſs more to the north or north-eaſt, in a channel near Polivo. N. lat. 36° 48′. E. long. 24° 40′. Olivier's Travels in the Ottoman Empire, p. 126—133. Sonnini's Travels in Greece and Turkey, p. 281—327.

ARGENTIERA, a town of Italy, belonging to the Venetian ſtates in the Cadorin, eleven miles N. N. W. of Pieve di Cadora.

ARGENTIERE, L', a town of France, in the department of the higher Alps, and chief place of a canton in the diſtrict of Briançon, on the Durance, nine miles north of Mont Dauphin.

ARGENTINA, in *Botany*. See POTENTILLA.

ARGENTINA, in *Geography*, a town of Savoy, in the county of Maurienne, near the river Arc, ſixteen miles E. S. E. of Chambery.

ARGENTINA, a town of Italy, in the kingdom of Naples, and province of Calabria Citra, at the foot of the Apennines, ten miles S. W. of Biſignano.

ARGENTINA, in *Entomology*, a ſpecies of PHALÆNA, (*Bombyx*, Gmel.) that inhabits Germany. The wings are indented, grey, with ſilvery ſpots. Fabricius. When this inſect is at reſt, the wings have three erect tufts on the back. The larva is naked and grey; with the fourth, eleventh, and twelfth ſegment tuberculated; the pupa is obtuſe and brown; feeds on oaks.

ARGENTINA, a ſpecies of PHALÆNA, (*Noctua*, Gmel.) found in the ſouthern part of Ruſſia. The wings are grey, with a broad abbreviated ſilvery ſtripe. Fabricius and Gmelin.

ARGENTINA, in *Ichthyology*, a genus in the order *Abdominales*, containing only four ſpecies; viz. ſphyræna, gloſſodonta, carolina, and machnata. The generic character is thus defined by Gmelin. Teeth in the jaws, and tongue; eight rays in the gill membrane; vent near the tail; and many rays in the ventral fins.

ARGENTINÆ, in *Natural Hiſtory*, a ſpecies of ECHINORHYNCHUS, ſo named, becauſe it infeſts the inteſtines of the atherine, atherina of Linnæus. Redi, Gmelin, &c.

ARGENTINE *flowers of antimony*. See ANTIMONY, § 6. Oxyds of antimony.

ARGENTINE, of Kirwan. See SCHIEFER SPATH.

ARGENTINE *Felſpar*, of Kirwan. See FELSPAR.

ARGENTOMAGUS, in *Ancient Geography*, *Argenton*, a town of Gaul, belonging to the Bituriges, in the road that led to Mediolanum on the eaſt, and Limonum on the weſt.

ARGENTON, in *Geography*, a ſmall and mean, but gay and lively town of France, in the department of the Indre, and chief place of a canton in the diſtrict of Chateauroux, five leagues S. S. W. of Chateauroux. It is ſituated in a beautiful valley, ſurrounded by vineyards on the Creuſe. The place contains 3395, and the canton 10,359 inhabitants: the territory includes 290 kiliometres, and 10 communes. N. lat. 46° 35′. E. long. 1° 52′.

ARGENTON *le Chateau*, a ſmall town of France in the department of the Two Sevres, and chief place of a canton in the diſtrict of Thouars; 3 leagues weſt of Thouars. The place contains 270 and the canton 7937 inhabitants; the territory includes 342½ kiliometres, and 19 communes. N. lat. 46° 59′. W. long. 0° 33′.

ARGENTON *les Egliſes*, a town of France in the department of the Two Sevres, four miles north of Thouars.

ARGENTOR, a river of France in the department of Charente, formed by two ſtreams called Argent and Or, and running into the Charente at the village of Porſac.

ARGENTORATENSIS, in *Ornithology*, a ſpecies of FRINGILLA found in the environs of Straſburgh. It is called by Briſſon *Linaria argentoratenſis*; and by Buffon, *Gyntel de Straſburgh*. This bird is brown; beneath, rufous with brown ſpots; abdomen and vent whitiſh. Gmelin. To this ſpecific character may be added, that it ſcarcely exceeds the ſize of the common linnet: the quills and tail are brown; and the legs reddiſh. It is familiarly known about Straſburgh by the name of *Gyntel*, and is ſaid to lay ſometimes four eggs, but ſeldom if ever more.

ARGENTORATUM, in *Ancient Geography*, *Straſburgh*, a city of Gaul, belonging to the Triboci, or Trebochi, which was a paſſage from Gaul to Germany, whence its name Stratre-burgus, or Straſburgh. It had anciently a manufacture of offenſive and defenſive arms of every kind. In the fourth century, Julian gained, under the walls of this city, a famous victory over the Germans, and took their king Chondomarus priſoner. After the eſtabliſhment of Chriſtianity among the Gauls, it became an epiſcopal ſee.

ARGENTRE' *ſur Laval*, in *Geography*, a town of France, in the department of the Mayenne, and chief place of a canton in the diſtrict of Laval, four miles eaſt of Laval. The place contains 1665, and the canton 7530 inhabitants: the territory includes 182½ kiliometres, and 9 communes.

ARGENTRÉ *ſous Vitré*, a town of France, in the department of the Ille and Villaine, and chief place of a canton in the diſtrict of Vitré, ſeven miles north-north eaſt of La Guerche. The place contains 2288, and the canton 12,805 inhabitants: the territory includes 202½ kiliometres, and 9 communes.

ARGENTUARIA, in *Ancient Geography*, a town of Belgic Gaul. Ptolemy.

ARGENTUM. See SILVER.

ARGENTUM *album*, mentioned in Domeſday book, ſignifies, according to Spelman, bullion, or ſilver uncoined. In thoſe ancient days, ſuch metal paſſed as money from one to another in payment. *Sumitur pro ipſo hoc metallo penſili non ſignato.*

ARGENTUM *Dei*, *God's penny*, anciently ſignified *earneſt-money*, or money given to bind a bargain; in ſome places called *erles*, or *arles*, and by the civilians and canoniſts, ARRHÆ. *Et cepit de prædicto Henrico tres denarios de* argenti *Dei præ manibus.*

ARGENTUM *fulminans*. See *Salts* of SILVER.

ARGENTUM *moſaicum* or *muſivum*. This is a metallic alloy in the form of ſilvery flakes, uſed as a pigment for giving a white metallic luſtre to plaſter caſts, paper, porcelain, &c.

It is prepared in the following manner. Take an ounce and a half of pure tin, and the ſame quantity of biſmuth: melt them together in a clean crucible, and ſtir the maſs repeatedly with a clean iron rod till the two metals are accurately mixed. Then remove the crucible from the fire; and when its contents are on the point of becoming ſolid, pour in an ounce and a half of warmed quickſilver; ſtirring it as before. Previouſly to uſing this alloy, it muſt be ground in a ſtone or earthenware mortar, with white of egg or ſpirit varniſh, and in this ſtate applied to the intended work: when dried it may be burniſhed in the uſual manner, and has then very much the appearance of ſilver. Encycloped. Method. Arts & Metiers, art. arg. muſicum.

ARGENTUM *nitratum*, in Pharmacy, otherwiſe known by the names Nitrated ſilver, and Lunar cauſtic.—See SILVER, *medical preparations of*.

ARGENTUM *vivum*. See MERCURY.

ARGENVILLE, in *Biography*. See DEZALLIER.

ARGENUS, in *Ancient Geography*, a port of Carmania. Pliny.

ARGENUSÆ, or ARGINUSÆ, in *Ancient Geography*, ſmall iſlands ſituated near the coaſts of Aſia Minor, ſouth-eaſt of the iſle of Leſbos and near it. They were rendered famous by the battle gained by the Athenians over the Lacedæmonians, in the twenty-ſixth year of the Peloponneſian war, or the 406th year before Chriſt. Of theſe three iſlands, the largeſt had a town called Arginuſa.

ARGEONESUS, a ſmall iſle of Egypt, near Canobus; ſo called from Argeus, king of Macedon, who began his reign in the 678th year before the Chriſtian æra.

ARGESTES, is uſed by Vitruvius for the wind which blows from that quarter of the horizon, which is 75° from the ſouth and weſtward.

Ricciolus

Ricciolus uſes the term to denote the wind which blows at 22° 30′ from the weſt towards the north, coinciding with that which is otherwiſe called W. N. W. Aſt. Reform.

ARGETÆ, in *Ancient Geography*, a people of Aſia who inhabited the weſtern banks of the river Indus. Pliny.

ARGETENAR, in *Aſtronomy*, a ſtar of the fourth magnitude, in the flexure of the conſtellation Eridanus.

ARGHAN, in *Geography*. See Ragian.

ARGIA, in *Entomology*, a ſpecies of Papilio (*Dan. Card.* Gmel.) The wings are rounded, entire, and white; tip of the anterior pair black. This is a native of Sierra Leona in Africa; and is figured by Cramer under the name of *Caſſiopea*. There is a large brown ſpot near the apex of the anterior wings beneath; and the inner margin is beſet with long, faſciculated, erect, white hairs. Fabricius, &c.

Argia, in *Geography*, a town of Arabia Deſerta, 200 miles S. S. E. of Ana. This is alſo the name of one of the three principalities into which Arabia Deſerta is divided.

ARGIADES, in *Entomology*, a ſpecies of Papilio (*Plcb. Rural.* Gmel.) The wings are entire, and blue, with a blackiſh margin; beneath, the colour is a browniſh-grey, with a lunar mark, and two rows of ocellated dots. Fabricius.—This inſect inhabits Saxony.

ARGIÆ *Inſulæ*, in *Ancient Geography*, iſlands of Aſia Minor, on the coaſt of Caria. Pliny.

ARGIANS. See Argives, and Argos.

ARGIL. See Clay.

Argil *native*,—*Alumine native*, Fr. *Reine Thonerde*, Germ. *Argilla pura*. Werner.—This mineral (called alſo by ſome Lac Lunæ,) is of a ſnow white or yellowiſh white colour. It is found in various ſized kidney-form maſſes; is amorphous; and preſents a fine-grained earthy fracture; it flies when broken into indeterminate blunt cornered fragments. It is opaque, but when ſoaked in water acquires a degree of ſemitranſparency like gum tragacanth; ſtains the fingers, feels ſomewhat meagre; adheres ſlightly to the tongue, and exhales, when moiſtened, an earthy ſmell. It is eaſily broken, being almoſt friable. Sp. gr. according to Bergman = 1,305; according to Gmelin 1,669.

Native Argil is infuſible *per ſe* even at 166° Wedgewood. It is ſoluble in mineral acids ſometimes with and ſometimes without effervеſcence, on account of a ſmall proportion of carbonated lime with which it is often mixed. By the analyſes of Schreber and Friſchmann, it is alſo found to contain a few ſlight traces of iron and ſilex. It is ſaid, with little probability however, that this mineral has been procured in Sileſia, at Poliniere, and in Lombardy; the moſt authentic ſpecimens come from Halle in Saxony, being found in the garden belonging to the college there; hence it has been ſuſpected to be an artificial product, and the ſtore of it is underſtood to have been for ſome years paſt exhauſted. It is not made any uſe of. Widenmann, p. 385. Lenz. verſuch, &c. vol. i.—Brochant, vol. i. Kirwan, vol. i.

ARGILA, in *Ancient Geography*, a town of Aſia Minor, in Caria. Steph. Byz.

ARGILETUM, the name of a ſmall hill of Rome, between mount Aventin and the capitol. Numa erected on this hill the temple of Janus.

ARGILIUS, a mountain of Egypt, near the Nile, ſo called becauſe Jupiter carried thither the nymph Argea, and had a ſon by her named Dionyſius.

ARGILL, or Hargill, in *Ornithology*, one of the ſynonymous names of the Linnæan Ardea *dubia*, and *gigantic crane* of Dr. Latham, being ſo called by Ives, it. p. 183.

ARGILLACEOUS, in *Agriculture*, ſuch ground or ſoil as contains a large proportion of clayey matter in its compoſition. See Soil.

Argillaceous *marl*, that ſort of marl which contains much clay. As a manure, this kind of marl is the moſt proper for the ſandy and light ſorts of ſoil.

Argillaceous *earth*. See Alumine.

Argillaceous *ſchiſtus*. See Thonschiefer.

ARGILLITE of Kirwan. See Thonschiefer.

ARGILLOCALCITE of Kirwan. See Marl.

ARGILLY, in *Geography*, a town of France, in the department of the Côte d'Or, and chief place of a canton, in the diſtrict of Beaune, fifteen miles ſouth of Dijon.

ARGILUS, in *Ancient Geography*, a town of Thrace in the vicinity of Amphipolis, at the mouth of the river Strymon. Thucydides (l. iv. §. 103.) ſays, that the Argilians were a colony of Andrians, eſtabliſhed in the neighbourhood of Amphipolis.

ARGINA, or Argyna, an ancient town of Greece in the country of the Ozolian Locrians. Pliny.

ARGINUSÆ. See Argenusæ.

ARGIOLUS, in *Entomology*, a ſpecies of Papilio. (*Plcb. Rural.* Gmel.) The wings are tailleſs; above blue, with a black margin; beneath bluiſh, ſlightly dotted with black. This inſect inhabits Europe. Linnæus, &c.

ARGIPPÆI, Argipæans, in *Ancient Geography*, a people of Scythia, whoſe language was different from that of the Scythians, though they reſembled them in their dreſs. They ſubſiſted not on the produce of the chaſe, but on the fruit of a tree, called "ponteia," of which, when ripe, they made a black and thick liquor, which they drank either clear or mixed with milk. Of the huſks they prepared a kind of cake which they reckoned nutritive. As they lodged both in ſummer and winter under trees, they formed a covering to ſhelter them. Such perſons, it is ſaid, were deemed ſacred, ſo that they had no occaſion for military weapons in their own defence; and ſuch was their reputation for wiſdom, that their neighbours referred diſputes to their arbitration, and their abode ſerved as an inviolable aſylum.

ARGIRA, a ſmall fountain of Achaia, not far from Charadrus.

ARGIRI, or, as it is called by Arrian, *Argali*, a town of India, on this ſide of the Ganges. Ptolemy.

ARGIRO Castro, in *Geography*, a town of European Turkey, in the province of Livadia, 26 miles north-weſt of Lepanto.

ARGISCH, a town of Wallachia, on the frontiers of Tranſylvania, 8 miles north of Helmanſtat, and 8 ſouth of Tergowitz.

ARGISH, a town of Aſia in Armenia, ſeated on the lake Van. N. lat. 38° 32′. E. long. 43° 15′.

ARGITHAMNIA, in *Botany*, (from αργος, white, and θαμνιον, a little ſhrub.) Schreb. g. 1418. Brown. 338. Swartz. Prodr. 39. 386. Juſſ. Claſs, *monoecia tetrandria*. Nat. Ord. *Tricoccæ*. *Euphorbiæ*, Juſſ. Gen. Char. male flowers. *Cal.* perianth four-leaved; leaflets lanceolate, erect. *Cor.* petals four, lanceolate, ovate, ciliate, ſhorter than the calyx; nectary, four glands between the petals, roundiſh, depreſſed. *Stam.* filaments four, longer than the petals; anthers ſimple. *Piſt.* rudiments of a ſtyle only. Female flowers in the ſame raceme under the males. *Cal.* perianth five-leaved, leaflets lanceolate. *Cor.* none. *Piſt.* germ ovate, obſcurely triangular; ſtyles three, ſpreading, half two-cleft, each of the clefts bifid; ſtigmas lacerate. *Peric.* capſule tricoccous, three-celled, ſix-valved. *Seeds* ſolitary, roundiſh.

Eſſ. Gen. Char. male, *Cal.* four-leaved. *Cor.* four-petalled. Female, *Cal.* five-leaved. *Cor.* none; ſtyles dichotomous. *Capſ.* tricoccous, with ſolitary ſeeds.

Species 1. A. *candicans*. Swartz. This ſhrub riſes about five feet high, covered with a whitiſh bark; leaves at the ends

of the branches which they ſurround; they are oval, ſerrate, of a dark green, about one inch and a third in length, and an inch in breadth; flowers axillary on ſhort pedunoles; calyx five-leaved; ſtamens ſix, greeniſh. The leaves when bruiſed are very odoriferous. A native of Jamaica, on a dry gravelly ſoil.

ARGITHEA, in *Ancient Geography*, a town of Greece, the capital of Athamania, according to Livy.

ARGIVES, a people of Greece, who inhabited that part of Peloponneſus called ARGOLIS; which ſee.

ARGIZALA, or AGRISAMA, a town of Aſia Minor, in Galatia. Ptolemy.

ARGO, in *Antiquity*, a ſhip or veſſel celebrated among the poets; being that wherein the Argonauts, of whom Jaſon was the chief, made their expedition in queſt of the golden fleece.

This ſhip, according to Diodorus Siculus, Apollonius, Tzetzes, Servius, and many other writers, is ſaid to have derived its name from Argus or Argo, the perſon who, under the direction of Minerva, conſtructed it; others have thought, that it was called Argo from the Greek word ἀργὸς, *ſwift*. Some again have attributed its name to that of Argos, the city in which it was built. Cicero cites, in his firſt Tuſculan, two verſes from an ancient Latin poet, who aſcribes the appellation of Argo to the Argives or Greeks who ſailed in it. Ovid, and many others, call it a ſacred ſhip; and it was thus denominated, probably, becauſe Minerva was ſaid to have given inſtructions for building it, or becauſe it was partly conſtructed of ſome ſacred timber from the grove of Dodona, which was ſacred to Jupiter Tomarius, and which iſſued out oracles.

Authors generally repreſent this ſhip as a long veſſel, reſembling the modern galleys, and furniſhed with 30 benches of rowers. It could not, however, be of any great bulk, if the ancient tradition be true, which reports, that the Argonauts were able to carry it on their backs from the Danube to the Adriatic ſea. However this be, Jaſon, it is ſaid, happily accompliſhed his enterpriſe; and conſecrated the ſhip Argo to Neptune; or, as others ſay, to Minerva, in the iſthmus of Corinth; where, they add, it did not remain long before it was tranſlated into heaven, and made a conſtellation. For an account of this enterpriſe, and of the perſons concerned in it, ſee ARGONAUTIC *expedition*, and ARGONAUTS.

ARGO *Navis*, or the *Ship*, in *Aſtronomy*, is a conſtellation of fixed ſtars in the ſouthern hemiſphere, whoſe ſtars, in Ptolemy's catalogue, are 45; in Tycho's, 11; in the Britannic catalogue, and Sharp's Appendix, 64.

ARGO, in *Conchology*, a ſpecies of ARGONAUTA that is diſtinguiſhed from others of the ſame genus, by having the flat keel of the ſhell ſlightly toothed along the ridges on each ſide; or, as Linnæus expreſſes it, "carina utrinque ſubdentata," keel ſubdentated on each ſide. This is *nautilus tenuis* of Rumpfius, *cymbium* of Gualteri and Teſſin, *nautilus ſulcatus* of Klein, *nautilus papyraceus* of Argenville, and *paper-nautilus*, *ſailor-ſhell*, or *ſailing-ſhell*, of Engliſh collectors.

The animal inhabitant of this ſhell, as the generic character of the argonauta implies, is either a *ſepia* or a *clio*; moſt probably the former; and its appearance and manners of life are ſo ſingular and intereſting, that they did not eſcape the notice of ſome of the earlieſt writers on natural hiſtory with whom the moderns are acquainted. It is a native of the Mediterranean and Indian ſeas, and is ſuppoſed to have taught mankind the uſe of ſails, and the art of navigation in the infant ſtate of ſociety; our admired poet alludes to this opinion in the following well-known lines in the "Eſſay on Man:"

"Learn of the little nautilus to ſail,
Spread the thin oar, and catch the driving gale."

When this creature intends to ſail, it diſcharges a quantity of water, by which its ſpecific gravity is made leſs than the ſea-water in which it lives, and riſing immediately to the ſurface, erects its arms, and expands a membrane between them, by means of which it is driven before the wind like a veſſel under ſail; at the ſame time that two of its arms which hang over the ſides of the ſhell, ſerve for oars and rudder, as occaſion may require. In this manner it is not unfrequently ſeen by navigators ſporting upon the ſurface of the water in calm weather; but the moment a ſtorm riſes, or that any thing diſturbs them, they lower the ſail, draw their arms into the ſhell, and taking in as much of the ſea-water as will ſink them, deſcend directly to the bottom. Pliny, H. N. ix. 29, &c.

ARGOB, in *Ancient Geography*, a diſtrict of Paleſtine, belonging to the half tribe of Manaſſeh, in the country of Baſhan, one of the moſt fruitful on the other ſide of Jordan. In this diſtrict were 60 cities, called Havoth Jair, which had high walls and ſtrong gates.—Alſo, the capital of this diſtrict, (Deut. iii. 4. 14. 1 Kings, iv. 13.) which, according to Euſebius, was 15 miles weſt from Geraſa. This is probably the ſame with Ragab or Ragaba, mentioned by Joſephus, and in the Miſhna.—*Argob* was alſo a place in Samaria, near the royal palace, where Pekah, the ſon of Remaliah, aſſaſſinated Pekahiah, the ſon of Menahem, king of Iſrael. 2 Kings, xv. 25.

ARGODA, or ARGHUM, a town in the interior of the Tauric Cherſoneſus, to the ſouth of Portacra. Ptolemy.

ARGOENUS MONS, a mountain of Aſia, towards N. lat. 38° 20′ north of mount Taurus.

ARGOL, in *Chemiſtry*, the ſame with TARTAR.

ARGOL. See ARCHIL.

ARGOL, in *Geography*, a town of France, in the department of Finiſterre, and chief place of a canton in the diſtrict of Chateaulin, two leagues north weſt of Chateaulin.

ARGOLI, ANDREW, in *Biography*, an Italian mathematician, was born at Tagliacozzo, in the kingdom of Naples, whence he removed to Venice. Here his merit was acknowledged, and he was appointed profeſſor of mathematics in the univerſity of Padua; and in 1636 diſtinguiſhed by the title of chevalier. He died in 1657, and left a treatiſe "De diebus criticis," printed in 1652, 4to.; and "Ephemerides," from 1620 to 1700, 4 vol. in 4to. Nouv. Dict. Hiſtor.

ARGOLIC SEA, in *Ancient Geography*, a name given by ſome writers to part, and by others to the whole of the ÆGEAN *Sea*.

ARGOLIC *Bay*, now the *gulf of Napoli*, was formed by a part of the ſea that intercepted the peninſula called Argolis on the ſouth-eaſt, and Laconia on the weſt. In this bay Pliny places the following iſlands: Pityuſa, Irine, Ephyre, Tiparenus, Aperopia, Colonis, Ariſteria, and Calauria.

ARGOLIS, ſo called from an ancient prince whoſe name was Argos, one of the ſix diſtricts of the Peloponneſus, ſituate on its north-eaſt ſide, was bounded by Achaia on the north, Arcadia on the weſt, Laconia and the Argolic gulf on the ſouth, and the Ægean ſea on the eaſt. The ancient limits are not clearly aſcertained; but it was much enlarged by ſome of its monarchs, ſo that it extended from eaſt to weſt about 70 miles; and from north to ſouth, from 37½° to 38° 20′ N lat. or about 50 miles. This province is peculiarly intereſting to the Grecian antiquarian and hiſtorian, becauſe it was the cradle of the Greeks, ſince it firſt received the foreign colonies by whom they were civilized. It became the theatre of moſt of the events recorded in the early annals of Greece. Here flouriſhed Inachus, who gave

gave his name to the river which waters the territory of Argos: its other rivers were Charadrus, Eraſinus, and Phryxus: there alſo lived Danaus, Hypermneſtra, Lynceus, Alcmæon, Perſeus, Amphitryon, Pelops, Atreus, Thyeſtes, Agamemnon, and many other celebrated heroes and heroines. This province contained the cities of Argos, Nemæa, Mycenæ, Nauplia, Træzené, and Epidaurus. The kingdom of Argos was founded, according to Euſebius, 1080 years before the firſt Olympiad, or 1856 years before Chriſt, by Inachus, and continued under the name of the Argolic kingdom till the reign of Acriſius, the fourteenth king, who transferred the ſeat of it to Mycenæ about the year 512 from its foundation; from which time that part of it was called the kingdom of Mycenæ till the diſſolution, when the Heraclidæ made themſelves maſters of this and of the whole peninſula, after it had ſtood upwards of 754 years under the government of twenty-one monarchs. The Argolic kingdom, properly ſo called, retained likewiſe its own kings after this diviſion, until the Heraclidæ, who divided the peninſula of Peloponneſus into three kingdoms. That of Argos had not continued above 40 years, before Maltas, their laſt king, having made an effort to recover the royal prerogative, loſt both his kingdom and life. At the period which Homer (Iliad, lib. ii. v. 559 to 580) celebrates, Argolis appears to have been governed by two dynaſties, of which the one reigned at Argos, and the other at Mycenæ; and the reſpective princes were Diomede and Agamemnon. The king of Mycenæ was at that time the moſt powerful chieftain not only in Argolis, but in the whole of Greece. The misfortunes of the family of Agamemnon ſoon led to the humiliation of Mycenæ. Argos became pre-eminent in the diſtrict of Argolis, and the Argives, inhabitants of Argos and its dependencies, during the hiſtoric ages of Greece, occupy the moſt prominent part of their ſection of the peninſula.

In their domeſtic inſtitutions, the Argives, in common with other Grecian ſtates, were firſt governed by limited kings, and afterwards their princes having attempted to become abſolute, they eſtabliſhed a republican form of government. In a maritime ſituation, and having eaſy acceſs to the growing refinements of Aſia Minor, of Corinth, and of Athens, the Argives ſucceſsfully cultivated commerce and the arts; and though they did not neglect rural occupations, they were much leſs excluſively addicted to paſturage and agriculture than their inland neighbours of Arcadia. The acceſſibility of their country, and their vicinity to the heroic and aſpiring Spartans, exerciſed their courage in conteſts of defence, while their own ambition impelled them to offence and aggreſſion.

About a century before the firſt Perſian invaſion, the Argives manifeſted a deſire and intention to reduce and command the inferior towns of the province. The inſolence of the capital provoked the indignation of the country. Mycenæ, Træzené, Epidaurus, and other places of leſs note, were often conquered, but never thoroughly ſubdued. Intereſt taught them to unite, and union enabled them to ſet at defiance the power of Argos, by which they were branded as rebellious, and which they reproached as tyrannical. Having many conteſts with the Spartans, with various ſucceſs, they, about the time of Cræſus, received a deciſive defeat (Herodotus, Clio), which depriving them of the valuable territory of Thyrſa, affected their intereſt much, but operating on the high ſpirit of Grecian heroiſm, affected their ſenſibility more. They had hitherto, like moſt of the Greeks, adorned their long hair to encreaſe the gracefulneſs of manly beauty, and to render their appearance more terrrible to their enemies. But in remembrance of this diſaſter, they ſhaved their heads, deprived the Argive women of their golden ornaments, and bound themſelves by a dreadful imprecation never more to aſſume their wonted appearance until they had recovered poſſeſſion of Thyrſa. Although they were not able to recover this territory from the Spartans, now the moſt potent ſtate of Greece, the Argives continued to be the ſecond power in the Peloponneſus. But having, from jealouſy of the Spartans, declined to participate in the defence of Greece againſt Perſia, the Argives fell into the diſrepute which never fails to overtake thoſe that from inteſtine differences and ſelfiſh rivalry withhold the efforts of patriotiſm, when required to repel an invading enemy. As deſerters of the common cauſe, the Argives incurred the hatred and contempt of their public-ſpirited neighbours. Mycenæ, Epidaurus and Træzené, which formed reſpectively the greateſt ſtrength and ornament of the Argive territory, threw off the yoke of a capital which for allegiance did not afford protection, and other towns of leſs importance obeyed the ſummons to liberty and independence. The inſurgents ſtrengthened themſelves by foreign alliance, and renounced the authority to which they had ſo long ſubmitted. By diviſion, inteſtine war, and the devaſtation of the province, they paid the price of their baſeneſs or folly, and left to poſterity an awful leſſon of the impolicy of obſtinacy and ſeparation, where common intereſt demands energy and concert.

If the Argives ſuffered by inaction when duty and intereſt called for activity, they did not raſhly fall into the oppoſite extreme of embroiling themſelves in the quarrels of their neighbours, when theſe were not likely to affect their intereſt or ſecurity. During the firſt years of the Peloponneſian war, they kept aloof from the conteſt, and employed themſelves in repairing the evils of the late diſſenſion; but finding the Spartans likely to attain a pre-eminence that muſt be dangerous if not fatal to neighbouring ſtates, they formed a defenſive confederacy, which taking its name from its chief promoters, was called the Argive alliance. Soon after, however, deviating from the prudent principle of the confederation, they at the inſtance of Alcibiades became aggreſſors, broke the amneſty with the Spartans, and brought upon themſelves the puniſhment of precipitate injuſtice. The Spartans taking the field, ravaged the country; internal tumult co-operated with foreign hoſtility in diſtreſſing the unſteady Argives, and compelled them to ſeek again in peace and juſtice the recovery of thoſe bleſſings which they had loſt by war and rapacity.

When the Spartans, by the complete diſcomfiture of Athens, became predominant over Greece, remote as well as adjacent, it would have been madneſs in the conterminous Argives to have queſtioned their ſupremacy, or to have provoked the anger of a power which could now overwhelm them in deſtruction. They therefore acquieſced in a ſuperiority which their oppoſition could not have deſtroyed. But when the imperious inſolence of victorious Sparta excited general reſentment, the Argives were among the firſt to join in a confederacy for repreſſing the ambition of Sparta, and reſtoring the independence of Greece. The policy of Antalcidas procured the eſtabliſhment of a peace, wherein, by ignominious ſacrifices to the ambition of Perſia, Sparta was able to retain a great part of her influence over her neighbours. Her exerciſe of her dominion, however, did not peculiarly affect Argos; and it was reſerved for another ſtate finally to humble the Spartan power. But the battle of Leuctra had no ſooner relieved the Argives from their dread of the Spartans, than inteſtine diſſenſions again broke forth.

The great defect of the Grecian republics was the want of

an efficient control, which ſhould at once mingle liberty and order, and allowing to each claſs and individual all the power that was neceſſary for promoting public and private good, ſhould reſtrain both tyranny and licentiouſneſs. Hence there were frequent contentions between the ariſtocratical and democratical parties, not rarely leading to ſedition and convulſion. The Athenians being the chief patrons of democracy, and the Spartans of ariſtocracy, the relative power of theſe parties, and other republics, was ſtrongly affected by the preponderance of Athens, or of Sparta. Lacedæmon being humiliated by Epaminondas, the influence of ariſtocracy was weakened throughout Greece; and the nobles in many places were ſlain or driven into exile. At Argos, more than two thouſand of the ariſtocratical party were killed. The Argives now joined the Thebans againſt the Spartans, and were inſtrumental in raiſing Thebes to a pitch of power which might have been dangerous to the independence of Argos, and of all Greece, had not the death of their conſummate general dried up the ſource from which Theban proſperity and greatneſs flowed.

The Peloponneſus being now freed from fears of the Lacedæmonians, the Thebans being in a ſtate of languor after their late and extraordinary efforts, and the Athenians immerſed in pleaſure and luxurious indolence, ſouthern Greece was for ſeveral years quiet, and the Argives are rarely mentioned in hiſtory. But Sparta having recovered a part of her former power, reſumed her pretenſions to the direction of the Peloponneſus. The Argives formed with Arcadia and Meſſenia a league for maintaining their reſpective independence: with fatal impolicy they called in Philip of Macedon, who overcame the Spartans. But a nominal auxiliary proved a real maſter; the Argives now ſhared the fate of the other Grecian ſtates, and became a dependency of Macedon. See ARGOS.

ARGONAUTA, in *Conchology*, the name of one of the Linnæan genera, the character of which is thus defined: animal a ſepia or clio; ſhell univalve, ſpiral, involuted, membranaceous, and containing only one cell. The ſpecies of this genus are few. Gmelin deſcribes five, viz. *argo*, *vitreus*, *cymbium*, *cornu*, and *arctica*; which ſee.

ARGONAUTIC, in *Ancient Hiſtory*, denotes ſomething belonging to the Argonauts. The Argonautic expedition is one of the moſt memorable tranſactions of antiquity; and references to it are interſperſed in moſt of the writings of the ancients. By the Greek writers, who have tranſmitted complete hiſtories of this event, we are informed that the intention of this armament was to bring back a golden fleece, which was detained by Æetes king of Colchis. It was the fleece of that ram on which Phrixus and Helle fled to avoid the anger of Ino. Upon his arrival at Colchis, Phrixus ſacrificed it to Mars, in whoſe temple it was ſuſpended. This fable has been thus explained: Phrixus flying with his ſiſter Helle from the rage of their ſtepmother Ino, the daughter of Cadmus, went on board a ſhip, whoſe enſign was a golden ram, and ſailed to Colchis. Helle was drowned by the way in that ſea, which from her was called the Helleſpont, now the Dardanelles. This, it is ſaid, was the ground of the poetical fable, that a ram with a golden fleece ſwam away with them to Colchis; and that the Argonauts undertook their famous expedition in order to regain that fleece.

After an interval of ſome years, Pelias, king of Iolcus, commiſſioned Jaſon, ſon of his brother Æſon, to go and recover this precious fleece. For this purpoſe a ſhip was built at Pagaſæ, a city not far from mount Pelion in Theſſaly. It was the firſt that was ever attempted; and the merit of the performance is aſcribed to Argus, who was inſtructed by Minerva, or divine wiſdom. This ſhip, called Argo, was built partly with ſome ſacred timbers from the grove of Dodona, ſacred to Jupiter Tomarius; and on this account it is ſaid to have been oracular, and to have given verbal reſponſes; which hiſtory is beautifully deſcribed by Claudian, De Bello Getico, v. 16.

"Argois trabibus jactant fudaſſe Minervam:
Nec nemoris tantam vinxiſſe carentia ſenſu
Robora; ſed, cæſo Tomari Jovis augure luco,
Arbore præſagâ tabulas animaſſe loquaces."

As ſoon as this ſacred machine was completed, a ſelect band of heroes, the prime of their age and country, conſulted together and engaged in this honourable enterpriſe. Among theſe Jaſon was the chief by whom the others were ſummoned and collected. Chiron, or, as others ſay, Muſæus, framed for their uſe a delineation of the heavens, and conſtructed the firſt ſphere, on which the ſtars were formed into aſteriſms for the benefit of the Argonauts, that they might be the better able to conduct themſelves in their perilous voyage. The heroes being all aſſembled, waited for the riſing of the Pleiades, at which ſeaſon they ſet ſail. The general account of their rout is, that they coaſted Macedonia, and proceeded to Thrace, where Hercules engaged with the giants, as he is ſuppoſed to have alſo done in ſeveral other places. They viſited Lemnos and Cyzicus, and from thence came to the Boſphorus. Here were two rocks called the Cyanean, and alſo the Symplegades, which uſed to claſh together with a mighty noiſe, and intercept whatever was paſſing. The Argonauts let fly a dove, that they might diſcover by her fate if there were a poſſibility of eſcaping. The dove made its way, with ſome difficulty; and encouraged by this omen, the heroes puſhed forward, and with the aſſiſtance of Minerva, eſcaped. After many adventures, which the poets have deſcribed in a manner wonderfully pleaſing, they arrived at the Phaſis, which was the chief river of Colchis. Immediately addreſſing Æetes, and informing him concerning the cauſe of their viſit, they demanded a reſtitution of the fleece. The king was exaſperated at their claim, and refuſed to give up the object in view, but upon ſuch terms as ſeemed impracticable. Jaſon, however, accepted of the conditions; and after having engaged in many labours, and, by the help of Medea, ſoothed a ſleepleſs dragon which guarded the fleece, he at laſt brought off the prize. This being happily effected, he retired privately to his ſhip, and immediately ſet ſail, at the ſame time bringing away Medea, the king's daughter. As ſoon as Æetes was appriſed of their flight, he fitted out ſome ſhips to purſue them, and arriving at the Thracian Boſphorus, took poſſeſſion of that paſs. The Argonauts, having their retreat prevented, returned by another rout, which writers have differently repreſented. The author of the Orphic Argonautics makes them paſs up the Phaſis towards the Mæotis, and from thence, through the heart of Europe, to the Cronian ſea, or Baltic; and then to the Britiſh ſeas and the Atlantic; and afterwards, by Gades and the Mediterranean, home. Timagetus ſays, they proceeded northward to the ſame ſeas, by the Iſter. Timæus traces their rout to the fountains of the Tanais, through the Palus Mæotis; thence, through Scythia and Sarmatia, to the Cronian ſeas; and from thence, by the Atlantic, home. Heſiod and Antimachus conduct them by the Southern ocean to Libya, and thence over land to the Mediterranean. Hecatæus Mileſius ſuppoſed that they went up the Phaſis, and turning ſouth over the great continent of Aſia, arrived at the Indian ocean; and thence proceeded to the Nile in Egypt, whence they made their progreſs regularly home. Valerius Flaccus copies Apollonius Rhodius, and purſues their courſe up the

Iſter,

Iſter, and by an arm of that river to the Eridanus, and thence to the Rhone, and afterwards to Libya, Crete, and other places. Pindar conducts them by the Indian ocean. Diodorus Siculus brings them back by the ſame way as they went out. Upon their arrival in Greece, they offered ſacrifices to the gods, and conſecrated their ſhip to Neptune.

Although the object of this expedition has been differently ſtated, and the account of it has been intermixed with many poetical fables, the reality of it has been generally admitted both by ancient and modern writers. Among the moſt eminent ancient writers who admitted it as an hiſtorical truth, were Herodotus, Diodorus, and Strabo, and with them every Grecian mythologiſt; and among the fathers, Clemens, Euſebius, and Syncellus. Among the moderns, the principal are, Scaliger and Petavius; and of our country, Archbiſhop Uſher, Cumberland, Dr. Jackſon, and ſir Iſaac Newton. The learned Bryant (Anc. Mythol. vol. 2. p. 484, &c.) rejects the hiſtory of the Argonautic expedition as a Grecian fable. The Grecians, he ſays, have applied to themſelves an ancient hiſtory to which they had no relation; and as the real purport of it was totally hid from them, they have, by their colouring and new-modelling what they did not underſtand, run themſelves into a thouſand abſurdities. He alleges the inconſiſtencies and contradictions of the different writers, who have given an account of this expedition. They differ as to the number of perſons concerned in it; and yet, allowing the higheſt eſtimate, they were too few to have achieved what they are ſaid to have performed. After many adventures, and long migrations in different parts, the Argonauts are ſaid to have returned to Iolcus, and to have accompliſhed all their peregrinations in four, or, as ſome ſtate it, in two months. "Is it poſſible," ſays Bryant, "for fifty perſons, or ten times fifty, to have performed ſuch mighty operations in this term, or indeed at any rate to have performed them? They are ſaid to have built temples, founded cities, and to have paſſed over vaſt continents, and through ſeas unknown; and all this in an open boat, which they dragged over mountains, and often carried for leagues upon their ſhoulders." Beſides, the æra of the expedition cannot be ſettled without running into many difficulties, from the genealogy and ages of the perſons ſpoken of. Some make the event ninety years, others ſeventy-nine, others only forty years before the æra of Troy. Writers have alſo differed as to the place whither the expedition was directed, the builder of the ſhip, and various other circumſtances minutely recited by this learned writer. According to him, the mythology and alſo the rites of Greece were borrowed from Egypt; and they were founded upon ancient hiſtories, which had been tranſmitted in hieroglyphical repreſentations. Theſe by length of time became obſcure; and the ſign was taken for the reality, and accordingly explained. In the account of Argo, he ſays, we have undeniably the hiſtory of a ſacred ſhip, the firſt that was ever conſtructed. This was no other than the ark, called by the Greeks "Argus" and "Arcas," originally framed by divine wiſdom. As the hiſtory of the Argo related to an ancient event which the Egyptians commemorated with great reverence, the delineation of it in the ſphere was intended as a laſting memorial of a wonderful deliverance; on which account one of the brighteſt ſtars in the ſouthern hemiſphere is repreſented upon the rudder of the ſhip. The ſtar was called by the Egyptians "Canobus," which was one of the titles of their chief deity, and regarded under this denomination as the particular god of mariners. The ſtar of this deity was put upon the rudder of the Argo to ſhew, that providence was its guide. According to this writer, all the miſtakes in this curious piece of mythology aroſe from hence, that the Arkites, who came into Greece, ſettled in many parts, but eſpecially in Argolis and Theſſalia, where they introduced their rites and worſhip; and the ſeveral circumſtances of the Argonautic hiſtory afford wonderful evidence of the Arkites and their rites. The Grecians took the hiſtory to themſelves; and in conſequence of this aſſumption, whereever they heard that any people under the title of Arcades, or Argæi, ſettled, they ſuppoſed that there Argo had been. Hence they made it to paſs not only through the moſt diſtant ſeas, but over hills and mountains, and through the midſt of both Europe and Aſia. They ſent their heroes to Colchis, merely becauſe ſome of their family had ſettled there. Jaſon, ſays Bryant, who was eſteemed the chief in all the Argonautic adventures, was a feigned perſonage made out of a ſacred title of the Arkite god, the ſame as Arcas, Argus, Inachus, and Prometheus; and the temples ſaid to be built by him were ſuch as were erected to his honour. Many of theſe were in Armenia, the region of the moſt ancient Minyæ, who were the worſhippers of the lunar deity Menes; and particularly in the vicinity of Mount Baris, where the ark really reſted, and where the memorials of the deluge were religiouſly obſerved.

Among thoſe writers who have allowed the reality of the Argonautic expedition, very different opinions have been entertained concerning its object and deſign. Diodorus Siculus ſuppoſes that the golden fleece denoted the ſkin of a ſheep ſacrificed by Phrixus, and guarded with care, from an apprehenſion that, according to an ancient oracle, the king of Colchis would be killed by the perſon who ſucceeded in taking it away. Strabo and Juſtin ſuppoſed that Colchis, a country lying between the Euxine ſea and Iberia, and now called Mingrelia, had conſiderable mines of gold, which gave riſe to the fable of the fleece. Theſe mines were apprehended by certain mythologiſts to have been contiguous to ſome of thoſe torrents which fall from the neighbourhood of mount Caucaſus, and to have brought down with them great quantities of gold duſt, which the inhabitants ſaved by ſetting fleeces of wool acroſs the narrow paſſages of thoſe currents. This account was afterwards diſguiſed by the fabulous poets after their manner, and embelliſhed with the ſtories of dragons, brazen bulls, dreadful ſeas, dangerous paſſages, and many ſuch perils and inſurmountable difficulties as commonly attend the too eager ſearch after that pernicious, though ſo much deſired, metal. Pliny and Varro aſcribe this voyage to the wiſh of ſome Greek merchants to get poſſeſſion of the fine wool of Colchis. The account which Suidas gives of the golden fleece, namely, that it was a parchment book made of ſheep's ſkin, and in which was written the whole ſecret of tranſmuting all metals into gold, ſcarcely deſerves mention.

Sir Iſaac Newton, in his Chronology, (apud oper. tom. v. p. 79. ed. Horſley), thinks that the Argonautic expedition was an embaſſy ſent by the Greeks, during the inteſtine diviſions of Egypt, in the reign of Amenophis or Memnon, to perſuade the nations upon the ſea-coaſts of the Euxine and Mediterranean ſeas, to take the opportunity of Amenophis's ſtay in Ethiopia, for revolting from Egypt, ſhaking off the yoke laid upon them by Seſoſtris, and ſetting up for themſelves, as the Libyans, Ethiopians, and Jews had done before; and fetching the golden fleece was only a pretence to cover their true deſign.

The following judicious and ſatisfactory account of the Argonautic expedition, and its effects, is given by Dr. Gillies, in his "Hiſtory of Greece." The northern diſtricts of Theſſaly being peculiarly expoſed to the dangerous fury of invaders, the petty princes of that province entered into a confe-

confederacy for their mutual defence. They aſſembled in ſpring and autumn at Thermopylæ, a place afterwards ſo illuſtrious, and then governed by Amphictyon, a deſcendant of Deucalion, whoſe name is immortalized in the Amphictyonic council. The advantages which the confederates derived from this meaſure, were ſoon perceived by their neighbours. The central ſtates gradually acceded to their alliance; and, about the middle of the fourteenth century before Chriſt, Acriſius king of Argos, and other princes of the Peloponneſus, were allowed to ſhare the benefits and ſecurity of this uſeful aſſociation.

After this event, the Amphictyons appear to have long confined themſelves to the original purpoſe of their inſtitution. The ſtates, whoſe meaſures were directed by this aſſembly, found ſufficient occupation in defending their own territories; and near a century elapſed, before they undertook, by common conſent, any diſtant expedition. But it was not to be expected that their reſtleſs activity could be always exhauſted in defenſive war. The eſtabliſhment of the Amphictyons brought together the chiefs moſt diſtinguiſhed by birth and bravery. Glory and emulation prompted them to arms, and revenge directed thoſe arms againſt the barbarians. Jaſon, Admetus, and other chieftains of Theſſaly, having equipped a ſmall fleet in the neighbouring harbour of Iolcus, and particularly the ſhip Argo, of ſuperior ſize and conſtruction to any before known, were animated with a deſire to viſit foreign lands, to plant colonies in thoſe parts of them that appeared moſt delightful, and to retort on their inhabitants the injuries which Greece had ſuffered from ſtrangers. The princes of the north having proclaimed this ſpirited deſign over the central and ſouthern provinces, the ſtandard of enterpriſe and glory was ſpeedily ſurrounded by the flower of the Grecian youth, who eagerly embraced this honourable opportunity to ſignalize their manly valour. Peleus, Tydeus, Telamon, and, in general, the fathers of thoſe heroic chiefs, who, in the ſucceeding age, ſhone with diſtinguiſhed luſtre in the plains of Troy, are numbered among the leaders of the Argonauts. They were accompanied by the choſen warriors, and by the venerable prophets, of their reſpective tribes; by an Eſculapius, the admired father of the healing art, and by the divine Orpheus, whoſe ſublime genius was worthy to celebrate the amazing ſeries of their adventures.

Theſe adventures, however, have been too much adorned by the graces of poetry, to be the proper ſubjects of hiſtorical compoſition. The deſigns of the Argonauts are veiled under the allegorical, or at leaſt doubtful, phraſe, "of carrying off the golden fleece;" which, though eaſily explained, if we admit the report that the inhabitants of the eaſtern banks of the Euxine extended fleeces of wool, in order to collect the golden particles which were carried down by the torrents from mount Caucaſus, is yet deſcribed in ſuch various language by ancient writers, that almoſt every modern who examines the ſubject, thinks himſelf entitled to offer, by way of explanation, ſome new conjecture of his own. But, in oppoſition to the moſt approved of theſe conjectures, we may venture to affirm, that the voyage to Colchis was not undertaken with a view to eſtabliſh extenſive plans of commerce, or to ſearch for mines of gold, far leſs to learn the imaginary art of converting other ſubſtances into that precious metal; all ſuch motives ſuppoſing a degree of ſpeculation and refinement unknown in that age to the gallant but uninſtructed youth of Theſſaly. The real object of the expedition may be diſcovered by its conſequences. The Argonauts fought, conquered, and plundered; they ſettled a colony on the ſhores of the Euxine; and carried into Greece a daughter of the king of Colchis, the celebrated Medea, a princeſs of Egyptian extraction, whoſe crimes and enchantments are condemned to eternal infamy in the immortal lines of Euripides.

Notwithſtanding many romantic fictions that diſfigure the ſtory of the Argonauts, their undertaking appears to have been attended with a conſiderable and a happy effect on the manners and character of the Greeks. From the æra of this celebrated expedition, we may diſcover not only a more daring and more enlarged ſpirit of enterpriſe, but a more deciſive and rapid progreſs towards civilization and humanity. The ſullen and unſociable chiefs, whoſe acquaintance with each other moſt commonly aroſe from acts of mutual hoſtility, hitherto gave full ſcope to the ſanguinary paſſions which characteriſe barbarians. Strength and courage were almoſt the only qualities which they admired: they fought and plundered at the head of their reſpective tribes, while the inhabitants of the neighbouring diſtricts were regarded as fit objects only to excite their rage, and gratify their rapacity. But theſe gloomy warriors, having exerted their joint valour in a remote expedition, learned the neceſſity of acquiring more amiable virtues, as well as of adopting more liberal notions of the public intereſt, if they pretended to deſerve the eſteem of their equals. Military courage and addreſs might alone procure them the reſpect of their immediate followers, ſince the ſafety of the little community often depended on the warlike abilities of the chieftain; but when ſeveral tribes had combined in a common enterpriſe, there was leſs dependence on the proweſs of any ſingle leader. Emulation and intereſt naturally rendered all theſe leaders as jealous of each other, as deſirous of the public applauſe; and, in order to acquire this applauſe, it was neceſſary to brighten the luſtre of martial ſpirit by the more valuable virtues of juſtice and humanity.

The Argonautic expedition is one of the greateſt epochas or periods of hiſtory, which ſir Iſaac Newton endeavours to ſettle, and from thence to rectify the ancient chronology. This he ſhews, by ſeveral authorities, to have been one generation, or about 30 years, earlier than the taking of Troy, and about 43 years later than the death of Solomon. Blair refers this expedition to the year 1263 before Chriſt, or 79 years before the taking of Troy. Playfair places it 41 or 42 years before this event, or in the year 1225 before Chriſt. For an account of the Newtonian ſyſtem, of the arguments in its favour, and of the objections that have been urged againſt it; ſee CHRONOLOGY.

ARGONAUTICA, in *Literary Hiſtory*, denotes poems on the ſubject and expedition of the ARGONAUTS. We have the Argonautics of Orpheus, in epic verſe, publiſhed by H. Stephens; the Argonauticon of Valerius Flaccus, in eight books of Latin heroics, in imitation of Apollonius, with reſpect to which Burman obſerves, that the imitator has often ſurpaſſed the original; the Argonautics of Apollonius Rhodius, an heroic poem, conſiſting of four books, "opus." as Quinctilian calls it, "non contemnendum."

ARGONAUTS, in *Antiquity*, a company of fifty-one, according to Valerius Flaccus, or, according to Apollonius Rhodius, forty-four heroes, who embarked along with Jaſon in the ſhip Argo, for Colchis, with a deſign to obtain a golden fleece.

Hercules, Theſeus, Caſtor, Orpheus, &c. were of the number of the Argonauts.

ARGONAUTS *of St. Nicholas*, was the name of a military order, inſtituted by Charles III. king of Naples, in the year 1382, for the advancement of navigation, or, as ſome ſay, merely for preſerving amity among the nobles.

They wore a collar of ſhells, incloſed in a ſilver creſcent, whence hung a ſhip, with this device, "Non credo tempori,"

pori," "I do not truſt time." Hence theſe Argonaut knights came to be called *knights of the ſhell*. They received the order of St. Baſil archbiſhop of Naples; and held their aſſemblies in the church of St. Nicholas, their patron.

ARGONNE, in *Geography*, a country of France, before the revolution, about 20 leagues in length, between the Meuſe, the Marne, and the Aiſne; of which the capital was St. Menehold.

ARGOON. See ARGUN.

ARGOPHYLLUM, in *Botany* (Αργος and φυλλον, white-leaf; the leaves being of a gloſſy whiteneſs beneath). Forſter. g. 15. Supp. p. 22. Schreb. 393. Juſſ. 161. Claſs, *pentandria monogynia*. Nat. Ord. *Ericæ*. Juſſ. Gen. Char. *Cal.* perianth ſhort, quinquefid; diviſions ſharp. *Cor.* petals five, lanceolate, ſpreading, three times greater than the calyx; nectary five angled, pyramidal, open at the top, conſiſting of many converging papillas, connate at the baſe. *Stam.* filaments five, ſubulate, inſerted into the receptacle, ſhorter than the nectary; anthers ovate. *Piſt.* germ turbinate, faſtened at the bottom to the calyx, flat above; ſtyle filiform; ſtigma globular. *Per.* capſule hemiſpherical, flat above, three-celled, opening into three parts. *Seeds*, numerous, globular, porous.

Eſſ. Gen. Char. *Capſ.* three-celled. *Nect.* pyramidal, five-angled, the length of the corolla.

Species 1. A. *nitidum*, perennial, ſtems, petioles, leaves underneath, panicles, calyxes, ſhining with a ſilky down; leaves alternate, petiolate, ovate, pointed at both ends, entire; peduncles axillary, ſolitary, elongated, terminating in a panicle. Found in New Caledonia.

ARGOS, αργος, from α negative, and εργον, *work*, or *buſineſs*; as if it were αεργος. So αργος αργυρος is *ſilver not worked*; αργοι πυροι, in Hippocrates, is *crude wheat, not prepared, but ſuch as it is taken from the floor*.

ARGOS, in *Ancient Geography*, a name given to ſeveral cities; and more particularly to the capital of a ſmall kingdom of Greece, denominated ARGOLIS. It was alſo called Argi, and Inachus, from its founder. It is ſaid to have been built by a colony of ARGIVES, who migrated from Egypt under the command of Inachus, and ſettled in Greece. Inachus was ſtyled the ſon of the ocean, becauſe his origin was not known, and becauſe he had come by ſea into Greece. Before his arrival the inhabitants were rude and barbarous. Theſe he united and civilized, and inſtructed in various arts. His ſon Phoroneus inſtituted the laws of government; and, on that account, he has been called the firſt king in Argos, the firſt of men, and the father of mortals. The city was ſeated at ſome diſtance from the ſea, on the river Inachus, in a ſpacious, rich, and well-watered plain, from which it is ſuppoſed to have derived its name. To this purpoſe Strabo ſays (l. viii. p. 170, &c.) that Argos is a Macedonian or Theſſalian term, ſignifying a plain or champaign country, and thus it is deſcribed by Homer. Hence it has been concluded that they are miſtaken, who have repreſented this city and its territory as dry and barren, and that they have miſunderſtood the epithet of "thirſty," aſcribed to it by the poet; which, it is conceived, ſhould have been tranſlated "deſireable," becauſe it was well watered by the Inachus, and by ſeveral other rivulets and ſprings. It was alſo diſtinguiſhed by the epithet "hippobotos," from the goodneſs of its adjacent paſtures, in which Neptune is ſaid to have fed his horſes, or perhaps from the excellent breed of horſes which this territory produced. The epocha of its foundation is referred to the year 1080 before the firſt Olympiad, or 1856 before Chriſt; and it loſt its diſtinction as the capital of the kingdom after the reign of Acriſius, or about the year 1344 before Chriſt, when the ſeat of government was tranſferred to Mycenæ. Upon the arrival of the Heraclidæ, and the diviſion of the peninſula into three kingdoms, about the year 1104, Argos recovered the rank which it had loſt. Strabo ſpeaks of Argos as the principal city of the Peloponneſus, next to Sparta. It was adorned by a number of magnificent edifices and ſtatues. The moſt ancient of theſe edifices was the temple of the Lycian Apollo, erected to this god by Danaus; and in this temple was the ſtatue of Apollo by Attalus the Athenian, that of Biton with a bull upon his back, one of Mercury by Epéus, and others dedicated to Apollo, Jupiter, and Diana. Over againſt this temple was that of Jupiter Nemæus, with the ſtatue of the deity in bronze by Lyſippus: the temple of Phoroneus, whoſe anniverſary was celebrated by the Argives: the temple of Fortune, and another dedicated to the Seaſons, &c. &c. Here were alſo the ſtatues of the heroes who took Thebes, and the cenotaph of the Argians who periſhed at the ſiege of Troy. The celebrated citadel, called "Lariſſa," was ſeated on an eminence to the north-weſt of the city. Argos was alſo much enriched by its trade, and particularly by the fine race of horſes that were bred about its territory. Bryant refers the origin of Argos, of the Argives, and alſo of the Argonauts, to a colony of Arkites, who came from Egypt and diffuſed themſelves widely through various parts of Greece. Anal. Anc. Mythol. vol. ii. p. 506. The medals of this city were gold, ſilver, and bronze; and their ordinary type was a wolf, which was the ſymbol of the Argians. There were alſo imperial Greek medals ſtruck in this city, in honour of Adrian, Antonine, Verus, Septimius Severus, Fauſtina, Donna, Geta, Elagabalus, Marcus Aurelius, Plautilla, Galien, and the younger Valerian. A ſmall village, called *Argo*, ſtill ſubſiſts on the ruins of the ancient Argos.

ARGOS, a town of the iſland of Niſyros, one of the Cyclades. Steph. Byz.—Alſo, a town of Aſia, in Cilicia, called in the time of Steph. Byz. Argeopolis, ſituated near mount Taurus.—Alſo, a town of Aſia Minor, in Caria. Steph. Byz.—Alſo, a place in the iſland of Cyprus, famous for the temple of Apollo Erythius, where Venus found the body of Adonis.

ARGOS *Amphilochium*, a town ſituated in the Ambracian gulf, two ſtadia, according to Polybius, and according to Livy twenty-two miles, from the city of Ambracia. Thucydides, who repreſents it as a maritime town, aſcribes its origin to Amphilochus, the ſon of Amphiarous, ſome years after the war of Troy; others ſay that it was founded by Alcmeon, in honourable remembrance of the friendſhip that ſubſiſted between him and his brother Amphilochus.

ARGOS *Hippium*. See ARPI.

ARGOS *Oreſticum*, a town of the Oreſtiade, a country of Epirus, built by Oreſtes; where he made his eſcape, after having killed his mother. Strabo.

ARGOS, or *Argers*, in *Geography*, a mean town of Turkey, in the Morea on the bay Napolidi Romania, and on the river Najo or Inachus; N.N.W. from cape Angelo. The Turks took it from the Venetians, under Mahomet II.; twenty miles ſouth of Corinth. N. lat. 37° 30'. E. long. 23° 5'.

ARGOS, a ſmall town of Africa, in the kingdom of Dongola in Abyſſinia, on the eaſtern bank of the Nile, through which the caravans that carry ſoap and linen paſs, and where they pay a duty to the douane of the place.

ARGOSTOLI, a ſea-port of the iſland of Cephalonia, oppoſite to Albania, the beſt in the iſland, at the diſtance of five miles from the fortreſs.

ARGOUGES, a town of France, in the department of the Channel, four leagues ſouth of Avranches.

ARGOW,

ARGOW, Argau, or Argovie, a country of Switzerland, ſituated on the river Aar, from which it derives its name, and forming the north-eaſtern part of the canton of Berne. It is divided into Upper and Lower Argow, which are ſeparated from each other by the ſmall town of Arburg. The upper Argow extends to the Thun, and the lower to the confluence of the Aar with the Rhine. By the diviſion of 1798, Argow, the chief town of which is Arau, was made a diſtinct department or canton; but by the conſtitution of 1801, Argovie was re-united with Baden and with the upper part of the Frickthall, and thus formed into the fourteenth department or canton, and ſix perſons were appointed to repreſent it in the diet. Argow is a very fertile country, well watered by rivers which flow into it from the canton of Lucerne, abounds with excellent paſtures, and produces alſo corn and wine. The induſtry of the inhabitants in the Lower Argow compenſates for the leſs fertility of the ſoil. The reformed religion is the general profeſſion of its inhabitants. See Berne.

ARGU, a town of Syria, five miles ſouth-eaſt of Damaſcus.

ARGUEDAS, a town of Spain, in Navarre, 2½ leagues from Tudella.

ARGUEIL, a town of France, in the department of the Lower Seine, chief place of a canton, in the diſtrict of Neufchatel, ſix leagues north-eaſt of Rouen. The place contains 340, and the canton 9,608 inhabitants: the territory includes 215 kiliometres, and 22 communes.

ARGUENON, a river of France in the late province of Bretagne, which has its ſource near Jugon, and runs into the ſea near St. Malo.

ARGUES, Gerard d', in *Biography*, a mathematician of France, was born at Lyons in 1597, and died there in 1661. He was the diſciple and friend of Deſcartes, whom he defended in return for his inſtruction. The works of this writer in French, are "A treatiſe on Perſpective," fol.; "A treatiſe on Conic Sections," 8vo.; "The practice of Drawing," 8vo.; and "A treatiſe on Stone-cutting," 8vo. Nouv. Dict. Hiſtor.

ARGUIER, in *Geography*, a town on the ſouth point of Porto Galere, towards the north-weſt corner of the iſland of Sardinia, in the Mediterranean, nearly eaſt from cape Caſs.

ARGUIN, an iſland of Africa, in the Atlantic, ſituate on the northern part of the coaſt of Senegambia, and in a gulph of the ſame name formed by cape Blanco, about ten leagues from it. N. lat. 20° 20'. W. long 17° 20'. To the weſt of this iſland are two other long ſmall iſlands, and in the bay, on the north ſide, are ſeveral ſhoals from the main. There is alſo a little iſland by the point called Terra Gorda, and more ſouthwards another called Monzora. Arguin was probably the iſland, which was known to the ancients under the name of "Cerne." It became the chief ſtation of the Carthaginians, in the voyage of Hanno, along that coaſt; and M. De. Bougainville contends, that the ciſterns found there are monuments of the Carthaginian power and ingenuity. Although Arguin is ſcarcely two miles in length, it has been for nearly a century, an object of conteſt to the Portugueſe, Dutch, Engliſh, and French: but at length the French, in 1725, demoliſhed the fort, and it has not been ſince rebuilt by any European power.

ARGULUS, in *Entomology*, one of the genera or diviſions of Müller, in his arrangement of Monoculi. Gmelin adopts it as a ſubdiviſion of the genus, with this definition: eyes placed beneath; antennæ two; legs from four to eight. This ſubdiviſion includes the three following ſpecies, *Charon*, *Delphinus*, and *Armiger*; and it is remarkable that the firſt kind has four legs, the ſecond eight, and the third ſix.

ARGUMENT, in *Rhetoric*, is ſome reaſon or ſeries of reaſoning, by which we eſtabliſh the proof, or ſhew the probability of ſome given propoſition. Logicians, ſomewhat more ſcientifically, define *argument*, a *medium*, from whoſe connexion with two extremes, the connexion of the two extremes themſelves is inferred. To illuſtrate this definition by an example; let it be inquired, "whether virtue is to be loved?" The agreement between virtue and love might be found by comparing each of them ſeparately with happineſs, as a common meaſure to both. For ſince the idea of happineſs agrees to that of love, and the idea of virtue to that of happineſs, it follows that the ideas of virtue and love agree to one another; and therefore it may be affirmed, "that virtue is to be loved." But, on the contrary, becauſe the idea of miſery diſagrees with that of love, but the idea of vice agrees to that of miſery, the two ideas of vice and love muſt conſequently diſagree with one another: and therefore it would be falſe to aſſert, "that vice is to be loved." The third thing logicians call the "medium" or "middle term," becauſe it does as it were connect two extremes, that is, both parts of a propoſition. But rhetoricians call it an "argument," becauſe it is ſo applied to what was before propoſed as to become the inſtrument of procuring our aſſent to it. Ward's Oratory, vol. i. p. 43. See Topics.

Arguments are termed *grammatical*, *logical*, *phyſical*, *metaphyſical*, *moral*, *mechanical*, *theological*, &c. according to the art, ſcience, or ſubject, from whence the middle term is borrowed. Thus, if we prove that no man ſhould ſteal from his neighbour becauſe the ſcripture forbids it, this is a "theological argument;" if we prove it from the law of the land, it is "political;" but if we prove it from the principles of reaſon and equity, the argument is "moral."

Arguments are either *certain* and *evident*, or *doubtful* and merely *probable*. "Probable arguments," are thoſe whoſe concluſions are proved from ſome probable medium. "Evident and certain arguments," are thoſe which prove their concluſions by clear media and undoubted principles: theſe are called *demonſtrations*. In reaſoning, Mr. Locke obſerves, that men ordinarily uſe four ſorts of arguments. The firſt is to allege the opinion of men, whoſe parts and learning, eminence, power, or ſome other cauſe, have gained a name, and ſettled their reputation in the common eſteem with ſome kind of authority: this may be called "argumentum ad verecundiam." Secondly, another way is to require the adverſaries to admit what is alleged, as a proof; or to aſſign a better: this he calls "argumentum ad ignorantiam." A third way, is to preſs a man with conſequences, drawn from his own principles or conceſſions: this is known by the name of "argumentum ad hominem." Fourthly, the uſing of proofs, drawn from any of the foundations of knowledge or probability: this he calls "argumentum ad judicium;" and obſerves, that it is the only one of all the four that brings true inſtruction with it, and advances us in our way to knowledge. For, 1. it argues not another man's opinion to be right, becauſe I, out of reſpect, or any other conſideration but that of conviction, will not contradict him. 2. It proves not another man to be in the right way, nor that I ought to take the ſame with him, becauſe I know not a better. 3. Nor does it follow, that another man is in the right way, becauſe he has ſhewn me that I am in the wrong: this may diſpoſe me perhaps for the reception of truth, but helps me not to it. That muſt come from proofs and arguments, and light ariſing from the nature of things themſelves; not from any ſhamefacedneſs, ignorance, or error. See Reason and Reasoning.

Beſide theſe, there are other arguments enumerated by different writers, as the "argumentum ab amore," which is uſed to engage

engage the reaſon by the affections; the "argumentum ad ignaviam," called by the Greeks αργος λογος, which always concludes in favour of inaction; the "argumentum ab invidiâ," which is made uſe of to render an adverſary's opinion odious; M. le Clerc has a diſſertation on this argument as applied to theology: and alſo "the argumentum a tuto," drawn from the conſideration of its being ſafer to chooſe one ſide of the queſtion than the other, when the evidence is equal on both ſides. This has been much uſed againſt atheiſts and infidels; it was firſt ſtarted by Arnobius, and adopted by ſeveral advocates for Chriſtianity, as Paſchal, Tillotſon, Gaſtrel, &c. Lord Shafteſbury and others have endeavoured to explode it: Clarke and Leibnitz only allow it a moral force. Mofheim has a diſſertation on this argument, viz. "De Vi argumenti quod a tuto dicitur in Theologiâ." Wolfem. 1723. 4to.

Logicians divide their arguments, with regard to their form, into ſyllogiſms, enthymemes, inductions, &c. An "argument in form," is a ſyllogiſm framed according to the ſtrict rules of logic.—According to Ariſtotle, the "enthymeme" is the argument of rhetoric, as the ſyllogiſm is that of logic.—Rhetoric is defined by ſome, the art of finding arguments adapted to perſuade, or gain belief.

Rhetoricians divide arguments, with reſpect to the places they are drawn from, into *intrinſic* or *artificial*; and *extrinſic* or *inartificial*, or *remote*.

ARGUMENTS, *artificial*, or *intrinſic*, by the Greeks called εντεχνα, by Cicero *inſita*, are the proper invention of him who ſpeaks: or they are thoſe which are taken from the ſubject treated of; of which there are ſeveral kinds, viz. genus and ſpecies, form, cauſe, and effect, &c. See each in its place, GENUS, &c. To theſe ſome add two other places of argument, viz. the manners and the paſſions.

ARGUMENTS, *inartificial*, or *extrinſic*, ατεχνα, by Cicero called *aſſumpta*, are thoſe which are borrowed from abroad, and are only applied by the orator to the point in hand; ſuch are laws, common report, books, oaths, torture, and witneſſes. The places, or general heads of arguments, with regard to their end, may be divided into, 1. Thoſe intended to perſuade or diſſuade, which are chiefly drawn from the conſiderations of profit, honour, and equity: 2. Thoſe intended to praiſe or diſpraiſe: and, 3. Thoſe intended to accuſe and defend. See TOPICS.

ARGUMENT, *dialectical*. See DIALECTICAL.

ARGUMENT is alſo uſed for a ſyllabus, or abridgment of the ſubject of a book, hiſtory, comedy, or the like. We have almoſt loſt the original uſe of prologues, which was to give the argument of the play.

ARGUMENT, in *Aſtronomy*, is, in general, a quantity upon which depends an equation, an inequality, or ſome circumſtance relating to the motion of a planet; or it is an arch whereby we ſeek another unknown arch, bearing ſome proportion to the firſt. Hence,

ARGUMENT *of inclination*, or *of latitude*, is an arch of a planet's orbit intercepted between the aſcending node, and the place of the planet from the ſun, numbered according to the ſucceſſion of the ſigns; or, more generally, the argument of latitude is the diſtance of a planet from its node, becauſe on this depends the latitude. Let ♈C (*Plate* I. *Aſtronomy, fig.* 13.) be the ecliptic, AB the orbit of a planet, N the aſcending node, ♈C the order of the ſigns, P the place of the planet, and P*m* perpendicular to ♈C; then N*m* reckoned from N, according to the order of the ſigns, is called the argument of latitude, becauſe the latitude P*m* depends upon N*m*. In order to obtain it, we muſt always ſubtract the place of the node from the place of the planet reduced to the ecliptic, adding twelve ſigns to the latter, if it be the leaſt. Take NA=N♈, and the longitude of a planet upon its orbit is computed from the point A; hence the longitude on the orbit is AP=AN+NP, and the longitude on the ecliptic is ♈*m*=♈N+N*m*=AN+N*m*; the difference of theſe longitudes is the difference between NP and N*m*, which difference applied to the longitude of the planet upon the ecliptic, adding or ſubtracting it, as N*m* is leſs or greater than NP, that is, as N*m* is between 0° and 90° or 180° and 270°, or between 90° and 180° or 270° and 360°, gives the longitude upon its orbit. This difference is called the *reduction*. To find it, put *c* = the coſine of the angle PN*m*, *t* = the tangent of N*m* the argument of latitude; then the cotang. $PN = \frac{\text{rad.} \times c}{t}$, hence 10 + log. *c*. − log. *t*. = log. cotang. PN; and the difference between PN and N*m* is the reduction required. E. G. Let the inclination of the orbit of Mercury be 7°, and the argument of latitude 30° 17′ 48″: then,

7° 0′ 0″	Coſ. +	10 = 19.9967507
30 17 48	tang.	= 9.7706171
30 29 1	cotang.	10.2301336

0 11 13 the Reduction.

In the tables of the planets' motions, a table of reductions is given, which applied to NP gives N*m*, or applied to the longitude of a planet on its orbit, gives the longitude upon the ecliptic; but if applied with a contrary ſign to the longitude on the ecliptic, it gives the longitude on its orbit. In like manner a reduction may be applied to the ſun's longitude, for the purpoſe of finding its right aſcenſion, or the contrary. Vince's Aſtron. vol. i. p. 149.

ARGUMENT, *menſtrual, of latitude*, is the diſtance of the moon's true place from the ſun's true place.

By this we find the quantity of the real obſcuration in eclipſes, or how many digits are darkened in any place. See ECLIPSE.

ARGUMENT, *Annual*, or annual argument of the moon's apogee, is the diſtance of the ſun's place from the place of the moon's apogee, or the arch of the ecliptic comprehended between theſe two places.

ARGUMENT *of the parallax*, denotes the effect which it produces in an obſervation, and which ſerves for determining the true quantity of the horizontal parallax.

ARGUMENT *of the equation of the center*, or of the equation of the orbit, is the anomaly or diſtance from the apogee or aphelion, becauſe this equation is calculated in an elliptic orbit for every degree of anomaly, and varies according to the variation of the anomaly. Thus alſo, the *argument* of that part of the equation of time, which ariſes from the unequal angular motion of the earth in its orbit about the ſun, is the ſun's anomaly, becauſe that part of the equation depends entirely upon the anomaly; and the latter being given, the former is found from it. In the computation of the place of the moon by the tables, there are fourteen arguments, correſponding to the fourteen inequalities in its motion, and the fourteen equations in the calculation: *e. g.* the firſt is 11′ 16″, multiplied by the mean anomaly of the ſun; becauſe this equation, which is 11′ 16″ when the ſun is 90° from his apogee, decreaſes as the ſine of the diſtance from the apogee, or the ſun's anomaly. Thus, the anomaly is the argument of the firſt equation, and ſo of the reſt.

ARGUMENTATION, the act of inventing or framing arguments, of making inductions, and drawing concluſions. See INDUCTION, &c.

Argumentation, according to Cicero, is the delivering or unfolding of an argument. The matter of argumentation is propoſitions; the form, their due diſpoſition, with regard

to one another, ſo that a concluſion may be drawn from them. See Enthymeme, Propoſition, Ratiocination, Sorites, Syllogism, &c.

ARGUN, or Argoon, in *Geography*, a river of Aſia, which riſes in a lake of Chineſe Tartary, called "Coulon Nor," or "Dalai," ſituated in N. lat. 49°. E. long. 119° 14'. and joins the Amur or Amoor, in N. lat. 53°. E. long. 121° 14'. This river ſeparates Ruſſia from Chineſe Tartary, according to the treaty of Nertchinſk in 1728. It has a pearl fiſhery, and near its banks are mines of lead and ſilver.

Argun, or *Argjan*, is alſo a mountain of Independent Tartary, forming the chain with the Kara Tau, though broken by the interſection of a river.

ARGUNA, a town on the coaſt of Africa, on the river Benin or Formoſa, thirteen leagues from Benin.

ARGUNSKOI, in *Geography*, a town of Siberia, ſeated on the Argun, near the confines of China, one hundred and thirty miles eaſt of Nertchinſk. N. lat. 50° 50'. E. long. 120° 14'. This is the fartheſt fort of the Ruſſians towards the eaſt, on the Mongalian frontiers, and was firſt built on the eaſt bank of the Argun, in 1682, for the convenience of levying the tribute payable by the Tunguſians, who inhabit theſe parts; and it was rebuilt in 1639 on the weſt ſide of that river. A conſiderable trade is carried on from this garriſoned town with the Monguls. The country round it is very fertile; and the air, though cold, very healthy. The territory of Argunſkoi is often viſited with ſlight ſhocks of an earthquake, in the ſpring or beginning of winter. The Chineſe erect new pillars every year, on the eaſt bank of the Argun, to mark the limits of their frontiers.

ARGURA or Argissa, in *Ancient Geography*, a town of Greece, in Theſſaly, ſituate upon the Penæus, forty ſtadia from Atrax. Strabo.

ARGUS Campus, a plain in the territory of Mantinæa. Pauſanias.

Argus, in *Fabulous Hiſtory*, is ſaid to have had an hundred eyes, ſome of which were open, whilſt the others were cloſed. He was called Παναπτης, *panoptes*, becauſe he ſaw every thing. On this account Juno intruſted him with the cuſtody of Io; but Jupiter, having compaſſion on Io in cloſe confinement, commiſſioned Mercury to charm Argus to ſleep with his flute, and to ſeal his eyes with his caduceus, and then to cut off his head. Juno, in recompence of his fidelity, took all the eyes of Argus, and fixed them to the wing and tail of the peacock; and, as the fable adds, transformed Argus into this bird. Macrobius (Saturn. i. 19.) gives this fable an aſtronomical origin: he ſays, that Argus repreſents the celeſtial ſphere, on which are diſperſed a thouſand ſtars; and that Mercury is the ſun, that makes them diſappear by its brightneſs. But when it was known that the Mercury of the Greeks was the Anubis of the Egyptians, and that Anubis repreſented the horizon, the application of the fable was no leſs obvious, as Mercury cauſed Argus to ſleep, and cloſed his hundred eyes, as the horizon every day veiled the ſtars of the celeſtial ſphere.

Argus, in *Conchology*, a ſpecies of Murex, found in India. The ſhell is gibbous, with tranſverſe tuberculated ribs; brown, obſcurely faſciated, and white within; aperture ovate. Gmelin, &c. *Obſ.* There are three or more ſuppoſed varieties of this ſpecies, one of which is believed to be the ſhell figured in Martin's Univerſal Conchology under the name of *Flag-Buccinum*; and which is found in the Friendly and Society iſlands.

Argus, a ſpecies of Cypraea, that inhabits the Indian and Atlantic ocean. This ſhell is ſlightly turbinated, ſomewhat cylindrical, and ſprinkled with ocellated marks; four brown ſpots beneath. Gmelin. It is called *argus* by Rumphius, *argus magnus* by Argenville, and *argus cowry* by Engliſh collectors. The length is about four inches; it is rather narrow, and of a grey or yellowiſh colour above, with three brown bands; the ocellar marks are ſometimes connected; and it is alſo remarkable that the ſpots on one ſide, beneath, are larger than the other; the lips are ſtraw-colour, and the teeth brown.

Argus *minor*, the name given by Argenville to the ſhell called by Linnæus and Gmelin *Cypraea cribraria*; which ſee.

Argus, in *Entomology*, a ſpecies of Curculio, deſcribed by Sparrman in the Stockholm Tranſactions for 1785, as a native of the Cape of Good Hope. It is downy; head and anterior margin of the thorax dotted with grey and white; wing-caſes with elevated ſtriæ, and both ſpotted and dotted with white and grey. Gmelin.

Argus, a ſpecies of Cimex (*Scutellatus*, Gmel.) It is black, dotted with numerous ocellar fulvous ſpots. Fabr. and Gmel. This creature inhabits Surinam, and is about the ſame ſize as *Cimex* Fabricii; the under-ſide is yellow, varied with black.

Argus, a ſpecies of Papilio, (*Pleb. rural.* Gmel.) The wings are deſtitute of tails, and blue; beneath, a ferruginous border on the poſterior pair, with blue ſilvery ocellated ſpots. Gmelin, &c. *Obſ.* This character cannot be conſidered unexceptionable, ſince it agrees only with the male inſect; the female is dark brown, and bluiſh only at the baſe of the upper ſurface. The larva from which it is produced is green, with a brown line along the back; and the head and fore-legs black.

Argus, a moſt ſingular ſpecies of Phalæna, (*Bombyx Att.* Gmelin,) in which the poſterior wings are furniſhed each with a tail, that is more than thrice the length of the reſt of the inſect. The ſpecific character is as follows: wings tailed, pale ferruginous, with numerous ocellar tranſparent ſpots; and tails very long. This is *phalæna brachyura* of Cramer; and found in Sierra Leona. A ſomewhat analogous ſpecies, being furniſhed with ſimilar tails, has been recently diſcovered in the interior of Africa.

Argus, in *Ichthyology*, a ſpecies of Pleuronectes, that inhabits the ſeas about the Antilles. The body is variegated and the tail rounded. Bloch and Gmelin. To this conciſe character of the ſpecies may be added, that it is white with yellow ſpots, which are dotted with brown, and encircled each with a blue ring; the other parts are alſo dotted with brown, and covered with ſoft ſcales; the head is broad; the eyes are unequal, and rather at a diſtance; the pupil blue; the iris white and brown; the lateral line bending in the middle, above the pectoral fin; the fins ſpotted with blue; the membrane yellowiſh; rays brown; dorſal fin extending from the noſtrils to the tail. It has ſeventy-nine rays in the dorſal fin, pectoral ten, ventral eight, anal ſixty-nine, and in the tail ſeventeen.

Argus, a ſpecies of Chaetodon, called by Renard *Ican Taci*, and by Valent *Cacatocha Babintang*. It has eleven ſpines in the dorſal fin; the body is entirely dotted with black; and the tail is entire. Gmelin, &c. The body of this fiſh is nearly ſquare; and the ſides are ſpotted and varied with brown; above it is violet, beneath white; the iris of the eye is golden; jaws equal; gill-covers large; the membrane looſe; the lateral line is arcuated; vent nearly in the middle of the body; fins ſhort and yellow; and four ſpines before the anal fin. This ſpecies is found in freſh waters and ſwamps, in India; lives on inſects; and the fleſh is ſapid.

Argus, in *Ornithology*, a ſpecies of Phasianus, that inhabits

inhabits China and Chineſe Tartary; and may be well eſteemed one of the moſt elegant of the feathered race. It was firſt introduced to the notice of the Engliſh naturaliſt through the medium of the Philoſophical Tranſactions, under the name of *Argus* or *Luen*: it next appeared in the London Magazine for 1766, and Gentleman's Magazine for 1768; and, at length was very completely deſcribed by Dr. Latham in his General Synopſis of Birds, publiſhed nearly twenty years ago. Still it is rarely met with in cabinets of Natural Hiſtory; though on the credit of ſome reſpectable and faithful writers, it is far from being an uncommon bird in its native country. There is at preſent a magnificent ſpecimen of it in the Leverian Muſeum.

From Dr. Latham we learn, that this bird is common in the woods of Sumatra, as well as thoſe of China; and that it is there called *Coo-ow*. Hitherto every attempt to keep it alive in a ſtate of captivity for a conſiderable length of time, has proved ineffectual; it has been known to live for about a month after being taken from the woods, but never longer. One circumſtance is very remarkable, it has a ſtrong antipathy to the light, and remains perfectly inactive in the open day; and, on the contrary, when put into a dark place ſeems eaſy, and ſometimes makes its note or call which correſponds with its name *Coo-ow*; it is rather plaintive, and not harſh like that of a peacock.

The ſize is that of the male turkey; the bill, like that of the common pheaſant, and of a pale yellow colour; the fore part of the head and beginning of the throat are covered with a granulated ſkin, of a fine ſcarlet colour; the irides are orange; round the eye the ſkin is duſky, and it has a kind of whiſker on each ſide of the lower jaw; the top and hind part of the head and neck, is changeable blue, with a forked creſt on the former; the lower part of the neck, back, and wing coverts, duſky, marked irregularly and tranſverſely with reddiſh brown: the nine outer quills are yellowiſh-brown, marked with ſmall duſky ſpots as big as tares on the outer, and ſmaller ſpots of white on the inner webs. The eleven remaining quills, dark brown, marked with round and oblong ſpots on both webs; and on the outer, near the ſhafts, a row of large eyes, from twelve to fifteen in number, the largeſt an inch in diameter, ſomewhat reſembling thoſe on a peacock's train; the throat, breaſt, rump, and upper tail-coverts dull orange, marked with round duſky ſpots; the tail conſiſts of fourteen feathers, the two middle ones are three feet in length, the next eighteen inches, and thence they gradually ſhorten to the outer ones which are twelve inches only in length; the colour duſky brown, dotted with white; and the two middle ones have round white ſpots encircled with black on the outer, and brown irregular ones ſurrounded with duſky on the inner webs; the lower belly and vent duſky, irregularly mixed with brown; the legs, like thoſe of a turkey, and of a greeniſh aſh colour. Vide Lath. Gen. Syn.

We muſt not omit obſerving that the deſcription of this ſpecies by Dr. Latham, was partly taken from a drawing ſent over with a ſpecimen of the bird; both the head and legs were wanting in this ſpecimen, and were ſupplied from the painted figure; in this figure the legs have no ſpurs; but in a drawing, done by Mr. Edwards, they are furniſhed with a ſpur like that of a cock.

Its ſpecific character, according to Gmelin, &c. is thus defined; pale yellow, dotted (or ſpotted) with black; face red; hind part of the head creſted, and blue. Buffon calls it *L'Argus, ou le Luen*.

ARGUS, in *Zoology*, a ſpecies of COLUBER introduced by Linnæus, and retained by Gmelin, in the Syſtema Naturæ, on the authority of Seba; but as the ſpecific characters aſſigned to the ſerpents by theſe authors are uniformly taken from the number of ſcuta, and ſquamæ, which, in this inſtance, they were unable to aſcertain, it unavoidably ſtands without any character by which the ſpecies may be diſtinguiſhed. A general deſcription is indeed added, yet, if other writers are to be depended on, it is not very remarkable for its accuracy; above, ſmooth brown, and ſomewhat reticulated; ſcales paleſt in the diſk; beneath, teſſellated: the back of the head likewiſe is bilobed and gibbous. Dr. Shaw gives a ſpecific character to this creature, which is taken from the colours, form, and ſituation of the ſpots in theſe words: cheſnut-brown ſnake, yellow beneath, and banded above by tranſverſe rows of ocellated red ſpots. Gen. Zool.

This is a large ſpecies, meaſuring according to Seba above five feet in length, and is of a moderate thickneſs. The head is large, flattiſh, and covered with ſmall ſcales in front; teeth large and ſtrong; and the ocellated red ſpots on the body are each ſurrounded by a white iris, which is encircled with red. The tail is moderately ſlender, tapering to a point, and apparently about a foot in length. It is a native of Arabia, and is ſuppoſed from the appearance of the head to be a poiſonous ſpecies.

ARGUTIÆ, in *Rhetoric*, witty and acute ſayings, which commonly ſignify ſomething farther than what their mere words at firſt ſight ſeem to import. Writers on rhetoric ſpeak of divers ſpecies of *argutiæ*, viz.

ARGUTIÆ *ab alieno*, when ſomething is ſaid, which ſeems repugnant either to the nature and property of a thing, or to common cuſtom, the laws, &c. and yet in reality is conſiſtent therewith; or when ſomething is given as a reaſon of another, which yet is not the reaſon of it. For inſtance, "ſi Cains nihil didiciſſet, erraſſet minus:" again, "Aureum hoc ſæculum eſt, quia plurimus jam auro honos venit."

ARGUTIÆ *ab alluſione*, thoſe wherein alluſion is made to ſome hiſtory, fable, ſentence, proverb, or the like; e. g. "multi umbram captant & carnem amittunt."

ARGUTIÆ *a comparatis*, when two things are compared together, which yet at firſt ſight appear very different from each other, but ſo as to make a pretty kind of *ſimile*, or *diſſimile*; e. g. "Par eſt pauper nil cupiens principi omnia habenti."

ARGUTIÆ *a repugnantibus*, when two things meet in a ſubject, which yet regularly cannot be therein; or when two things are oppoſed to each other, yet the epithet of the one is attributed to the other; e. g. "Dum tacent clamant."

ARGUZIA, in *Botany*. See MESSERSCHMIDIA.

ARGY, in *Geography*, a town of France, in the department of the Indre, and chief place of a canton, in the diſtrict of Chatillon ſur Indre, three and a half leagues eaſt of Chatillon.

ARGYLE, a townſhip of America, in Waſhington County and State of New York, on the eaſt bank of Hudſon river, containing 2,341 inhabitants, incluſive of fourteen ſlaves. In the ſtate cenſus of 1796, there appeared to be 404 electors.—*Argyle* is alſo a townſhip of Shelburne County in Nova Scotia, ſettled by Acadians and Scots.

ARGYLESHIRE, or ARGATHIA, in Scotland, which together with Perthſhire and the Weſtern Iſlands, is ſaid to have conſtituted the ancient kingdom of the Scots, while the reſt of Caledonia was ſubjected to the Picts and Romans, comprehends Kintyre, Knapdale, Argyle Proper, Cowal, and Lorne. It is bounded on the ſouth by the Iriſh ſea and the Frith of Clyde; on the eaſt, by Perthſhire; on the north-eaſt by Lochaber; and on the north-weſt by ſeveral iſlands. The extent of it from ſouth to north, between the Mull of Kintyre or Cantire, and the point of Ardnamurchan, where it joins the ſhire of Inverneſs, is about 114 miles; and the breadth in ſome places,

including the iſles, about 70. This country, like all other parts of the Highlands, affords a very wild and horrid proſpect of hills, rocks, and huge mountains, piled upon each other in a ſtupendous and dreadful diſorder; bare, bleak, and barren to the view; or at beſt covered with ſhagged heath, which appears black and diſmal to the eye, except in the ſummer, when it is variegated with an agreeable bloom of a purple colour. The coaſt of Argyle is rocky; yet indented with bays and inlets, that afford good harbours for ſhipping. The country is well watered by rivers, brooks, and lakes, abounding with fiſh; the vales and flat parts of it are cultivated for corn; the mountains feed an innumerable quantity of black cattle, which run wild among the hills in winter as well as ſummer; the heath and woods, of which there is a conſiderable number, afford ſhelter to deer, roebucks and all ſorts of game in great plenty: the circumambient ſea, with its locks, bays, and harbours, pours forth myriads of fiſh; but the innate wealth of the country is dug from the bowels of the mountains in iron, lead, and other metals and minerals.

Argyle is the ſeat of a provincial ſynod, conſiſting of five preſbyteries and 49 pariſhes; and gives the titles of *duke* and *earl* to the noble family of Campbell, the moſt powerful of all the Scottiſh nobility. The Duke of Argyle is, by hereditary right, great maſter of the king's houſehold in Scotland; admiral of the Weſtern iſles; general of Denoon cattle; keeper of Dunſtaffnage and Carrick; and, before the juriſdictions were aboliſhed, enjoyed other hereditary offices, which rendered him too powerful as the ſubject of a limited monarchy. He ſtill poſſeſſes many royalties; his vaſſals, even of the name of *Campbell*, are ſo numerous, and his influence extends ſo far, that he could, on occaſion, bring 3000 or 4000 fighting men into the field. Argyleſhire is in general peopled by this clan; and affords a great number of caſtles and ſeats belonging to gentlemen who hold of the duke, and boaſt themſelves deſcended from his family.

Argyle Proper is bounded by Knapdale and Cowal on the ſouth; Lochaber on the north; Lennox and the Grampian hills on the eaſt; and Lorne on the weſt. It lies between Lochfyn and Lochlow; which laſt is a freſh water lake about a mile broad, but extending 24 in length, including 12 iſlands, on two of which are the caſtles of Ereonel and Glenurquhart. This lake, which gives the title of viſcount to the duke of Argyle, iſſues in the river Aw, which, after a courſe of ſix or ſeven miles, enters Loch Ettiff, and this falls into the weſt ſea, oppoſite to the iſle of Mull: all theſe abound with excellent trout and ſalmon. Argyleſhire ſends one member to parliament. Its chief towns are Inverary and Campbeltown.

When the projected canal ſhall be completed, and ſome villages and harbours erected, the populous county of Argyle (Mr. Knox affirms) will become one of the moſt valuable provinces of the Britiſh empire. It abounds in black cattle, ſheep, and fiſh, though the latter are leſs numerous than thoſe on the more northern ſhores. Waſhed on both ſides by the ſea, deeply indented by navigable lakes and bays; having an eaſy communication with the fiſhing grounds on the North Highlands; with Glaſgow, and the trading towns on the Clyde; with Ireland, Wales, Whitehaven, Liverpool, Briſtol, and other marts on the weſt coaſt of England, we may eaſily conceive, that the period is at no great diſtance, when Argyleſhire will become a great commercial county. To corroborate this opinion, he obſerves, than after a veſſel gets under ſail from this coaſt, ſhe enters at once into the Atlantic, where ſhe meets with no interruption till ſhe makes the coaſt of America or the weſt Indies. The line, therefore, which nature points out for the inhabitants, is that of ſalt-making, fiſhing, ſhip-building, freights, or the carrying trade; ſoap and glaſs-making, by means of the kelp upon their ſhores, and ſand found upon Greſſ iſland, which is adapted for the latter.

ARGYNELLUS, in *Entomology*, a ſpecies of Curculio, that inhabits the Cape of Good Hope. It is ſilvery green; eyes black; beak flat above, with a black longitudinal furrow. Spec. Inſect. Nov. Act Stockh. 1785. Gmelin.

ARGYNNIS, a ſpecies of Sphinx (*Zygæna*, Fabricius). The wings are greeniſh-black, with gold ſpots; poſterior pair brown, and gold at the baſe. This is a beautiful inſect, and inhabits Braſil. Gmelin. The abdomen is black, and red at the tail; a few green ſpots on the anterior wings, and violet ſpots on the poſterior ones.

Argynnis, in *Mythology*, an appellation of Venus. Agamemnon built a temple to this goddeſs, under this appellation, in honour of a young favourite named Argynnus, or Argenus, who was drowned in the river Cephiſſus in Bœotia. Propertius mentions it, lib. iii. eleg. vi p. 6*y*.

"Sunt Agamemnonias teſtantia littora curas,
Quæ notat Argyni parva natantis aqua."

ARGYPANA, in *Ancient Geography*, a town of Italy mentioned by Polybius, who ſays it was ravaged by Hannibal.

ARGYPHEA, a town of the Peloponneſus, named in the hymn of Apollo aſcribed to Homer.

ARGYRA, a country of India, on the other ſide of the Ganges, mentioned by Mela, Pliny, and Pompey.—Alſo, a town of India, and the metropolis of the iſland of Iabadios, on the weſtern ſide of which it was placed by Ptolemy. This iſland, called by Steph. Byz. Ibadios, ſeems to have been the ſame with that named Taprobana. It is ſaid to have derived its name Argyra from ἀργυρος, *ſilver*, on account of its fertility, and the gold which it produced.—Argyra was alſo a town of Greece in Achaia. Pauſanias informs us, that this, together with ſeveral other towns, was depopulated by Auguſtus, in order to ſupply Patras with inhabitants. A fountain of the ſame name was adjacent to its ruins.

ARGYRASPIDES, or Argyroaspides, in *Antiquity*, perſons armed with ſilver bucklers, or bucklers ſilvered.

The argyraſpides, according to Quintus Curtius, made the ſecond corps of Alexander's army; the firſt was the phalanx.

According to Juſtin's account, lib xii. cap. 7. Alexander, having penetrated into India, and extended his empire as far as the ocean, for a monument of his glory, ordered the armour of his ſoldiers, and the houſings of his horſes to be adorned with ſilver. And hence he commanded them to be called argyraſpides, from the Greek ἀργυρος, *ſilver*, and ἀσπις, *buckler*. By this author it ſhould ſeem, that Alexander's whole army were called argyraſpides.—After that prince's death, the argyraſpides deſpiſed all other chiefs of the army, diſdaining to obey any other, having borne arms under Alexander.

ARGYREIA, in *Botany*, a genus of plants ſo named by Lureiro, from the ſilvery appearance of the leaves, ſeems nearly related to Argophyllum, which approximates cloſely to ivy.

ARGYRELLA, in *Entomology*, a ſpecies of Phalæna (*Tinea*, Gmel.). The wings are ſilvery, gloſſed with brown and ſtriated. This is a large inſect, and inhabits Auſtria.

ARGYREUS, a ſpecies of Curculio found in India. The body is green, with ſpots of ſilver and gold. Fabricius and Gmelin. The latter author arranges it with thoſe that have the thighs unarmed; but adds in his deſcription

that they are fomewhat armed, thofe of the firſt pair of legs having an obſolete ſpine.

ARGYRINI, in *Ancient Geography*, a people placed by Steph. Byz. and Lycophron among the Epirotæ, or in Epirus; but J. Veſſius ſays they were the inhabitants of Argyrrhium.

ARGYRIPA, a town of Apulia, in Italy; built by Diomedes. See ARPI.

ARGYRITES, in *Antiquity*, a denomination given to Grecian games, which formed part of the worſhip of ſome divinity. They were ſo called, becauſe the victor obtained, as a recompence, either ſome coin or vaſes of ſilver, or bucklers of braſs, &c. which were of a different kind in different places.

ARGYRITIS, in *Natural Hiſtory*, a name given by the ancients to a ſubſtance reſembling ſilver.

In this ſenſe, argyritis was uſed to ſignify ſuch litharge as was of a white colour, by way of diſtinguiſhing it from that which was yellow, which they dignified with the name *chryſitis*, as we do at preſent with that of litharge of gold. The argyritis of late writers ſeems to have been the ſame with the *lapis magnetis* of the ancients, mentioned by Theophraſtus, and diſtinguiſhed from the magnet.

ARGYROCOME, in *Botany*. See BACCHARIS, GNAPHALIUM, and XERANTHEMUM.

ARGYRODAMAS, in *Natural Hiſtory*, a ſort of ſilver-coloured talc, which bears the fire, and neither burns, melts, nor changes its hue. Plott's Hiſt. Staff.

Hence its denomination among the ancients of *argyrodamas*, quaſi *argentum indomitum*.

ARGYRODENDROS, in *Botany*. See PROTEA.

ARGYROLIBANUS, in the *Materia Medica* of the ancient Greeks, a word uſed to expreſs the white kind of olibanum.

ARGYROPHTHALMUS, in *Ornithology*, a ſpecies of CORVUS, whoſe general colour is black; breaſt blue; eyes ſilvery; tail white at the tip; and bill and legs black. Gmelin.

The firſt account that we have of this bird is in Brown's illuſtration of Natural Hiſtory; he figures it under the name of the *Surinam Daw* in the tenth plate of that work, from a ſpecimen then in the collection of M. Tunſtal, eſq. The ſame was afterwards deſcribed by Dr. Latham, as being of the ſize of a common crow. Bill duſky; head deep green; hind part rich blue; beneath that pale green; under each ear, and on the hind part of the neck, a ſpot of the ſame; neck, breaſt, belly, back, and wing-coverts deep changeable green; prime quills duſky; ends rich blue; tail duſky; legs fleſh-coloured. This bird he calls the *Surinam Crow*; but having loſt its tail, one very ſtriking characteriſtic of the ſpecies was unavoidably omitted, viz. the white ſpot at its extremity. In the year 1784, Jacquin publiſhed his "Beytrage zur Geſchichte der Vogel," at Vienna, in which this ſpecies is more ſatisfactorily deſcribed; and his deſcription was afterwards inſerted in the Supplement to Dr. Latham's Ornithology, and the Gmelinian Syſtema Naturæ. From hence it appears to be about the ſize of a jay; the prevailing colour black; irides ſilvery white. with a ſpot of blue above, and another beneath; the breaſt and outer part of the wing deep blue; tip of the tail white; bill and legs black. It inhabits Carthagena in New Spain, South America; and is called *Oiſeau de Plata*; has a monotonous voice; frequents woods; and being eaſily tamed, is often kept in houſes in that country.

ARGYROPOEIA, in *Alchemy*, the art of making ſilver out of other more imperfect metals.

The word is formed of ἀργυρος, *ſilver*, and ποιεω, *I make*.

ARGYROPS, in *Ichthyology*, a ſpecies of SPARUS, found in Jamaica and Carolina; and called by Willughby, *Zanthurus indicus*. The tail is lunated; back grooved; iris of the eye ſilvery. Brown, in his Nat. Hiſt. of Jamaica, deſcribes it as Sparus iride argentea, dentibus anterioribus conicis. The three firſt rays of the dorſal fin are very long and ſetaceous; this fin conſiſts of twelve rays; the ſecond of twenty-ſix; pectoral fin of ſeventeen; ventral fin of ſix; anal fin of ſifteen; and tail of twenty rays. Gmelin, &c.

ARGYROPULUS, JOHN, in *Biography*, a Peripatetic philoſopher, was born at Conſtantinople, in the beginning of the fifteenth century, and was one of the firſt Greeks, who fled from that city, and ſought an aſylum in Italy, where he came to reſide ſeveral years before the taking of Conſtantinople by the Turks in 1453. In 1456, he was taken under the patronage of Coſmo di Medici, who committed to him the education of his ſon and nephew in the Greek language and philoſophy; and who afterwards appointed him profeſſor of the Greek language at Florence. At his requeſt, he undertook to tranſlate into Latin the phyſics and ethics of Ariſtotle. But, being obliged to leave Florence on account of the plague, he went to Rome, where cardinal Beſarion conferred upon him the profeſſorſhip of the Greek language. Here he read lectures upon Ariſtotle, and he had the honour of being the firſt modern Greek who taught philoſophy in that city. His ſalary, though liberal, was not ſufficient to defray the expences of his luxurious table; and at the age of ſeventy, in the year 1486, he fell a ſacrifice to the unreſtrained indulgence of his appetite, as, by eating melons to exceſs, he brought on a fever which was fatal to him. His learning was reſpectable; but his manners were not amiable; and he manifeſted a degree of literary jealouſy which diſguſted his friends, and prevented him from freely communicating his learning to the Italians. He affected to deſpiſe Cicero, whom he maintained to have been ignorant of philoſophy and Greek learning. His tranſlations, which are found in the more ancient Latin editions of Ariſtotle, and in the Greek and Latin editions of Baſil, are valuable. He alſo wrote a "Commentary on Ariſtotle's Ethics;" Solutions of queſtions propoſed to him by certain philoſophers and phyſicians in the iſland of Cyprus; Epiſtles and ſeveral ſmall pieces extant in MS.; Brucker's Hiſt. Philoſ. by Enfield, vol. ii. p. 405. Fabr. Bibl. Græc. l. v. c. 43. § 21. tom. x. p. 425.

ARGYROSTOMA, in *Entomology*, a ſpecies of MUSCA, found in the environs of Vienna. It is black and hairy; ſilvery in front, with bands of the ſame. Schranck, Gmelin, &c.—This inſect is ſhining above; eyes reddiſh; and the wings tranſparent.

ARGYROSTOMUS, in *Conchology*, a ſpecies of TURBO, of a whitiſh colour, radiated with brown; the wreaths of the ſpire are ſix, and are rather rounded; the firſt ſpire conſiderably larger that the others; the aperture is ſilvery; and the tip ſometimes red. It is a native of India; is called *Os argenteum* by Argenville, and is thus ſpecifically deſcribed by Gmelin. Shell ſomewhat ovate; rough, with more elevated dorſal tranſverſely ſtriated lines.

ARGYROSTOMUS, a ſpecies of TROCHUS, that inhabits the ſouthern ocean. This ſhell is ovate, with undulated ribs, and ſtriated tranſverſely; aperture ſomewhat compreſſed; wreaths of the ſpire ſwelled; the firſt ſlightly carinated at the baſe. Gmelin. The breadth is about two inches, and the height nearly the ſame; its colour is black; the firſt wreath terminates in a row of tubercles; and the pillar lip is very green.

ARGYRRHIUM, or ARGYRIUM, in *Ancient Geography*,

graphy, now *S. Filippo d'Argiro*, a town of Sicily, which was the birth-place of Diodorus Siculus. This city, built upon the point of a rock of a conical form, commanded its whole territory; and according to hiſtory, diſputed the palm with that of Syracuſe, as to extent and riches. Its population was encouraged and increaſed by Timoleon, after he had expelled the tyrants of Sicily. Enriched by commerce, the inhabitants who came to reſide here, embelliſhed it with ſuperb edifices: they built a theatre almoſt as large and ſplendid as that of Syracuſe; and erected magnificent mauſolea in the form of pyramids. This city is now ſo much reduced, that ſcarcely a trace remains of its ancient grandeur. The ſcite of the temple of Hercules, and of the lake dug there by Iolas, his ſon-in-law, is now called the "Lago d'Ercole." Nevertheleſs the ſoil is fertile, and admits of cultivation. The ſaffron of this territory is deemed excellent, and it yields a kind of potter's earth, which by its unctuous and detergent quality ſerves the inhabitants inſtead of ſoap. Argyrium was founded by the Sicanians, who came into Sicily from Spain; being compelled to leave the rich plains of Leontium by the attacks of the Leſtrigons and Cyclopes, they retired to this place which nature ſeems to have previouſly fortified for their ſecurity. Hiſtorians relate, that the Argyrians cut off their hair in order to ſacrifice it to Hercules, in token of their gratitude for the water with which he furniſhed them by means of the above mentioned lake, as Argyrium was before deſtitute of water. The modern inhabitants retain the practice, and cut their hair almoſt entirely off, preſerving only two locks on their temples. De Non's Travels in Sicily, &c. p. 842.

ARGYRUNTUM, or ARGYRUTUM, in *Ancient Geography*, a maritime town of Illyria, according to Pliny and Ptolemy; now Novegrad in Dalmatia.

ARHAW, in *Geography*, a river of Africa, in the kingdom of Algiers and province of Tlemſan, which flows into the Sheliff, near a noted ſanctuary, called Seedy Abid, at a ſmall diſtance from mount Atlas.

ARHON, a large mountain of Africa, in the kingdom of Fez. It is a branch of mount Atlas, and extends for a conſiderable diſtance from eaſt to weſt. Its inhabitants are partly Moors expelled from Spain, and partly ſome Arab families. The ſoil produces abundance of barley, which is the only grain of the country. They have alſo olives and dried raiſins: and they rear great numbers of bees. They alſo manufacture ſoap, which is an article of commerce. Their habitations, which are rather huts than houſes, are ſcattered over the country. The emperor of Morocco draws from them a conſiderable tribute: and it is ſaid, that this ſimple diſtrict is able to furniſh 10,000 ſoldiers.

ARHUS. See AARHUS.

ARI, a town of Italy, in the kingdom of Naples, and province of Abruzzo Citra, five miles ſouth-eaſt of Civita di Chieti.

ARIA, in *Ancient Geography*, the name of an iſland in the Euxine ſea, oppoſite to Pharnacea, called alſo *Chalceritis*. Pliny.

ARIA, a mountain of Aſia, part of a chain of mountains mentioned by Ammianus Marcellinus.

ARIA, the moſt conſiderable lake of Perſia, is ſituated in the weſtern part of the province of Segiſtan or Seiſtan, according to the map of major Rennel between 33° 15′ and 32° 45′, N. lat. and 59° 15′, and 61° 20′ E. long. In the French maps it is called the lake of Zeré, from a village of that name near its weſtern extremity; and in the map of major Rennell, the ſea of Durrah or Zurrah, from a village ſeated on a river at the diſtance of twenty miles from the lake, which village is denominated Corra or Curra, whence is probably derived Zurrah. Pinkerton (Mod. Geog. vol. ii. p. 355.) ſuggeſts that this appellation might as well be ſupplanted by that of the ſea of Segiſtan. According to Otter (Voyage en Turkie et en Perſe, tom. i. 217.) cited by this geographer, the length of this lake is thirty leagues, or a day's journey, in breadth; and the water is freſh and full of fiſh. By his account it only receives the river of Ferah (Farree) or Parra, which runs from the north-eaſt.

ARIA, and *Ariana*, are names that have been applied by ancient geographers very variouſly. Some have applied them to the ſame country, and others to diſtinct countries. Ptolemy mentions only Aria, without noticing Ariana, and the Ariani. Pliny (l. vi. c. 23.) mentions Ariana, but takes no notice of Aria; and yet he diſtinguiſhes (l. vi. c. 25.) between the Arii and Ariani. Parthia, he ſays, has the Arii to the eaſt, and to the ſouth the Ariani and Carmania. Hence it has been conjectured, that the Ariani were more widely extended than the Arii, and that under this general denomination were included the Gedroſii and the Drangæ. Arrian (l. iii. c. 25.) has Aria and the Arii, but is ſilent with regard to Ariana. Strabo has both names, and extends the limits of Ariana beyond thoſe of Aria: obſerving in general, without ſettling their boundaries, that Ariana commences from India; and he cites Eratoſthenes, who ſays that Ariana was bounded on the eaſt by Indus, on the ſouth by the Great Sea, on the north by Paropamiſus and the mountains as far as the Caſpian ports, and on the weſt by the boundaries which ſeparate Parthia from Media, and Carmania from Parætacene and Perſia; and, accordingly, Ariana is very extenſive. Salmaſius (Exerc. Plin. p. 553.) diſtinguiſhes his Ariana from Aria, but does not aſſign to it any preciſe limits. The limits of Aria, according to Ptolemy, are parts of Margiana and Bactria on the north, on the eaſt the Paropamiſadæ, and on the ſouth Drangiana: and Strabo ſays, that the Arii are adjacent to the Paropamiſadæ on the weſt. Ariana, in major Rennell's map, is a part of the province of Perſia, called Koraſan or Koreſan.

ARIA, or *Artacoana*, the chief city of the country called Aria, ſeated on a river, called by Arrian, Areios; by Pliny, Aries; by Ammian, Arias; which had ſeveral ſources in the deſert of Margiana, and in the Saraphi mountains, and runs into the Aria Palus, or lake of Aria. In its courſe it paſſed by Alexandria, according to Pliny, who calls this city Alexandria Arion or Ariorum. Aria or Artacoana is the preſent HERAT, placed in Rennell's map at the confluence of two ſtreams, which form the river that runs into the lake of Durrah.

ARIA, Ital. for *Air*, Engliſh (which ſee). Herr Sulzer, an elegant German writer on the ſubject of the fine arts, has deſcribed the conſtruction, and what was thought the perfection of an opera *Air*, about the middle of the laſt century, during *da capo* times; and not only apologized for ſecond parts to airs, and a return to the firſt, but pointed out their utility and beauty in doctrines now quite exploded, both in theory and practice. In the remarks of Mr. Framery on the encomiums of H. Sulzer (Encycl. Meth. p. 95.), he allows that his precepts are excellent, but that his definition appears imperfect. He then gives his own notions, which tally more with modern practice. After which he adds, "as to the form of opera *Airs* indicated by M. Sulzer, it is much varied ſince he wrote on the ſubject." The Italians at length, tired of their eternal monotony, melt down the ſecond part of their *Airs* into the firſt; or, if diſtinct, when the expreſſion of the words requires it, they do not think themſelves obliged to return to it by a *da capo*. The *Airs* of comic operas are conſtantly

ſtantly confined to one part or ſtrain, unleſs ſome new meaſure, or diſſimilar idea in the words, abſolutely requires a different expreſſion. The movement then is changed, and finiſhes by an *Allegro*, without returning to the firſt part.

ARIA-*Bepou*, in *Botany*. See MELIA.

ARIA *Theophraſti*. See CRATÆGUS.

ARIA-*Veela*. See CLEOME.

ARIACA, in *Ancient Geography*, a maritime country of India, ſituate, according to the Periplus of the Erythræan ſea, towards the gulf Canthi Colpus, and thought by M. d'Anville to be the ſouthern part of the country called *Larice*.—*Ariaca* was alſo a town of Margiana. Ptolemy.

ARIACÆ, a people of Scythia, on the left bank of the Iaxartes, near the Caſpian ſea. Ptolemy.

ARIACES SADINORUM, or *Sadanarum*, a people of India, on this ſide the Ganges.

ARIACOS, or ARIACE, a ſmall town of Aſia Minor, in Myſia, ſituate between Placia and Scylace, near Olympus. Pliny.

ARIADNÆA, in *Antiquity*, ſolemn feſtivals held at Naxos, in honour of *Ariadne*.

The Ariadnæa are ſaid to have been inſtituted by Theſeus, in atonement for his cruelty in expoſing Ariadne big with child on that coaſt. They were of a mournful caſt; one part of the ceremony was for a young woman to lie down, and counterfeit all the agonies of a woman in labour. There was another feſtival, which was celebrated with various expreſſions of mirth, in honour of another Ariadne, who was of a gay and ſprightly temper. Plut. in Theſ. and Potter's Arch.

ARIADNE, in *Entomology*, a ſpecies of PAPILIO (*Nymph. Phal.*) deſcribed by Linnæus, Fabricius, and Gmelin. The wings are angulated, fulvous, with undulated black ſtreaks, and a white marginal ſpot on the anterior pair. It inhabits Java.—*Obſ.* Cramer has figured this inſect under the name of *Papilio Merione*; and the *Papilio Coryta*, of the ſame author, appears to be only a variety of the former ſpecies.

ARIADNE, in *Fabulous Hiſtory*, a daughter of Minos, king of Crete, who being prepoſſeſſed in favour of Theſeus, commiſſioned to deſtroy the Minotaur, gave him, in token of her love, a clue of thread, which ſerved to conduct him out of the labyrinth, after his defeat of the monſter. Theſeus, on leaving the iſland, took with him Ariadne, but abandoned her in the iſle of Naxos. Bacchus found, and married her, and preſented her with a crown of gold manufactured by Vulcan, which was afterwards transformed into a conſtellation. Ariadne had a ſon by Bacchus, called Eumedon, who was one of the Argonauts. According to Plutarch, there were two females of the name of Ariadne; one of them was eſpouſed to Bacchus in the iſland of Naxos, and became the mother of Staphylos; the other was abandoned by Theſeus in the ſame iſland, where ſhe died. Hence were derived the two kinds of feaſts, called ARIADNÆA. Ariadne's fountain in the iſle of Naxos is now only a ſimple ſtreamlet of water, to which, ſays Olivier, (Travels in the Ottoman empire, t. ii. p. 110.) travellers would pay no attention, if they were not thus reminded of the ſpot where Ariadne abandoned herſelf to all the deſpair of a forſaken miſtreſs, and from which ſhe perceived the veſſel which was tranſporting her lover from her. At the brink of this fountain, it is ſaid, where ſhe came every day to ſhed tears, Bacchus found her; and equally compaſſionating her misfortunes, and enamoured of her beauty, ſucceeded in conſoling her, and in prevailing with her to forget an ungrateful man.

ARIADNE, in *Statuary*, a beautiful ſtatue of Parian marble, which was for near three hundred years one of the greateſt ornaments of the Belvidere; where it was placed by pope Julius II. It is now in the muſeum at Paris. Ariadne is here repreſented ſleeping upon the rocks of Naxos; where ſhe had been ungratefully left by Theſeus. The diſorder of the drapery in which ſhe is wrapped, beautifully points out the diſtraction and anguiſh of her mind before ſhe fell aſleep. On the upper part of her left arm is a bracelet in the form of a little ſerpent, which the ancients called Ophis; and which, by being taken for the repreſentation of the aſpic, has occaſioned this ſtatue for a long time to be called Cleopatra.

ARIALDUNUM, in *Ancient Geography*, a town of Spain, under the juriſdiction of Corduba. Pliny.

ARJAN, a name given by a tribe of Tartars, called Barſchkirians, to their favourite drink, which is a mixture of ſour milk and mead, and which they keep in an oblong bottle, ſuſpended near the chimney of their hut.

ARIANA, in *Ancient Geography*. See ARIA.

ARIANA, in *Geography*, formerly called Abderana, a village in Africa, in the province of Tunis Proper, and about three miles diſtant from the city of Tunis. It is inhabited by poor gardeners, who ſupply the city with fruit and herbs. At this place the Carthaginian aqueduct forms a curious object, being ſeventy-four feet high, and ſupported by columns ſixteen feet ſquare, beautifully cut; and near it are ſeveral matamores or ſubterraneous magazines for corn, ſtrongly arched, and capable of holding a great number of buſhels.

ARIANO, a town of Italy, and a biſhop's ſee, in the kingdom of Naples, and Principato Ultra. According to Mr. Swinburne (Travels in the Two Sicilies, vol. i. p. 202.), it is an ugly city, built upon the uneven ſummit of a mountain, with an extenſive proſpect, but much expoſed. He ſuppoſes that it is not ſo ancient as the time of the Romans; and that it owes its riſe to the demolition of ſome neighbouring town, and to the advantage afforded by its ſituation for diſcovery and defence. After having ſeveral times changed its poſſeſſors, it became a part of the demeſne of the crown in 1466. It has neither trade nor manufactures, and has declined ever ſince the deſolation occaſioned by an earthquake in 1456. The number of inhabitants is eſtimated about 14,000, and it includes twenty pariſhes and convents, beſides an ill-endowed cathedral. The wine of Ariano is pale, and reſembles, both in colour and the ſharpneſs of its taſte, red champagne. The ſoil in its vicinity lies upon a ſoft argillaceous ſtone: at a ſmall diſtance to the eaſt, is a bank conſiſting of layers of volcanic earth, interſperſed with thick ſtrata of oyſter-ſhells. The laſt and moſt deſtructive earthquake experienced in this territory, was that of the year 1732. N. lat. 41° 8′. E. long. 15° 19′.

ARIANS, a denomination given to a claſs of the ancient inhabitants of the Ruſſian empire, called by the Ruſſians Votiaks from the river Votiak, on which they were formerly ſituated. They call themſelves Ari, and their territory Arimæ. Their chief town is Chlueof, and the other towns are Slobodſkoi, Kaigorod, and Orlof. At firſt they were ſubject to the Bulgarians, and afterwards to the Tartars, from whoſe language they adopted many words into their own.

ARIANS, in *Eccleſiaſtical Hiſtory*, followers of *Arius*, a preſbyter of the church of Alexandria about the year 315; who owned Chriſt to be God, yet maintained him inferior to the Father even as to his deity, and his eſſence to be different from that of the Father, and that he was neither co-eternal nor co-equal with him; alſo that the Holy Ghoſt was not God.

The Arians owned that the Son was the word, but denied that word to have been eternal; aſſerting, that it had only been created before all other beings. They held,

that Chriſt had nothing of man in him but the fleſh, with which the λογος or *word* was joined, which ſupplied the reſt.

The diſtinguiſhing ſentiments of Arius may be deduced from his own writings. In his letter to Euſebius of Nicomedia, he ſays; "We cannot aſſent to thoſe expreſſions, always Father, always Son, at the ſame time Father and Son; that the Son always co-exiſts with the Father; that the Father has no pre-exiſtence before the Son, not ſo much as in thought, or a moment. But this we think and teach, that the Son is not unbegotten, nor a part of the unbegotten by any means. Nor is he made out of any pre-exiſtent thing; but, by the will and pleaſure of the Father, he exiſted before time and ages, the only begotten God, unchangeable; and that before he was begotten, or made, or deſigned, or founded, he was not.—But we are perſecuted, becauſe we ſay, that the Son has a beginning, and that God has no beginning. For this we are perſecuted, and becauſe we ſay, the Son is out of nothing; which we therefore ſay, becauſe he is not a part of God, nor made out of any pre-exiſtent thing." In his letter to Alexander, biſhop of Alexandria, he ſays; "We believe, that there are three perſons, the Father, the Son, and the Holy Ghoſt. God, the cauſe of all things, is alone without beginning. The Son, begotten of the Father before time, made before the ages, and founded, was not before he was begotten. Nor is he eternal, or co-eternal, or begotten at the ſame time with the Father." The creed, which was preſented by Arius at the council of Jeruſalem in 335, was this: "We believe in one God, the Father Almighty; and in the Lord Jeſus Chriſt his Son, begotten of him before all ages; God the word, by whom all things were made, which are in heaven and in earth; who came down and was incarnate, and ſuffered, and roſe again, and aſcended to the heavens, and ſhall come again to judge the living and the dead; and in the Holy Ghoſt; the reſurrection of the fleſh; the life of the world to come, and the kingdom of heaven; in one catholic church of God, extending itſelf from one end of the earth to the other." In ſhort, the Arians ſeem to have believed, that Chriſt was the Word of God, and was in the beginning with God; but was not the ſelf-exiſtent God, with whom he was in the beginning; but his Son, created by the Father before all ages, one ſuper-angelical and perfect Spirit; and thereby became his only Son, by whom he created all other beings: and that, when he came down from heaven to inhabit the body which was prepared for him in the womb of the bleſſed Virgin, this ſuper-angelical ſpirit alone was the ſoul that informed and enlivened it. From the following abſtract of the real opinions of the Arians, as they are given by Dr. Cave in the words of Arius, the reader may be enabled to compare them with thoſe that have been deemed orthodox. Firſt, as the Arians believed the divine ſubſtance of the Father to be unbegotten and without beginning, they concluded that it was different from the ſubſtance of the Son, who was begotten and had a beginning. But the Athanaſians believed the Father and the Son to be of the ſame ſubſtance; that is, of the ſame *generical* ſubſtance, as two men are of the ſame ſubſtance; and the Pſeudo Athanaſians believe them to be of the ſame *numerical* ſubſtance. Secondly, as the Arians believed the divine ſubſtance of the Father to be indiviſible and uncompounded, they could not believe the Son to be generated of or from it, in any *literal* ſenſe, either as being compounded with it, or divided from it; and therefore they concluded, that the generation of the Son was *figurative*; and was not a participation of ſubſtance, but a creation, as the word creation is frequently uſed in Scripture with reſpect to mankind; and they conſumed this from Prov. viii. 22. And becauſe they believed it blaſphemous to ſay, that this generation was out of the indiviſible ſubſtance of the Father, and no other ſubſtance then exiſted, they ſaid, he ſubſiſts, not of or from the Father, but from nothing, and he is not of the Father's ſubſtance, for he is created and made. But the Athanaſians believed, the Son was *literally* generated from the Father's ſubſtance. Thirdly, as the Arians believed the Father and the Son to be of a different ſubſtance, they believed them alſo to be diſtinct beings, ſeparately exiſting; in which they agreed with ſome of the orthodox fathers, as Origen, Gregory Nyſſen, Cyril of Alexandria, Maximus the Martyr, Damaſcen, Dionyſius of Alexandria, Alexander of Alexandria, &c.: and ſuffered from others who believed him to be of or from the Father's ſubſtance, as the leaves are from the tree; but not divided from it, as the Athanaſians. Fourthly, they believed that Chriſt was the only begotten Son of God, becauſe he only was created by the *immediate* act and power of God himſelf; and that all other beings, the Holy Ghoſt not excepted, were created by Chriſt; in which they agreed with Origen and Euſebius, men of as great character as any in the Chriſtian church. And therefore they called him a creature; but not like other creatures. Fifthly, they believed, that the Son was generated or created before all ages; and was a real perſon, when ſpoken of, Prov. viii. 22.; and that his generation was over, as ſoon as he exiſted. Whereas ſome of the orthodox believed him to be only an attribute, when there ſpoken of; and that he was afterwards generated into a *Son*; and ſome of them believed him eternally generating, as light from the ſun. Sixthly, they believed the divine being, who deſcended from heaven and was born of the virgin Mary, was the only intelligent ſpirit that animated the *body* of Chriſt; and that this divine being ſuffered: but the orthodox believed, that the divine being, that deſcended from heaven and animated the body of Chriſt, was incapable of ſuffering; and that it was only the *human* nature, or *ſoul* of Chriſt that ſuffered; i. e. a mere man. Seventhly, as the Arians believed Chriſt to be the Son of the only true God, and not the only true God and Father of that Son, it was very conſiſtent with their belief to ſay, "He is not the true God." But if it be imagined, that by this expreſſion they meant to deny, that Chriſt was truly God the Son, the expreſs words of Eunomius, who calls him, "The only begotten God, the firſt-born of the whole creation, Chriſt, true God, not unbegotten;" prove the contrary: and Arius himſelf explains his meaning ſufficiently, when he ſays, "He is not the true (ſelf-exiſtent and unoriginate) God, but receives his divinity by communication; which was alſo the opinion of Origen, Euſebius, and Lactantius. It has been commonly aſſerted, that Arius denied the *eternity* and *divinity* of the Son of God: but the author of "The Apology of Ben Mordecai," p. 98. ſays, that this aſſertion never appeared to him to have been made upon good authority; for he never denied the *eternity* of the Son in any other ſenſe than that in which it is denied by the orthodox, and ſignifies unoriginate and unbegotten; that is, ſelf-exiſtent: and that the charge againſt him of his not believing the *divinity* of Chriſt is not founded, appears from this circumſtance; that his adverſaries accuſed him of idolatry, becauſe he worſhipped the Son of God; ſuppoſing him at the ſame time to be a God created before all ages. Now if he was idolatrous in believing Chriſt to be a created God, it is impoſſible he ſhould at the ſame time be guilty of denying his divinity. Beſides, Theodoret ſays, it was the opinion of Arius and Eunomius, that Chriſt took a body; but the godhead or divinity performed the office of a ſoul: and Athanaſius ſays, Arius taught that Chriſt had the fleſh as a covering to the divinity or godhead.

Never

Nevertheleſs, Athanaſius's enmity to Arianiſm is well known. He ſpeaks of it as the worſt of all hereſies, and ſays, the devil was the father of it; nor will he by any means allow, that Arians can be rightfully called Chriſtians. However, in declaiming againſt Arianiſm, as the worſt and moſt hateful of all hereſies, he makes this its peculiarity, that the Arians endeavoured to carry their point by externals, that is, civil authority, or the power of the magiſtrates. And on account of the violent methods to which they recurred, he ſays, that this ſect, or hereſy, had put on the devil complete.

The riſe of the Arian controverſy is referred by ſome to the year 316, by others to 319, by Baronius to 315, and by Baſnage and others to the year 317. Socrates (Eccl. Hiſt. l. i. c. 5.) gives this account of its origin. "Alexander," he ſays, "diſcourſing one day too curiouſly concerning the doctrine of the Trinity in Unity, in the preſence of his preſbyters and the reſt of his clergy, Arius, one of the preſbyters, ſuppoſed his biſhop to advance the doctrine of Sabellius, and diſliking that, he went into an opinion directly oppoſite." Theodoret alſo ſays (Eccl. Hiſt. l. iv. c. 1.) that Arius took occaſion, from things ſaid by Alexander, to raiſe a diſturbance: and Conſtantine likewiſe, in his letter to Alexander and Arius, firſt blames the former for putting queſtions to his preſbyters, which he ought not; and then the latter, for inconſiderately uttering notions that ought to have been buried in ſilence. Accordingly, it ſeems to have been the chief view of the Arians, as well as of the orthodox, to ſteer a kind of middle courſe between Sabellianiſm and Socinianiſm. To which purpoſe, the Arians maintain, againſt the Sabellians, that the Son of God is a being diſtinct and different from the Father, and not a mere virtue, or character, or mode of exiſtence; and againſt the Socinians, as well as the Neſtorians and Sabellians, that Chriſt was not a mere man, but a true God.

After Arius had for ſome time publiſhed the doctrines that are aſcribed to him, Alexander was blamed for his indifference, and for his toleration of ſuch novelties. Rouſed by reproaches and complaints, he appointed a time for hearing the ſubjects in diſpute fairly debated between Arius and thoſe who oppoſed him. Arius adhered to the opinions he had advanced; and they who oppoſed him aſſerted the Son to be conſubſtantial and co-eternal with the Father. And though another aſſembly was appointed for debating the points in agitation, they could by no means come to an agreement. Alexander himſelf is ſaid to have been at firſt in ſome ſuſpence; but at length he declared himſelf in favour of thoſe who were the antagoniſts of Arius.

The Arians were firſt condemned and anathematized by a council at Alexandria, conſiſting of 100 biſhops, in 320, under Alexander, biſhop of that city; who accuſed Arius of impiety, and cauſed him and ſeveral eccleſiaſtics, of whom two were biſhops, to be expelled from the communion of the church: and afterwards by 318 fathers in the general council of Nice, aſſembled by Conſtantine in the year 325. In the interval between theſe councils, Alexander had written a circular letter to all biſhops, in which he repreſents Arius and his partiſans as heretics, apoſtates, blaſphemers, enemies of God, full of impudence and impiety, forerunners of antichriſt, imitators of Judas and of men whom it was not lawful to ſalute, or to bid God ſpeed. Yet Sozomen (l. i. c. 15.) acknowledges, that they were learned, and, in all appearance, good men. Euſebius of Nicomedia, and Euſebius the hiſtorian, endeavoured to pacify Alexander, and to perſuade him to compromiſe the quarrel; and Conſtantine ſent a letter, about the year 324, by Hoſius of Corduba, addreſſed to Alexander and Arius, in which he reproved them both for diſturbing the church with their inſignificant diſputes, and exhorted them to mutual forbearance and forgiveneſs. But the diſpute was not to be thus terminated; and Socrates repreſents the parties on both ſides as equally contentious and refractory. Accordingly the Nicene council was ſummoned. At this council Euſebius propoſed a creed, in which he avoided the offenſive word Ομοουσιος, *homoouſios*, and anathematized every impious hereſy, without ſpecifying any; but his advice was not followed, the term was inſerted, and the Arian doctrines were anathematized. But notwithſtanding theſe meaſures, Arianiſm was not extinguiſhed; on the contrary, it became the reigning religion, eſpecially in the Eaſt, where it obtained much more than in the Weſt. Arius was recalled from baniſhment by the emperor Conſtantine, in two or three years after the council of Nice, as ſome ſay in 327 or 328, or according to others in 330; and the laws that had been enacted againſt him were repealed. In the year 335, Athanaſius, his zealous opponent, was depoſed and baniſhed into Gaul, by the council held at Tyre; and Arius and his followers were reinſtated in their privileges, and received into the communion of the church: in little more than a year after this, he fell a victim to the reſentment of his enemies, and died a tragical death, occaſioned probably by poiſon, or ſome other violence. The Arian party found a protector in Conſtantius, who ſucceeded his father in the empire of the Eaſt; and the zeal with which he abetted them, produced many animoſities and tumults to the time of his death, in the year 362. They underwent various revolutions, perſecuting and oppreſſed, under ſucceeding emperors, according to the degree of intereſt they had in the civil power; till, at length, Theodoſius the Great exerted every poſſible effort to ſuppreſs and diſperſe them. He drove them from their churches, enacted laws whoſe ſeverity expoſed them to the greateſt calamities, and rendered, throughout his dominions, the decrees of the council of Nice triumphant over all oppoſition; ſo that the public profeſſion of the Arian doctrine was confined to the barbarous and unconquered nations, ſuch as the Burgundians, Goths, and Vandals.

The Arians were divided into various ſects, of which ancient writers give an account under the names of *Semi-Arians*, *Euſebians*, *Actians*, *Eunomians*, *Acacians*, *Pſathyrians*, and others. But they have been commonly diſtributed into three claſſes, viz. the genuine *Arians*, *Semi-Arians*, and *Eunomians*. The Arian cauſe ſuffered as much from the diſcord and animoſity that prevailed among theſe ſects, as from the laboured and zealous efforts of the orthodox party.

Arianiſm was carried in the fifth century into Africa, under the Vandals; and into Aſia, under the Goths. Among thoſe fierce and ſavage nations, which were overturning the Weſtern empire, it found a fixed reſidence, and a peaceful retreat. As their ſecurity animated their courage, they treated the Catholics with the ſame violence which the latter had employed againſt them and other heretics; and they perſecuted and vexed in various ways ſuch as profeſſed their adherence to the Nicene doctrines. The Vandals, who reigned in Africa, ſurpaſſed all the other ſavage nations in barbarity and injuſtice towards the Catholics. The kings of this fierce people, particularly Genſeric and Hunneric his ſon, demoliſhed the churches of thoſe Chriſtians who acknowleged the divinity of Chriſt, ſent their biſhops into exile, and maimed and tormented in various ways ſuch as were firm and inflexible in the profeſſion of their faith. During theſe perſecutions in Africa, a ſtupendous miracle is ſaid to have been wrought, by which the Supreme Being is ſuppoſed to have teſtified his diſpleaſure

againſt the Arians, and his favour to their adverſaries. This miracle conſiſted in enabling thoſe Catholics, whoſe tongues had been cut out by the Arian tyrant Hunneric, to ſpeak diſtinctly, and to proclaim aloud the divine majeſty of the Saviour of the world. This remarkable fact, ſays Moſheim, can ſcarcely be denied, ſince it is ſupported by the teſtimony of the moſt credible and reſpectable witneſſes; but whether it is to be attributed to a ſupernatural and miraculous power is a matter not ſo eaſily decided, and which admits of much diſpute. The reality of this extraordinary fact is atteſted by Victor, an African biſhop; Æneas of Gaza, a platonic philoſopher; a perpetual edict of the emperor Juſtinian; count Marcellinus in his Chronicle of the times; and pope Gregory the firſt, who had reſided at Conſtantinople as the miniſter of the Roman pontiff. Among the moderns who have defended its miraculous nature, we may mention Abbadie, Berriman, Chapman, and Dodwell; and we may refer to Mr. Middleton's "free Inquiry into the miraculous powers," &c. in his "Miſcellaneous works," vol. i. p. 149, &c.; and to Mr. Toll's Defence, p. 80, &c. for arguments againſt it. The learned hiſtorian, Mr. Gibbon, obſerves in his uſual manner, (Hiſt. of the Decline, &c. of the Roman empire, vol. vi. p. 295.), that "this ſupernatural gift of the African confeſſors, who ſpoke without tongues, will command the aſſent of thoſe, and of thoſe only, who already believe, that their language was pure and orthodox; but the ſtubborn mind of an infidel is guarded by ſecret, incurable ſuſpicion; and the Arian, or Socinian, who has ſeriouſly rejected the doctrine of the Trinity, will not be ſhaken by the moſt plauſible evidence of an Athanaſian miracle." Italy, the Gauls, and Spain, were alſo deeply infected with Arianiſm; and towards the commencement of the ſixth century, it was triumphant in many parts of Aſia, Africa, and Europe. Many of the Aſiatic biſhops favoured the Arians ſecretly, while their opinions were openly profeſſed, and their cauſe maintained by the Vandals in Africa, the Goths in Italy, the Spaniards, the Burgundians, the Suevi, and the greateſt part of the Gauls. The Greeks, indeed, who had received the decrees of the council of Nice, perſecuted and oppreſſed the Arians, wherever their influence and authority could reach; but the Nicenians, in their turn, were not leſs rigorouſly treated by their adverſaries, particularly in Africa and Italy, where they felt, in a very ſevere manner, the weight of the Arian power, and the bitterneſs of their reſentment. The triumphs of Arianiſm were, however, but tranſitory; and its proſperous days were entirely eclipſed, when the Vandals were driven out of Africa, and the Goths out of Italy, by the arms of Juſtinian; for the other Arian princes were eaſily induced to abandon themſelves the doctrine of that ſect; and not only ſo, but to employ the force of laws and the authority of councils to prevent its farther progreſs among their ſubjects, and to extirpate it entirely out of their dominions. Such was the conduct of Sigiſmund, king of the Burgundians; Theodemir, king of the Suevi, who had ſettled in Luſitania; and Reccared, king of Spain. However, it revived again in Italy, under the protection of the Lombards, in the ſeventh century.

Eraſmus ſeems to have aimed, in ſome meaſure, to reſtore Arianiſm, at the beginning of the ſixteenth century, in his commentaries on the New Teſtament: accordingly, he was reproached by his adverſaries with Arian interpretations and gloſſes, Arian tenets, &c. To which he made little anſwer, ſave that there was no hereſy more thoroughly extinct than that of the Arians: "*Nulla hereſis magis extincta quam Arianorum.*" But the face of things was ſoon changed: Servetus, a Spaniard by nation, publiſhed, in 1531, a little treatiſe againſt the Trinity: which once more excited attention to the ſentiments of the Arians in the Weſt.—Indeed he rather ſhewed himſelf a Photinian than an Arian; only that he made uſe of the ſame paſſages of ſcripture, and the ſame arguments againſt the divinity of our Saviour, with the proper Arians.

It is true Servetus had not, properly ſpeaking, any diſciples; but he gave occaſion, after his death, to the forming of a new ſyſtem of Arianiſm in Geneva, which did not a little perplex Calvin.—From Geneva, the new Arians removed to Poland, where they gained conſiderable ground; but at length became SOCINIANS.

The appellation Arian has been indiſcriminately applied, in more modern times, to all thoſe who conſider Jeſus Chriſt as inferior and ſubordinate to the Father: and whoſe ſentiments cannot be ſuppoſed to coincide exactly with thoſe of the ancient Arians. Whilſt they all concur in maintaining the pre-exiſtence of Chriſt as a ſuper-angelic ſpirit, which ſupplied the place of a ſoul to him upon his conception and birth, and alſo his derivation from and ſubordination to the Father; ſome of them aſcribe to him a higher degree, rank, and dignity, than others. Accordingly they have been ſometimes diſtinguiſhed into High and Low Arians. The former, approaching in opinion to thoſe that have been called Semi-Arians, or rather to the ancient Arians, whilſt they believe the Father to be the one ſupreme God over all, abſolutely eternal, underived, unchangeable, and independent; conceive the Son to be the firſt derived being from the Father, and under him employed in creating, and alſo in preſerving and upholding the World, and in exerciſing a moral, as well as natural, adminiſtration over mankind; ſo that, under this diſtinguiſhing character, he is inveſted with the office of final judge. Of theſe high Arians, ſome ſuppoſe, that Jeſus Chriſt, ſuſtaining relations, and exerciſing offices ſo honourable in themſelves and ſo intereſting to mankind, is a proper object of ſubordinate worſhip; whilſt others imagine, that worſhip in the proper and diſcriminating ſenſe of the term, belongs only to the Father, the ſelf-exiſtent, infinite, and ſupreme deity. Some Arians of this claſs have maintained, that the ſon of God, before his incarnation, had only, or chiefly, the care and government of the Jewiſh people allotted to him; whilſt other angels were appointed preſidents or princes of other nations and countries. This was the opinion of Mr. James Peirce, an ingenious and learned commentator: ſee his "Paraphraſe and notes, &c. on Coloſſ. ii. 15. and Heb. ii. 9." Others have alſo maintained, that the conduct of all the diſpenſations of Providence, in every period of time, as they related to the patriarchs, to the Jewiſh nation, to the prophets, to Chriſtians, and to the world in general, has been entruſted to Chriſt; and that he was diſtinguiſhed by various appropriate titles, as Jehovah, the angel of the covenant, the angel Jehovah, the angel of the preſence, and the Logos, &c. To this purpoſe they allege, among other arguments, the declaration of the Apoſtle (Heb. i. 2. xi. 3.) that it was by Chriſt, God made the worlds, αιωνας, the ages or diſpenſations; i. e. by whom God formerly diſpoſed and ordered thoſe eminent and remarkable periods of time; the Antediluvian, the Patriarchal, the Moſaic, and the Preſent; being put under his government, according to the will of the Father. See Ben Mordecai's Apology, letter ii. paſſim. It is alſo alleged as a further preſumption in favour of this hypotheſis, that the ſacred writings contain a revelation and hiſtory of the adminiſtration of Providence with regard merely to the inhabitants and concerns of our world, or of the terreſtrial globe; and, of courſe, that the ſubordinate direction and ſuperintendence of this part of the government of the ſupreme and infinite ſovereign of this, and innumerable other

worlds, is entrusted with Jesus Christ; a superior being adapted, by his pre-existent dignity, and extraordinary perfections and powers, to the office of ruler and judge. The low Arians, on the other hand, are distinguished from the Socinians in no other respect, besides their maintaining the pre-existence, prior dignity, and transcendent native perfections of that super-angelic spirit, which was united to the body of Christ, in his miraculous incarnation: but that he is entitled to no kind of religious worship, in the peculiar and appropriate meaning of this term. Arians of both descriptions claim the appellation of Unitarians, though they do not adopt the dogma of the simple humanity of Christ, of late exclusively maintained by some modern Unitarians.

Mr. Whiston was one of the first divines who revived the Arian controversy, in the beginning of the eighteenth century. About the year 1706 he began to entertain some doubts about the proper eternity and omniscience of Christ. This led him to review the popular doctrine of the Trinity; and in order to execute this review, with a degree of diligence and circumspection suitable to its importance, he read the New Testament twice over, and also all the genuine monuments of the Christian religion, till near the conclusion of the second century. By this inquiry, he was led to think, that, at the incarnation of Christ, the Logos, or eternal wisdom, supplied the place of the rational soul, or πνευμα; that the eternity of the son of God was not a real *distinct* existence, as of a son properly *co-eternal* with his father, by a true eternal generation, but rather a metaphysical existence *in potentiâ*, or in some sublimer manner in the father, as his wisdom or word; that Christ's real *creation*, or *generation* (for both these terms are used by the earliest writers), took place some time before the creation of the world; that the council of Nice itself established no other eternity of Christ; and finally, that the Arian doctrine in these points was the original doctrine of Christ himself, of his holy apostles, and of the most primitive Christians. Mr. Whiston was confirmed in these sentiments by reading Novatian's treatise concerning the Trinity; but more especially by the perusal of the "Apostolical Constitutions," the antiquity and authenticity of which he endeavoured, with more zeal than precision and prudence, to prove, in the third part of his "Primitive Christianity." The consequence to himself was, his removal from his theological and pastoral functions, and also from his mathematical professorship at Cambridge; "as if Arianism," says the translator of Mosheim, "had extended its baneful influence even to the science of lines, angles, and surfaces." Whiston was followed by Dr. Clarke, who published his famous book; intitled, "The Scripture Doctrine of the Trinity," &c. in consequence of which, he was reproached with the title of *Semi-Arian*. See Semi-Arians. He was also threatened by the convocation, and combated by argument. Dr. Waterland, who has been charged with verging towards *Tritheism*, was one of his principal adversaries. The history of this controversy, during the last century, may be found in a pamphlet, intitled, "An Account of all the considerable Books and Pamphlets that have been wrote on either Side, in the Controversy concerning the Trinity, from the year 1712; in which is also contained an Account of the Pamphlets written this last Year, on each Side, by the Dissenters to the end of the year 1719;" published at London, 1720. The more recent treatises on the subject of the Trinity are well known to our theological readers. See Trinity. Mosheim's Eccl. Hist. Lardner's Works. Ben Mordecai's Apology, Letter I. Jortin's Rem. on Eccl. Hist. vol. i.

ARIANISM, the doctine of Arius, who lived in the beginning of the fourth century. See Arians.

ARIARATHIA, or Ariarathera, in *Ancient Geography*, a town of Asia, in Cappadocia. Steph. Byz.

ARIAS, or Arius, a river of Aria.

Arias *Montanus*, in *Biography*, a learned Benedictine monk of the sixteenth century, was born at Seville, of a noble but reduced family. Having completed his education at Alcala, where, besides the study of theology, he made himself master of the Latin and Greek languages, and also of Hebrew, Arabic, Syriac, and Chaldee; he travelled through France, Germany, Italy, the Netherlands, and England, for the purpose of acquiring an acquaintance with the modern languages. Upon his return he took priest's orders, and then accompanied the bishop of Segovia to the council of Trent, where he obtained great reputation. He afterwards retired to Aracena, a pleasant spot near the mountains of Andalusia, to prosecute his literary labours. From this retreat he was summoned by Philip II. and entrusted with the care of a new edition of the Polyglot *Bible*, which he much enlarged and improved. The execution of this work contributed so much to his reputation, that he became the object of envy; and he was under the necessity of taking a journey to Rome, to vindicate himself from the censure of those who reproached him with having too closely followed the explanations of the Jewish Rabbis. As soon as he returned to Spain, Philip offered him a bishoprick, as a recompence for his labours; but this he declined accepting, and contented himself with a pension of two thousand ducats, and the office of chaplain to the king. He died at Seville in 1598, at the age of seventy-one years. His mode of living was singularly abstemious, as he drank no wine, and seldom tasted animal food. He was indefatigable in his studies; and was regarded as one of the first literary characters in Spain. His writings, which are numerous, bear evident marks of sound sense, as well as profound erudition. Besides his "Dissertations on Jewish Antiquities," prefixed to the Polyglot, printed in the "Critici Sacri," and published separately, in 4to. at Leyden in 1596; he has left in Latin, "Commentaries on several parts of Scripture," published at Antwerp, at different periods, between the years 1583 and 1599; a "History of Mankind," in 1593; "A Treatise on the History of Nature," in 1601; "A Version of the Psalms and Ecclesiastes," in Latin verse, in 4to. 1574, with other poetical pieces; and a translation of Jonathan's Chaldee paraphrase of Hosea, and of the Itinerary of Benjamin of Tudela. Dupin. Nouv. Dict. Histor.

ARIASPE, or Agriaspe, in *Ancient Geography*, a town of Asia, in Drangiana, the *Bergaspe* of major Rennell's map, seated on the river Heermund, in the province of Segistan or Seistan. N. lat. 32° 15'. E. long. 63° 46'.

ARIASSOR, or Ariassus, a city of Pamphylia, which was a bishop's see. Ptolemy.

ARICA, in *Geography*, a jurisdiction in the bishoprick of Arequipa in Peru, extending along the coast of the South sea. It produces little else than Agi or Guinea pepper, and in some places large olives, of which they make oil and pickles.

Arica, a sea-port town of South America, in the province of Los Charcas in Peru. It is the port-town to most of the mines in that country; and it is the only place in this part of the coast which admits a landing. It was formerly strong and populous, and carried on a great trade, as the harbour is good and convenient for shipping. The immense booty taken here by sir Francis Drake in 1579, contributed to the decline of the opulence and trade of Arica. At that time most of the silver of Potosi was shipped in this port for

Lima; but ſince that period, the Spaniards have chiefly ſent it by land, as the moſt ſecure, though moſt difficult mode of conveyance. It alſo ſuffered much by an earthquake in 1605. As they have little or no rain in this place, their houſes are built without roofs. The valley of Arica is principally famous for the culture of Guinea pepper, which the Spaniards planted here, of which they raiſe annually to the value of eighty thouſand crowns. This port is ſtill much frequented, not merely on account of the mines, to which it affords an eaſy acceſs, but for the rock-ſalt which is dug out of the adjacent mountains, and ſhipped for the weſtern coaſt. S. lat. 18° 27'. W. long. 71° 5'.

ARICADA, in *Ancient Geography*, a town of Aſia, in Drangiana. Ptolemy.

ARICARETS, in *Geography*, a nation of South America, in Guiana, on the banks of a river called Aricari.

ARICHAT, a town in the iſland of Cape Breton.

ARICHI, in *Ancient Geography*, a people of Aſiatic Sarmatia, among the Mæotæ, near the Palus Mæotis. Ptol.

ARICIA, a town of Italy, in Latium, near the Alban mount, on the Appian way, about twenty miles from Rome. This city exiſted before the eſtabliſhment of the Greeks and Latins in Italy; and the inhabitants of it were often diſtinguiſhed among the enemies of Rome in its naſcent ſtate. Cicero ſpeaks of it as a municipal town; and Frontinus, ranking it in the number of colonies, ſays, that its walls were erected by the orders of Sylla. Near it was the "Nemus Aricinum," or grove of Diana, who hence obtained the epithet of "Aricina." Here ſhe had a temple frequented by her votaries, who travelled to it on foot from Rome, with flaming torches, and crowns on their heads.

ARICONIUM is placed, in Antonine's Itinerary, near Roſs, about eleven miles from Caerleon: our other antiquaries place it at Kencheſter. It was a town of the Silures.

ARICOURIS, in *Geography*, a people of South America, in Guiana, towards the river of the Amazons. De Laet ſays, they manifeſt no ſigns of religion, but ſeem to reſpect the ſun and moon, without paying them any worſhip; and yet they appear to believe the immortality of the ſoul, as they point to the heavens, as, after death, the abode of thoſe who have lived well. They are timid, ſuſpicious, and inclined to revenge. They are addicted to ſorcery, and conſult ſoothſayers, who, as they think, are inſpired by a demon called "Watipa," and thus enabled to foretel future events. Their eyes and hair are black, and they have no covering: but the men envelope themſelves all over in a kind of gummy dye, to preſerve their bodies from the heat of the ſun, and the women paint themſelves with it more ſlightly, and in a variety of figures.

ARIDANA, a town of Arabia, ten miles ſouth of Mecca.

ARIDAS, a kind of tapeſtry, manufactured in the Eaſt Indies, from a ſhining thread obtained from certain herbs; and hence called "Aridas of herbs."

ARIDED, in *Aſtronomy*, a fixed ſtar of the ſecond magnitude, in the extremity of the Swan's tail. It is alſo called Hierezim, Adigege, and Aridef.

ARIDELOSIS, ἀριδήλωσις, in *Rhetoric*, is ſometimes uſed for the figure commonly called SYNONYMIA.

ARIDSONG, in *Geography*, a town of Aſia, in the country of Thibet, one hundred and fifty-two miles north of Carmandu. N. lat. 30° 40'. E. long. 84° 45'.

ARIDULLAM, in *Natural Hiſtory*, the name of a foſſile ſubſtance, uſed in the Eaſt Indies in intermittent fevers. It is of a greeniſh yellow colour, and coarſe texture, and when burnt, emits fumes ſmelling like arſenic. It is properly of the ZARNIC kind, though ſomewhat different from all the European kinds.

ARIDURA, in *Phyſic*, a dryneſs, or want of juice and moiſture of the parts. Hence it is alſo uſed by ſome for an aridity or conſumption: and it is more particularly uſed to denote a hectic fever. The term is more frequently uſed by *Modern Writers*, to denote a particular atrophy, or waſting of ſome ſingle member of the body: in which ſenſe, it amounts to the ſame with what we otherwiſe call WITHERING.

ARIEN, in *Geography*, a ſmall iſland in the Adriatic, near the coaſt of Italy, three leagues north of Venice.

ARIENZO, a town of Italy, in the kingdom of Naples, and country of Lavora, fourteen miles north-eaſt of Naples. Its ſituation is low, but delightful, and it is ſurrounded with vineyards and gardens. It now belongs to Caraffa, duke of Madaloni.

ARIES, or the *Ram*, in *Aſtronomy*, a northern conſtellation, the firſt of the twelve ſigns of the zodiac; from which alſo a twelfth part of the ecliptic takes its denomination, and into which the ſun enters about the twentieth of March. The ſtars in this conſtellation, in Ptolemy's catalogue, are 18; in Tycho's, 21; in Hevelius's, 27; in the Britannic catalogue, 66; but they are moſt of them very ſmall, one only being of the ſecond magnitude, two of the third, and all the reſt ſmaller.

ARIES, in *Artillery*, denotes a battering-ram, or a military engine with an iron head, much in uſe among the ancients, to batter and beat down the walls of places beſieged.

Of this there were three kinds; the firſt rude and plain; the others artificial and compound.

The firſt ſeems to have been no more than a great beam, which the ſoldiers bore in their arms, and with one end of it, by main force, aſſailed the walls. This required a great force to work it; yet produced but a ſmall effect.

The ſecond or compound ram is deſcribed by Joſephus (De Excid. Hieroſol. 3.) thus: "The ram is a vaſt long beam, like the maſt of a ſhip, ſtrengthened at one end with a head of iron, ſomewhat reſembling that of a ram, whence it took its name. This is hung by the middle, with ropes, to another beam which lies acroſs two poſts; and hanging thus equally balanced, is by a great number of men violently thruſt forward, and recoiled backward, and ſo ſhakes the wall with its iron head, nor is there any tower or wall ſo thick or ſtrong, as to reſiſt the repeated aſſaults of this forcible machine."

The third only differed from the former, in that it was covered with a χελωνη, or ſcreen, to guard the ſoldiers; whence it was called *teſtudo arietaria*.

Mr. Felibien deſcribes a fourth ſort of battering-ram, which ran on wheels; and was the moſt perfect and effectual of them all. Vitruvius affirms, that the battering-ram was firſt invented by the Carthaginians, while they laid ſiege to Cadiz: theirs was the ſimple kind firſt mentioned. Pephaſmenos, a Tyrian, afterwards contrived to ſuſpend it with ropes; and finally, Polydus, the Theſſalian, to mount it on wheels, at the ſiege of Byzantium under Philip of Macedon. Yet Pliny aſſures us, that the ram was invented at the ſiege of Troy; and it was this that gave occaſion to the fable of a wooden horſe. The invention has been aſcribed by ſome to Artemorus, a Greek architect, who flouriſhed 441 years before Chriſt. Some have ſuppoſed, that the walls of Jericho, mentioned in the book of Joſhua, were beaten down by this inſtrument; the ram's horns by which they were overthrown being no other than the horns of the battering ram.

Plutarch tells us, that Marc Antony, in the Parthian war, uſed a ram of 80 feet long; and Vitruvius aſſures us,

they were ſometimes made 106, and ſometimes 120 feet long; to this great length perhaps the force of the engine was in great meaſure owing.

The ram was managed at once by a whole century of ſoldiers; ſo that it played continually and without intermiſſion; being uſually covered with a *vinea*, to protect it from the attempts of the enemy.

The battering ram is repreſented in *Plate* I. *Artillery*, *fig.* 1. This ram AB is ſuſpended by a rope *x* to the croſs beam *y*, at the top of the frame CD. Its head A is faſtened to a large beam by three or four bands of iron four feet broad. At the extremity of each of theſe bands *a* was a chain *b* alſo of iron, faſtened by one end to a hook *c*; and at the other extremity of each of theſe chains was a cable firmly bound to the laſt link. Theſe cables extended through the whole length of the beam to the end of the ram B, where they were bound firmly together with ſmall ropes. To the end of theſe cables was fixed another, compoſed of ſeveral ſtrong cords plaited together for ſome length, and then running ſingle. At each of theſe ſeveral men were placed to balance and work the machine. The unſuſpended ram differed from this only in the manner of working it: inſtead of being ſlung by a chain or cable, it moved on ſmall wheels, on another large beam.

Theſe battering-rams, by their own weight, and by the action of the men who impelled them, excited a force which in ſome caſes exceeded the utmoſt effect of our battering cannon. Dr. Deſaguliers (Lectures, vol. i. p. 65.) has demonſtrated that the momentum of a battering-ram, twenty-eight inches in diameter, one hundred and eighty feet long, with a head of caſt iron of one and a half ton, the whole ram weighing with its iron hoops, 41,112 pounds, and moved by the united ſtrength of 1000 men, would only be equal to that of a ball of thirty-ſix pounds weight ſhot point blank from a cannon. Mr. Attwood, comparing the effect of the battering-ram, having its metal extremity equal to a twenty-four pounder, with a cannon ball of twenty-four pounds weight, obſerves, that in order to their producing the ſame effect in penetrating a wall or making a breach in it, the weight of the ram muſt exceed that of the cannon ball in the proportion of the ſquare of 1700, the velocity of the ball, to the ſquare of the velocity with which the battering-ram could be made to impinge againſt the wall expreſſed in feet. Eſtimating this at ten feet in a ſecond, the proportion of the weights will be that of about 2,890,000 to 100, or 28,900 to 1; and therefore the weight of the battering-ram muſt be 346 ton. In this caſe, the battering-ram and the cannon ball, moving with the velocities of 10 and 1700 feet in a ſecond, would have the ſame effect in penetrating any obſtacle; but, as the weight of the ram was probably never ſo great as the above ſuppoſition ſtates it to have been, the force of a cannon ball to make a breach in walls muſt exceed that of the ancient aries: but the momentum of this, or the impetus by which it communicated a ſhock to the whole building, was far greater than the utmoſt force of cannon balls; for if the weight of the battering-ram were no more than 170 times greater than that of a cannon ball, each moving with its reſpective velocity, the momenta or forces of both would be equal; but as the weight of theſe ancient machines was certainly much greater than 170 times that of our heavieſt cannon balls, their momentum or impetus to ſhake or overturn walls and demoliſh buildings, was much ſuperior to that which is exerted by the modern artillery. And ſince the ſtrength of fortifications will in general be proportioned to the means which are uſed for their demolition, the military walls of the moderns have been conſtructed with leſs attention to their ſolidity and maſſy weight than the ancients thought to be a neceſſary defence againſt the aries; that ſort of coheſive firmneſs of texture which reſiſts the penetration of bodies being now more neceſſary than in ancient times. Nevertheleſs it is manifeſt, that even now ſolidity or weight in fortifications is alſo of material conſequence to the effectual conſtruction of a wall or battery.

The ram was frequently uſed in the fourteenth century. Sir Chriſtopher Wren employed it in demoliſhing the walls of the old church of St. Paul's previouſly to his rebuilding it; and found no machine ſo well adapted to this purpoſe. See CATAPULTA.

ARIES, in *Entomology*, a ſpecies of SCARABÆUS, a native of the Cape of Good Hope. The thorax is roundiſh, and the head armed with a very ſhort ſubulate horn. Fabricius. Gmelin.

ARIES, in *Zoology*, the Linnæan and Gmelinian ſpecific appellation of the common ſheep, or kind of OVIS, with compreſſed lunated horns, "cornibus compreſſis lunatis," Faun. Suec. Syſt. Nat. &c.; ovis domeſtica, of Ray; pecus, aries, ovis, vervex, agnus, of Plin. Aldr. Jonſt. &c.; brebis et belier, of Buff.; ſchaaf, wedder, hammel, lamb, of Geſn. Thierb.; and ram or common ſheep, of Penn. Briſſ. thus defines this ſpecies: "aries laniger, cauda rotunda brevi." Dr Shaw obſerves, in his Zoology, that the moſt prominent characters are: that the horns twiſt ſpirally outwards; that the tail is round and ſhort; and that the body is covered with wool; but theſe characters, he remarks, are ſo greatly varied in different races, that it is hardly poſſible to fix on an abſolute diſtinctive mark which ſhall apply to all the varieties.

Pallas, whoſe extenſive travels through the Ruſſian empire, and eſpecially Siberia and Great Tartary, enabled him to make many important obſervations on theſe uſeful animals, found what he regarded only one ſpecies ſubdivided into four varieties, diſtinguiſhed by their tails, the form of their heads, their ears, and fleece; and hence he condemns as unfounded and fanciful the idea of making ſpecific differences of the accidental varieties, which he imagines the education or mode of life, the climate, food, and croſſing of the breed have produced in ſheep, as in other animals; and in conformity with this opinion, he conſiders not only thoſe varieties found in Europe, but alſo thoſe of other quarters of the globe, as only accidental varieties of the ſame ſpecies; an opinion in which he appears confirmed by finding that they produce a prolific race, though the breed be ever ſo croſſed; and which he thinks would not be the caſe were they different ſpecies. Some preceding naturaliſts evidently entertain very oppoſite ſentiments on this ſubject; but whether we are to regard the ſeveral apparently diſtinct kinds of the ſheep as ſo many ſpecies, or as varieties originating from one parent ſtock only, it is deſirable, nay highly requiſite, to draw ſome line of diſcrimination between the more remarkable, or, if the expreſſion may be allowed, more permanent varieties, by which they may be aſcertained. This is confeſſedly a matter of the utmoſt difficulty. Linnæus has, we think, deviſed the beſt mode in which it can be accompliſhed without exciting the prejudices of naturaliſts, or claſhing with their opinions; and Gmelin has certainly improved upon it. A name and character are aſſigned to each variety, ſo far as it is deemed practicable to define them; and by arranging them ſtill as varieties only of the common ſpecies *Aries*, the reader is at liberty to form thoſe concluſions he may think proper. The varieties enumerated by Gmelin amount to ten that are very diſtinct, and are arranged in the following order.

1. *Anglica.* α.—Ovis anglicana. Amoen. Acad. 4. p. 174. Hornleſs

Horntefs ſheep of Pennant. In Lincolnſhire, and other counties in England, and alſo in many other parts of Europe, the hornleſs breeds of ſheep are raiſed in great numbers. Independently of this kind being deſtitute of horns, the tail and ſcrotum hang down as low as the knees; and by theſe characters it may be diſtinguiſhed.

2. *Ruſſica.* β.—Ovis ruſſica. Amoen. acad. 4. 174. This is the variety which Pallas calls ovis brachyura and ovis ruſſica; it inhabits Ruſſia, and is called the Ruſſian ſheep by the natives. According to Gmelin, this kind is horned; has a ſhort tail; and is covered with ſhort curly wool. Dr. Pallas acquaints us that it is not only reared throughout all the northern parts of Ruſſia, but likewiſe by the Finns and other neighbouring nations; and that ſome of this kind have been tranſported into Siberia, where they have ſupported themſelves on ſome paſtures, though in poor condition. In the ſouthern countries they are, however, in leſs eſtimation than the long-tailed and fat-tailed kinds, which are much ſuperior to them in ſize, fat, and flavour; but the ewe of the former will couple readily with the ram of the fat-tailed variety, and produce an animal larger and more noble than its mother, with a tail ſwelled at the baſe with fat, and meagre towards the end. This ſhort-tailed kind bears ſome reſemblance to the ſheep of Iceland, eſpecially in ſize, tail, and coarſeneſs of the fleece; yet it differs from that breed in one eſſential particular, the horns, which are much ſmaller in proportion. The Tſcherkeſſian ſheep, we are told, reſembles it alſo in the form of the head, ſtraight erect ears, and thickneſs of the fleece; but in texture the fleece is very different, being fine in the Tſcherkeſſian kind, and in the other as coarſe as dog's hair; and the ſhort-tailed kind is uniformly diſtinguiſhed by the tail being about a quarter of a yard ſhorter than the other variety.

3. *Hiſpanica.* γ.— Ovis hiſpanica. Amoen. Acad. 4. 174. Spaniſh ſheep. The ſpires of the horns are extended horizontally, and the wool is remarkably fine and plentiful on the animals of this breed. It is ſaid to be peculiar to Spain.

4. *Polycerata.* δ.—Ovis polycerata. Amoen. Acad. 4. 174. Ovis ſexcornis et tricornis. Aldr. Brebis a pluſieurs cornes, Belier d'Iſlande. Brebis d'Iſlande. Buff. Ove Gotlandia Pall.; and many horned ſheep of Pennant. This kind is diſtinguiſhed by having more than two horns; how far we are authorized to admit it as a definitive, rather than an accidental variety, is doubtful. In a ſupplement to the article ſheep in the work of Buffon, the count inſerts a few obſervations on the drawings of two Walachian ſheep, a ram and ewe, which were ſent him by Mr. Collinſon, one of the members of the Royal Society of London at that time, in the courſe of which this animal is mentioned; and from thence we ſhould rather conclude the variety is accidental. "The rams, ewes, and wedders of Iceland," ſays that writer, "differ chiefly from ours in having larger and thicker horns. Some of them have three, four, or five horns; but this peculiarity of having more horns than two muſt not be conſidered as common to the whole race of Iceland ſheep; for in a flock of four or five hundred, hardly three or four wedders can be found with four or five horns; and when theſe occur, they are ſent to Copenhagen as rarities. As a farther proof of their being ſcarce, they give a higher price in Iceland for this than for the common kind." Dr. Pallas ſpeaks of an accidental variety of the Kirguiſe ram with five horns, and of another with four horns diſpoſed with great ſymmetry. Dr. Shaw deſcribes the many-horned ſheep as a diſtinct variety. He obſerves that it occurs in the northern parts of Europe more frequently that in other regions, and that it is ſaid to be moſt common in Iceland. The horns are either three, four, or five in number; ſometimes placed with great regularity, and ſometimes differing in proportion and ſituation. A four horned variety, with very long hairs hanging from the breaſt, is alſo found in ſome parts of Europe: the two largeſt horns in this kind are ſtraight and nearly upright on the top of the forehead, the ſmaller pair are ſeated on each ſide of the head, and turn downwards. Gen. Zool.

5. *Africana.* ε.—Ovis Africana. Amoen. Acad. 4. p. 173. Aries pilofus, pilis brevibus veſtitus, Briſſ. Ovis Africana, pro vellere lanoſo pilis brevibus hirtis veſtita, Sloane. Ovis æthiopica, Charlet.; and ovis pilis brevibus, Gmel. The African ſheep covered with ſhort hair inſtead of wool. *Gliſ.* The African ſheep of Mr. Pennant and Dr. Shaw is the following ſpecies.

6. *Guineenſis.* ζ.—Auribus pendulis, palearibus laxis pilofis occipite prominente, Linn.: aries (ovis guineenſis) pilofus, pilis brevibus veſtitus, juba longiſſima, auriculis longis pendulis, Briſſ.; aries guineenſis ſ. angolenſis, Maregr.; ovis guineenſis ſ. angolenſis Maregravii, Raj.; moutons, Adanſ.; moutons de Guinée, Des Marches; belier de Senegal, belier des Indes, autre belier des Indes, et brebis des Indes, Buff.; ſheep of Sahara, Shaw, it.; African ſheep, Penn.; African ſheep, Shaw's Zool.; Guinea ſheep. Linnæus, in the twelfth edition of the Syſtema Naturæ, conſidered this animal as a diſtinct ſpecies, and aſſigned it the character above mentioned: "ears pendulous, dewlaps lax and hairy; hind part of the head prominent." Gmelin deems it a variety only. In point of figure, this creature is ſo very remarkable that it cannot eaſily be confounded with any other variety: "its meagre appearance, length of neck and limbs, pendent ears, and long arched or curved viſage," are ſtrikingly characteriſtic; and as Dr. Shaw further obſerves, "it is covered rather with hair than wool, and has a pair of pendent hairy wattles beneath the neck, as in goats; the horns are ſmall, and the tail long and lank." This kind is ſuppoſed to be moſt frequent in Guinea.

7. *Laticaudata.* η.—Arabica platyura, Ruſſel; Arabiæ ovis, Alder.; ovis Turcica, Charletta.; ovis cauda obeſa, Ludolf; ovis laticauda. Raj. Gmel.; aries (ovis laticauda) laniger, cauda latiſſima, Briſſ.; moutons de Barbarie ou a groſſe queue, Chardin; mouton de Barbarie, mouton d'Arabie, Buff.; ovis laticauda, platyceros ſ. Arabica, Amoen. Acad. 4. p. 173.; ovis ſteatopyga, aries kirgiſicus, Pall.; ſchaaf, deren Schwaentz gar feiſſt, Rauwolf; arabiſches ſchaaf, Geſn. Thierb.; die hieſige ſchaafe, Oſb. Broad-tailed ſheep. This kind is aſſerted to be the largeſt breed of ſheep in the world; and, according to Dr. Pallas and others, is reared throughout all the temperate regions of Aſia, from the frontiers of Europe to thoſe of China, in the vaſt plains of Tartary. All the Nomade hordrs of Aſia, the Turcomans, Kirguiſe, Calmucks, and Mongul Tartars rear it; and indeed it conſtitutes their chief riches, the number they poſſeſs being enormous. The Perſians alſo rear it in abundance, as likewiſe the Hottentots, as Kolben relates in his Travels to the Cape of Good Hope. Oſbeck ſays, in his Journey to China, that the fat-tailed ſheep is reared throughout that vaſt empire, and it occurs in moſt parts of Syria, Barbary, and Ethiopia. Pallas thinks there is ſufficient evidence that it is more univerſally reared in different countries than any other kind. The flocks of all the Tartar hordes reſemble each other in having a large yellowiſh muzzle, the upper jaw often projecting beyond the lower one, and by having long hanging ears; by the horns of the adult ram being large, ſpiral, wrinkled, and bent in a lunar form. The tails of theſe ſheep become oftentimes ſo large and heavy, as to greatly incommode the animal in walking

walking or grazing; they grow to the weight of fifteen, twenty, or thirty pounds, and even, according to ſome accounts, they have been known to increaſe to the weight of fifty pounds each. The ſhepherds are, therefore, very frequently obliged to faſten behind the ſheep a ſmall board furniſhed with wheels on which the tail may reſt, and the animal be in ſome degree relieved of the weight he would be otherwiſe obliged to bear. This kind is in great eſtimation, the fatty ſubſtance of the tail reſembling marrow, and the fleece in ſome countries being of an exquiſite fineneſs. Mr. Pennant remarks that both the broad and long-tailed varieties of this kind of ſheep were known to the ancients, being mentioned by Ariſtotle and Pliny; the former ſpeaking of the firſt, and the latter of the ſecond; one ſays the tail was a cubit broad, and the other a cubit long.

8. *Bucharica*. 9.—Auriculis magnis pendulis, pulvinari adipoſa minore, Pallas xi. 78.—Bucharian ſheep, with large pendulous ears, and ſmall fatty cuſhions. From Dr. Pallas we learn that this kind of ſheep is reared in immenſe flocks by the Bucharian Tartars, and it is alſo common in Perſia and Syria. Pallas and Gmelin both regard it as a mixed or hybrid breed, between the long-tailed and fat-tailed varieties; the former believes they never attain the ſize of either of the parents. The head is like that of the Kirguiſe ſheep; but the muzzle is ſharper like that of the Indian ſheep of Buffon; the body is rather ſmaller than that of the Kirguiſe ſheep; the ears large and pendent; and they have a ſmall uropygium or fat rump, like that of the Tartar ſheep on the Jeniſſy, eſpecially when begotten by a Kirguiſe ram; but in general they have a tail, fat and broad at the baſe, with a long narrow appendage, which reſembles the tail of the Tſcherkeſſian ſheep. The Bucharian Tartars have a very valuable traffic with the furs of the lambs of this variety, which are exquiſitely fine and beautiful. The ſame variety is likewiſe raiſed in great numbers by the Perſians; and it is ſuſpected by ſome writers that this is alſo the variety known more generally by the name of ovis macrocereas, an inhabitant of Syria, Paleſtine, and various countries of Africa.

9. *Longicauda*, 1.—Cauda longiſſima, Gmel.; alterum genus, Raj.; ovis arabica, Jonſt.; aries (ovis longicauda) laniger cauda longiſſima, Briſſ.; ovis dolichura ſive Tſcherkeſſica, Pall.; Schaaffe, Oſear.; ein ander arabiſch ſchaaff, Geſn. Thierb. Long tailed-ſheep. The long-tailed, or, as the natives of Ruſſia and Tartary call it, the Tſcherkeſſian ſheep, is deſcribed as a handſome animal, with a noble air, in its native country and the ſouth of Ruſſia, reſembling in its habits, horns, fleece, and length of tail, the Spaniſh, but more particularly the Engliſh ſheep. Its head is well-proportioned, and of an elegant form; ears ſtraight; horns large, even, rounded in the angles, tapering to a point, and bending inwards towards the back. The rams are ſeldom without horns, and the ewes have them often bent in a lunar form. The wool, though coarſe, is without admixture of hair, which is perhaps but an accidental diſtinction, and promiſes to be much meliorated by croſſing the breed, and rearing the animal with more care and ſkill. It is even known to become much finer without the aſſiſtance of art, merely from the influence of a temperate climate, as on mount Caucaſus. The tail of the ram is covered with fine long wool like the Indian ſheep deſcribed by Buffon, which trails on the ground ſo as to efface the prints made by the animal's feet on the ſand, and it contains often twenty joints or vertebræ. In paſſing from the ſtate of nature to that of ſervitude, it ſeems to have loſt its native ferocity, together with the coarſeneſs of its fleece. Dr. Pallas ſays, it is a mild gentle animal, and is leſs degenerate in form from the argali, which he deems the parent ſpecies, than the ſteatopyga; but which on the other hand has retained much more of its native wildneſs than the Tſcherkeſſian breed; perhaps becauſe it is allowed to range with little reſtraint on the wide extended plains of Great Tartary. The Tſcherkeſſian breed is reared in all the European regions of the Ruſſian empire, ſituated on this ſide the river Occa, in the nearer Poland, and by the paſtoral people of mount Caucaſus, and is commonly of a white colour. The ſame variety, we find in Ruſſel's Natural Hiſtory of Aleppo, is reared under the name of Bedouin ſheep by the Arabs, and in the weſtern parts of Mauritania. In the latter a trifling difference is obſervable, in the length and thickneſs of the tail. Long-tailed ſheep are likewiſe reared in Morocco, and which it is ſuppoſed belong to this variety, becauſe they poſſeſs the diſtinguiſhing character, a long tail, although in other reſpects they are different. Theſe have an ugly look; the head is covered entirely with hair; the ears are ſmall, and pendulous; and the wool remarkably long. The inhabitants of Ukraine and Podoli carry on an extenſive traffic with the ſkins of the Tſcherkeſſian variety.

10. *Capenſis*. 2.—Ovis auriculis magnis pendulis, cauda magna ex adipe vix prominente.—Cape ſheep of Pennant. An awkwardly formed animal with large pendulous ears, covered entirely with coarſe hair inſtead of wool. The tail, Dr. Shaw obſerves, is ſometimes ſo enveloped in fat as to be ſcarcely viſible, the parts on each ſide ſwelling out into a pair of naked hemiſpheres, of ſuch a ſize as ſometimes to weigh nearly forty pounds. The legs are rather long; the viſage ſomewhat arched; and the horns of the male like thoſe of the common ſheep.

In the General Zoology, by Dr. Shaw, the Ovis Strepſiceros, or Cretan ſheep, which Linnæus and Gmelin deem a diſtinct ſpecies, is conſidered alſo as a variety of *Aries*. The principal varieties of the ſheep, according to Dr. Shaw, are the following: Cretan ſheep (ovis Strepſiceros, Linn.); many horned ſheep (ovis polycerata, Linn.); African ſheep (ovis guineenſis, Linn.); broad-tailed ſheep (ovis laticaudata, Linn.); fat-rumped ſheep (ovis Steatopyga); Spaniſh ſheep (ovis Hiſpanica, Linn.); and hornleſs ſheep (ovis Anglica, Linn.).

Thus far have naturaliſts endeavoured to trace and define from the parent ſpecies, the more remarkable varieties into which theſe uſeful animals appear to be divided; and if we have digreſſed too far from the conciſeneſs of the Gmelinian order, by attending more fully than that writer to the collateral obſervations of Linnæus, of Pallas, and other diſtinguiſhed naturaliſts, who have entered minutely into the ſame inquiry; on a ſubject of ſo much importance, it is at leaſt excuſable. In the preſent inſtance, it is incumbent only to aſcertain the principal varieties, ſo far as the characters aſſigned to them may juſtify: to dwell on the intermediate variations into which theſe varieties have again degenerated is needleſs; by education or culture, the effects of climate, food, and croſſing breeds, theſe are now extended beyond the ability of the naturaliſt to aſcertain with accuracy; and it would at beſt but tend to obſcure the ſubject, were we to enlarge upon them. To the agriculturiſt, or the practical farmer of this country in particular, the hiſtory of the firſt variety, and perhaps one or two more, is obviouſly uſeful; but to treat on thoſe would alone extend this inquiry to undue limits. Nor does it with ſtrict propriety fall under the article *Aries*; it is a ſubject that deſerves the fulleſt inveſtigation, and elucidation the moſt ample; and will be duly attended to in its proper article, ſheep, or ovis. See SHEEP, and OVIS.

Aries *Kill*, in *Geography*, a ſmall creek which runs northerly into Mohawk river, two miles and a half weſt from Scoharie river in New York.

Aries *Moromorus*, in *Zoology*, a name given to the Gmelinian Camelus *Arcuatus*, or Peru camel, in Neiremberg's Natural Hiſtory. This creature is called the ſheep of Peru, moutons, or moutons de Perou, by Feuillé, Frezier, and other writers.

ARIETIS, in *Entomology*, a ſpecies of Leptura, in the Fauna Succica, and Syſtema Naturæ of Linnæus, Hiſtoire des Inſectes of Geoffroy, and Britiſh Inſects of Donovan. Degeer arranges it with the Cerambyces, under the ſpecific name of *quadrifaſciatus*; Scopoli calls it Stenocorus *arietis*; Fabricius makes it a Callidium; and Gmelin a Cerambyx in his family of that name, (palpis clavatis, Callidia).

This is a very common inſect in England; and probably throughout the other parts of Europe is not leſs frequent. It is found in gardens, and is eaſily diſtinguiſhed from other ſpecies of the ſame genus. The thorax is black; wing-caſes black, with four yellow tranſverſe bands; the ſecond of which is arched and curved upwards; and the legs are ferruginous. Fabr. Gmel. &c.

ARIETIS, a ſpecies of Veſpa, that inhabits South America. The colour is in general black; petiole of the abdomen, and the legs rufous. Fabricius.

ARIETTA, in *Muſic*, the diminutive of *Aria*. The French have a very confuſed notion of the meaning of this term, and call by the name of *ariette* the capital ſong of a muſical drama, and which the Italians term *l'aria d'abilita*, generally compoſed to diſplay the powers of a principal performer, in point of execution. *Arietta*, every where but in France, has been always underſtood to imply a little ſhort air, a *cavatina*. "Now we begin to emerge from barbariſm (ſays M. Guinguiné) why do we continue to ſpeak like barbarians?"

ARIETUM Levatio, in *Antiquity*, a kind of ſportive exerciſe, probably the ſame with that which in later times is called, "running at the quintain."

ARIGÆUM, in *Ancient Geography*, a town of India, ſuppoſed by major Rennel to be Irjab, in the modern Cabul, in the route of Tamerlane, near the ſouthern mountains. Alexander found it burnt and abandoned, according to Arrian.

ARIGENUS, the capital of the Viducaſſi, ſituate in the northern part of Gallia Lyonnenſis. Ptolemy.

ARIGNA, in *Geography*, a place ſituated amidſt valuable coal and iron mines in the county of Leitrim, Ireland, at which great iron works have been lately eſtabliſhed. As ſoon as the completion of the royal canal opens a communication between Dublin and the Shannon, ſo as to afford an eaſy conveyance of the articles to market, great advantages are expected. Dr. Beaufort.

ARIGNANO, a town or village of Italy, in the duchy of Tuſcany, on the river Arno, between Florence and Arezzo.

ARIGNAY, a town of France in the department of Upper Garonne, and chief place of a canton in the diſtrict of St. Gaudens, 5 leagues W. of Rieux, and 3 N.N.E. of St. Gaudens.

ARII, or Arians, in *Ancient Geography*, a denomination by which ſeveral people of Aſia were diſtinguiſhed. Thus, the Arii or Ἀρειοι, were the inhabitants of Aria, in the vicinity of the Sogdians, according to Herodotus: he alſo ſays that Arii or Ἀρειοι was an appellation commonly given to the Medes.—*Arii* were a people placed by Ptolemy in Arabia Felix.

Arii, or *Ariani*, were alſo a people of Germany, occupying the firſt rank, according to Tacitus, among thoſe who were denominated Lygians. They were more valiant, and alſo more fierce, than moſt of the other Germans; and with their ferocity they blended a conſiderable degree of cunning. They wore black bucklers, painted their bodies, and made their attacks in the night.

ARILLUS, in *Botany*, the ſeed-coat of the permanent huſk that inveſts the ſeed. Some have objected to this term, as improper; but Dr. Smith (Linn. Tranſ. vol. v. p. 265.) is of opinion, that it expreſſes the true nature of the tunic, to which it is applied, much better than the hypothetical one of nectarium, the erroneous one of capſule, or even the analogical denomination of corolla.

ARIM, in *Geography*, a town of Aſia, in India, ſuppoſed by the eaſtern geographers to be at an equal diſtance from the columns of Hercules on the weſt, and thoſe of Alexander to the eaſt, and therefore uſed by them in reckoning the longitudes.

ARIMA, a town of Japan, in a country of the ſame name. N. lat. 31° 45′. E. long. 129° 24′. The ſtrait of Arima lies between the ſmall iſland of Nangayuma, and that of Xinco.

Arima, in *Ancient Geography*, a mountain of Cilicia, or of Lydia.

ARIMANIUS, or Ahriman, in the *Perſian Theology*, denotes the devil or the principle of evil, which, as ſome ſay, co-exiſted from eternity with Ormuſd or Oromaſdes, the principle of good; each of them poſſeſſing the powers of creation, but each diſpoſed, by his unchangeable nature, to exerciſe them with different deſigns. Others ſay, that Ormuſd firſt ſubſiſted alone, but being diſſatisfied with a ſolitary exiſtence, and with having no power to oppoſe him, Ahriman was produced. Perhaps theſe divinities were originally, like Mithras, merely human beings; the one, a good prince, who had diſtinguiſhed himſelf by rendering important ſervices, civil or military, to his countrymen: the other, a tyrant, who had been the cauſe of grievous public calamities. Arimanius was not called by the Perſians a god, but an evil dæmon; and they always wrote his name with the letters inverted. This rude and vulgar ſuperſtition, which had no other object than individual men, was afterwards corrected by philoſophy, and changed into the worſhip of two ſpiritual beings, one the author of good, the other of evil. The ſyſtem which ſuppoſes two ſuch principles in nature, ſeems to have been held by the Perſian Magi, before the time of Zoroaſter; but it does not appear, how far they ſuppoſed them dependent upon the ſupreme divinity. Zoroaſter, however, certainly taught the doctrine of their inferiority to the firſt parent of all things. According to this ſyſtem the principle of good, it is ſaid, is eternally abſorbed in light, and the principle of evil eternally buried in darkneſs. The wiſe benevolence of Ormuſd formed man capable of virtue, and amply provided for him the means of happineſs. By his vigilant providence, the motion of the planets, the order of the ſeaſons, and the temperate mixture of the elements, are preſerved. But the malice of Ahriman has long ſince pierced *Ormuſd's egg*, or in other words, violated the harmony of his works. Since that fatal irruption, the good and evil are blended; the rankeſt poiſons ſpring up amidſt the moſt ſalutary plants; deluges, earthquakes, and conflagrations atteſt the conflict of nature; and the mind, as well as the habitations of man, is perpetually agitated with vice and misfortune. Ahriman's power, however, is ſubject to limitation and reſtraint. Ormuſd will ultimately triumph over the furious malice of his rival; and at that deciſive period, Ahriman and his followers, diſarmed

diſarmed and ſubdued, will ſink into their native darkneſs; and virtue will maintain the eternal peace and harmony of the univerſe. The modern PERSEES exalt the Ormuſd into the firſt and omnipotent cauſe, whilſt they degrade Ahriman into an inferior, but rebellious ſpirit. Their deſire of pleaſing the Mahometans, ſays Mr. Gibbon (Decl. and Fall of the Rom. Emp. vol. i. p. 322, 8vo.), may have contributed to refine their theological ſyſtem. Plutarch. de Iſide and Oſiride, apud Oper. t. ii. p. 351. Hyde de Rel. vet. Perſ. c. 11. 21, &c. See MAGI, and ZOROASTER.

ARIMANNI, in *Antiquity*, the denomination of a claſs of perſons employed in agriculture in the middle ages, who were free men. Among the writers of the middle ages, they were called alſo *conditionales*, *originarii*, *tributales*, &c. They ſeem to have been perſons who poſſeſſed ſome ſmall allodial property of their own, and, beſides that, cultivated ſome farms belonging to their more wealthy neighbours, for which they paid a fixed rent, and bound themſelves likewiſe to perform ſeveral ſmall ſervices, ſuch as ploughing a certain quantity of their landlord's ground, aſſiſting him in harveſt and vintage work, &c. It does not appear whether theſe Arimanni were removable at pleaſure, or held their farms by leaſe for a certain number of years. The former, ſays Dr. Robertſon (Hiſt. Ch. V. vol. i. p. 276, 8vo.), if we may judge from the genius and maxims of the age, ſeems to be moſt probable. Theſe perſons, however, were conſidered as free men in the moſt honourable ſenſe of the word. They enjoyed all the privileges of that condition, and were even called to ſerve in war; an honour to which no ſlave was admitted. Nevertheleſs, though their condition was greatly ſuperior to that of ſlaves, ſuch was the ſpirit of tyranny which prevailed among the great proprietors of land, and ſo various their opportunities of oppreſſing thoſe who were ſettled on their eſtates, and of rendering their condition intolerable, that many free men, in deſpair, renounced their liberty, and voluntarily ſurrendered themſelves as ſlaves to their powerful maſters, who might thus become more immediately intereſted to afford them protection, together with the means of ſubſiſting themſelves and their families.

ARIMANON, in *Ancient Geography*, a city of refuge beyond Jordan; probably the famous Ramoth in Gilead. Joſh. xxi. 38.

ARIMANON, in *Ornithology*, the name given by Buffon to that ſpecies of PSITTACUS, ſince called by Gmelin *taitianus*, and Otaheitan blue parraket by Dr. Latham. See TAITIANUS.

ARIMANTIS, in *Ancient Geography*, a town of Africa, in the Pentapolis. Ptolemy.

ARIMARA, a town of Aſia, in Syria, ſituate on the Euphrates. Ptolemy.

ARIMASPI, a people who inhabited the northern part of European Scythia, called Scythia Arimaſpæa, which lay eaſtward joining to Scythia, in Aſia. They were ſo called, it is ſaid, from the Scythian *Arima*, one, and *Spon*, eye; not becauſe they had but one eye, as ſome of the ancients abſurdly believed, but rather, as Bochart conjectures, becauſe they were ſuch excellent archers, at which exerciſe it is neceſſary to ſhut one eye; that the nick-name of *one-eyed* was given to them on that account. According to Diodorus, who places them in Aſia, to the ſouth of the Oxus, they were called *Evergetes*, becauſe, in an expedition of Cyrus, when his army was ſo diſtreſſed with famine, that the ſoldiers were reduced to the neceſſity of eating their comrades, this people ſupplied them with 3000 carriages of proviſions. Steph. Byz. aſcribes the appellation to the kind treatment which they afforded to the Argonauts, when they travelled through their country.

ARIMATHÆA, or RAMATHA, a city of Paleſtine, placed by Jerome between Lydda and Joppa; but M. D'Anville places it a little to the ſouth-eaſt of Lydda and Diopolis. Modern travellers ſpeak of a city called Ramatha, between Joppa and Jeruſalem. The name Ramatha, whence Arimathæa is derived, ſignifies height; but this place, which lay weſt of Jeruſalem, was very different from Ramathaim-Zophim, Samuel's country (1 Sam. i. 1.), which was north in the mountains of Ephraim, and was probably the ſame as Ramah, near Bethel, four leagues diſtant from Jeruſalem. Arimathæa was the city of Joſeph, the honourable counſellor, mentioned Luke, xxiii. 50. The ancient Arimathæa, ſays Volney (Travels in Egypt and Syria, vol. ii. p. 333.), is now *Ramla*, which is one-third of a league to the ſouthward of Lydda, or the preſent Loudd, and is in as ruinous a ſtate as Loudd itſelf. Within its boundaries nothing was found but rubbiſh; and yet the aga of Gaza reſides here in a ſerai, the floors and walls of which are tumbling down. He maintains about 100 horſemen, and as many Barbary ſoldiers, who are lodged in an old Chriſtian church, the nave of which is uſed as a ſtable, and in an ancient kan, which is diſputed with them by the ſcorpions. The adjacent country is planted with lofty olive trees, diſpoſed in quincunxes, which are decaying. Amidſt theſe plantations are every where found dry wells, mouldering ciſterns, and large vaulted reſervoirs, which prove that, in ancient times, this town muſt have been upwards of a league and a half in circumference: at preſent it ſcarcely contains 200 families. The manufacture of the place is ſoap, which is ſent into Egypt, and the ſpinning of cotton, which is chiefly purchaſed by two French houſes eſtabliſhed there. The aga built here, in 1784, a windmill, completed after the plan and under the direction of a Venetian carpenter; and this is the only windmill obſerved by Volney in Syria or Egypt, though it is ſaid to have been originally invented in theſe countries. The only remarkable antiquity at Ramla is the minaret of a ruined moſque, on the road to Yafa, which appears, by an Arabic inſcription, to have been built by Saif-el-din, ſultan of Egypt. In the adjacent plain between Ramla and Gaza, there is a number of villages, conſiſting of huts built of dried mud, which, like their inhabitants, exhibit every appearance of poverty and wretchedneſs. The only fuel is dung kneaded into cakes, and dried in the ſun. The environs of theſe villages are ſown, at the proper ſeaſon, with grain and water melons; and the reſt is a deſert, abandoned to the Bedouin Arabs, who feed their flocks in it.

ARIMINUM, RIMINI, a town of Italy, in Umbria, on the coaſt of the Adriatic, at the mouth of a river of the ſame name, and ſouth-eaſt of a ſmall river called Rubicon. Strabo (l. v.) aſcribes its foundation to the Umbri, who inhabited the country before the Senones. The Romans, when they became maſters of it, ſent a colony thither A. U. 485., and a new colony was ſent thither by Auguſtus. This is the firſt town of which Cæſar took poſſeſſion, after paſſing the Rubicon. It is now in a ſtate of great decay; but there are ſome monuments of antiquity that claim the attention of the curious traveller. In the market-place there is a kind of ſtone pedeſtal, with an inſcription, declaring, that on it Cæſar had ſtood and harangued his army; but the authenticity of this is not aſcertained to the ſatisfaction of antiquarians. The harbour is now choaked with ſand; and the brick tower, which formerly ſerved for a faro or light-houſe, is ſurrounded with gardens; but they ſtill ſhew on the coaſt the ſpot where St. Anthony is ſaid to have ſtood when he preached to the fiſhes. N. lat. 44° 8′. E. long. 13° 30′. Keyſler, vol. iii. p. 223. Moore's Travels, vol. i. p. 276. In the collection of Dr. Hunter there was a medal of bronze, which Dr. Coombe aſcribed to this city.

ARINE, Giran, a town of Africa, in Mauritania Cæſarienſis.

ARINGA, in *Ichthyology*, a name given by Paulus Jovius and others to the herring, *Clupea Harengus* of Linnæus.

ARINGIAN, in *Geography*, a town of the province of Tranſoxana, belonging to Samarcand.

ARINTHOD, a town of France, in the department of Jura, and chief place of a canton in the diſtrict of Lons-le-Saulnier, 2½ leagues ſouth of Orgelet. The place contains 1,315, and the canton 10,603 inhabitants: the territory includes 220 kiliometres, and 47 communes.

ARINUS, in *Entomology*, a ſpecies of Papilio *(Pleb. urb.)*, deſcribed by Cramer and Fabricius. The wings are deſtitute of tails, above and beneath black, with a ſnowy white tranſverſe ſpot on the firſt pair; extremity of the abdomen ſanguineous. Fabricius, Gmelin, &c.

ARIOGE, the name given by Cramer to the variety *β*, *Papilio Eubule* of Fabricius. See Eubule.

ARIOLA, in *Geography*, a ſmall town in the kingdom of Naples, in the Principato Ultra, with the title of a principality.

ARIOLATER, in *Entomology*, a ſpecies of Lamia, in the Fabrician Species Inſectorum. It inhabits India. The thorax is ſpinous, and lineated; wing-caſes brown, with a ſemicircular white line. Fab. *Obſ.* Gmelin, in his Syſt. Nat. adopts this ſpecific character; it belongs, in his arrangement, to the *Lamia* family, in the *Cerambyx* genus.

ARIOLATOR, is a ſpecies of Ichneumon that inhabits South America. The thorax is armed with two ſpines, and is of a rufous colour; the abdomen black, with four white ſtreaks. Fab. This is the *Ichneumon ſpinoſus* of Degeer, and is thus characteriſed by Linnæus in the twelfth edit. Syſt. Nat.: Ichneumon thorace ferrugineo biſpinoſo, alis faſciis binis fuſcis, abdomine faſciis quatuor albis. *Obſ.* The two erect ſpines on the poſterior part of the thorax are white; and the wings faſciated with brown.

ARIOLI, in *Antiquity*, a kind of prophets, or religious conjurors, who, by abominable prayers, and horrid ſacrifices at the altar of idols, procured anſwers to their queſtions concerning future events. Iſid. Orig. l. viii. c. 9. Theſe are alſo called *harioli*, and their operation, *hariolation*. Sometimes they were denominated *aruſpices*, or *haruſpices*. The arioli were diſtinguiſhed by a ſlovenly dreſs, diſorderly and matted beards, hair, &c.

ARION, in *Biography*, a perſon of great celebrity both as a muſician and poet, was a native of Methymne in the iſle of Leſbos, and flouriſhed about the year before Chriſt 620. He is ſaid to have been the inventor of the dithyrambic meaſure, and to have excelled in lyric poetry, which he ſung to his lute. After having been treated with great reſpect and kindneſs at the court of Periander, king of Corinth, he viſited Italy and Sicily, and acquired great wealth by the exerciſe of his profeſſion. Determining to return to Greece, he embarked, with all his effects, on board a Corinthian veſſel; but the ſailors, allured by ſuch a prize, conſpired to throw him overboard. In the mean while, he requeſted permiſſion to ſing one funeral ſtrain before his death; and having obtained leave, he ſtood upon the prow with his inſtrument in his hand, chanted with a loud voice his ſweeteſt elegy, and then threw himſelf into the ſea. A dolphin, as the fable ſays, charmed with his muſic, ſwam to him while floating on the waves, bore him on his back, and carried him ſafely to Cape Tænarus, in Sparta, whence he returned to his patron Periander. The ſailors, imagining that he was dead, and confiding in their own ſecurity, arrived at Corinth; and confounded by his appearance againſt them, paid the penalty of their evil purpoſe with their lives. Such is the ſtory which antiquity has preſerved; and the fable, whatever might be its origin, ſufficiently atteſts his reputation as a muſician. His life has been recorded by Herodotus, and alſo by Solinus, Plutarch, Aulus Gellius, and others. Nouv. Dict. Hiſtor.

Arion, in *Entomology*, a ſpecies of Papilio *(Pleb. rur.)* that inhabits Europe. The wings are without tails; above brown, diſk blue, with black ſpots; beneath grey, with ocellated dots. Fabricius, Donov. &c. The male has a ſingle black ſpot on the anterior wings, and a row of marginal ſpots on the poſterior ones; the female has about ſix black ſpots on the diſk of the anterior pair.

ARJONA, in *Geography*, a ſmall town of Spain, in Andaluſia, on the river Frio, between Jaen and Andujar.

ARIOSO, in *Muſic*, an adjective uſed adverbially, implies, according to Rouſſeau, a kind of melody bordering on the majeſtic ſtyle of a capital air.

ARIOSTI, Attilio, in *Biography*, a native of Bologna, was deſigned for the prieſthood, but devoted himſelf to the profeſſion of muſic, and became an eminent muſical compoſer and performer. He exerciſed this profeſſion at Bologna and Venice, and alſo in Germany, where in 1700 he compoſed a Ballet, and an Opera called "Attis," for the electoral princeſs of Brandenburg, to whom he was appointed "Maeſtro di capella." Having continued for ſome years in Italy and Germany, and diſtinguiſhed himſelf by his compoſition of operas and other pieces, and alſo by his performances on the violoncello, and viol d'amore, an inſtrument either invented or much improved by himſelf; he came to England in 1716, and played on his new inſtrument, the firſt of the kind heard in this country. When the Royal Academy of Muſic was eſtabliſhed in 1720, he was employed to compoſe ſeveral operas; and he formed one of the celebrated muſical triumvirate of the time with Handel and Bononcini; but both Attilio and Bononcini were obliged to give way to the ſuperior genius of Handel. The former, without much invention, is ſaid to have been a perfect harmoniſt, and to have treaſured up much good muſic in his head. By way of relieving his neceſſities, he publiſhed a book of cantatas by ſubſcription, and left England; after which his hiſtory is not known. Burney's Hiſt. Muſic, vol. iv.

ARIOSTO, Ludovico, a celebrated Italian poet, was born in 1474, at the caſtle of Reggio in Lombardy, and deſcended of a family allied to the dukes of Ferrara. At an early age he manifeſted his poetical genius by a drama on the ſubject of Pyramus and Thiſbe, which was acted by his brothers and ſiſters; and though his father for ſome time endeavoured to prevail with him to ſtudy the law, which he ſeems to have reluctantly proſecuted for ſome years without making any great progreſs, he was at length allowed to indulge his own inclination. At his father's death, when he was 24 years of age, he found himſelf in embarraſſed circumſtances, and was almoſt induced to abandon his favourite ſtudies. But being invited to the court of Alphonſo duke of Ferrara, he became the particular favourite of the duke's brother, the cardinal Hippolito of Eſte, and maintained his attachment to him, with ſome occaſional interruption, as long as he lived. Having recovered and much improved his early knowledge of the Latin language, Cardinal Bembo wiſhed him to employ it in his compoſitions rather than the Italian; but Arioſto declined it, alleging, "that he preferred being the firſt of Italian writers, to being the ſecond or third among the Latin ones;" and alſo adding, "that his genius was moſt inclined to the former." After the death of Hippolito, he was patronized by his brother Alphonſo, who was much delighted with his converſation, and enabled by his bounty to build a

ſmall

ſmall houſe at Ferrara, where he employed himſelf in thoſe ſtudies and compoſitions which made his name immortal. This retirement, in which he lived with the plainneſs and ſimplicity of a philoſopher, and where he enjoyed eaſe and liberty, he preferred to any other ſituation which he might have obtained under the offered favour of Pope Leo X. and ſeveral diſtinguiſhed princes and cardinals. When he was aſked why he had not built his houſe in a more magnificent manner, and more ſuitable to the noble deſcriptions which he had given of ſumptuous palaces, beautiful porticos, and pleaſant fountains, in his Orlando Furioſo, he replied, "that words were combined together with leſs expence than ſtones." Upon his door he inſcribed the following verſe:

"Parva, ſed apta mihi, ſed nulli obnoxia, ſed non
Sordida, parta meo ſed tamen ære domus."

Thus tranſlated by Sir John Harrington in his "Life of Arioſto," p. 420:

"This houſe is ſmall, but fit for me, but hurtful unto none,
But yet not ſluttiſh, as you ſee, yet paid for with mine owne."

Arioſto was ſo attached to a plain and frugal mode of life, that he ſays of himſelf in one of his poems, "that he was a fit perſon to have lived in the world when acorns were the food of mankind." But, though he was fond of retirement, he enjoyed the friendſhip of the moſt eminent men of learning of his time, who highly eſteemed him, and whom he mentions with great reſpect in the laſt canto of his "Orlando Furioſo." However, he was chiefly attached by obligation and friendſhip to the houſe of Eſte; and the adulation he beſtows upon it in ſeveral parts of his works would have ſubjected him to the charge of inſincerity and ſervility, if it had not been ſanctioned by the general practice of his age and nation. For the glory of his country he was ardently ſolicitous; and he often laments the injury and diſgrace which Italy ſuffered under the dominion of foreigners. In his general behaviour he was affable and condeſcending; and, on particular occaſions, he manifeſted a becoming degree of ſpirit and reſolution, even when he thought himſelf ill-treated by perſons of the higheſt rank. His charity and integrity are ſaid to have been exemplary: to his mother he was ſingularly dutiful and affectionate; and ſhewed her the greateſt reſpect in her old age. The writers of his life record ſeveral inſtances of his attachment to the fair ſex; and it is ſaid, that he was privately married to his miſtreſs Aleſſandra, by whom he had two illegitimate ſons; but that he did not acknowledge her as his wife, for fear of loſing ſome eccleſiaſtical benefices which were incompatible with a married ſtate. His conſtitution was delicate and infirm; and, notwithſtanding his temperance and general abſtemiouſneſs, his health was often interrupted. He bore his laſt ſickneſs with uncommon reſolution and ſerenity; affirming, "that he was willing to die on many accounts, and particularly becauſe he found that the greateſt divines were of opinion that we ſhall know one another in the other world;" and he obſerved to thoſe who were with him, "that many of his friends were departed, whom he deſired to viſit, and that he thought every moment tedious till he gained that happineſs." He died at Ferrara, on the 6th of July 1534, according to Sanſovino; and on the 8th of July 1533, according to Sir John Harrington; at the age of 59 years; and he was interred with ſingular tokens of reſpect in the church of the Benedictine monks, who, contrary to their cuſtom, attended his funeral. An epitaph, written by himſelf, was inſcribed upon his tomb. His death was regretted by all who knew him, and particularly by the men of letters, who honoured his memory in Latin and Italian poems. Sir John Harrington cloſes his account of him in theſe words: "his learning, his good behaviour, his honeſty, made him both beloved of all good men in his life, and bewailed of all honeſt men in his death; ſo as methinks, reading over his life, I could find in my heart to wiſh (ſaving for ſome very few things),

"Sic mihi contingat vivere, ſicque mori."

The works of Arioſto, who, as Dryden ſays, with all his faults, muſt be acknowledged a great poet, are ſatires, comedies, ſonnets, ſongs, ſmall pieces of poetry, and his great heroic poem, called "Orlando Furioſo," on the compoſition of which he beſtowed his principal attention, and which manifeſts the diſtinguiſhing exertion of his poetical powers. The author began this poem when he was about 30 years of age; and whilſt he was engaged in the compoſition of it, he roſe ſometimes at one or two o'clock in the morning, both at home and abroad, and continued to write as long as he found himſelf properly diſpoſed. The poem itſelf was ſingularly popular at its firſt publication, even among the loweſt claſs; and inſpired a very extraordinary degree of enthuſiaſm. Such were the reputation and authority which Arioſto acquired by it, that he commanded reſpect among the moſt licentious and abandoned. To this purpoſe it is related, that when he was governor of a province in the Apennines, which was overrun with ſmugglers and banditti, his influence was ſufficient to preſerve for ſome time the tranquillity of the diſtrict over which he preſided. Once, however, as he wandered in a fit of reverie to ſome diſtance from the fortreſs which he inhabited, he was ſurpriſed by a party of free-booters, to one of whom he was known as the author of "Orlando:" as ſoon as this information was communicated to the reſt, they fell at his feet, conducted him to the caſtle; and, at parting, told him that they reſpected him as governor on account of his character as poet. To ſuch a degree was Arioſto himſelf charmed with his own verſe, and ſo much did he alſo excel in his manner of reading, that he was always diſguſted if he heard his own writings repeated with an ill grace and accent. Accordingly, it is ſaid, that, when he accidentally heard a potter ſinging a ſtanza of his "Orlando" in an incorrect and ungraceful manner, he was ſo incenſed, that he ruſhed into his ſhop and broke ſeveral of the pots which were expoſed to ſale; when the potter expoſtulated with him for this unprovoked injury, Arioſto replied, "I indeed have broken half a dozen of your pots, which are not worth ſo many half-pence; and you have ſpoiled a ſtanza of mine, which is worth a conſiderable ſum of gold." A ſimilar tale has been told by Plutarch of Philoxenus, and applied alſo to Camoëns. The "Orlando Furioſo," after ten years labour, was publiſhed at Ferrara *in* forty cantos, in 1516; and the author gave it complete, in forty-ſix cantos, in 1532. This poem has been very differently appreciated by different writers, from the time of its firſt publication to the preſent day. Whilſt ſome have unduly extolled it, others have degraded it below its juſt rank. A French writer prefers it to the Odyſſey of Homer, and Sir John Harrington compares it with the Æneid of Virgil; and in anſwer to the objection, that Arioſto wants art, and recedes from the example of Homer and the precepts of Ariſtotle, he obſerves, that what was proper in Homer at the time when he wrote, would now appear otherwiſe from the different circumſtances of the age, and that with regard to the rules of Ariſtotle, he followed them very ſtrictly. Some have preferred Arioſto to Taſſo; whilſt others have regarded the latter as much ſuperior to the former, and have adopted the common ſaying, that "Arioſto's

tomb was in Taſſo." The "Orlando Furioſo," ſays a biographer of approved judgment and taſte (ſee Aikin's Gen. Biog.) "is a tiſſue of adventures in love and arms, ſlightly, and often not at all, connected by reference to the principal hero, and formed upon the fictitious manners of chivalry, with all its accompaniments of enchantments, transformations, and ſupernatural events of every kind, and not without a mixture of moral allegory: it has its tragic and comic ſcenes, its ſerious and burleſque; and the tranſitions from the one to the other are often immediate: thus, as a whole, nothing can be more wild, incongruous, and abſurd; and it might be thought proſtituting the dignity of epic poetry to beſtow the name on his performance, or to put it in parallel with any of the great works of that claſs. Yet the inexhauſtible invention, the boundleſs variety, the wonderful facility, and the profuſion of real poetical beauties of the moſt different kind, have ever rendered it a moſt attractive piece; and as far as the ends of poetry are to excite admiration or pleaſure, it certainly has attained them. Many even of the moſt cultivated critics are inclined to prefer its wild charms to the more regular and ſtudied beauties of Taſſo; and perhaps, in general opinion, it ſtill ſtands as the firſt ſpecimen of Italian heroic poetry. It is not free from the licentiouſneſs of its age, and has ſome ſingular ſtrokes of ridicule upon topics thought ſacred. But by much the greater part can offend the delicacy of taſte only, and not that of morals." Editions of this work have been numberleſs, and in various countries; and tranſlations, and imitations, of part or the whole, in different languages, have been very frequent. Mr. Hoole's tranſlation in Engliſh verſe is much eſteemed. Gen. Dict. Nouv. Dict. Hiſtor.

ARIPO, in *Geography*, a fort in Aſia, on the weſtern ſide of the iſland of Ceylon, at the mouth of the river Ceronda.

ARIS, a town of Poliſh Pruſſia, 74 miles ſouth-ſouth-eaſt of Koniſberg.

Aris, in *Ancient Geography*, a river of Greece, in Meſſenia, on the banks of which was built the city Thuria. Pauſanias.

ARISABIUM, a town of India, on the other ſide of the Ganges. Ptolemy. Some have thought that this is the modern Ava.

ARISARUM, in *Botany*. See Ambrosinia and Arum.

ARISBA, in *Ancient Geography*, a town of Aſia Minor, in the Troade, founded, ſays Steph. Byz., by the Mitylenians, but according to Photius, by the Mileſians. It was a little ſouth-eaſt of Abydos; the Trojans took it before the ruin of their city, and preſerved it as an ally. Alexander's army, after paſſing the Helleſpont, encamped near this city, when he went to viſit the ruins of Troy. This city ſtruck imperial Greek medals in honour of Trajan.—Alſo, a town of the iſland of Leſbos, ruined by an earthquake, according to Pliny.—Alſo, a town of Greece in Bœotia.

ARISBUS, a river of Thrace which ran into the Hebrus. Strabo.

ARISCH, Abu, in *Geography*, a principality of Arabia, is properly a part of Tehama, and ſtretching along the Arabian gulf northward from Loheja, for the ſpace of two degrees: like the reſt of Tehama, it is every where dry and barren, except in parts that are watered by the rivers from the mountainous regions of Yemen. The remarkable places in this principality are the capital, known by the ſame name, which is encompaſſed with walls, and is the ſeat of the ſheriff, twenty leagues north of Loheja, in N. lat. 16° 45′. and E. long. 42° 15′.; and the ſea-port town of Gezan, a day's journey from Abu Ariſch.

ARISE, Licence to, in *Law*. See Licence.

ARISH, El, in *Geography*, a town of Egypt, near a gulf of the Mediterranean to which it gives name, in the road from Catieh to Gaza, 42 miles eaſt-north-eaſt of Catieh, and 115 miles north-eaſt of Suez. The town is ſituated three leagues from the ſea, in a ſandy country; and it is the laſt place where water, which can be drank, is to be found, until you arrive at Salahia.

Arish, a Perſian long meaſure, containing 3197 Engliſh feet. Arbuth. Tab. 32.

The Perſian *ariſh*, according to Mr. Greaves, is a long meaſure equal to $38\frac{384}{1000}$ Engliſh inches.

ARISI, *rice*, an Indian word, which does not properly ſignify the plant which produces the rice, but the ſeed itſelf when cleanſed from its huſk, and rendered fit for uſe. The Indians call it ariſi in that ſtate; but in the huſk, and upon the plant, they call it nellon.

ARISTA, in *Aſtronomy*, the ſame as Spica virginis.

Arista, in *Botany*, a long needle-like beard, that grows out from the huſk of corn, or graſs; called alſo the *awn*.

Arista, in *Ichthyology*. See Atherina.

ARISTÆNETES, in *Biography*, a Greek pagan writer of the fourth century, was the friend of Libanius the rhetorician, and mentioned with reſpect by Ammianus Marcellinus. He periſhed in an earthquake that happened at Nicomedia in the year 358; and left two books of amatory epiſtles, written with terſeneſs, elegance, and tenderneſs, and containing quotations from Plato, Lucian, Philoſtratus, and others. An edition of theſe epiſtles, with notes, was publiſhed by Mercer, at Paris, in 1595, 8vo. and reprinted in 1600 and 1610. Fabr. Bib. Græc. l. ii. § 10. t. i. p. 432.

ARISTÆUM, in *Ancient Geography*, a town of Thrace, built on the ſummit of mount Hæmus, mentioned by Pliny, and Diodorus Siculus.

ARISTÆUS, in *Mythology*, the ſon of Apollo and the nymph Cyrene. He is ſaid to have communicated to mankind the art of curdling milk, of managing bees and forming hives, and of cultivating olives. At Thebes, he married Autonoé the daughter of Cadmus, by whom he had a ſon, the unfortunate Actæon, and a daughter named Macris. After the death of his ſon, he removed to the iſland of Cea, where he reſtrained the progreſs of a deſtructive plague, and erected an altar to Jupiter, and offered ſacrifices both to him and to Canicula, or the dog-ſtar; by whoſe favour, the Eteſian winds were cauſed to blow, and to mitigate the heat that had been ſo fatal; and from this time, it is ſaid, theſe winds have been regular every year for forty days. From Cea, he paſſed over to Sardinia, which he eſtabliſhed, cultivated, and peopled; and thence he proceeded to Sicily, and imparted his ſecrets to the inhabitants of that iſland. One of his principal ſtations was Arcadia, whither, according to Pindar, he removed from the iſland of Cea; and in Arcadia he taught the inhabitants the method of ſtocking their hives with bees; and hence Virgil (Georg. l. iv. v. 283.), gives him the name of *Arcadius*. He afterwards went to Thrace, where Bacchus admitted him to the myſteries of the Orgies, and imparted to him a variety of important and uſeful diſcoveries. This fabled benefactor of mankind lived for ſome time near mount Hæmus, and then diſappeared. His numerous ſervices were recompenſed both by Greeks and Barbarians, with divine honours; and the gods are ſaid to have placed him among the ſtars, ſo that he became the Aquarius of the zodiac. He was ſometimes called Agreus or Nomius. Huetius has curiouſly diſcuſſed the reſemblance of the fable of Ariſtæus, to the true hiſtory of Moſes. Gen. Dict.

Aristæus,

Aristæus, in *Biography*, was alſo an eminent Geometrician, of Crotonia, who lived before Euclid, 330 B. C. Pappus (Mathem. Collect. in proœm. lib. vii.) ſpeaks of him as a writer on conics, reſpected by Euclid. This Ariſtæus was a diſciple of Pythagoras, and ſucceeded him in the care of his ſchool after his death, and continued to teach his doctrine for thirty-nine years. Fabr. Bib. Græc. v. i. p. 496.

ARISTANDER, a famous ſoothſayer, was a native of Telmeſſus, a city of Aſia, whoſe inhabitants were ſaid to be naturally endowed with the gift of divination. He was firſt employed in the court of Philip of Macedon, and when this monarch dreamed that the queen's womb was cloſed with a ſeal, on which was engraved the figure of a lion, he interpreted it as ſignifying, that the ſon of whom ſhe was pregnant would have the heart of a lion. He accompanied Alexander in his Perſian expedition, and in order to anſwer the purpoſes of policy or ſuperſtition, he performed ſeveral myſterious rites before the famous battle of Arbela. On this, and alſo on ſeveral other occaſions, he predicted victory, and perhaps contributed to obtain it; it is ſaid, that by the ſucceſs of his art, he gained a very conſiderable degree of influence not only over the credulity of Alexander's ſoldiers, but over the mind of Alexander himſelf. Q. Curtius, l. iv. c. 2, 6, 13, 15. l. v. c. 4. l. vii. c. 7. l. ix. c. 4. Plut. in Alex. Oper. t. i. p. 684. Arrian. l. i. c. 8. Gen. Dict.

ARISTARCHUS, a celebrated Greek aſtronomer and philoſopher, was born at Samos, and flouriſhed about the middle of the third century before Chriſt. There has been a conſiderable difference of opinion about the preciſe time of Ariſtarchus; according to Blair's tables, he died at the age of eighty-one, in the firſt year of the 125th olympiad, or 280 years before Chriſt. Playfair, with Plutarch, who makes him contemporary with Cleanthes the ſucceſſor of Zeno, refers him to the 129th olympiad, or 264 years before Chriſt. But the time in which he flouriſhed may be more ſatisfactorily aſcertained by the teſtimony of Ptolemy; who informs us, that he made an obſervation of the ſolſtice in the fiftieth year of the firſt period of Calippus; and ſuppoſing with Blair, this period to commence in the year of Darius's death, or the 330th before Chriſt, the fiftieth year muſt have been the 280th before Chriſt. Ariſtarchus is well known to have maintained the modern opinion with regard to the motion of the earth round the ſun, and its revolution about its own center or axis. To this purpoſe Archimedes ſays in his "Arenarius," (apud Opera, p. 449. ed. Rivalti.) that "Ariſtarchus the Samian laid down a certain hypotheſis, from which it follows, that the world is much larger than we have ſtated; for he ſuppoſes that the fixed ſtars and the ſun are immoveable, and that the earth is carried round the ſun in the circumference of a circle." The editor remarks, that in this paſſage Archimedes ſeems to intimate that Ariſtarchus was the firſt author of this opinion. Sextus Empiricus alſo (Adv. Mathem. p. 410.), in ſpeaking of the hypotheſis of the earth's motion, plainly inſinuates that Ariſtarchus had been the firſt diſcoverer of it. Plutarch (Queſt. Plat. apud oper. t. ii. p. 1006.) obſerves, that this opinion was taught hypothetically by Ariſtarchus, and dogmatically by Seleucus. There is alſo a paſſage of Plutarch (De facie in orbe lunæ. Opera, t. ii. p. 933.), which, with the correction propoſed by Gaſſendus, and adopted by Menage, Fabricius, and Bayle, affords another deciſive teſtimony to prove, that the opinion of the motion of the earth was held by Ariſtarchus. "Bring not an accuſation againſt us, as Cleanthes thought the Greeks ought to have done againſt Ariſtarchus the Samian, as a diſturber of the foundation of the world, becauſe he endeavoured to explain the celeſtial appearances on the ſuppoſition that the heavens ſtand ſtill, and that the earth is carried in an oblique orbit, and at the ſame time revolves about its own axis." Ariſtarchus alſo taught, that the annual orbit of the earth is but merely as a point, compared with the diſtance of the fixed ſtars. His method of determining the diſtance of the ſun from the earth, was by means of the dichotomy of the moon (ſee Dichotomy); and in this way he concluded, that it contained at leaſt eighteen or twenty times that of the moon from the earth. He alſo found by methods, the detail of which would be too tedious, that the diameter of the moon bears a greater proportion to that of the earth than that of 43 to 108, but leſs than that of 19 to 60, ſo that the diameter of the moon, according to his ſtatement, ſhould be ſomewhat leſs than a third part of that of the earth. He alſo eſtimated the apparent diameter of the ſun at the 720th part of the zodiac. Beſides his aſtronomical diſcoveries, Ariſtarchus invented a peculiar kind of ſun dial, mentioned by Vitruvius, l. ix. c. 9. The only work of this ancient aſtronomer now extant is a treatiſe "On the magnitudes and diſtances of the ſun and moon;" firſt publiſhed by Vallus, at Venice, fol. in 1498; afterwards by Wallis, with his own notes, and Commandine's verſion, at Oxford, in 1683, 8vo.; and again in Wallis's works, vol. iii. A fragment of this work is introduced by Pappus in his "Coll. Mathem. l. vi. prop. 48. p. 135. Another work "On the mundane ſyſtem," has been aſcribed to him, but it is generally underſtood to be a ſpurious work, written by Roberval. Gen. Dict. Montucla. Hiſt. Mathem. tom. i. p. 218. Fabr. Bib. Græc. l. iii. c. 5. § 14. t. 2. p. 89.

Aristarchus, a Greek grammarian, was a native of Samothrace, reſided chiefly at Alexandria under Ptolemy Philometor, who intruſted him with the education of his ſon; and died in the firſt year of the 156th olympiad, or the 156th year before Chriſt. To Ariſtarchus the ancient commentators upon Homer attribute the diviſion of the Iliad and Odyſſey into books, according to the order and number of the Greek letters. He was a rigid critic, and exerciſed his talents in this way upon Homer, Pindar, Aratus, and other poets. Eraſmus (Adag.) ſays, that it was his practice, in reviſing Homer, to mark thoſe verſes which he thought unworthy of him with an obeliſk, and to condemn them as ſpurious, and to diſtinguiſh thoſe which he thought particularly excellent with an aſteriſk. Cicero alludes to this practice in two familiar epiſtles, viz. Ad. Fam. lib. iii. ep. 11. lib. ix. ep. 10. Oper. t. vii. p. 95. p. 290. ed. Olivet. Cicero in his oration againſt Piſo, (Oper. t. vi. p. 213.) uſes the name of Ariſtarchus proverbially for a ſevere critic, when he tells Piſo, that he is not an Ariſtarchus to affix a mark to a bad verſe, but a Phalaris to aſſault the perſon of the poet. Thus alſo when he requeſts his friend Atticus to examine his orations with ſtrictneſs, he calls him his Ariſtarchus, (Ep. ad Att. l. i. ep. 14. t. viii. p. 61.). Horace alſo ſuggeſts the ſame idea in his Ars Poetica, v. 445, &c.

"Vir bonus et prudens verſus reprehendet inertes,
Culpabit duros, incomptis allinet atrum
Tranſverſo calamo ſignum: ambitioſa recidet
Ornamenta; parum claris lucem dare coget:
Arguet ambiguè dictum? mutanda notabit:
Fiet Ariſtarchus: nec dicet, cur ego amicum
Offendam in nugis?

"A friendly critic, when dull lines move ſlow
Or harſhly rude, will his reſentment ſhow;
Will mark the blotted pages, and efface
What is not poliſh'd to its higheſt grace;
Will prune th' ambitious ornaments away,
And teach you on th' obſcure to pour the day:

Will

Will mark the doubtful phraſe with hand ſevere,
Like Ariſtarchus, *rig'rous* and ſincere:
Nor ſay, For trifles why ſhould I diſpleaſe
The man I love?"

Ariſtarchus was of a contentious temper, and had frequent diſputes, at Pergamus, with Crates the grammarian. In the decline of life he was dropſical, and ſought a remedy by ſtarving himſelf to death, which happened in the iſle of Cyprus. His ſchool of grammarians and critics ſubſiſted at Alexandria for ſeveral ages after his time, and produced no leſs than forty grammarians. Suidas ſays, that he wrote 800 books of commentaries; and therefore the apology which he is ſaid to have made for not writing, was not very proper: "I cannot write what I would, and I will not write what I can." Suidas. Gen. Dict. The name of Ariſtarchus has given title to ſeveral books.

ARISTARCHUS, a diſciple and companion of the apoſtle Paul, accompanied him to Epheſus, and here his life was in danger, and followed him in his ſubſequent travels. He was originally a Jew of Theſſalonica. Acts xix. Col. iv. 10. Philem. 24.

ARISTEA, in *Botany*, Schreb. 1712. Aiton, Kew. 3. p. 506. Claſs, *triandria monogynia*. Nat. Ord. *Enſatæ—Irides*, Juſſ. Gen. Car. *Cal.* ſpathes bivalve; *Cor.* petals ſix roundiſh, ſpreading nearly equal. *Stam.* filaments three, ſhorter than the petals, filiform; anthers oblong. *Piſt.* germ inferior, triangular; ſtyle filiform, longer than the ſtamens, declinate; ſtigma funnel-form, gaping, fimbriated, ſomewhat triangular. *Per.* capſule oblong, three-cornered, three-celled, three-valved. *Seeds* very many.

Eſſ. Gen. Char. Pet. ſix; ſtyle declinate; ſtigma funnel-form, gaping; capſ. inferior, with many ſeeds.

Species, 1. A. *cyanea*, graſs-leaved Ariſtea. Curt. Bot. Mag. 458. *Ixia africana*, Lin. Spec. Plant. p. 51. Miller, &c. *Moræa africana*, Murr. Syſt. Veg. This is a ſmall fibrous rooted plant, riſing to ſix or eight inches in height; leaves graſs-ſhaped, two or three inches long, bent inwards, forming a tuft at the root; flowers blue, with a white eye. A native of the Cape of Good Hope, whence it was introduced into the Kew garden by Mr. Maſſon, in 1774.

ARISTEAS, in *Biography*, a pagan officer under Ptolemy Philadelphus, king of Egypt, about two hundred and fifty years before Chriſt. To this perſon is aſcribed a Greek work, ſtill extant, entitled "An hiſtory of the interpreters of ſcripture," or of that Greek tranſlation of the Hebrew ſcripture which we call the Septuagint. The account which Ariſteas gives is briefly as follows. Whilſt Demetrius Phalereus, a noble Athenian, was employed by order of Ptolemy Philadelphus, in collecting books from all nations for the royal library at Alexandria, he was inſtructed to procure a copy of the ſacred books of the Jews, and to engage proper perſons from Jeruſalem to tranſlate them into Greek. As the king wiſhed for information what was proper to be previouſly done towards facilitating the accompliſhment of his object, Ariſteas, (the pretended author of the hiſtory of the ſeventy-two interpreters.) Soſibeus of Tarentum, and Andreas, three noblemen of the king's court, favourably inclined towards the Jews, recommended the releaſe of the Jewiſh captives who were detained in Egypt, and whoſe whole number amounted to 198,000, before any meſſage was diſpatched to Jeruſalem. Accordingly, a degree was iſſued for their releaſe; and twenty drachmas each were paid out of the treaſury for this purpoſe, ſo that the whole ſum devoted to their redemption was not leſs than 662 talents. When this was done, Demetrius propoſed that a letter ſhould be written to Eleazar, the high-prieſt at Jeruſalem, requeſting him to ſend from thence a true copy of the Hebrew original of the ſacred books, and with it ſix perſons out of each of the twelve tribes of Iſrael, to tranſlate it into the Greek language. The bearers of this meſſage were Ariſteas and Andreas, who carried with them, as royal preſents, ſeveral gifts for the temple, in money for ſacrifices and other uſes of the ſanctuary, 100 talents; in utenſils of ſilver, ſeventy talents; and in thoſe of gold, fifty talents; and of precious ſtones, as ornaments to the utenſils, five times the value of the gold. Upon their arrival at Jeruſalem, they were received by the high-prieſt, and by the Jews, with great reſpect, and their requeſt was immediately granted. Having received from the high-prieſt a true copy of the law of Moſes, written in golden letters, and ſix elders out of every tribe, i. e. ſeventy-two in all, they returned to Alexandria. The ſeventy-two elders being introduced to the king, they were tried by ſeventy-two queſtions, propoſed to them, to each one in their order; and as their anſwers were ſatisfactory, the king gave to each of them three talents, and ſent them into the iſland of Pharos adjoining to Alexandria, in order to perform the work aſſigned them. In the courſe of ſeventy-two days they completed their buſineſs, and as they agreed in the verſion of each period by common conference together, Demetrius wrote it down; and when the whole had been read and approved in the king's preſence, each of the tranſlators received another preſent of three rich garments, two talents in gold, and a cup of gold of the weight of a talent; and they were all ſent home into their own country. Such is the account of Ariſteas, which he addreſſed in form of a letter to his brother Philocrates. A Latin verſion of this hiſtory by Palmerius was prefixed to the Latin edition of the Bible, printed at Rome in 1471. It was alſo printed in Greek at Baſil, in 1561, 8vo and as an appendix to the edition of Joſephus, at Cologne, in 1691, with notes by Fabricius; and another edition was publiſhed at Oxford, in 1692, 8vo. It is univerſally allowed even by thoſe who diſpute the genuineneſs of this hiſtory, that it is ancient; becauſe it agrees with the accounts of the Septuagint, given by Joſephus and Euſebius, which appear to have been borrowed from Ariſteas: and ſome modern writers have concurred with theſe and other ancient writers in admitting the truth of the narrative. But thoſe who have taken great pains in examining this ſubject, have produced a conviction that now pretty generally obtains, that the tradition relating to the appointment of ſeventy-two interpreters by Ptolemy Philadelphus, for the purpoſe of tranſlating the Hebrew ſcriptures into Greek, is entitled to no credit; and that the ſtory was invented by the Jews of Alexandria, in order to give importance and authority to the tranſlation, which they had been under a neceſſity of making, after Greek had become their common language. The work aſcribed to Ariſteas, a pagan officer in the court of Ptolemy, was probably written by ſome Helleniſt Jew at Alexandria, not leſs than 200 years after the reign of Ptolemy Philadelphus; in proof of which it is alleged, that Alexander Polyhiſtor, who wrote about that time, mentions a hiſtory of the Jews by Ariſteas. Hody (Bibl. Text. Orig. Oxon. 1705. fol.), Van Dale (Diſſert. ſupr. Ariſt. de Septuag. Amſt. 1704, 4to.), F. Simon (Crit. Hiſt. Vet. Teſt. l. ii. c. 2.), Dupin (Proleg. ad Bibl. l. i. c. 6. § 2, 3.), and Prideaux (Conn. p. ii. b. 1. vol. iii. p. 49.) Archbiſhop Uſher (Syntagma de Septuag. Interpret. verſ.), Morinus (Exercit. Biblicæ), Walton (Prolegomena to the Polyglot Bible, c. 9.), Voſſius (de LXX. Interpret.), and many others, concur in rejecting the hiſtory of Ariſteas, as a fiction; and they have urged a variety

of objections, that ſeem to be unanſwerable, againſt its authenticity. Although there was in the reign of Ptolemy Philadelphus a Greek tranſlation, the narrative of Ariſteas was written at a time when the Jews were much given to religious romances; and whilſt the author pretends to be a heathen Greek, he every where ſpeaks as a Jew. He makes Ptolemy advance an incredible ſum for redeeming captives and obtaining this verſion; a ſum which Prideaux eſtimates at nearly two millions ſterling, which may be reckoned above twenty times as much as the whole library was worth. Beſides, the queſtions propoſed to the ſeventy-two interpreters, and their extemporary anſwers, carry very much the air of a fiction. The repreſentation of ſeventy-two elders being ſent from Jeruſalem to Alexandria, and ſix being choſen out of every tribe, has the appearance of a Jewiſh fiction, as it concerns the Jewiſh ſanhedrim, and the twelve tribes, of which a heathen Greek muſt probably have been ignorant. Beſides, this is ſaid to have been tranſacted by Demetrius Phalereus, who was baniſhed, or poiſoned, or dead, at the time when this verſion was made. Nor is it probable that ſix elders of every tribe in Paleſtine could have been found ſo well ſkilled in both languages as to make an exact verſion from the Hebrew into the Greek. Moreover, why ſhould ſeventy-two be ſent, when ſeven would have been ſufficient for the work, and ſuch a number might have been more eaſily obtained. Gen. Dict. Fabr. Bibl. Græc. lib. iii. c. 12. § 2. t. ii. p. 317.

ARIST'ELLA, in *Botany*. See STIPA.

ARISTERA, in *Ancient Geography*, an iſland ſouth-eaſt of the peninſula of Argolis.

ARISTERIA, a town of Syria, in the Cyrrheſtic territory. Ptolemy.

ARISTIDA, in *Botany*, an exotic graſs (from *ariſta*, an awn or beard). Lin. g. 94. Schreb. 125. Claſs, *triandria digynia*. Nat. Order, *Gramineæ*. Gen. Char. *Cal.* glume one-flowered, bivalve; valves linear-ſubulate, membranaceous, unequal. *Cor.* glume bivalve, thicker than the calyx; outer valve linear, converging longitudinally, hirſute at the baſe, terminated by three awns ſubequal, patulous; inner valve lanceolate, ſharp, very ſhort, wrapped within the outer valve; nectary, two-leaved; leaflets, lanceolate, obtuſe. *Stam.* filaments capillary; anthers oblong. *Piſt.* germ turbinate; ſtyles capillary; ſtigmas villoſe. *Per.* none; glume converging, involving, gaping. *Seed*, one, filiform, the length of the corolla, naked.

Species, 1. A. *adſcenſionis*. Browne, jam. 135, 1. "Panicle branching, ſpike ſcattered, corollas one-valved;" culms in tufts, one or two feet high, decumbent, jointed, ſimple; branches of the panicle preſſed cloſe, ſubdivided, upright; florets on ſhort pedicles, narrow, brown; awn three-parted at the baſe; anthers dark purple. This ſpecies, according to Linnæus, has the habit of the *feſtuca ovina*. It is a native of the iſle of Aſcenſion, and of Jamaica, where it is called the bearded graſs. 2. A. *americana*. Swartz. obſ. 41. t. 2. f. 2. Browne, jam. 135. f. 2. "Panicle ſimple, corollas two-valved, one with dorſal, the other with terminating awns;" culm half a foot high, jointed, ſubdivided; leaves linear, ſtiff, even; panicle with ſimple alternate ſpreading branches; florets moſtly pointing one way, approximated; rachis compreſſed, ſomewhat flexuoſe. Dr. Browne calls this the ſmaller bearded graſs, a native of Jamaica. 3. A. *plumoſa*, "panicled, the middle awn longeſt and woolly, culms villoſe." The woolly horns give this ſpecies the appearance of *ſtipa pennata*, but the panicle is more compound, all the parts ſmaller, and the culm villoſe; the awn is alſo naked towards the baſe, where it has two briſtles or little awns, which are oppoſite, ſhort, ſpreading. We are informed by Linnæus, that this ſpecies was found in America, by Schreber. 4. A. *arundinacea*, "panicled, corollas two-valved, middle awn longer, ſmooth;" culms four feet high; leaves rolled inwards, narrow, even, ſtriated; panicle oblong, hoary; outer valve of the corolla awned at the tip; awn length of the flower, naked, and at its baſe, a minute awn ſcarcely viſible. Found in the Eaſt Indies, by Koenig. 5. A. *gigantea*, "panicle elongated, looſe, one-ranked; calyces one-flowered; awns of the corolla ſubequal, ſtraight;" culm lofty, branched, ſmooth; panicles about eight inches long, terminal; calyx very ſmooth, unequal, bluiſh; corolla ſmooth, with equal ſhort awns, almoſt naked. Found on the iſland of Teneriffe, by Maſſon. 6. A. *hyſtrix*. Pluk. Alm. 191. f. 3. "Panicle divaricated, very ſpreading; flowers ſimple, ſmooth, awns ſtraight, divaricated;" culm creeping, ſtoloniferous, ſmooth, very tough, leafy, ſhort; leaves convoluted; panicle terminating, large; peduncles and pedicels binate; rachis angular; flowers filiform, oblong; calyx one-flowered; valves unequal; corolla longer than the calyx, convoluted, terminated by three equal ſtraight ſpreading awns. Obſerved in Malabar by Koenig.

ARISTIDES, ſurnamed *the Juſt*, in *Biography*, the ſon of Lyſimachus, an illuſtrious Athenian, was diſtinguiſhed for valour and ability, and peculiarly eminent for juſtice, magnanimous ſelf-denial, and virtuous patriotiſm, diſregarding his own private intereſt or power, where theſe might interfere with the welfare of his country. From his early youth he manifeſted a firm and ſteady temper, and a diſdain of meanneſs and diſſimulation. In the courſe of his diligent application to ſtudy, he betimes directed his attention to the ſubjects of government. Accuſtomed to admire the laws of Lycurgus, he preferred an oligarchy to the unbounded democracy that prevailed at Athens, to which his early and perſevering antagoniſt Themiſtocles was ardently attached. Hence aroſe that competition between them, which diſplayed itſelf on various occaſions, in the progreſs of their advancement to public offices. Ariſtides engaged in the ſervice of his country from the pureſt principles of patriotiſm; and his character was held in ſuch general eſtimation, that when the following verſes of Æſchylus, deſcribing Amphiaraus, were once recited in the theatre,—

> "To be, and not to ſeem, is this man's maxim;
> His mind repoſes on its conſcious worth,
> And wants no other praiſe,"

the attention of the whole audience was directed to Ariſtides, as the perſon to whom this deſcription might with the utmoſt propriety be applied. Ariſtides and Themiſtocles were ſo much the champions of oppoſite parties in the Athenian ſtate, that their mutual competition led them to counteract one another even in meaſures that were juſt and uſeful. Ariſtides, however, could not purſue this line of conduct without ſelf-reproach; and having, on a particular occaſion, reſiſted a propoſal of Themiſtocles, which he thought right in itſelf and conducive to the public good, he exclaimed, as he came out of the aſſembly in which the meaſure had been debated, "The affairs of the Athenians will never proſper, till they throw both of us into the *barathrum*," that is, the dungeon for condemned criminals. In the office of public treaſurer, he convicted Themiſtocles and others with whom he was connected, of peculation; and thus he excited a party againſt himſelf, which accuſed him of having miſapplied the public money; and he was cleared only by the interpoſition of the court of Areopagus. When he was again inveſted with the ſame public truſt, he allowed the perſons who were concerned

cerned with him to act fraudulently without controul, but at the ſame time kept a ſecret account againſt them. His conduct was univerſally applauded, and it was the general wiſh that he might be continued in office. However, when they were proceeding to elect him, he gave them a ſevere rebuke, and told them, "that while he had ſerved them faithfully, he was the object of their diſpleaſure and calumny; but when he had violated his truſt, he was applauded, as an excellent citizen." He then expoſed the frauds, and all parties were aſhamed of their conduct.

The firſt public diſplay of his generous and patriotic character was when Darius ſent the Perſian hoſt to invade Attica. The republican equality of the Athenian democracy extending to military inſtitutions, their army was commanded by ten generals, each of whom had the ſupreme direction for one day in their reſpective turn. Ariſtides, one of the ten, perceived that a viciſſitude of command muſt interrupt unity of deſign, and prevent a regular ſyſtem and ſteady plan of military operations. The ableſt of the generals he well knew to be Miltiades; and he was aware that it was expedient for the country, in time of preſſing emergency, to be guided by its greateſt ability. The day approaching when it belonged to him to aſſume the command, he generouſly yielded his authority to the approved valour and experience of Miltiades. The other generals followed this magnanimous example, ſacrificing the dictates of private ambition to the intereſt and glory of their country; and the commander in chief thus enjoyed an opportunity of exerting, uncontrouled, the utmoſt vigour of his genius.

After the defeat of the Perſians in the famous battle of Marathon, in the year before Chriſt 490, Ariſtides was entruſted with the care of the ſpoils, which he faithfully brought to the public account, without reſerving any thing to himſelf. The following year he was archon or chief magiſtrate, and he continued to watch the welfare and intereſts of his country. Formed in ſuch ſchools of moral and political knowledge as then flouriſhed at Athens, he had learned to prefer glory to pleaſure, the intereſt of his country to his own perſonal renown, and the dictates of juſtice and humanity even to the intereſts of his country. His ambition was rather to deſerve, than to acquire, the admiration of his fellow-citizens; and while he enjoyed the inward ſatisfaction of conſcious rectitude, he was little anxious about the external rewards of ſplendid actions. Earneſt to promote beneficence, he did not court popularity, but his conduct, without ſeeking the favour of the multitude, commanded their eſteem and reſpect. His opinion gave law to the courts of juſtice, or rather ſuch was the effect of his equity and diſcernment, that he alone became ſovereign umpire in Athens. In all important differences he was choſen arbitrator; and the ordinary judges were deprived of the dignity and advantages formerly reſulting from their office. The Athenian magiſtrates were extremely diſpleaſed with an authority which had in a great degree ſuperſeded their juriſdiction. But the moſt formidable foe of Ariſtides was Themiſtocles; pre-eminent in genius that exerted itſelf in every department of public conduct, and excelling in arms, in policy, in eloquence, he ſecured a certain path to popularity. The affability of his manners, the magnificence of his entertainments, and profuſion of his gifts, confirmed among the populace the impreſſion of his talents and qualifications. Themiſtocles beheld with jealouſy the influence acquired by the ſtern integrity of Ariſtides, and being himſelf ſo much better calculated for winning the affections of the multitude, ſucceeded in rendering the upright patriot obnoxious to the people. Ariſtides truſting to the innocence and integrity of his own heart, diſdained to employ any unworthy means, either for gaining the favour, or for averting the reſentment, of the multitude. The conteſt, therefore, ended in his baniſhment for ten years, by the oſtraciſm, by which the majority of the Athenian aſſembly might expel any citizen, however inoffenſive or meritorious had been his paſt conduct, who, by his preſent power and greatneſs, ſeemed capable of diſturbing the equality of republican government. Among thoſe who voted againſt him on this occaſion, one perſon was a ruſtic citizen, who, unable to write his name on the ſhell by which his concurrence in the ſentence was ſignified, accidentally met with Ariſtides, and requeſted him to inſcribe his name. The patriot aſked him, "Did Ariſtides ever injure you?" the voter replied, "I do not ſo much as know him; but I am diſguſted with everywhere hearing him called "the Juſt." Ariſtides took the ſhell, wrote his own name upon it, and returned it to the voter. Upon his leaving Athens, he lifted his hands towards heaven, and prayed that the Athenians might never be compelled to remember Ariſtides.

While Ariſtides was in exile, Xerxes had brought to a concluſion his immenſe preparations for the invaſion of Greece. But when the Perſian armament endangered his country, he ſacrificed all reſentment to patriotiſm, joined his countrymen, who lamented his abſence and wiſhed his return, and at Salamis performed important ſervices. Some time after the victory at Salamis, in the year before Chriſt 480, to which his concurrence with Themiſtocles greatly contributed, this commander informed the Athenians that he had conceived a project of great advantage to the ſtate, but which he could not ſafely communicate to the public. The people directed him to diſcloſe it to Ariſtides The object of this ſcheme was the deſtruction of the whole confederate fleet of Greece, their own ſhips excepted, which would render Athens ſole miſtreſs of the ſea. Ariſtides reported his opinion, that the project of Themiſtocles was eminently advantageous, but that nothing could be more unjuſt; and this determined them againſt acquieſcing in it.

Mardonius having attempted to induce the Athenians to ſubmiſſion, Ariſtides, now chief annual magiſtrate, inſpirited and invigorated his gallant countrymen to perſevere in reſiſtance, and in the following ſummer commanded the Athenian troops in the battle of Platæa, which entirely diſcomfited the armament of Xerxes. When Athens was rebuilt, Ariſtides was active in promoting a popular decree, which gave to all the citizens a ſhare in the government, and enjoined that the archons ſhould be choſen out of the whole body. The virtues of Ariſtides were now celebrated throughout Greece; and the finances of the confederates were committed to his management. This important office he executed with ſuch ſkill and fidelity, as very greatly improved the public reſources. The placability of his diſpoſition was eminently diſplayed in his conduct towards his inveterate antagoniſt, Themiſtocles; for when he had incurred the diſpleaſure of the ruling party, Ariſtides declined concurrence in the capital proſecution of him; and when Themiſtocles was baniſhed, he was ſo far from triumphing on occaſion of his fall, that he ever afterwards ſpoke of him with a greater degree of reſpect. After having contributed ſo momentouſly to the good of Athens and of Greece, Ariſtides died of old age, about 467 years before Chriſt, either in Pontus, or at Athens, univerſally regretted by the affectionate admiration of his country. He, who had long managed the common treaſury of Greece, left not a ſufficient ſum to defray the expence of his funeral. His ſon Lyſimachus received a preſent of three hundred pounds from

the public, to enable him to purſue and finiſh his education. His daughters were maintained and portioned at the expence of the treaſury. Plut. in vit. Ariſt. Oper. t. 1. p. 315, &c. Anc. Un. Hiſt. vol. v. p. 214—246. Travels of Anacharſis, vol. i.

Aristides, *Ælius*, a celebrated ſophiſt, was born at Adriani or Adrianothera, a city of Myſia, in Bithynia, and flouriſhed about the year 176, under the reigns of Antoninus Pius, Aurelius, and Commodus. He was a diſciple of Polemon the rhetorician of Smyrna, of Herodes at Athens, and of Ariſtocles at Pergamus, acquired great reputation as an orator, and has left ſeveral orations, which appear to have been compoſed with peculiar attention, and abound with many excellent moral ſentiments. The ſubjects were laudatory, in praiſe of the heathen divinities, of illuſtrious men, of great cities and ſtates, &c.; gratulatory, on the reſtoration of Smyrna after an earthquake; ſuaſory, to perſuade the Athenians to aid the Spartans and Thebans, to induce the inhabitants of Smyrna to aboliſh licentious comedies, to recommend mutual harmony to the ſtates of Aſia, &c.; apologetic, in defence of Pericles, Miltiades, Cimon, and Themiſtocles, and alſo in vindication of himſelf from the charge of vanity, &c. From ſeveral of theſe orations it appears, that Ariſtides was credulous and ſuperſtitious, and rigidly devoted to the worſhip of the gods, particularly Eſculapius, to whom he conceived himſelf much indebted for hints, communicated in his dreams, and conducive to his health. In one of his orations he expreſſes his diſpleaſure againſt ſome ſophiſts, whom he compares with chriſtians, as Dr. Lardner ſuppoſes; and whom he calls the wicked or atheiſtical people of Paleſtine, becauſe they did not worſhip the eſtabliſhed deities of the Greeks and Romans. On another occaſion he undeſignedly pays a tribute of reſpect to the liberal diſpoſition of the chriſtians; for in an oration or epiſtle, written A. D. 178, congratulating the people of Smyrna upon their reſtoration after the deſtructive earthquake of 177, he celebrates not only the liberality of the emperors, but likewiſe the generous compaſſion of many others in the cities of Aſia, among whom M. Tillemont reaſonably imagines there were ſeveral chriſtians. The people of Smyrna, in gratitude for the intereſt which he took in their calamity, and re-eſtabliſhment of their city, for his pathetic repreſentation of their circumſtances which moved the compaſſion of the emperor Antoninus, and induced him to iſſue an order for reſtoring the city, honoured Ariſtides as the founder of their new city, and erected in their forum a braſs ſtatue to his memory. An inſtance of the vanity of this orator is mentioned by Philoſtratus (de vit. Sophiſt. l. 2. c. 9.); for, when Marcus Aurelius came to Smyrna, Ariſtides neglected, for three days, to pay his reſpects to the emperor. When at length he viſited him, the emperor aſked him, "How it had happened that he had ſo long delayed his viſit?" "I was employed (he replied) in a work on which my mind was ſo intenſely occupied, that I could not divert my attention from it." The emperor, pleaſed with his ingenuouſneſs and his application, requeſted Ariſtides to appoint a time when he might hear him declaim. "Let it be to morrow, if you pleaſe," ſaid the orator; "but I muſt deſire my friends to be preſent, and that they may be permitted to applaud, and clap their hands with all their might." The emperor ſmiling, told him, "that would depend upon himſelf." In the orations of Ariſtides there are many paſſages, which not only ſhew that he was a fine writer and good ſpeaker, but an advocate for what he imagined to be truth and virtue. If he ſays, he had rather be a fine ſpeaker than be Darius the ſon of Hyſtaſpes, he joins with it a ſober and virtuous life. And again, in another place, where he expreſſes his ſuperior value for learning and eloquence above all things, he ſays; "nor can he be ſo ſtupid as to deſpiſe glory if it comes to his ſhare, and ſo far as it may flow from fine ſpeaking, and a life of virtue ſuited to his diſcourſes; for he did not deſire to obtain it by other means." "A character of ſuch eminence," ſays Lardner, "muſt have been an ornament to the popular religion and its rights; and the charms of eloquence in his hymns to the gods, and in his other orations, cannot but have had powerful attractions."

Among the works of Ariſtides, are found an epiſtle "On the Cauſes of the Increaſe of the Nile," in which he ſets aſide the common explanations of this phenomenon, and aſcribes it wholly to the immediate power and providence of God; and an excellent treatiſe "On popular and ſimple Diction," exemplified from Demoſthenes and Xenophon; which latter piece was publiſhed by Aldus, among the Greek rhetoricians, at Venice, in 1508. The oration of Ariſtides in praiſe of Athens, intitled "Panathenaica," written in imitation of Iſocrates, is annexed to H. Stephens's edition of Iſocrates, publiſhed in 1593. The entire works of this orator were publiſhed in Greek, at Florence, in 1517, folio; or in Greek and Latin, in three vols. 12mo., by P. Stephens, in 1604; at Upſal by Norman, in 1677; and by Jeb, in two volumes 4to., at Oxford, in 1722. Philoſtrat. de vit. Sophiſt. Suidas. Lardner's Works, vol. viii. p. 81—88. Fabr. Bib. Græc. l. iv. c. 30. § 4, 5. t. iv. p. 373, &c.

Aristides, a painter of Thebes, was cotemporary with Apelles, about the year 334 before Chriſt, and diſtinguiſhed for force and felicity of expreſſion. He is ſaid to have been the firſt who painted *mind*, and expreſſed the affections and paſſions. One of his ſubjects was the repreſentation of the deſtruction of a town, and deſcribed by Pliny. Among other ſcenes of horror, a child was painted clinging to the breaſt of its wounded mother, who feared that after ſhe was dead the child ſhould ſuck blood inſtead of milk. This piece was carried by Alexander to Pella in Macedon. The Bacchus and Ariadne of this maſter was part of the plunder of Corinth; and after it had been bought by Attalus, king of Pergamus, at a very high price, it was reſerved by Mummius for the temple of Ceres at Rome. For another piece Attalus is ſaid to have given one hundred talents. Ariſtides's old man with a lyre teaching a boy to play, was fixed in the Capitol. His Sick Man was much admired. Pliny, H. Nat. l. xxxv.

Aristides, an eloquent Athenian philoſopher, and a convert to Chriſtianity, flouriſhed about the year 126; and retaining the habit of his former profeſſion, preſented to the emperor Adrian an apology for the Chriſtians, which was extant in Jerom's time, and which he repreſents as a monument with the learned of his ingenuity. This apology was imitated by Juſtin in the book which he preſented to Antoninus Pius, his ſons, and the Roman ſenate. It is to be regretted that no fragment of this eminent Chriſtian apologiſt's compoſition now remains. Euſeb. H. E. l. iv. c. 3. Hieron. ad. Magn. ep. 84. Lardner's Works, vol. ii. p. 290.

Aristides *Quintilianus*, author of the moſt ample and, in many inſtances, ſatisfactory treatiſe among the ſeven Greek writers on muſic publiſhed by Meibomius. He flouriſhed after Cicero, and before Ptolemy; which is all the information that can be obtained concerning the period of his exiſtence. With many wild and fanciful notions about muſical effects, his doctrines often breathe taſte and feeling, but the taſte and feeling of an enthuſiaſt. His moral diſtinctions of melopoeia are as curious and fanciful as thoſe which the Arabs aſſign to the ſtrings of their lute. (See

Arabian *Muſic.)* He allows of three modes, τροποι, or ſtyles of melopœia; the *dythirambic*, or bacchanalian; the *nomic* conſecrated to Apollo; and the *tragic*: acquainting us that the firſt of theſe modes employed the ſtrings or ſounds in the middle of the great ſyſtem; the ſecond, thoſe at the top; and the third, thoſe at the bottom.

"Theſe modes had other ſubaltern modes that were dependent on them; ſuch as the *erotic* or amorous, the *comic*, and the *encomiaſtic* uſed in panegyrics. All theſe being thought proper to excite or calm certain paſſions, were by our author imagined to have had great influence upon the manners, ηθη; and with reſpect to this influence, melopœia was divided into three kinds: firſt, the *ſyſtaltic*, or that which inſpired the ſoft and tender paſſions, as well as the plaintive, or, as the term implies, ſuch as affect and penetrate the heart; ſecondly, the *diaſtaltic*, or that which was capable of exhilarating, by kindling joy, or inſpiring courage, magnanimity, and ſublime ſentiments; thirdly, the *heſychaſtic*, which holds the mean between the other two, that is, which could reſtore the mind to a ſtate of tranquillity and moderation.

"Theſe imaginations are evidently drawn from the dreams of Pythagoras. Iamblicus, in his life of that philoſopher, tells us, that he had invented certain muſical airs, with which, by a happy mixture of genera, he could at his pleaſure govern the paſſions of his ſcholars, and awaken terror, anger, melancholy, compaſſion, emulation, fear, and deſires of all kinds, as well as ſtimulate appetite, pride, caprice, and vehemence; guiding ſuch affections according to virtue, with ſuitable melodies, as with ſo many ſalutary and healing medicines.

"Ariſtides Quintilianus, however, defines the three genera in a manner more conſonant to modern ideas and feelings than any of the other Greek writers.

"The *Diatonic* is the moſt natural, becauſe all who have ears, though uninſtructed with muſic, are capable of ſinging it.

"The *Chromatic* is more artificial, for it can only be ſung by ſuch as are adepts in muſic.

"The *Enharmonic* is the moſt refined and difficult of all, and has been received and practiſed only by the greateſt artiſts." Burney's Hiſt. of Muſ. vol. i.

ARISTIPPUS, founder of the Cyrenaic ſect, was a native of Cyrene in Africa, and flouriſhed about the firſt year of the 97th olympiad, or the 392d year before Chriſt. During his attendance at the Olympic games, he heard of the fame of Socrates, and immediately went to reſide at Athens, that he might become his diſciple. After his introduction to the ſchool of this great maſter of wiſdom, he was for ſome time eſteemed, on account of his genius and improvement, one of its chief ornaments; but his fondneſs for effeminate and luxurious indulgence gave great offence to Socrates and his friends. Of this propenſity on the part of Ariſtippus, and his maſter's deſire to correct it, we have a beautiful illuſtration in a dialogue preſerved by Xenophon, Mem. l. ii. Involved in expences which his patrimony could not defray, he ſet up a ſchool of Rhetoric, and he is remarked to have been the firſt diſciple of the Socratic ſchool who took money for teaching. With a view, probably, of diverting or of ſilencing the reproofs of Socrates, he ſent him a preſent of 20 minæ, or about 64*l.*; but Socrates refuſed the preſent, alleging that his demon forbade him to receive it. At length the freedom of his manners alienated him from Socrates, and obliged him to leave Athens.

Devoted to a life of pleaſure, Ariſtippus viſited the iſland of Ægina, and there met with the celebrated Lais, whom he accompanied to Corinth. In this voyage, he was terrified by a ſtorm, and one of the crew obſerving that he was ſomewhat diſconcerted, aſked him, "Why are you philoſophers afraid, when we illiterate ſeamen fear nothing?" "Becauſe," replied Ariſtippus, "we have more to loſe." In his way from Corinth to Aſia, he was ſhipwrecked on the iſland of Rhodes; and accidentally perceiving a geometrical anagram on the ſand, he exclaimed to his companions, "take courage, I ſee the footſteps of men." When they arrived at the principal town in the iſland, he procured by his addreſs accommodation for himſelf and his fellow-travellers, thus confirming one of his own aphoriſms, "If you aſk what advantage a man of learning hath above one that is illiterate, ſend them together among ſtrangers, and you will ſee." After ſome interval, Ariſtippus repaired to the court of Dionyſius, tyrant of Sicily. When he firſt came to Syracuſe, he was aſked by Dionyſius, "Why he viſited his court?" To which he replied, "to give what I have, and to receive what I have not." By the verſatility of his diſpoſition, and ſuppleneſs of the ſyſtem which he had adopted, as well as by the politeneſs of his manners, he accommodated himſelf to every ſituation, verifying the maxim of the poet:

"Omnis Ariſtippus decuit color, et ſtatus, et res—"
"Yet Ariſtippus every dreſs became,
In all offices, in every ſtate the ſame."
Hor. ep. i. 17. 23.

Whilſt he ridiculed the ſingularities which were affected by other philoſophers, particularly the ſtately gravity of Plato, and the rigid abſtinence of Diogenes, he complied with the requiſition of Dionyſius, which enjoined all the gueſts at a public feſtival to appear in purple robes; whilſt Plato refuſed, he adorned himſelf with a rich and ſplendid dreſs, and converſed and danced with the eaſe and grace of a courtier. By theſe flexible and captivating manners, he conciliated the regard of the Sicilian tyrant, and gained a command of the royal favours. Thus diſtinguiſhed, he became the object of envy to his brethren; and this circumſtance will account for many of thoſe tales that have been circulated to the diſadvantage of this philoſopher both by ancient and modern writers. However it is impoſſible wholly to exculpate him from the charge of libertiniſm. The reaſon of Ariſtippus's leaving Syracuſe is not known, nor is it certain whither he removed. Æſchines, who remained in Sicily till after the exile of Dionyſius, on his return to Athens, found Ariſtippus teaching in the city, probably about the year 366 before Chriſt; and it is pretty certain that he and the reſt of the philoſophers left Syracuſe before the expulſion of the tyrant. But whether he ever returned to his own country, and alſo when and how he died, are circumſtances concerning which we have no certain information.

Ariſtippus was, without doubt, the man of pleaſure in practice, as well as the preceptor of pleaſure by profeſſion. And yet, though he deviated from the ſtrictneſs of Socratic morals both in his principles and his conduct, he muſt be allowed the credit of elegant manners, a thirſt after knowledge, ready wit, and an ingenuous temper. The manner in which he became re-united to his friend Æſchines, who had offended him, affords an amiable illuſtration of the latter quality. In the midſt of a diſpute which was becoming violent, "Let us give over," ſaid he, "and be friends, before we make ourſelves the talk of ſervants; we have quarrelled, it is true, but I, as your ſenior, have a right to claim the precedency in the reconciliation." Æſchines acquieſced, and acknowledged his ſuperior merit. The following repartees, ſelected from a great number attributed to Ariſtippus, deſerve to be recorded. Polyxenus, a friend of

Ariſtippus, happened to call upon him when preparations were making for a ſumptuous entertainment, and began a tedious diſcourſe againſt luxury: Ariſtippus, tired of the harangue, invited Polyxenus to ſtay and ſup with him, and he accepted the invitation. "I perceive then," ſays Ariſtippus, "it is not the luxury of my table that offends you, but the expence." When he was aſked, "what he had gained by philoſophy?" he replied, "a capacity of converſing, without embarraſſment, with all claſſes of men." A wealthy citizen complaining that Ariſtippus, in requiring 500 drachmas for the inſtruction of his ſon, had demanded as much as would purchaſe a ſlave: "purchaſe then one with the money," ſaid the philoſopher, "and you will be maſter of two." To one who boaſted of his ſkill and activity in ſwimming, he ſaid, "Are you not aſhamed to value yourſelf on that which every dolphin can do better?" The following maxims are not unworthy of the Socratic ſchool: "Philoſophers," ſaid Ariſtippus, "excel other men in this, that if no laws exiſted, they would live honeſtly." "It is better to be poor than illiterate; for the poor man only wants money, the illiterate want the diſtinguiſhing characters of human nature." "The houſes of the wealthy are frequented by philoſophers, for the ſame reaſon that induces phyſicians to frequent thoſe of the ſick." "The truly learned are not thoſe who read much, but they who read what is uſeful." "Young people ſhould be taught thoſe things which will be uſeful to them when they become men." For the diſtinguiſhing ſentiments of the Cyrenaic ſect, founded by Ariſtippus, ſee CYRENAICI. Diogenes Laertius, lib. ii. § 62—80. Brucker's Hiſt. Philoſ. by Enfield, vol. i. p. 182—186. Travels of Anacharſis, vol. iii.

ARISTO of *Chios*, a Greek philoſopher of the Stoic ſect, was the ſon of Miltiades, and the intimate aſſociate of Perſeus; and as they both attended the lectures of Zeno at the ſame time, he muſt have flouriſhed about 260 years before Chriſt. He was called, on account of his perſuaſive powers of eloquence, the Siren. His loquacity and love of pleaſure diſpleaſed his maſter, from whom he removed to the ſchool of Polemon; and afterwards he made unſucceſsful attempts to eſtabliſh a ſchool of his own. He oppoſed the doctrine of uncertainty maintained by the Academic philoſophers, and particularly by Arceſilaus; and made ſeveral innovations on the Stoic philoſophy. He excluded from the courſe of his ſtudies both phyſics and logic; the former as incomprehenſible, and the latter as unuſeful to the purpoſes of human life. He taught, with the Stoics, that virtue alone is the ſupreme good; but alſo that in other things there is no difference which can render one more deſirable than another. This doctrine of indifference he applied to moral actions, repreſenting all actions as alike; ſo that to a wiſe man it was the ſame thing whether he performed the part of an Agamemnon or a Therſites, provided he did it well. Seneca charges him with rejecting and contemning the preceptive part of philoſophy in its relation to the particular duties of life. Whilſt he diſcouraged all ſpeculations in opinions, he maintained that the divine nature is incomprehenſible, and he doubted whether the gods have perception or animal life, thus in effect denying the exiſtence of deity. "Philoſophers," ſays Ariſto, "injure, inſtead of benefiting their diſciples, if what is well meant be ill interpreted; and thus it is that the pupils of Ariſtippus became diſſolute, and thoſe of Zeno moroſe." He ſhould have added, ſays Bayle, that every teacher ſhould avoid ambiguous maxims, and prevent falſe gloſſes being put upon them; nor ſhould we infer, that the doctrines of theſe philoſophers had not a tendency, even if rightly underſtood, to produce hurtful effects. While he inveighed againſt Arceſilaus, he himſelf became addicted to pleaſure in his old age. His death is ſaid to have been occaſioned by his bald head being ſcorched with the heat of the ſun. Cic. de Fin. l. iv. c. 27. Nat. Deor. l. i. c. 14. Seneca's Ep. 89. 94. Diogenes Laertius. Gen. Dict. Brucker by Enf. vol. ii. p. 352.

ARISTO of *Ceos*, a Peripatetic philoſopher, filled the Ariſtotelian chair about 230 years before Chriſt, being the fourth in ſucceſſion from the celebrated founder of that ſchool, and died about the year before Chriſt 183. He is repreſented by Cicero (de Fin. l. v. c. 5.) as a neat and elegant orator, but deficient with regard to the dignity and authority of a philoſopher. Athenæus (l. x. p. 419. and l. xii. p. 456.) cites a work aſcribed to him, and intitled "Amatory Similes."

ARISTO, *Titus*, a Roman lawyer, very much diſtinguiſhed by his talents and character, lived in the time of Trajan, about the year 110. The younger Pliny, in his Epiſtles, (l. i. ep. 22. l. viii. ep. 14.) highly extols both his learning and his character; but if it be true that in an illneſs, which he is ſaid to have borne with great patience, he ſummoned his friends, and intreated them to aſk his phyſician, what was likely to be the iſſue of his diſorder? ſo that if they pronounced it incurable, he might put an end to his own life, we muſt admit the high panegyric of Pliny with conſiderable abatement. Aulus Gellius (l. xi. c. 11.) ſpeaks of him as the author of many books. Gen. Dict.

ARISTOBRATHRA, in *Ancient Geography*, a town of India, on this ſide of the Ganges. Ptolemy.

ARISTOBULUS, in *Biography*, an Alexandrian Jew, was preceptor of Ptolemy Euergetes, eldeſt ſon of Ptolemy Philometor, king of Egypt, and flouriſhed about 145 years before Chriſt. He was an admirer of the Greek philoſophy, and united the ſtudy of the Ariſtotelian ſyſtem with that of the Moſaic law. Euſebius repreſents him as a favourite of Ptolemy, and cites from his "Commentaries on the books of Moſes," inſcribed to that prince, ſeveral verſes of Orpheus, in which mention is made of Moſes and Abraham. Theſe verſes are alſo found in the works of Juſtin Martyr; but ſo much altered as to afford reaſon for ſuſpecting their authenticity. In the Commentary the author alſo aſſerts, that part of the law had been tranſlated into Greek in the time of Alexander; and that the whole was tranſlated, under the care of Demetrius Phalereus, in the reign of Ptolemy Philadelphus. But the commentary was not written till 120 years after the reign of that king; and as Demetrius Phalereus was in exile during the reign of Ptolemy Philadelphus, he could not have ſuperintended the Septuagint tranſlation. It is therefore probable, that Ariſtobulus either invented the ſtory of the Septuagint interpreters, or borrowed it from Ariſteas, in order to ſupport the credit of this tranſlation with his brethren in Paleſtine. See ARISTEAS. Ariſtobulus ſeems to have been deſirous of aſcribing the Grecian philoſophy to a Hebrew origin, as we learn from Clement of Alexandria (Strom. lib. i.); and of eſtabliſhing an opinion that Pythagoras, Plato, and other Greek philoſophers, were acquainted with the Jewiſh law. It is not unlikely that he forged the above-mentioned verſes of Orpheus, and alſo the tales reſpecting the Greek verſions of the Hebrew ſcriptures. Upon the whole, Ariſtobulus may be ranked with thoſe who have been ſuſpected of practiſing pious frauds. Euſeb. Præp. Ev. l. xii. c. 13. l. viii. c. 8. Brucker by Enf. vol. ii. p. 167.

ARISTOCRACY, in *Politics*, a form of government, where the ſupreme power is lodged in the hands of the optimates, i. e. of a council or ſenate compoſed of the principal

perſons of a ſtate, either in reſpect of nobility, capacity, or probity. The word is derived from ἄριστος, *optimus*, and κρατέω, *impero, I govern*.

In an ariſtocracy, the legiſlative and executive authority is veſted in a ſelect aſſembly, the members of which either fill up by election the vacancies in their own body, or ſucceed to their places in it by inheritance, property, tenure of certain lands, or in reſpect of ſome perſonal right or qualification. The ſeparate advantage of an ariſtocracy conſiſts in the wiſdom which may be expected from experience and education; for a permanent council naturally poſſeſſes experience; and the members who ſucceed to their places in it by inheritance, will probably be trained and educated with a view to the ſtations which they were deſtined by their birth to occupy. In an ariſtocracy, however, there is leſs honeſty than in a republic, and leſs ſtrength than in a monarchy. Its miſchiefs are diſſenſions in the ruling orders of the ſtate, which, from the want of a common ſuperior, are liable to proceed to the moſt deſperate extremities; and oppreſſion of the lower orders by the privileges of the higher, and by laws partial to the ſeparate intereſts of the law makers. It would be a very happy thing, ſays Monteſquieu, if by ſome indirect method or other, the people could be emancipated from their ſtate of annihilation; and, conſequently, the beſt ariſtocracy is that in which the part of the people who have no ſhare in the legiſlature is ſo ſmall and inconſiderable, that the governing party may have no intereſt in oppreſſing them. Thus when Antipater made a law at Athens, that any perſon who was not worth 2000 drachmas ſhould be excluded from the right of ſuffrage, he formed by this means the beſt poſſible ariſtocracy; becauſe the ſum was ſo ſmall, that few of any rank or conſideration in the city were excluded. The more an ariſtocracy borders on democracy, the nearer it approaches to perfection; and it is the more imperfect in proportion as it draws towards monarchy. In an ariſtocracy, the laws ſhould tend, as much as poſſible, to infuſe a ſpirit of moderation, which would ſupply the place of the ſpirit of equality in a popular ſtate; and as modeſty and ſimplicity of manners conſtitute the ſtrength of an ariſtocratic nobility, the nobles ſhould not be inveſted with perſonal and particular prerogatives, diſtinct from thoſe of their body. There are two principal ſources of diſorder, which ſhould be avoided; theſe are exceſſive inequality between the governors and the governed, and the ſame inequality between the different members of the body that governs.

Ariſtocracies, ſays archdeacon Paley, are of two kinds; firſt, where the power of the nobility belongs to them in their collective capacity alone; that is, where although the government reſide in an aſſembly of the order, yet the members of that aſſembly ſeparately and individually poſſeſs no authority or privilege beyond the reſt of the community; ſuch is the caſe in the conſtitution of Venice. Secondly, where the nobles are ſeverally inveſted with great perſonal power and immunities, and where the power of the ſenate is little more than the aggregated power of the individuals who compoſe it; ſuch was the caſe in the conſtitution of Poland. Of theſe two forms of government, the firſt is more tolerable than the laſt; for although many, or even all the members of a ſenate ſhould be ſo profligate as to abuſe the authority of their ſtations in the proſecution of private deſigns, yet, whilſt all were not under a temptation to the ſame injuſtice, not having the ſame end to gain, it would be ſtill difficult to obtain the conſent of a majority to any ſpecific act of oppreſſion, which the iniquity of an individual might prompt him to propoſe: or if the will were the ſame, the power is more confined: one tyrant, whether the tyranny reſide in a ſingle perſon, or a ſenate, cannot exerciſe oppreſſion in ſo many places at the ſame time, as may be carried on by the dominion of a numerous nobility over their reſpective vaſſals and dependents. Of all ſpecies of domination, this is the moſt odious; the freedom and ſatisfaction of private life are more reſtrained and haraſſed by it, than by the moſt vexatious laws, or even by the lawleſs will of an arbitrary monarch, from whoſe knowledge, and from whoſe injuſtice, the greateſt part of his ſubjects are removed by their diſtance, or concealed by their obſcurity. An ariſtocracy of this kind has been productive, in ſeveral inſtances, of diſaſtrous revolutions; and the people have concurred with the reigning prince in exchanging their condition for the miſeries of deſpotiſm. This was the caſe in Denmark about the middle of the ſeventeenth century, and more lately in Sweden. In England, alſo, the people beheld the depreſſion of the barons, under the houſe of Tudor, with ſatisfaction, although they ſaw the crown acquiring thereby a power which no limitations, provided at that time by the conſtitution, were likely to confine. From ſuch events this leſſon may be drawn; "that a mixed government, which admits a patrician order into the conſtitution, ought to circumſcribe the perſonal privileges of the nobility, eſpecially claims of hereditary juriſdiction and local authority, with a jealouſy equal to the ſolicitude with which it provides for its own preſervation." Mont. Sp. of Laws, vol. i. p. 18. 72—77. Paley's Princ. of Philoſ. vol. ii. p. 180—182. See OLIGARCHY.

ARISTOGITON, in *Biography*, an Athenian who, with Harmodius, attempted to reſtore the liberty of their country by the overthrow of the two tyrants Hippias and Hipparchus.

Harmodius and Ariſtogiton, connected not only as citizens of Athens, but as friends, reſolved to revenge an affront offered to the daughter of the former by Hipparchus, who had obliged her to retire from a public proceſſion, at which ſhe was entitled to have aſſiſted, carrying a baſket of flowers. Nothing leſs would ſatisfy the reſentment of theſe two men, than the depoſition of the tyrants. Having concerted the proper meaſures for their enterpriſe, they ſecretly imparted their plan to a ſmall number of the citizens, and fixed the day of execution to be the feaſt of Panathenæa, when all the citizens wore arms. They accordingly attacked and ſlew Hipparchus, in the year 514 before Chriſt, but were themſelves inſtantly apprehended, and Harmodius was put to death. Ariſtogiton was put to the torture, in order to force him to declare his accomplices. The moſt intimate friends of Hippias were named, and immediately put to death. When Ariſtogiton was aſked by the tyrant, if there were any more? "There now remains," ſaid he with a ſmile, "only yourſelf worthy of death." Leæna, the miſtreſs of Harmodius, is ſaid to have behaved with ſimilar intrepidity; for fearing leſt the pains of torture might extort from her a confeſſion, ſhe bit off her tongue, and ſpit it out. Though theſe champions of liberty periſhed themſelves, yet the ſpirit which they excited continued to operate until it effected the emancipation of the Athenians, and drove Hippias into exile three years after this event, or about the year 510 before Chriſt. Having reinſtated freedom, the Athenians erected in the forum ſtatues, made by Praxiteles, to the memory of Harmodius and Ariſtogiton, who had begun this revolution, and ſet them up to public view, that the ſight of them might inſpire the citizens with a more violent hatred of tyranny. They ſung hymns to their praiſe at the Panathenæa, decreed that no ſlaves ſhould bear their names, and very extenſive privileges were granted in perpetuity to their deſcendants.

However, neither the characters nor the motives of theſe conſpirators, whatever benefit might reſult from their conſpiracy, ſeem to have deſerved ſuch teſtimonies of reſpect. Thucyd. l. vi. c. 56. Plat. in Hipp. t. ii. p. 229. Philoſtr. in Vit. Apollon. l. vii. c. 4. p. 283. Aulus Gellius, l. ix. c. 2. Travels of Anacharſis, vol. i. p. 171.

ARISTOLOCHIA, in *Botany*, birthwort (ἀριστολοχία, and λόχια, or λοχεῖα, from its ſuppoſed uſe in diſorders attending parturition). Linn. g. 1022. Schreb. 1383. Juſſ. 73. Gærtn. 14. Claſs, *gynandria hexandria*. Nat. Order, *Sarmentaceæ*. *Ariſtolochiæ*, Juſſ. Gen. Char. *Cal.* none. *Cor.* monopetalous, tubular, irregular; baſe ſwelling, ſubglobular, tortuloſe; tube oblong, hexagon-cylindric; limb dilated, extended below into a long tongue. *Stam.* filaments none; anthers ſix, faſtened at bottom to the ſtigmas, four-celled. *Piſt.* germ oblong, inferior, angular; ſtyle ſcarcely any; ſtigma ſubglobular, ſix-parted, concave. *Per.* capſule large, ſix angled, ſix-celled. *Seeds* ſeveral, depreſſed, incumbent.

Eſſ. Gen. Char. Stigmas ſix. *Cal.* none. *Cor.* monopetalous, tongue-ſhaped, entire. *Capſ.* ſix-celled, inferior.

Species 1. A. *bilobata*, two-lobed birthwort. A. longa ſcandens, foliis ferri equini effigie Plum. Ray. "Leaves two-lobed, ſtems twining;" ſtem filiform, ſubdivided, leaves cordate; lobes oblong, nerved, entire; petioles crooked ſmooth; peduncles one-flowered, longer than the leaves; corolla ligulate; tube globoſe, many-keeled, curved, hexagonal, bluiſh, funnel-ſhaped, at the throat marked with longitudinal brown lines; limb elongated, ſpatulate. Native of Dominica and Hiſpaniola, covering trees and ſhrubs, and flowering from November till January. 2. A. *trilobata*, three-lobed birthwort. Jacq. obſ. 8. t. 3. Browne, 329. 3. Swartz. obſ. 341. "Leaves three-lobed, ſtem twining; flowers very large, bagged at the baſe, tongue linear, very long." This is a climbing plant like the former; the ſtem is aromatic, and the flowers large and ventricoſe. It is a native of the Weſt Indies, and South America; introduced here about the year 1775; and flowers in June and July. 3. A. *pentandra*, five-ſtamened birthwort. Jacq. Amer. 232. t. 147. pict. 115. t. 224. "Leaves cordate, haſtate-ſubtrilobate, ſtem twining, bracte cordate, embracing." The flowers of this are ſmaller, and have only five ſtamens. It is a native of America. 4. A. *peltata*, peltated birthwort. Jacq. Amer. pict. 114. 222. "Leaves kindney-ſhaped, ſubpeltate, ſtem twining;" ſtem filiform, ſtriated; leaves ſmall, nerved, entire, ſmooth, ſtanding on footſtalks which embrace the ſtem; corolla ſpotted, brown; tube globoſe at the baſe, crooked, reflex, an inch long, brown, dotted with green; throat funnel-ſhaped, pubeſcent at bottom; border having a lip an inch in length, tongue-ſhaped, retuſe at the tip, ſlightly emarginate, ſet with convex, acute, dark purple dots, green below the tip to the throat. A native of St. Domingo and South America, where it flowers in February and March. 5. A. *maxima*, greateſt birthwort. Jacq. Amer. 223. t. 146. pict. 114. 223. "Leaves oblong, acuminate, ſtem twining, peduncles many-flowered." This has ſtrong climbing ſtems by which it mounts up to the top of the talleſt trees; leaves four inches long, two broad, oval, obtuſe, thick; flowers curved in looſe cluſters at the ends of the ſhoots; fruit like a purſe, very large. It was ſent to England by Mr. R. Miller, from New Spain, and ſince found by profeſſor Jacquin, to whoſe elegant figure of it we have above referred. 6. A. *bilabiata*, two-lipped birthwort. Swartz. obſ. 342. Plum. ſpec. 5 ic. 32. f. 1. "Leaves cordate-tongue-ſhaped, obtuſe, ſtem twining, corolla two-lipped;" ſtems filiform; branchlets alternate, looſe, three or four leaved; leaves entire, ſtiffiſh, ſmooth, petioles ſhorter than the peduncles; corolla middle-ſized, brown purple, ſtriated; tube globoſe at the baſe; border elongated, oblong, blunt, reflex; funnel of the tube, ſplit, ſo as to make the corolla bilabiate. A native of South America. 7. A. *erecta*, upright birthwort. "Leaves lanceolate, ſeſſile, ſubhirſute; ſtem erect, peduncles ſolitary, one-flowered, flowers very long; ſtalk three feet high, leaves long, narrow, hairy, with very ſhort footſtalks; flowers ſolitary, axillary, four inches long, of a dark purple colour; ſeeds flat, heart-ſhaped. Diſcovered at Vera Cruz by Dr. Houſtoun, who ſent the ſeeds to Europe about the year 1733, where it was cultivated by Mr. Miller. 8. A. *arboreſcens*, tree birthwort. Pluk. alm. 50. t. 78. f. 1. "Leaves cordate-lanceolate; ſtem erect, ſhrubby," about two feet high; branches ſtrong enough to ſupport themſelves; flowers ſolitary, axillary. A native of North America. 9. A. *caudata*, tailed birthwort, Jacq. Amer. 233. t. 145. pict. 114. t. 221. "Leaves cordate, obtuſe, emarginate at the tip, lobes incumbent, lip tailed;" the lobes of the leaves lap over each other at the baſe; the lip of the corolla ends in a briſtle-ſhaped tail. A native of America. 10. A. *odoratiſſima*, ſweet-ſcented birthwort. Browne, 329, 1. Sloane, v. 1. 162. t. 104. f. 1. "Leaves cordate; ſtem twining, ſhrubby; peduncles ſolitary; lip of the corolla very large;" root long geniculated; ſtem climbing, ſix or eight feet high; branches numerous; leaves cordate or triangular, four inches long, longitudinally ribbed; corolla yellowiſh. The whole plant has a ſtrong grateful ſmell. A native of Jamaica, where it is called *contrayerva*; cultivated by Miller in 1752. 11. A. *ſipho*, broad-leaved birthwort. L'Heritier, ſtirp. nov. 1. p. 13. t. 7. "Leaves cordate; peticled; flowers ſolitary; border trifid, equal; bracte ovate; ſtem twining, ſhrubby." This is a tall twining ſhrub with few branches, of a camphoraceous ſmell; leaves ſpreading, remote, roundiſh, ſinuate-cordate, veined; peduncles lateral, one-flowered; bracte decurrent, embracing the peduncle; corolla of a purpliſh brown, an inch and a half long; tube ſhaped like a ſyphon, with a trifid flat border. A native of North America, and introduced here by Mr. Bartram about the year 1763. It flowers in June. 12. A. *anguicida*, ſnake-killing birthwort. Jacq. Amer. 232. t. 144. pict. 114. t. 220. Morris. hiſt. 3. f. 12. t. 17. f. 7. "Leaves cordate, acuminate; ſtem twining, ſhrubby; peduncles ſolitary; ſtipules cordate;" root thick; ſtems ſlender, long, jointed, purple; corollas purple, ſtraight, truncated as it were with a lanceolate lip. If the juice of the root mixed with the ſaliva be put into the mouth of a ſerpent, it may be handled with ſafety; but will recover in two hours. A native of Mexico and the Weſt Indies. 13. A. *maurorum*, Mooriſh birthwort. Mor. hiſt. 3. f. 12. t. 17. f. 11. "Leaves haſtate, quite entire; ſtem weak, ſimple; flowers ſolitary, recurved." It has ſeveral filiform ſtems producing ſeven or eight leaves on each ſide of the upper part of the ſtem, theſe are aſh-coloured, oppoſite, reſembling thoſe of *oſmunda regalis*. The flowers are larger than thoſe of common birthwort, brown, and appear among the lower leaves. Diſcovered by Rauwolf in olive grounds about Aleppo. 14. A. *Indica*. Indian birthwort. Gærtn. Pract. i. 45. Carelu. vegon. Rheed. Mal. 8. 48. t. 25. "Leaves cordate, rather acute; ſtem twining; peduncles many-flowered;" ſtems ſhrubby, ſtriated, ſlender; leaves entire, ſmooth, frequently retuſe or emarginate; peduncles axillary, with alternate acute bractes, within which ſtands a ſingle flower on its proper pedicel; corolla a duſky purple. A native of the Eaſt Indies and Cochinchina. 15. A. *boetica*, Spaniſh birthwort. Mor. t. 17. f. 6. "Leaves cordate, rather acute; ſtem twining; peduncles about three, longer than the petioles;" the ſtems are ſlender, ſtriated, ſpreading over hedges and buſhes; leaves acuminate, on long petioles;

flowers

flowers crooked, oblong, very dark purple; ſtipules ovate-rhombed, and mucronate. Found by Cluſius in Andaluſia. An evergreen, and odorous plant, flowering in January and February, cultivated by Gerard, in 1597. This was formerly called climbing birthwort. 16. A. *ſempervirens*, evergreen birthwort, *ſiphlochia cretica*. Bauh. pin. Mor. Hiſt. 12. t. 17. f. 16. "Leaves cordate-oblong, acuminate, waved; ſtem weak, flowers ſolitary;" the ſtems are many, trailing, more than a foot long, ſtriated, angular; leaves nerved, dark coloured, evergreen, on long petioles; flowers axillary, crooked, longer than the leaves, of a dark purple externally, internally yellow. A native of the iſland of Crete or Candia, flowering in May and June. Cultivated in the Chelſea garden in 1739. 17. A. *ſerpentaria*, Virginia birthwort or ſnake-root. Woodv. Med. Bot. 291. t. 106. Mat. Med. "Leaves cordate-oblong, flat; ſtem weak, flexuoſe, round; flowers ſolitary;" root a congeries of ſmall fibres, yellowiſh; ſtem jointed, firm, from ſix inches to a foot in height; leaves lanceolate cordate, nerved; flowers blue or purpliſh, on long footſtalks, proceeding from the lower joints of the ſtem; tube compreſſed at the throat, ventricoſe and round at the baſe, ſpreading at the border. It flowers in May, and perfects its ſeeds in Auguſt. A native of Virginia and Carolina. Cultivated by Tradeſcant at Lambeth, in 1632. 18. A. *piſtolochia*. Lin. ſp. 1364. "Leaves cordate-crenulate, netted underneath, petioled; flowers ſolitary;" the ſtems are angular, branching, ſeldom riſing to a foot in height, and ſcarcely ſtrong enough to ſupport themſelves; bracte heart-ſhaped at the baſe of the peduncle; flowers ſmall, lip bent inwards, tube and beginning of the petal yellow, broader and blood-coloured. A native of the ſouth of France, Spain, and Swiſſerland. Cultivated by Gerard in 1596. 19. A. *rotunda*, round-rooted birthwort; "leaves cordate, ſubſeſſile, obtuſe; ſtem weak, flowers ſolitary;" the roots are roundiſh, about the ſize of a ſmall turnip; they ſend out three or four weak trailing branches, to the extent of two feet; leaves rounded at the end; flowers ſtand ſingly, cloſe to the petioles, they are of a purpliſh black colour, and curved inwards at the lip. A native of the ſouth of Europe, flowering from June till the end of Auguſt. 20. A. *longa*, long-rooted birthwort. Woodv. Med. Bot. p. 294. f. 107. "Leaves cordate, petioled, obtuſe; ſtem weak; flowers ſolitary, fruit ovate;" the root is very long, ſomewhat fuſiform; ſtems weak, angulated; branches trailing; peduncles at the axils of the leaves; flowers of a pale purple colour, angulated, tube gradually widening to the mouth, which is ovate and terminating in a pointed apex. A native of the ſouth of Europe. It flowers at the ſame time as the A. *rotunda*, which it very much reſembles. They were both cultivated by Gerard in 1596. 21. A. *hirſuta*, rough birthwort. Tournef. itin. i. t. 147. "Leaves cordate, rather obtuſe, ſhaggy; flowers ſolitary, pendulous, recurved, ſubtruncate." This ſpecies has ſome reſemblance to the preceding, but the leaves are hairy, and not ſo deeply eared at the bottom, the flowers are alſo much larger; ſtem ſtriated, hairy, leaves obtuſe, dagger-pointed; corolla incurved, and recurved, without an elongated lip. Tournefort ſays the root is nearly two feet in length, and two inches in thickneſs; ſtems two feet high, knotted, at each knot ariſes a ſingle leaf three inches long; flowers axillary, of the ſhape of an S, and of a pale green, mixed with a purple colour. It is a native of the iſland of Scio or Chios. 22. A. *clematitis*, common birthwort. Hudſ. 394. With. 1003. Woodv. Med. Bot. ſupp. f. 238. Eng. Bot. 398. "Leaves cordate, ſtem erect, flowers axillary, crowded;" ſtems two feet high, ſimple ſtriated, ſmooth, a little zigzag; leaves alternate, on footſtalks without ſtipules, heart-ſhaped, entire, ſmooth, broad, veined, nerved; flowers five or ſix in a cluſter, axillary, of a pale yellow, appearing from July till September, conſiſting of one petal, globoſe at the baſe, with ſix furrows, theſe funnel-ſhaped, and terminating in a tongue-like figure; ſtyle ſimple, with ſix ſtigmas. Smith. Found in England about the ruins of nunneries, abbeys, &c. The following five are new ſpecies. 23. A. *ſcandens*, Mill. Dict. n. 10. "Leaves cordate, on very long footſtalks; ſtems climbing; flowers terminal, on very long peduncles." This climbs to a very conſiderable height; leaves broad, longitudinally veined; flowers in looſe cluſters at the extremities of the branches, and on long peduncles. It grows about Tolu in New Spain, from whence Mr. R. Millar ſent the ſeeds to England. 24. A. *conſertа*. Mill. Dict. 11 "Leaves cordate, petioled; ſtem climbing; flowers in axillary cluſters." This climbs to the height of three or four feet; leaves ſhort, ſomewhat like thoſe of A. *rotunda;* flowers dark purple. It was diſcovered by Mr. R. Millar at Campeachy. 25. A. *bracteata*, Retz. obſ. 5. 29. n. 80. "Leaves cordate, obtuſe; ſtem weak; flowers ſolitary; bractes cordate, petioled." Stem flexuoſe, ſtriated; flowers peduncled, ſhorter than the leaf, with a long curved lip. Found by Koenig about Madras. 26. A. *obtuſata*, Swartz. prod. 126. Plum. ic. 27. t. 53. "Leaves cordate, rounded at the tip, three-nerved, netted, and tomentoſe beneath; ſtem twining; peduncles ſolitary." A native of the Caribbee iſlands. 27. A. *grandiflora*, Swartz. prod. 126. Browne, jam. 327. n. 2. "Leaves broad, cordate; ſtem twining, ſubherbaceous; peduncles ſolitary; tip of the corolla very large, with a long tail." Flowers large, five or ſix inches round the margin; throat cloſed longitudinally for a conſiderable time; lip terminating at the lower extremity in a long ſlender appendix. A native of Jamaica (about St. Ann's).

Medicinal Properties. The A. *rotunda*, *longa*, and *clematitis*, formerly were admitted into the materia medica of the Britiſh pharmacopœias; and the laſt is ſtill retained by the Edinburgh college. The virtues which the ancients aſcribed to their roots were very conſiderable, and they were conſequently employed in various diſeaſes, particularly thoſe thought to proceed from obſtructions more eſpecially of the uterine ſyſtem; and we are informed by Dr. Cullen, that in ſome caſes of this deſcription, he found the *ariſtolochia* an uſeful remedy. Though many ſpecies of this genus have been recommended for their medicinal powers, it is only that of *ſerpentaria* which has continued to maintain its character as a medicine of importance. The root of *ſerpentaria*, as well as that of ſome of its congeners before mentioned, was firſt recommended as a medicine of extraordinary power in counteracting the poiſonous effects of the bites of ſerpents; ſince that time it has been principally employed in fevers, eſpecially thoſe of the malignant kind; a practice founded on a ſuppoſition that the morbific matter of theſe fevers was to be ſubdued by the ſame means as that of the poiſon of ſerpents: hence the *ſerpentaria* has been deemed the moſt powerful of thoſe medicines termed alexipharmics. But ſince this theory has been exploded, its good effects are now aſcribed to its tonic and antiſeptic properties. It is certainly a powerful ſtimulant and diaphoretic, and has been found very uſeful in fevers, where theſe effects have been required, as appears from the writings of Huxham, Hillary, Pringle, &c. See Woodville's Med. Bot. p. 293.

Propagation and Culture. Thoſe ſpecies that are natives of hot climates, as 1, 7, 9, 10, 12, 14, 23—27, require a ſtove to preſerve them. The ſeeds, by which they are to be propagated, ſhould be brought over in their pods, and immediately on their arrival here, ſhould be ſown in ſmall pots filled with light

light earth, and ſhould this happen in autumn or winter, the pots ſhould be plunged into the tan of the bark ſtove, and under the ſhade of large plants. After remaining till March, they ſhould be plunged into a hot-bed under frames, where the plants ought to appear in May. But if the ſeeds arrive in ſpring or ſummer, they muſt be ſown in ſmall pots, and plunged into a moderate hot-bed, obſerving to ſhade them conſtantly during the heat of the day; but the ſeeds ſown at this ſeaſon of the year ſeldom grow the ſame year, and in that caſe the pots ſhould be plunged in the tan-bed of the ſtove in autumn, and in the ſpring following treated as before directed. When they are ſtrong enough, they ſhould be tranſplanted into ſeparate ſmall pots, and treated as other tender plants of the ſame countries. 8. The tree birthwort will live in the open ground, but requires ſhelter in winter. 11. is hardy and may be propagated by ſeeds, ſuckers, or by parting the roots. 13, 15, 16, 18, are propagated by parting the roots; they ſhould be ſcreened from ſevere froſt. 17, 19, 20, 21, are propagated by ſeeds, in pots placed under a frame to defend them againſt froſt, but the glaſſes to be taken off when the weather is mild; and they would be greatly improved by removing them to a gentle hot-bed in March. As the ſeaſon advances, they ſhould be gradually enured to bear the open air; when the pots are taken out of the bed, they may be expoſed to the morning ſun, but ſcreened during the heat of the day. They are to be refreſhed with water moderately during dry weather only. In winter, the pots muſt be ſheltered as before; and, in March, before the roots begin to ſhoot, they ſhould be tranſplanted into ſeparate ſmall pots, and placed under the frame till ſpring, when they may be removed into the open air, and treated in the ſame manner as in the former year. The next ſpring they may be turned out of the pots, and planted in a warm border, where they will only require to be kept clean from weeds, and the roots defended from the froſt, by covering the border, in autumn, with old tanner's bark. By this management the plants will become much healthier and ſtronger than if kept in pots, and when they are three years old, will flower, and produce plenty of ſeeds. The 22d ſpecies ſpreads ſo rapidly by its creeping roots, that it will be found troubleſome, unleſs planted where it cannot injure other plants. All the ſpecies are perennial, and their ſtems generally require ſupporting. See Martyn's Mill. Dict.

ARISTOMENES, in *Biography*, a famous general of the Meſſenians, diſtinguiſhed by his love of liberty and his valour, and alſo by the viciſſitudes of his fortune, was the ſon of Nicomedes, and a deſcendant of the royal family of Meſſene. The oppreſſion of the Spartans rouſed his indignation, and he took up arms, in connection with the Argives and Arcadians, for the reſcue of his country; and thus commenced the ſecond Meſſenian war, in the year before Chriſt 684. which terminated in the year 668 before the ſame æra. The firſt battle was fought in a village of Meſſenia, and the victory was long doubtful; but Ariſtomenes by his valour determined the fate of the day; and the army unanimouſly ſaluted him as king. This honour, however, he declined, and choſe to retain that of general. His next object was to intimidate the Spartans by a ſingle act of courage; and with this view he repaired to Lacedæmon, and having ſecretly entered the temple of Minerva, he affixed to the walls a buckler, with this inſcription, "Ariſtomenes has conſecrated this to the goddeſs, from the ſpoils of the Lacedæmonians." In a ſecond engagement the Lacedæmonians were again defeated, and one of their towns was taken and pillaged; but in this action Ariſtomenes received a wound in the thigh, which however did not prevent his marching to inveſt Sparta, whence he was under a neceſſity of retreating. In the third year of the war, the Meſſenians were betrayed by the treachery of Ariſtocrates, king of Arcadia, and ſuffered a defeat, attended with the loſs of the greateſt part of their army. Thus weakened and diſtreſſed, the reſolution of Ariſtomenes was invincible; and with a ſmall band of ſelect men, he contrived to haraſs the Spartans, and to penetrate into Laconia. At length the valiant general was taken priſoner, and confined in a deep cavern amidſt the other wounded and dying priſoners. In this noiſome receſs he continued three days; when perceiving at a ſmall diſtance from him a fox preying upon a dead body, he ſeized its leg and permitted it to conduct him to a ſmall hole through which he could diſcern the light. Having enlarged the aperture with his hands and nails, he obtained a paſſage through which he made his eſcape, undiſcovered, to his countrymen at their poſt on mount Ira. He ſoon renewed his ravages among the enemy, and compelled them to a truce; but he was perfidiouſly ſeized by ſome Cretan ſoldiers in the ſervice of Sparta, and carried away captive. Theſe Cretans, who were ſeven in number, ſtopped at the houſe of a widow with one daughter; and whilſt they were intoxicated with wine, the woman cut the thongs by which he was bound, and ſet him at liberty. Thus releaſed, he ſlew all his guards, and accompanied by the mother and daughter, haſtened to Ira, where the latter was married to his ſon. Ira was treacherouſly ſurrendered to the Spartans; but Ariſtomenes forming a ſmall band of his followers into a column, marched directly to the enemy's line, which opening to the right and left, as he advanced, afforded him an unmoleſted paſſage. He then joined the Arcadians, by whom he was kindly received; and propoſed to them a bolder exploit than any which he had yet achieved. "I have ſtill left," ſaid he, "five hundred brave ſoldiers who will follow me where I pleaſe; if you aſſiſt me, whilſt the Spartans are occupied in the pillage of Ira, I will march immediately to Lacedæmon and ſurpriſe it." The propoſal was received with great applauſe; but, before it could be executed, the Arcadian king contrived to delay it till he had forewarned the Spartans of their danger. His treachery was diſcovered, and the enraged people ſtoned him to death. Thus diſappointed, he ſent the Meſſenians, under the conduct of his ſon, to the iſland of Sicily, where they founded the city of Meſſina, about the year 668 before Chriſt, according to Pauſanias; and he remained in Greece, watching a favourable opportunity for accompliſhing the deſigns againſt the Spartans which he was ſtill meditating. Such was his reputation, that when a perſon of the firſt rank at Rhodes conſulted the oracle at Delos whom he ſhould marry, he was directed to eſpouſe the daughter of the moſt worthy of the Greeks, meaning Ariſtomenes. On a viſit to his ſon-in-law, Ariſtomenes died, and a magnificent tomb was erected for him at Rhodes. The independence of his country, however, expired with him. Pauſanias, l. iv. c. 21, 22, 23. Anc. Un. Hiſt. vol. v. p. 413—423. Travels of Anacharſis, vol. iv. p. 38—53.

ARISTONAUTÆ, in *Ancient Geography*, a town of Achaia, near the frontiers of Sicyonia, north of Pallene, and at the bottom of a ſmall gulf.

ARISTONIS URBS, a city of Egypt in the road from Coptos to Berenice, 25 miles from Dioſpolis.

ARISTONUS, in *Biography*, an eminent Grecian ſculptor. The exact time when he lived is not known. He erected a ſtatue of Jupiter at Olympia, the face of which was placed towards the riſing of the ſun. The god held the eagle with one hand, and in the other the thunder. His head was crowned with the flowers of ſpring.

The

The eagle is neceſſarily attached to Jupiter in order to diſtinguiſh the god, but with reſpect to the other attributes, we may fairly infer that they were introduced in order to point out the union of juſtice and mercy in the divine nature. The thunder, an emblem of his power to execute judgment, is placed in his hand, but the bloſſoms of ſpring are as a crown upon his head, to ſhew that it is his delight and his glory rather to bleſs mankind. The face of this ſtatue being turned towards ſun-riſe, ſeems to ſtrengthen this idea, and might be intended to exhibit the care and government of the Divine Being in the conduct of his providence.

ARISTOPHANES, a celebrated comic poet, flouriſhed about the middle of the fifth century before Chriſt, and was contemporary with Sophocles, Socrates, Euripides, and ſeveral others of the greateſt men in Greece. The place of his birth is not known; but it is generally ſuppoſed that he was not a native of Athens, though he was much eſteemed in this city, where he ſeems to have reſided and been admitted to the honour of a denizen. Having been accuſed by Cleon of aſſuming the title of a citizen without poſſeſſing a legal right to it, in his defence he parodied two verſes which Homer has put into the mouth of Telemachus, of which this is the ſenſe: "I am, as my mother tells me, the ſon of Philip; for my part I know little of the matter; for what child knows his own father?" This ſtroke of pleaſantry, it is ſaid, having induced his judges to confirm him in his privileges as a citizen, he breathed nothing but vengence againſt Cleon, and compoſed a piece againſt him abounding with the bittereſt ſarcaſms. As he advanced in life he employed thoſe talents for poetry which diſtinguiſhed his early age, in that ſpecies of dramatic writing, called "The Old Comedy," which flouriſhed during the Peloponneſian war, and a little before it, and which introduced on the ſtage real perſons by name, in order to make them the objects of invective or ridicule. Having reduced this kind of comedy from its rude and unconnected ſtate into a better and more uſeful form, he made it the vehicle of very unallowable and licentious ſeverity and abuſe. This was particularly the caſe in his firſt comedies; but he is ſaid to have become more moderate in his later performances, and to approach in his manner to what was called "Middle Comedy," in which real perſons were not introduced, but the characters were in ſome meaſure diſguiſed by fictitious names; ſee COMEDY. His firſt efforts were directed to the reformation of abuſes in the ſtate; and he laſhed, without diſcrimination, the uſurpation and miſconduct of the great, and the follies and vices of the people in general. Whilſt he expoſed the ſiniſter deſigns of the magiſtrates and generals of the Athenians by his wit and ſatire upon the theatre, he at the ſame time took care to defend the commonwealth againſt its foreign enemies; inſomuch that Lacedæmon and other cities which were jealous of the grandeur of Athens, frequently experienced that Ariſtophanes alone was worth an army to that city, and that it was impoſſible to ſucceed while they followed the advice of this poet, who had made the ſtage a kind of ſchool for the art of war, and all other virtues which can render a city formidable to its enemies. We are told that the freedom with which he reprehended the errors and faults of the philoſophers, poets, generals, and miniſters of ſtate, and thoſe of the maſs of citizens, was ſo well received by the Athenians, that they caſt handfuls of flowers upon his head, and carried him in triumph through the city with the greateſt reſpect and loudeſt acclamations. As a recompence for the zeal which he manifeſted on behalf of the commonwealth, they paſſed a public decree, that he ſhould be honoured with a crown of the ſacred olive in the citadel, which was the higheſt token of reſpect that could be paid to any citizen. Two excellent actors, Calliſtratus and Philonides, performed in the comedies of Ariſtophanes. When the firſt appeared, it was underſtood that the comedy was directed only againſt the vices of individuals; and when the ſecond acted, that it attacked the leaders of the adminiſtration. But the licentious attacks of Ariſtophanes, though often applauded by the multitude, were diſapproved and condemned by the moſt intelligent part of the public. Accordingly, by one decree, the acting of comedy was prohibited; by a ſecond, it was forbidden to mention any perſon by name; and by a third, to attack the magiſtrates. But theſe decrees were ſoon forgotten or repealed; nor would the multitude conſent to relinquiſh a ſpecies of entertainment in which all the abuſive and obſcene expreſſions their language afforded, were laviſhed on the objects of their jealouſy or reſentment. Towards the end of the Peloponneſian war, the licentiouſneſs of the poets was reſtrained, and Ariſtophanes himſelf ſubmitted to this reformation in his latter pieces. But no reformation which he might effect in the ſtate, much leſs any gratification which he might afford to the ſplenetic humour of individuals, can atone for or excuſe his malignant attack on the reputation and life of Socrates. His comedy of "The Clouds," was written with a view to expoſe to ridicule this admirable philoſopher. To this purpoſe he repreſents him ſuſpended in a baſket, reſembling his thoughts to the ſubtle and light air which he reſpires, and invoking the clouds, the tutelary deities of the ſophiſts, whoſe voice he imagines that he hears in the midſt of the fogs and darkneſs by which he is ſurrounded. To inflame the more againſt him the prejudices of the people, he accuſes him of teaching the youth of Athens to contemn the gods, and to deceive men. This piece, which was received at its firſt and ſecond recital with applauſe, though it did not obtain the crown, is thought to have contributed towards preparing the Athenians for that unjuſt decree, which bereaved that age of its brighteſt ornament. Ariſtophanes, notwithſtanding the malignity of his ſatire, the occaſional obſcenity of his humour, and the licentiouſneſs of his morals, was univerſally admired among the ancients on account of the Attic elegance of his ſtyle, and the peculiar poignancy of his wit. The purity and elegance of his diction was ſo much admired even by Plato, the diſciple of Socrates, that in an epigram he repreſents the graces ſearching for a deſirable manſion, and at length fixing it in the mind of Ariſtophanes; and St. Chryſoſtom, the moſt eloquent of the Greek fathers of the church, is ſaid to have laid him always under his pillow when he went to bed. Nevertheleſs, many of the ancients felt and cenſured the faults of Ariſtophanes. The character which Plutarch (in Compar. Ariſtoph. & Menand., Oper. t. ii. p. 853 and 854.) gives of him, is as follows: "he outrages nature, and addreſſes himſelf more to the populace than to a genteel audience; his ſtyle is conſtantly mixed and unequal, elevated to bombaſt, familiar even to vulgarity, and buffooniſh even to childiſhneſs. In him the father is not to be diſtinguiſhed from the ſon, the citizen from the peaſant, the warrior from the tradeſman, nor a god from a menial ſervant. His impudence can only be endured by low people; his wit is bitter, ſharp, and cutting; his pleaſantry conſiſts chiefly in a play upon words, groſs equivocations, and far-fetched and licentious alluſions. In him, ſubtlety of expreſſion becomes malignant, and ſimplicity appears ſtupid; we are more inclined to hiſs than to laugh at his raillery, and his gaiety is effrontery; in ſhort, he writes not to pleaſe rational and worthy people, but to gratify envy, ſpite, and debauchery." Upon the whole, we may obſerve, that ſuch wit as his would not be admired in any modern

modern compoſition. Friſchlin has written an expreſs vindication of Ariſtophanes, in anſwer to the objections of Plutarch. Cicero likewiſe, in his firſt book "De legibus," ſtiles him the moſt witty poet of the "Old Comedy," and highly commends him for endeavouring to expel the new deities out of the city, and to prevent the admiſſion of ſcandalous forms of religion. Brumoy thinks that Plutarch's remarks are too ſevere; and Mr. Cumberland has defended the author of the "Clouds," with true claſſical zeal, ſomewhat, perhaps, at the expence of Socrates and Euripides. Athenæus (Deipn. l. x. c. 9.) informs us, that he wrote his comedies when he was drunk, as Alcæus likewiſe did his poems. Julius Cæſar Scaliger compares Horace to this poet; but Friſchlin is of opinion, that Plautus has a greater affinity to him in his manner of writing, and has actually imitated him in many parts of his plays. By others, his writings have been repreſented as containing within them the germ of true comedy, and the models of the beſt comic ſtyle; and they maintain that the author well underſtood that ſpecies of raillery, which, in his age, was pleaſing to the Athenians, and which muſt pleaſe in every age.

Ariſtophanes is ſaid to have invented a peculiar kind of verſe, which was called by his name, and is mentioned by Cicero in his "Brutus." Suidas tells us, that he likewiſe invented the "tretrameter" and "octameter" verſe. Eleven of the fifty-four comedies ſaid to have been written by this poet, ſtill remain, and theſe belong entirely to the firſt æra, known by the name of "the Old Comedy." Of this kind of drama Eupolis, Cratinus, and Ariſtophanes, were the three moſt celebrated authors. Of "the Middle Comedy," he gave a ſpecimen in his "Cocalus," that is now loſt, in which he did not introduce real perſons, as in his "Equites," "Clouds," and "Frogs," but fictitious ones. Madame Dacier obſerves, that there are but two of them, "Plutus," and the "Clouds," which, with a regard to decency, will admit of a tranſlation into the modern languages. The deſign of the latter has been already mentioned. The former, written after the magiſtrates had given orders that no perſon ſhould be expoſed by name on the ſtage, was intended to reproach the Athenians with their avarice, which had been the occaſion of their committing many errors in concerns of the greateſt importance. This is the moſt eſteemed of any of the comedies now extant. Euripides, to whom this poet had a particular averſion, is ſatirized in ſeveral of his plays, particularly in his "Frogs," his "Acharnenſes," and his "Theſmophoriuzaſæ." The beſt editions of Ariſtophanes are thoſe of Kuſter, Bergler, and Brunck. Gen. Dict. Travels of Anacharſis, vol. iv. p. 48. 53, &c. Nouv. Dict. Hiſtor.

ARISTOPHANEUM, in *Ancient Phyſic*, a name given to a kind of emollient plaſter, prepared of pitch, wax, opopanax, apochyma, and vinegar.

ARISTOPHILI, in *Ancient Geography*, a people of Aſia, in the Paropamiſus. Ptolemy.

ARISTOTELIA, in *Antiquity*, annual feaſts, celebrated by the citizens of Stagira, in honour of Ariſtotle, who was born there; in gratitude for his having procured from Alexander, the re-building and re-peopling of that city, which had been demoliſhed by king Philip. It is ſaid, that after his death at Chalcis in the iſland of Eubœa, they fetched away his bones, built an altar upon his tomb, called the place by his name, and held their aſſemblies there afterwards. Mandeville, in his fabulous account of his voyages, ſays, that this was ſtill in being in his time; that is, in the fourteenth century. Ammon. in Vit. Ariſtot. Stanley's Hiſt. of Philoſ. p. iv. c. 8.

ARISTOTELIA (from Ariſtotle), in *Botany*, a ſmall ſhrub, a native of Chili. Schreb. n. 816. L'Heritier ſtirp. nov. 31. t. 16. Juſſ. 433. Claſs, *dodecandria monogynia*. Gen. Char. *Cal.* perianth one-leaved, five-parted; diviſions lanceolate, concave, acute, upright. *Cor.* petals five, wedge-ſhaped, concave, erect, lying over each other at the ſides, ſcarcely longer than the calyx. *Stam.* filaments fifteen, very ſhort; anthers linear, ſhorter than the germ. *Piſt.* germ ſuperior, roundiſh, rather three-cornered; ſtyle filiform, longer than the corolla; ſtigmas three, recurved. *Per.* berry ſubglobular, obtuſely three-cornered, three-celled. *Seeds* two, or ſolitary in each cell, angular.

Eſſ. Gen. Char. *Cal.* five-leaved. *Cor.* five-petalled, berry three-celled. *Seeds* two in each cell.

Species, 1. A. *macqui*, ſhining-leaved Ariſtotelia; root woody; ſtem brachiate, round, grey, tubercled; branches ſpreading, beſet with wart-like glands; leaves oppoſite, oblong-ovate, acuminate, ſerrate; the younger leaves of a ſhining bright green, ſomewhat viſcid, on foot-ſtalks; ſtipules in pairs, minute, like glands; peduncles racemed, axillary, nodding; flowers pedicelled, drooping, globoſe, herbaceous; calyx villoſe; ſtyle often trifid; berry the ſize of a pea, of a dark purple, becoming black. This ſmall ſhrub is a native of Chili, whence it was firſt ſent to Europe by Dombey, and known by the name of *macqui*. The inhabitants of Chili make a wine of the berries, which they give in malignant fevers. It is hardy enough to bear the open air in general. But in ſevere winters it ought to have the protection of a green-houſe. It flowers in April and May, and was introduced here about 1773, by Meſſrs. Kennedy and Lee. Loureiro has given the name of *Ariſtotelia* to a genus of the claſs *gynandria*, found in China.

ARISTOTELIAN, ſomething that relates to the philoſopher Ariſtotle.—Thus we ſay, an Ariſtotelian dogma, the Ariſtotelian ſchool, &c. See ARISTOTLE.

ARISTOTELIAN *philoſophy*, the philoſophy taught by Ariſtotle, and maintained by his followers.

The Ariſtotelian is otherwiſe called the *Peripatetic philoſophy*; the riſe, progreſs, viciſſitudes, and fate of which, ſee under ARISTOTLE, and PERIPATETICS.

ARISTOTELIANS, a ſect of philoſophers, otherwiſe called Peripatetics.

ARISTOTELICA *rota*. See ROTA.

ARISTOTLE, in *Biography*, was born at Stagira, on the coaſt of Thrace, in the beginning of the ninety-ninth olympiad, eighty-five years after the birth of Socrates, and 384 before the birth of Chriſt. Stagira, as well as the neighbouring Greek cities, enjoyed the precarious dignity of independent government: it was the ally of Athens in the Peloponneſian war, and, like other nominal allies, experienced the ſtern dominion of that tyrannical republic. The city of Stagira indeed owes its celebrity wholly to Ariſtotle and his family; and, if its name is ſtill familiar to modern ears, this proceeds merely from having communicated to our philoſopher the appellation of Stagirite. His father, Nicomachus, who was the phyſician and friend of Amyntas, king of Macedon, derived his deſcent through a long line of medical anceſtors from Æſculapius the companion of the Argonauts, whoſe ſkill in the healing art had raiſed him to a ſeat among the gods. Nicomachus improved a branch of knowledge which was the inheritance of his family, by writing ſix books on natural philoſophy and medicine. The mother of Ariſtotle was Pheſtis. He loſt his parents in early youth, but inherited from them a large fortune. He was left to the guardianſhip of Proxenus, a citizen of Atarna in Myſia, who received the young Stagirite into his family, and ſkilfully directed his education. At the age of ſeventeen, Ariſtotle was attracted by the

love of learning to Athens, and particularly by the deſire of hearing Plato in the academy, the beſt ſchool of ſcience as well as morals then exiſting in the world, and where the moſt aſſiduous ſtudent might find competitors fit for exciting his emulation and ſharpening his diligence. Plato early obſerved of him, that he required the rein rather than the ſpur. His induſtry in peruſing and copying manuſcripts was unexampled, and almoſt incredible; he was named, by way of excellence, the ſtudent or reader. Plato often called him the "ſoul of his ſchool;" and, when Ariſtotle happened to be abſent from his prelections, often complained, "Intellect is not here," and that he ſpoke to a deaf audience. As the ſtudent advanced in years, his acuteneſs was as extraordinary in canvaſſing opinions, as his induſtry had been unrivalled in collecting facts: his capacious mind embraced the whole circle of ſcience; and, notwithſtanding his pertinacity in rejecting every principle or tenet which he could not on reflection approve, his very ſingular merit failed not to recommend him to the diſcerning admiration of Plato, with whom he continued to reſide twenty years, even to his maſter's death; alike careleſs of the honours of a court, to which the rank and connections of his family might have opened to him the road in Macedonia; and indifferent to the glory of a name, which his great abilities might have attained by eſtabliſhing a ſeparate ſchool, and founding a new ſect in philoſophy. While Ariſtotle thus attended to the improvement of his mind, he did not neglect whatever might adorn his perſon. His figure was not advantageous; he was of a ſhort ſtature, his eyes were remarkably ſmall, his noſe was high, his limbs were diſproportionably ſlender, and he liſped or ſtammered in his ſpeech. For his ungracious perſon Ariſtotle is ſaid to have been anxious to compenſate by the finery and elegance of his dreſs: his mantle was ſplendid; he wore rings of great value; and he ſhaved both his head and his face, while the other ſcholars of Plato kept their long hair and beards. This fondneſs for dreſs, however, neither altered his character, nor interrupted his ardent paſſion for knowledge. When he was about ſix and thirty years of age, he loſt his maſter Plato. Of that ſage he always ſpoke with a degree of reſpect approaching to veneration. Soon after Plato's deceaſe, Ariſtotle wrote verſes in his praiſe, and erected altars to his honour. The epitaph inſcribed by Ariſtotle on the monument of his maſter, is preſerved in a Latin verſion of an ancient life of Ariſtotle, written in Greek, and aſcribed by ſome to Ammonius, and by others to Philoponus, and it is as follows:

"Gratus Ariſtoteles ſtruit hoc altare Platoni,
Quem turbæ injuſtæ vel celebrare nefas."

"To Plato's ſacred name this tomb is rear'd,
A name by Ariſtotle long rever'd!
Far hence, ye vulgar herd! nor dare to ſtain
With impious praiſe this ever-hallow'd fane."

Theſe extraordinary tokens of reſpect on the part of Ariſtotle, afford a preſumption amounting almoſt to certainty, that there is no truth in the relation of which Ariſtoxenus is ſaid to have been the original author, and which has been tranſmitted by Ælian, Diogenes Laertius, and others, that Ariſtotle gave great offence to Plato by the effeminate elegance of his dreſs, and by his pertneſs and loquacity; and that in reſentment of the preference manifeſted by his maſter in favour of Xenocrates and Speuſippus, he intruded into the ſchool, perplexed Plato at the age of eighty, when his faculties were failing, with ſubtle queſtions, drove him from the academy, and took poſſeſſion of the chair, till it was reclaimed for Plato by his diſciple Xenocrates. In the Latin tranſlation of the life of Ariſtotle above mentioned, this calumny is charged on Ariſtoxenus, who, as Suidas obſerves, entertained a perſonal enmity againſt Ariſtotle, for preferring Theophraſtus to him in the ſucceſſion of his ſchool. For the aſſertion that Ariſtotle inſtituted a new ſchool before Plato's death, we have, therefore, no ſufficient authority. It has been alſo related by Ælian, (Var. Hiſt. l. v. c. 9.) whoſe teſtimony, indeed, does not deſerve implicit credit, and alſo by Athenæus (Deipnoſoph. l. viii. p. 354.) that Ariſtotle, in his youth, was ſo much addicted to pleaſure as to ſpend his patrimony; that he afterwards entered into the army; and abandoning a military life, profeſſed medicine, and practiſed pharmacy; till at length he was led by accident to turn his attention to philoſophy. But the age at which he was admitted into the academy, and other circumſtances, very much invalidate the credibility of this account. The connections which Ariſtotle had formed, at the time of his maſter's death, with ſome of the moſt illuſtrious, as well as the moſt extraordinary, perſonages of his own or any age, might naturally inſpire him with the deſign of leaving Athens, after he had loſt the philoſopher and friend whoſe fame had firſt drawn him thither, and whoſe inſtructive ſociety had ſo long retained him in that celebrated city. Ariſtotle might probably have directed his views to the ſucceſſion in his deceaſed maſter's chair at the academy; and upon the election of Speuſippus, diſappointment and diſguſt might have furniſhed additional motives to his leaving Athens. Whatever might have been the caſe in this reſpect, Ariſtotle, while a boy at Atarna, had contracted an intimacy with Hermias, who, originally in a ſtate of ſervitude, had been enabled by the bounty of a patron to proſecute the ſtudy of philoſophy; and having become a fellow-ſtudent with Ariſtotle at Athens, ſoon united with him in the bands of affectionate eſteem, which finally cemented into firm and unalterable friendſhip. Ariſtotle through life purſued the calm and ſecure paths of ſcience, but Hermias ventured to climb the dangerous heights of ambition. His enterprizing ſpirit, ſeconded by good fortune, raiſed him to the ſovereignty of Aſſus and Atarna, Greek cities of Myſia. Thither, at the invitation of his royal friend, Ariſtotle repaired. At Atarna he found the wiſh of Plato realized; and in his friend Hermias, philoſophy ſeated on a throne. In that city he reſided near three years, enjoying the inexpreſſible happineſs of ſeeing his enlightened political maxims illuſtrated in the virtuous reign of his fellow-ſtudent and ſovereign. But Hermias being afterwards depoſed, Ariſtotle was obliged to fly. When Hermias was put to death by Artaxerxes, king of Perſia, Ariſtotle erected a ſtatue of his friend in the temple of Delphos, and wrote in praiſe of him an epitaph, and a hymn to virtue; of which we have an elegant tranſlation, with ingenious remarks, in biſhop Hurd's Notes on Horace's Art of Poetry, v. 219. Ariſtotle, on this occaſion, eſcaped to Mitylene in the iſle of Leſbos, in company with Pythias, the kinſwoman and adopted daughter of the king of Aſſus and Atarna, but now miſerably fallen from the lofty expectations in which her youth had been educated. But this ſad reverſe of fortune only endeared her the more to Ariſtotle, who married the fair companion of his flight in his thirty-ſeventh year; which is preciſely that age pointed out by himſelf as the fitteſt, on the male ſide, for entering into wedlock. Pythias died ſhortly afterwards, leaving an infant daughter, whom Ariſtotle named after a wife tenderly beloved, and who repaid his affection with the moſt amiable ſenſibility. Ariſtotle was now diſtinguiſhed thoughout Greece, and Philip of Macedon, acquainted with his fame, and apprized of his merits, early deſigned to requeſt his acceptance of the tuition of his ſon Alexander, and at length prevailed on him to undertake the charge,

charge, in the fourth year of the 109th Olympiad, or the 341ſt before Chriſt, when Alexander was fourteen years of age. See ALEXANDER.

In the education of Alexander, the Stagirite ſpent near eight years, or five (Juſtin. Hiſt. l. xii. c. 16.), during which long period, in an office of much delicacy, he enjoyed the rare advantage of giving the higheſt ſatisfaction to his employers, while he excited the warmeſt gratitude in his pupil. But the ambition of Alexander had early taken root; and the peculiarities of his character had diſplayed themſelves in a very public and very important tranſaction, which happened long before the Stagirite arrived at the court of Pella. This was his intercourſe with the Perſian ambaſſadors, which has been mentioned under the article ALEXANDER. In training ſuch a youth, ſays Dr. Gillies, the Stagirite had a rich field to cultivate; but he could only hope to give a new direction to paſſions, which it was too late to moderate or controul. In his treatiſe on politics, he has carefully delineated the plan of education beſt adapted to perſons of the higheſt rank in ſociety; and, in performing the taſk aſſigned to him by Philip, this plan was to be ſkilfully modified, by adjuſting it to the peculiar circumſtances and extraordinary character of his pupil. Alexander's loftineſs could not be conquered, but it might be made to combat on the ſide of virtue; if he was angry, it was proved to him that anger was the effect of inſult, and the mark of inferiority. His love for military glory, which, while it is the idol of the multitude, will always be the paſſion of the great, could neither be reſtrained nor moderated; but, to rival this tyrant of his breaſt, ſtill more exalted affections were inſpired, which rendered Alexander as much ſuperior to conquerors, as conquerors deem themſelves ſuperior to the loweſt of the vulgar. Agreeably to a maxim inculcated in that book of Ariſtotle's politics which relates to education, the two years immediately following puberty conſtitute that important period of life, which is peculiarly adapted for improving and ſtrengthening the bodily frame, and for acquiring that corporeal vigour which is one main ſpring of mental energy. During this intereſting period of youth, with the proper management of which the future happineſs of the whole life is ſo intimately connected, Ariſtotle obſerves that the intellectual powers ought indeed to be kept in play, but not too ſtrenuouſly exerciſed, ſince powerful exertions of the mind and body cannot be made at once, nor the habits of making them be ſimultaneouſly acquired. In conformity with this principle, Alexander was encouraged to proceed with alacrity in his exerciſes, till he acquired in them unrivalled proficiency; after which, the whole bent of his mind was directed to the moſt profound principles of ſcience. Ariſtotle having directed the ſtudies of his pupil to ſuch ſubjects as expanded and invigorated the underſtanding, proceeded to thoſe which regulate private and public conduct. He carefully inſtructed his pupil in ethics and politics. He wrote to him, long afterwards, a treatiſe on government; and exhorted him to adjuſt the meaſure of his authority to the various characters of his ſubjects, agreeably to a doctrine which he frequently maintains in his political works, that different nations require different modes of government, reſpectively adapted to their various turns of mind, and different habits of thinking.

The influence which Ariſtotle acquired with his royal pupil he employed to beneficent purpoſes. One diſtinguiſhed inſtance is his conduct to his native country. See ALEXANDER, ARISTOTELIA, and STAGIRA.

After the moſt intimate communication during the ſpace of eight or nine years, the pupil and the preceptor ſeparated for ever, to purſue, in a career of almoſt equal length, the moſt oppoſite paths to the ſame immortal renown; the one by arms, the other by philoſophy; the one by gratifying the moſt immoderate luſt of power, the other by teaching to deſpiſe this and all ſimilar gratifications. During his eaſtern triumphs, terminated in the courſe of ten years by his premature death, Alexander gave many illuſtrious proofs of gratitude to the virtuous director of his youth. Although the tutor declined accompanying his pupil in this expedition, their mutual regard was maintained by a friendly correſpondence; and the conqueror furniſhed the philoſopher with materials for his Natural Hiſtory, by ſending him, at a great expence, from different countries, a large collection of animals. See Plin. H. N. l. viii. c. 16. Athen. l. ix. However, in a ſubſequent period, Alexander's reſentment againſt Calliſthenes was transferred to Ariſtotle, and a mutual alienation took place between the philoſopher and the prince.

Having taken leave of the Macedonian capital, Ariſtotle returned to his beloved Athens, where he ſpent thirteen years, almoſt the whole remainder of his life, inſtructing his diſciples, and improving the various branches of his philoſophy. Finding the academic chair occupied by Xenocrates, the ſucceſſor of Speuſippus, he obtained permiſſion to apply to the purpoſes of public inſtruction a large building in the ſuburbs of the city, called the Lyceum, which had been uſed for military exerciſe. Accordingly, about the ſecond year of the 111th olympiad, or the 335th year before Chriſt, he opened his ſchool, and founded a new ſect of philoſophers, denominated, from the circumſtance of his walking when he delivered his lectures, PERIPATETICS. Here he delivered his acroatic, acroamatic, or eſoteric and exoteric philoſophy; the former, conſiſting of phyſics and logic, and delivered to a ſelect audience; the latter, compoſed of rhetoric, ethics, and politics, and delivered to the public at large. See ACROATICS. The talents and virtues of Ariſtotle expoſed him to envy and calumny, and the ſound wiſdom of his philoſophy excited the hatred of the many pretenders that naturally abounded in ſuch a reſervoir of literature as Athens. He regarded with equal contempt, vain pretenders to real ſcience; or real profeſſors of ſciences which he deemed unproductive of any beneficial purpoſe. "He fought," (ſays his modern biographer and interpreter), "only for truth, and was careleſs of the obſtacles which ſtood in his way to attaining it, whether they were found in the errors of philoſophers, or in the prejudices of the vulgar. Such a man, in ſuch a city as Athens, where, ſince the days of Socrates, the learned taught publicly, and converſed freely with all deſcriptions of perſons, could not fail to have many rivals and many enemies. Sophiſts and ſcioliſts, ſoothſayers and ſatiriſts, and that worſt of banes ſatirical hiſtorians, heaped obloquy on a character, the ornament of his own age, and deſtined to be the inſtructor of poſterity." In pretended piety, the enemies of Ariſtotle found the means of accuſing a ſage whoſe incomparable wiſdom corroded their envy. After having taught thirteen years in the Lyceum with the higheſt reputation, he was charged with irreligion before the Areopagus by the hierophant Eurymedon, abetted by Demophilus, a perſon of weight in the republic, and both of them inſtigated to this cruel proſecution by our philoſopher's declared enemies. The heads of the accuſation were, "that Ariſtotle had commemorated the virtues both of his wife Pythias and of his friend Hermias, with ſuch ceremonies and honours as the piety of Athens juſtly reſerved for the majeſty of the gods." Though theſe accuſations were extremely frivolous, yet Ariſtotle was condemned, but eſcaped puniſhment by leaving the country. After making a rhetorical defence of himſelf, and accompanying it with a proverbial line:

"Ὄχνη ἐπ' ὄχνῃ γίγαται, σῦκα δ' ἐπὶ σύκοις."

"Pears upon pears, and figs on figs grow here:"

importing that Athenians would always be Athenians, he withdrew from Athens, aſſigning this reaſon for his conduct, according to Ælian, (l. iii. c. 36). "I am not willing to give the Athenians an occaſion of being guilty of injuſtice a ſecond time againſt philoſophy;" referring probably to the caſe of Socrates, and which he conſidered as ſimilar to his own. In the ſecond year of the 114th Olympiad, or the 324th year before Chriſt, Ariſtotle, accompanied by a few friends, retired to Chalcis in Eubœa, and there, in the ſixty-third year of his age, and the third year of the 114th Olympiad, or 323 years before Chriſt, he died.

The cauſe and manner of his death have been variouſly repreſented. Suidas ſays, that he drank hemlock, becauſe he had been called to account for the hymn written by him in honour of Hermias. Others, for it is needleſs to advert to the tales of monkiſh writers, report, that the occaſion of his death was too intenſe an application to abſtruſe inquiries, and particularly ſo on the queſtion concerning the tides of the Euripus, which ebbed and flowed ſeven times in a day. He was twice married; firſt to Pythias, and afterwards to Herpilis a native of Stagira, by whom he had a ſon named Nicomachus, to whom he addreſſed one of his treatiſes on morals. His conſtitution was infirm; but his health was preſerved, and his life prolonged, notwithſtanding cloſe and ſedulous application, by his temperance.

Ariſtotle exhibited a character as a man, worthy of his pre-eminence as a philoſopher; inhabiting courts without meanneſs and without ſelfiſhneſs; living in ſchools without pride and without auſterity; cultivating with ardent affection every domeſtic and every ſocial virtue; manifeſting on all occaſions that regard to truth, which is emphatically expreſſed in the adage ſaid to be his, "Amicus Plato, Amicus Socrates, magis tamen amica veritas;" while with indefatigable induſtry he reared that wonderful edifice of ſcience, the plan of which we are ſtill enabled to diſcover from his imperfect and mutilated writings.

Of Ariſtotle's writings the fate was as extraordinary as unmerited; few of them were publiſhed in his life-time; the greater part of them nearly periſhed through neglect. The manuſcripts and library were bequeathed to Theophraſtus, the moſt illuſtrious of his pupils. Theophraſtus again bequeathed them to his own ſcholar, Neleus, who, carrying them to Scepſis, a city of the ancient Troas, left them to his heirs in the undiſtinguiſhed maſs of his property. The heirs of Neleus, men ignorant of literature and careleſs of books, totally neglected the intellectual treaſure that had moſt unworthily devolved to them, until they heard that the king of Pergamus, under whoſe dominion they lived, was employing much attention and much reſearch in collecting a large library. Afraid that the deſpotic power of the prince might ſeize ſo valuable an acceſſion, they hid their books under ground; and the writings of Ariſtotle, as well as the vaſt collection of materials from which they had been compoſed, thus remained in a ſubterraneous manſion for ſeveral generations, a prey to dampneſs and to worms. At length they were relieved from their priſon, or rather raiſed from the grave, and ſold for a large ſum, together with the works of Theophraſtus, to Apellicon of Athens, a lover of books rather than a ſcholar (ſee Apellicon), through whoſe labour and expence the work of reſtoring Ariſtotle's manuſcripts, though performed in the ſame city in which they had been originally written, was very imperfectly executed. To this, not only the ignorance of the editors, but both the condition and the nature of the writings themſelves, did not a little contribute. (See Dr. Gillies's Life of Ariſtotle, vol. i. p. 35.) Hiſtory has not informed us what became of Ariſtotle's original manuſcript; but the copy made for Apellicon was, together with his whole library, ſeized by Sylla, the Roman conqueror of Athens, and by him tranſmitted to Rome. Tyrannion, a native of Pontus, who had been taken priſoner by Lucullus, procured the manuſcript from Sylla's librarian. He communicated the uſe of it to Andronicus of Rhodes, who then flouriſhed as a philoſopher at Rome. See Andronicus. The Rhodian having undertaken the taſk of arranging thoſe long injured writings, finally performed the duty of a ſkilful editor. From the æra of Andronicus's publication to that of the invention of printing, a ſucceſſion of reſpectable writers, on civil and ſacred ſubjects (not excepting the venerable fathers of the Chriſtian church) confirm by their citations and criticiſms the authenticity of moſt of the treatiſes ſtill bearing Ariſtotle's name. According to the moſt credible accounts, he compoſed above 400 different treatiſes, of which only 48 have been tranſmitted to the preſent age. But many of theſe laſt conſiſt of ſeveral books; and the whole of his remains together ſtill form a golden chain of Greak erudition, exceeding four times the collective bulk of the Iliad and Odyſſey.

The works of Ariſtotle are referred to three heads, God, Nature, and Man. Whatever reaſonings relate to theology, though ſcattered in different treatiſes, may be referred to his metaphyſics; a name unknown, indeed, to Ariſtotle, but given to his theological works by his editors, and importing, that the fourteen books which bear it, ſhould immediately follow his numerous treatiſes on the ſubjects of phyſics or natural philoſophy; that we may not reſt ſatisfied with the knowledge of bare effects, but proceed to the inveſtigation of cauſes, and of the deity himſelf, the primary cauſe of all. In connection with his "fourteen books under the title of metaphyſics," we may mention his treatiſe "of the univerſe and its cauſe," and "a refutation of Xenocrates, Zeno, and Gorgias." Ariſtotle's doctrines concerning Being conſidered abſtractedly, concerning deity, and concerning the ſoul, are comprehended under the term "metaphyſics;" becauſe they *paſs beyond* ſenſible bodies to objects that are perceived only by the underſtanding; and this branch of ſcience is called by him "the firſt philoſophy." The doctrine of Being, or ontology, is nothing more than the definition and arrangement of general terms; and from a ſeries of definitions Ariſtotle deduces ſuch corollaries as neceſſarily follow from them. The firſt principle or axiom, as he ſtates it, of this doctrine is, that it is impoſſible that the ſame thing ſhould be, and ſhould not be, in the ſame ſubject, at the ſame time, and in the ſame reſpect. To this univerſal principle, which is itſelf incapable of demonſtration, becauſe it is a primary truth, all demonſtration may be reduced. Being exiſts either by itſelf, or by accident; on the firſt all properties or accidents depend; but of the latter no certain knowledge can be obtained. Being may be either in power, or act; and power is either active or paſſive. The former is the principle of motion or change, and the latter conſiſts in the ſubject upon which active power is exerciſed. Power remains when it is not exerted in action; and action takes place when a thing is otherwiſe than when it was in power. Again, Being is either notional, as it is conceived in the mind, or real, as it exiſts in nature. To unity, which is one of the properties of Being conſidered with reſpect to numbers, are nearly related, identity, equality, and ſimilarity. Being alſo admits of genus and ſpecies. The doctrine of Ariſtotle concerning the First Mover, is more important. From the circular motion

motion of the heavens, which he conceives to be eternal, he deduces his notion of the Firſt Mover; itſelf unmoved and eternal, which eternally communicates motion to other ſubſtances. This ſubſtance, the cauſe of eternal motion, is itſelf ſimple, pure energy, immaterial, eternal, and immutable; and its act, by which it is the firſt cauſe of all motion, conſiſts in the ſimple energy of pure intelligence. This influence operates, independently and immediately, upon inferior intelligences of the ſame nature with itſelf; and by their agency the motions of the primary and ſubordinate ſpheres are produced. The Firſt Mover is in its eſſence incorporeal; indiviſible, becauſe unity is perfect; immutable, becauſe nothing can change itſelf; and eternal, becauſe motion is eternal. This incorporeal intelligence, happy in the contemplation of himſelf and the firſt cauſe of all motion, is, according to the ſyſtem of Ariſtotle, the Being of Beings, or God. Perplexed with difficulties in his conception of the mode by which motion was communicated, he recurred to analogy, and ſuppoſed that the Firſt Mover acts upon the firſt celeſtial ſphere to give it motion, in a manner ſimilar to that by which the mind of man acts upon the human body. From the well-known fact, that the motion of the body follows the conceptions and volition of the mind, he aſſumed a certain intellectual influence, exerciſed by the Firſt Mover, as the principle of local motion, and thus imagined that he had ſolved the great problem that had hitherto been found inexplicable, in what manner mind acts upon body.

Hence has ariſen an inquiry, whether Ariſtotle is to be ranked in the claſs of Theiſts or of Atheiſts. From the preceding curſory view of his ſyſtem, it appears that it does not exclude the idea of deity; for he ſpeaks of the Firſt Mover as a being diſtinct from the world, ſeparate from matter, and poſſeſſing intellect, deſire, and a power of communicating motion; upon whom the univerſe is dependent, not as upon an animating principle, but an external moving power. This being he repreſents as ſuperior to all other intelligent natures, and calls him God. At the ſame time, Ariſtotle's notion of a deity cannot be reconciled with juſt conceptions of the divine nature and attributes. Although he makes God the cauſe of all motion, yet, by ſuppoſing the univerſe to have exiſted from all eternity, he diveſts him of the glory of creation, and connects him with a world already formed by a chain of neceſſity, for no other purpoſe than to make him the firſt ſpring of a vaſt machine. God indeed, in the ſyſtem of Ariſtotle, is immutable; ſo is likewiſe the celeſtial ſphere, in which he is ſuppoſed to reſide. In producing motion he acts neceſſarily; and eternally employed in the contemplation of his own nature, he obſerves nothing, and cares for nothing beyond himſelf. Poſſeſſing neither immenſity nor omnipreſence, and far removed from the inferior parts of the univerſe, he is not even a ſpectator of its inhabitants and their concerns, and cannot therefore be a proper object of reverence and worſhip. As to thoſe intelligent natures which he conceived to be inferior to the Firſt Mover, Ariſtotle taught, that they are ſimple immaterial ſubſtances, preſiding over the lower celeſtial ſpheres; but he has no where clearly determined, whether they were proper objects of religious worſhip. It is probable, that he ranked every thing of this kind among the popular ſuperſtitions, and that this was the cauſe of the complaints which were brought againſt him by the Athenians.

On the ſubject of Mind, Ariſtotle aſſerted with Plato, that there are in man different faculties, which have reſpectively a different organ; but he expreſſes himſelf in ſuch obſcure terms, that it is not eaſy to perceive his true meaning. The ſoul, which is the firſt principle of action in an organized body, poſſeſſes life potentially, but does not move itſelf. It is not a rare body, compoſed of elements; for it differs from theſe in having perception. It has three faculties, the nutritive, the ſenſitive, and the rational. The firſt is that by which life is produced and maintained. The ſecond is that by which we perceive and feel, without perceiving itſelf or its organs, but ſome external object by the intervention of its organs, which are adapted to produce the ſenſations of ſight, hearing, ſmell, taſte, and touch. The external ſenſes, by means of ſenſible ſpecies or forms that are immaterial, perceive objects as wax receives the impreſſion of a ſeal without receiving any part of its ſubſtance; but the difference of theſe objects is perceived by the common or internal ſenſe. Perception differs from intellect; the former being common to all animals, the latter belonging to a few. Fancy is the perception produced by the immediate action of the ſenſes. Memory is derived from fancy, and has its ſeat in the ſame power of the ſoul; being the effect of ſome image impreſſed upon the ſoul by means of the ſenſes. Reminiſcence is that mental faculty, by which we ſearch for any thing which we wiſh to recollect, through a ſeries of things nearly related to it, till at laſt we call to mind what we had forgotten. The intellect is that part of the ſoul by which it underſtands; and it is paſſive and active; the former being the ſeat of the ſpecies or forms of things, and the latter the efficient cauſe of all knowledge. The principle of local motion is the deſire or averſion which ariſes from the practical exerciſe of the underſtanding; and it produces either rational volition or ſenſitive appetite. The production of animal life ariſes from the union of the nutritive ſoul with animal heat. Life is the continuance of this union, death its diſſolution.

As to the Soul or firſt principle of animal life, and of all perception, intelligence, or action, Ariſtotle was at a loſs in explaining its ſpecific nature. He could only define the mind to be that principle by which we live, perceive, and underſtand. When he attempted to form an abſtract conception of this principle, he was perplexed; and he was ſo unacquainted with the nature of this ſubſtance, or ſo undeciſive in his opinion, or perhaps ſo anxious to conceal it, that he recurs to the uſe of a term, which merely expreſſes the confuſed idea which he had formed to himſelf from obſerving its operations, and called Ἐντελεχεια, or "perfect energy," denoting ſome unknown ſource of ſenſitive and rational life in certain organiſed bodies. It does not certainly appear from the writings of Ariſtotle, whether he thought the ſoul of man mortal or immortal; but the former appears moſt probable, from his notion of the nature and origin of the human ſoul, which he conceived to be an intellectual power, externally tranſmitted into the human body from an eternal intelligence, the common ſource of rationality to human beings. We have no evidence that he ſuppoſed the union of this principle with any individual to continue after death.

Ariſtotle's hiſtories of the heavens and of the earth; of animals, plants, and minerals; and even of man, conſidered merely as a material and ſentient being, may, conformably with modern language, be arranged under the head of Nature; though, in Ariſtotle's own acceptation, that term has a more limited ſenſe; and is confined to terreſtrial objects, and thoſe exiſting between this earth and the lunal ſphere.

The phyſical writings of Ariſtotle are the following: "Of Phyſics, or the Doctrine of Nature;" explaining the principles and properties of natural bodies: "Of Heaven;" treating of the univerſe, the celeſtial ſpheres, and ſimple bodies or elements: "Of Generation and Corruption;" "Of Meteorology;" "Of the Hiſtory of Animals;"

"Of

"Of the parts of Animals and their Cauſes;" "Of the Production of Animals;" "Of the Progreſſion of Animals;" "Of the Soul, or Vital Principle;" "Of the Senſes;" "Of Memory;" "Of Sleep;" "Of Dreams;" "Of Animal Motion;" "Of the Length of Life;" "Of Youth and Old Age;" "Of Reſpiration;" "Of Plants;" "Of Breath;" "Of Marvellous Facts;" "Of Phyſiognomy;" "Of Sounds;" "Of Colours;" and "Problems."

In Ariſtotle's ſyſtem of "Φύσις," the principles of nature are neither the "ſimilar parts" of Anaxagoras, nor the "atoms" of Leucippus and Democritus, nor the "ſenſible elements" of Thales, nor the "unity" of Parmenides, nor the "numbers" of Pythagoras, nor the "ideas" of Plato; but they were the three following, viz. "form, privation, and matter;" the two former being contrary to each other, and the latter the common ſubject of both. Matter, according to Ariſtotle, is a primary ſubſtance without quantity or quality, form or figure, or any of the properties of body. This incorporeal matter, though really borrowed from the Pythagoreans, Ariſtotle claimed as his own invention, and he boaſted of his having been the firſt who had diſcovered the true principle of bodies. Form is the peculiar nature or eſſence of any thing, or that which makes it to be what it is. Privation is the abſence of form, ſo that matter and form are the conſtituent principles of things, and privation is accidentally aſſociated with them. In order to unite matter and form, Ariſtotle for this purpoſe conceived in his mind a vague notion, which he has very obſcurely and unſatisfactorily explained, of ſome internal cauſe of motion and arrangement, to which he applied the term "nature." Cauſes are diſtinguiſhed by this philoſopher into four kinds; material, of which things are made; formal, by which a thing is that which it is, and nothing elſe; efficient, by the agency of which any thing is produced; and final, or the end for which it is produced. Subſtances he divides into eternal, as the heavens which revolve round the earth with a circular motion peculiar to the celeſtial ſpheres; and periſhable, as animal or terreſtrial bodies. The heavenly ſphere has neither levity nor gravity, is liable to no change, and is eternal. Its natural motion is circular, but there are other ſpheres which move in a contrary direction to this, in order to produce the viciſſitudes of terreſtrial things. The motion of the firſt ſphere, or "primum mobile," is equable and uniform; this and the firſt mover being eternal and immutable. The ſtars are of the ſame nature with the ſpheres that ſupport them, but more denſe; and they communicate light and heat to the air, and thence to the inferior world, by means of friction; and they are moved in conſequence of the motion of the ſpheres, in which they are placed. The earth is ſpherical, and immoveably fixed in the center of the motion of all the ſpheres. The firſt ſphere revolves with the greateſt velocity from weſt to eaſt, and the inferior ſpheres in a contrary direction. The velocities of the ſpheres of the ſeven planets are inverſely as their diſtances from the firſt ſphere. The world, according to this philoſopher, is finite and eternal; and there is only one world. Bodies, according to his ſyſtem, are either ſimple elements produced by the union of the firſt matter and form, or compound terreſtrial bodies produced from the combination of elementary bodies. The elements are four, namely, fire, air, water, and earth. The two principles of motion are gravity and levity; by the former, bodies deſcend towards the center of the world, and by the latter, they riſe towards the heavens. The element of earth has ſimple gravity; that of fire, ſimple levity; air and water partake of both. Compound bodies ſuffer a perpetual ſucceſſion of diſſolution and production; and this change is effected by the action of the circular motion of the heavens, by means of which the ſun and ſtars, which are the immediate agents in production and diſſolution, approach towards or recede from the earth. An action and a paſſion that are reciprocal ariſe from the mutual contact of different bodies. In ſenſible bodies there are certain primary qualities, ſome active and others paſſive, which conſtitute their ſpecific difference. Of this kind are heat and cold, moiſture and dryneſs, heavineſs and lightneſs, hardneſs and ſoftneſs, roughneſs and ſmoothneſs, and the like. From the union of the two firſt of theſe pairs of primary qualities, the elements are formed: as fire, from heat and dryneſs; air, from heat and moiſture; water, from cold and moiſture; and earth, from the union of cold and dryneſs. All the elements may be tranſmuted; and all mixed bodies are formed by the combination of all of them. From the general principles of production and diſſolution, and from the mutual action and paſſion of the ſimple qualities, Ariſtotle endeavours to aſſign the cauſes of natural appearances, and to explain the nature of mixed bodies, both perfect and imperfect. In his ſpeculative phyſics, Ariſtotle diſplays an extenſive practical knowledge of nature. His writings in natural hiſtory are a continued chain of phyſical and anatomical facts, which appear to have been the reſult of accurate obſervation. He collected by diligence, and by the aſſiſtance of others, and particularly of Alexander his pupil, a great number of natural bodies which he accurately examined; and he appears to have himſelf diſſected, or to have been preſent at the diſſection of, many animals, eſpecially of fiſhes.

Upon the philoſophy of man, as our author calls it, that is, of man conſidered as a ſocial and rational being, endowed with ſentiment, affection, and intellect, Ariſtotle's writings are as clear and copious as they are ſolid and ſatisfactory. His treatiſes on logic, ethics, and politics, as well as his books on rhetoric and poetry, may all be referred to this one head, and viewed as connected parts of one great ſyſtem of knowledge. In the moſt important, "ethics," contained in ten books to Nicomachus, ſeven to Eudemus, two intitled "the greater morals," and a ſmall part comprehending definitions of "virtues and vices," he conſidered, in the firſt place, their object, to wit, happineſs; and afterwards the faculties of the mind, their exertions and determinations which tend to produce happineſs. The excellencies of our ſpecies, he obſerves, all refer either to the underſtanding or the will; the firſt poſſeſſes reaſon eſſentially in itſelf, the ſecond is capable of being combined and aſſimilated with this divine principle. From the two powers of the underſtanding and the will, are reſpectively derived two claſſes of virtues, the intellectual and the moral. Sagacity, penetration, intelligence, wiſdom, are virtues of the underſtanding; gentleneſs, temperance, fortitude, juſtice, are virtues of the heart. The former claſs conſiſts in the proper diſpoſition and habit of the intellectual part of the ſoul; the latter in the proper diſpoſition and habit of the deſires and affections, which being formed ſubordinate to reaſon, and capable of liſtening to its dictates, then only perform their duty, when, like obedient ſubjects, they cheerfully obſerve the commands of their ſovereign. The intellectual virtues depend chiefly on education and exerciſe; the moral proceed entirely from habit, from which they derive their name. It is by practiſing juſtice, that we become juſt; by practiſing temperance, that we become temperate; by practiſing courage, that we become courageous. Hence the wonderful power of legiſlation and early inſtitution, by which the Cretans, the Spartans, and ſome other nations were honourably diſtinguiſhed among the reſt of mankind. Virtue is a practical art, and like all practical arts, can be preſerved by practice only. It is neither

ther natural, nor contrary to nature. We are born capable of attaining it, but the invaluable attainment muſt be made and perfected by habit. The virtues depend on the propriety of the affections from which they ariſe; and lye in a mean betwixt the extremes of too much and too little. Thus, to fear every thing is cowardly; to fear nothing is audacious; courage requires that we ſhould fear only ſuch objects as are truly formidable, and only in that degree in which they ought to be feared. In the ſame manner, he who is too much affected by objects of pleaſure, and ſeizes every opportunity to enjoy them, is called intemperate; he who is too little affected by ſuch objects, and refuſes every opportunity to enjoy them, may be called inſenſible. Temperance teaches us to purſue only ſuch pleaſures as we ought, at proper times, in proper places, and on proper occaſions. According to the ſame view of things, generoſity lies in the middle between avarice and profuſion; modeſty, between pride and diffidence; mildneſs, between iraſcibility and ſoftneſs; magnificence, between oſtentation and parſimony; popularity, between forbidding diſdain and officious adulation; in a word, every virtue conſiſts in a mean equally remote from two vicious extremes. Conſidered as the quality of an action, virtue conſiſts in the propriety of that affection from which the action proceeds, when the affection is neither too ſtrong, nor too weak, but has preciſely that degree of ſtrength which right reaſon teaches us to approve. As the quality of an action, virtue conſiſts therefore in mediocrity; but as the quality of a perſon, it conſiſts in the habit of this mediocrity, ſince in judging perſons and characters, we regard not particular acts and feelings, but ſuch acts and feelings as are frequent and habitual. There are many, and thoſe the moſt important virtues, the exerciſe of which is not in the firſt inſtance attended with pleaſure. To ſupport labour, to endure pain, to encounter difficulties and dangers, which wiſdom and fortitude on many occaſions require, are not obviouſly recommended by any natural deſire; nor is the practice of ſuch duties immediately agreeable. It is ſtill leſs agreeable, at firſt, to curb and reſtrain our natural appetites for pleaſure, which is the proper office of temperance; nor can that vigilant circumſpection, and ever-watchful attention to the moſt remote conſequences of our actions, which is eſſential to the virtue of prudence, be acquired without trouble and care, without many painful efforts and difficult ſtruggles. Yet it is the nature of all thoſe virtues, as well as of the hardeſt leſſons of juſtice, patriotiſm, and friendſhip, to become through habit agreeable; and the only ſure teſt that we have acquired them is, that they are practiſed with pleaſure. The moral virtues cannot, according to Ariſtotle, ſubſiſt without ſome mixture of the intellectual; but the latter may ſubſiſt alone and independent; and according to both Ariſtotle and Plato, the pureſt and moſt permanent felicity of which man is ſuſceptible, reſults from the exerciſe of his rational powers upon ſubjects of abſtract ſpeculation. The labours of the ſtateſman or general, the exertions of the legiſlator or patriot, all refer to ſome end or purpoſe, the attainment of which may be prevented by fortune, or fruſtrated by the weakneſs or wickedneſs of man. The practice of juſtice, generoſity, temperance, and fortitude requires many conditions, and ſuppoſes a variety of ſituations, which it is not always in our power to command. The juſt or generous man muſt have objects to whom he may diſtribute his juſtice or generoſity; he muſt poſſeſs the means by which to exerciſe thoſe virtues which all participate of frail mortality; ſince, though directed by prudence, they are impelled by paſſion, and reſult from the exigencies of our preſent corporeal ſtate. But the energies of contemplative wiſdom are pure and ſimple, like the intellectual ſource from which they ſpring. Not ſubſervient to remote purpoſes or contingent ends, they are immediately agreeable on their own account, and on every ſide round and complete in themſelves. Such are the principal doctrines to be found in Ariſtotle's "*Ethics.*"

His treatiſe on "*Politics,*" comprehending eight books, in the very firſt paragraph, in a few plain words, ſtates the only legitimate purpoſe of political eſtabliſhments. "Every political ſociety forms, it is plain, a ſort of community or partnerſhip inſtituted for the benefit of the partners. Utility is the end and aim of every ſuch inſtitution; and the greateſt and moſt extenſive utility is the aim of that great aſſociation comprehending all the reſt, and known by the name of the commonwealth."

Having ſtated and explained the grand purpoſes of ſociety, he conſiders the beſt ſyſtems of means for attaining thoſe purpoſes, and traces the diſtinction of ranks which ariſes from the inequalities of individual talents, virtue, and fortune. Political inſtitutions are beſt fitted for promoting human happineſs, when they are moſt ſuitable to the opinions and ſentiments of the people, and the circumſtances of the times and country. No one political ſyſtem will equally ſuit all ſituations, and ſcarcely any two. Government being an arrangement, the beſt government muſt be the beſt arrangement, and the beſt arrangement is that in which the materials to be arranged are the beſt fitted both to receive and to preſerve. The materials of the ſtateſman or legiſlator are the number and character of his people, and the extent and quality of his country. The excellence of a commonwealth, however, is not to be eſtimated by its populouſneſs or extent, but by its fitneſs for performing its proper functions; the ſame energies and habits conſtitute the happineſs both of individuals and of nations. Men make governments, not governments them; nor by any ſyſtem of political arrangements can a happy commonwealth be conſtituted from fools or cowards, profligates or knaves. The bricks muſt be firſt prepared, before the edifice can be reared. The human character is a compound of good and evil; the former ariſes from the balance of the affections, under the controul and guidance of reaſon, the latter reſults from paſſion operating without reſtraint. That government is the beſt, which moſt powerfully ſtimulates the energies of the people to beneficial purpoſes, and reſtrains them from hurtful purſuits. That muſt be a ſyſtem of freedom in the firſt place tempered by order, and moderation in the ſecond. Mixed governments, wiſely formed and balanced, beſt correſpond to the ſtate of mankind. Democracy, though apparently moſt agreeable to the rights of man, is not the beſt adapted to his wants; the general will unreſtrained is apt to run into exceſs, and precipitate in deliberation, to be tardy in execution. While ſimple democracy is inexpedient for the people themſelves, ſimple ariſtocracy and ſimple monarchy are equally inexpedient; and being the ſubjection of the many to a few or to one, are moreover unjuſt. For theſe reaſons Ariſtotle recommends a conſtitution that combines and balances the three orders as the moſt generally likely to promote the good of ſociety. To his treatiſe on politics, Ariſtotle has added two books on "*Oeconomics,*" in which he has treated in a ſimilar way, on the management of domeſtic concerns.

In "*Logic,*" or the art of reaſoning, in which Ariſtotle has the merit of being an inventor, his writings are, "The Categories," or ten general heads of arrangement; "of Interpretation," explaining the philoſophical principles of Grammar; "Analytics," including the whole doctrine of ſyllogiſms and demonſtration; "Topics," or common-places of arguments; and "Sophiſtic Refutations,"

tions," teaching the art of replying to an opponent. Theſe pieces collected in one volume, are called the "Organon of Ariſtotle." The arrangement of the ten CATEGORIES (which ſee) was borrowed from the Pythagorean ſchool, and is ſaid to have been firſt invented by ARCHYTAS of Tarentum, and communicated to Ariſtotle by Plato, who converſed with this Pythagorean in Italy. The art of ſyllogiſtical reaſoning (ſee SYLLOGISM), was perhaps altogether the invention of Ariſtotle; and, whatever may be thought of its utility, it muſt be allowed to have been a wonderful effort and diſplay of ingenuity. On the invention and application of ſyllogiſms, Ariſtotle treats with a degree of minuteneſs and ſubtilety, which produces obſcurity. His logical diſſertations would have been clearer, as well as more conciſe, if he had carefully diſtinguiſhed between words and ideas, and confined his attention chiefly to the latter. The reader will find a diſtinct account of the logic of Ariſtotle, by Dr. Reid, in the ſecond volume of lord Kaimes's Sketches of the Hiſtory of Man. Edinb. 4to. 1774. p. 165. See alſo the articles DEMONSTRATION, DIALECTICS, LOGIC, PROPOSITION, SYLLOGISM, &c. in this work.

The "*Rhetoric*" of Ariſtotle is compriſed in three books, in which the principles of eloquence are inveſtigated, and the whole art of oratory taught with ſo much depth of inveſtigation, and accuracy of arrangement, that the work has been the baſis of all that has been ſince delivered upon the ſubject by Cicero, Quinctilian, and later writers. See ORATORY. Another treatiſe, addreſſed to Alexander, is added, in which are diſtinctly conſidered the ſeveral ſpecies of diſcourſe belonging to the general heads of deliberative, demonſtrative, and judicial pleading.

On the ſubject of "*Poetry*," the "Poetic" of Ariſtotle affords a correct analyſis of the conſtituent parts of the drama and the epic; and contains general principles and particular obſervations, which could only have been written by a maſter in criticiſm.

The pieces on "*Mathematics*" which Ariſtotle has left, are, an obſcure, and probably imperfect treatiſe on "Incommenſurable Lines," and a book of "Queſtions in Mechanics."

Although among the works of Ariſtotle, nothing written expreſsly on Muſic has come down to us, if we except his tract περὶ ἀκουστῶν, and the nineteenth ſection of his Problems; yet we find from theſe, and from his works in general, that he had thought much and deeply on the ſubject. Indeed among the titles of two hundred and fifty of his loſt books, which have been collected by Fabricius, a work on Muſic appears, Περὶ Μουσικῆς, written expreſsly on the ſubject. We ſhall therefore do the art and ſcience of Muſic the honour to rank this great, this firſt of men, among its benefactors.

For a further account of the reception, progreſs, and decline of the Ariſtotelian philoſophy in the middle and in later ages; ſee PERIPATETICS. See alſo LOGIC, METAPHYSICS, PHILOSOPHY, PHYSICS, &c.

Having given a copious account of the life and writings of Ariſtotle, to which his diſtinguiſhed talents, his rank as an author, his perſonal merit, and his reputation, and influence in the various departments and ſeminaries of literature for many ages, gave him a juſt claim, and without which a work of this nature muſt have been eſſentially imperfect; it may not be improper to collect a few particulars that may ſerve to aid us in appreciating his literary character as well as the importance and utility of his writings. Whilſt we diſregard the fictions of calumny and panegyric, we ſhall not unduly extol his talents and virtues, nor degrade them below their juſt ſtandard. On the one hand, no credit can be attached to the abuſe of Timæus the Tauromenite, who repreſents him as a pretender to learning, a vile paraſite, and an habitual glutton and drunkard; nor to the cavils that were raiſed againſt his reputation, in conſequence of the honour he paid to the memory of his friend Hippias, and that of his wife Pythias: and, on the other hand, there is no foundation for aſcribing his extraordinary wiſdom to divine revelation; nor are we ſufficiently authoriſed to ſay with the Jews, that he gained his philoſophy in Judæa, and borrowed his moral doctrine from Solomon; much leſs that he was of the ſeed of Iſrael and the tribe of Benjamin; or with the Chriſtians, that he was a ſpecial meſſenger, ſupernaturally ordained to prepare the way for divine revelation, and that we are indebted to the aid of his philoſophy for the extent and accuracy of our acquaintance with the ſublime myſteries of religion. Although we cannot believe that juſt before his death, he diſcourſed to his friends concerning "the contempt of death, and the immortality of the ſoul;" that in his laſt moments he dictated a book in order to ſhew, that wiſe men need not lament their exit from their tenement of clay, of which book, an Hebrew verſion of the Arabic tranſlation from the ſuppoſed original was rendered into Latin, about the year 1200, by Manfred, ſon of the emperor Frederic I.; yet we cannot allow that either his doctrine or his life warranted his being condemned as an advocate for immorality or impiety, much leſs that he was the moſt infamous of human beings. On a fair and impartial eſtimate, it will perhaps be found, that neither were his virtues of that exalted kind which command admiration, nor his faults ſo criminal as not to admit of ſome apology. He may, perhaps, be juſtly cenſured for having taught his pupil Alexander principles of morals and policy, which were accommodated to the manners of a court, and which might be eaſily rendered ſubſervient to his ambitious views. And it cannot be doubted, that his philoſophical doctrines concerning nature were not favourable to the public forms of religion. Few will now be found ſuch extravagant admirers of Ariſtotle as to join with Suidas in extolling him as "the ſecretary of nature," and as "having dipped his pen in intellect;" and yet all muſt admit, that he poſſeſſed a profound and penetrating genius, and a wonderful talent for claſſing ideas, defining terms, and analyzing the faculties and operations of the human mind. He had alſo, without doubt, an extenſive acquaintance with natural objects, and he was a diligent obſerver of phyſical and moral phenomena. If he had beſtowed that attention on the diſcrimination and arrangement of natural bodies which he devoted to words, he might have been a Linnæus; or if he had, according to the modern mode of philoſophiſing, deduced general principles from facts and experiments, he might have been a Bacon, a Boyle, or a Newton. Inſtead of doing this, his ambition to ſtand diſtinguiſhed among philoſophers as the founder of a new ſect induced him to try his ſtrength in abſtruſe diſquiſitions, and to indulge a too daring ſpirit of contradiction and innovation. His object was to erect his own edifice upon the ruin of every other ſtructure. As lord Bacon has finely remarked (De Augm. Scient. l. iii. c. 4.), "like a Turkiſh deſpot, he thought he could not reign ſecure, unleſs all his brethren were ſlain. Innovating rather in words than in reality, and determining to oppoſe his new philoſophy to ancient tenets, of which many were founded on truth and experience, he ſometimes miſrepreſents the opinions of former philoſophers; ſometimes ſelects thoſe which were moſt trifling, or moſt eaſily refuted; and ſometimes has recourſe to uncertain principles and vague terms, in hopes that obſcurity might be miſtaken for novelty. Having acquired the habits and manners of high life at the court of Amyntas to which his father introduced him, and having occaſion, as preceptor to Alexander, to accommodate his

his philoſophy to the ambition of the young prince with whoſe education he was entruſted, he deſerted the fanciful republic of Plato, and finding the morals of Socrates too confined for his purpoſe, framed a ſyſtem of ethics for himſelf, which would allow full ſcope for the aſpiring views of Alexander and his friends. Even the Syllogiſtic art, which was peculiarly his own, is very materially defective, tends to miſlead by multiplying hypothetical propoſitions, or by teaching the practice or detection of ſophiſtry, and affords little or no aſſiſtance in the inveſtigation and diſcovery of truth. The concluſion in every ſyllogiſm is, in fact, contained in the premiſes; if the premiſes have not been previouſly proved by other means than ſyllogiſtic reaſoning, the concluſion is not eſtabliſhed; if they have, the ſyllogiſm is unneceſſary; ſo that, as Dr. Reid obſerves in his account of Ariſtotle's logic (ubi ſupra), other kind of reaſoning, independently of obſervation and experiment, only carries a man round, like a horſe in a mill, without any real progreſs. Upon the whole, it has been obſerved by competent and candid judges, that the philoſophy of Ariſtotle is rather the philoſophy of words than of things, and that the ſtudy of his writings tends more to perplex the underſtanding with ſubtile diſtinctions than to enlighten it with real knowledge. The veneration that was paid to him in the Arabian, Jewiſh, and Chriſtian ſchools, was rather the means of obſtructing than of aiding and promoting the progreſs of uſeful ſcience. It was not, as an excellent biographer remarks, till mankind were emancipated from their vaſſalage to Ariſtotle, that the human mind aſſerted its native freedom and dignity, and that genuine ſcience began to enlighten the world. The principal writings of Ariſtotle have been often ſeparately printed; and of his entire works, the chief editions are, Gr 6 vols. fol. ap. Ald. Venet. 1498. 6 vols. 12mo. Ald. 1552. 10 vols. 4to. Sylburgii, Franc. 1587. Gr. and Lat. fol. Caſauboni, Lugd. 1590. 1646, fol. Genev. 1605. 8vo. Lugd. 1597. 2 vols. fol. Du Val, Paris, 1629, 1654. Vid. Diog. Laert. t. i. p. 268. Dion. ARISTOTUS, in *Ichthyology*, a name given by Albertus and ſome other old writers to the fiſh which we call the *ſhad*; Clupea *Alloſa*. Linn.

ARISTOXENUS, in *Biography*, is the moſt ancient Greek writer on the ſubject of muſic that has come down to us. He was the ſon of a muſician, whom ſome call Mneſias, others Spintharus. He had his firſt education at Mantinæa, a city of Arcadia, under his father, and Lampus of Erythræ; he next ſtudied under Xenophilus, the Pythagorean, and laſtly under Ariſtotle, in company with Theophraſtus. Suidas, from whom theſe particulars are tranſcribed, adds, that Ariſtoxenus, enraged at Ariſtotle having bequeathed his ſchool to Theophraſtus, traduced him ever after. But Ariſtocles the Peripatetic, in Euſebius, exculpates Ariſtoxenus in this particular, and aſſures us that he always ſpoke with great reſpect of his maſter Ariſtotle.

From the preceding account it appears that Ariſtoxenus lived under Alexander the Great, and his firſt ſucceſſors.

His *Harmonics* in three books, all that are come down to us, together with Ptolemy's Harmonics, were firſt publiſhed by Gogavinus, but not very correctly, at Venice, 1562, in 4to. with a Latin verſion. John Meurſius next tranſlated the three books of Ariſtoxenus into Latin, from the MS. of Joſeph Scaliger, but, according to Meibomius, very negligently. With theſe he printed at Leyden, 1616, 4to. Nicomachus and Alypius, two other Greek writers on muſic. After this Meibomius collected theſe muſical writers together, to which he added Euclid, Bacchius ſenior, Ariſtides Quintilianus; and publiſhed the whole with a Latin verſion and notes, from the elegant preſs of Elzevir, Amſt. 1652. The learned editor dedicates theſe ancient muſical treatiſes to Chriſtina, queen of Sweden.

Ariſtoxenus is ſaid by Suidas to have written four hundred and fifty-two different works, among which thoſe on muſic were the moſt eſteemed; yet his writings upon other ſubjects are very frequently quoted by ancient authors, notwithſtanding Cicero, and ſome others, ſay that he was a bad philoſopher, and had nothing in his head but muſic. The titles of ſeveral of the loſt works of Ariſtoxenus, quoted by Athenæus and others, have been collected by Meurſius in his notes upon this author; by Tenſius and Menage; all which Fabricius has digeſted in alphabetical order. We ſhall here only mention ſuch as concern muſic, which are upon ſubjects ſo intereſting to inquirers into the merits of ancient muſic, that their loſs is much to be lamented. 1. "Of Performers on the Flute, and concerning Flutes and other muſical inſtruments." 2. "Of the Manner of boring or piercing Flutes." 3. "Of Muſic in general." In this work, which was different from his *Harmonics*, he treated not only of the rhythmical, metrical, organical, poetical, and hypercritical parts of muſic, but of the hiſtory of muſic and muſicians. 4. "Of the Tragic Dance." With reſpect to the tracts of Ariſtoxenus that are come down to us, they are cited by Euclid, Cicero, Vitruvius, Plutarch, Diogenes Laertius, Athenæus, Ariſt. Quintilianus, Ptolemy, and Boethius. And as a muſical writer, he is ſo much celebrated by the ancients, and ſo frequently mentioned by the moderns, that his treatiſes which are extant, ſeem to deſerve a particular attention. They are given by all his editors as diviſions of one and the ſame work; but the two firſt books are evidently independent fragments. The ſecond book is not a ſecond, but another firſt part. It is ſurpriſing that Meibomius ſhould regard it as a continuation, and wonder in his notes, that Porphyry ſhould quote the ſecond book as the firſt. The ſecond book is plainly the opening of another work, as appears by its beginning with an explanation of the ſubject, and a ſketch of the order in which the author propoſed to treat it, all which is done in the firſt book. It is likewiſe full of repetitions. There appears, however, through the cloud of bad readings, and all kinds of corruptions in the text, to be an accuracy, and an Ariſtotelian preciſion in theſe old books, which are not to be found in later writers, who ſeem to have all the negligence and inaccuracy of compilers.

As Pythagoras and Ariſtoxenus were heads of the two moſt numerous and celebrated muſical ſects in antiquity, we ſhall endeavour to make ſuch of our readers as are curious in theſe matters, acquainted with their different tenets.

The Pythagoreans, by their rigid adherence to calculation, and the accurate diviſions of the monochord, may be ſaid to have truſted more to the judgment of the eye, concerning the perfection of conſonance, than to that of the ear. Intervals, according to them, were conſonant or diſſonant, in proportion as the ratios of the vibrations were ſimple or complex. Thus the octave was more perfect than the 5th, becauſe the ratio of 1 to 2 is more ſimple, and more eaſily perceived, than that of 2 to 3: and the 5th, for the ſame reaſon, was more perfect than the 4th, $\frac{3}{4}$. It was upon this principle that they allowed of no deviation from the ſtrict ratios of ſounds. They left nothing to the uncertain judgment of the ear, which they thought no more able to determine a perfect conſonance without a

monochord, than the eye to form a perfect circle without compaſſes.

Ariſtoxenus, on the contrary, referred every thing to the ear. He thought the ſenſes ſufficiently accurate for muſical, though not for mathematical purpoſes; and that it was abſurd to aim at an artificial accuracy in gratifying the ear, beyond its own power of diſtinction. The philoſophy of the Pythagoreans, their velocities, vibrations, and proportions, he rejected with contempt, as being foreign to the ſubject; ſubſtituting abſtract cauſes in the room of experience, and making muſic leſs the object of ſenſe than of intellect.

According to theſe principles, his doctrine maintained, that concords were to be taken by the judgment of the ear only, and other intervals on which the ear was leſs able to determine the perfection, by the difference, or ſum of concords. Thus the tone was the difference between the 4ths and 5ths: the ditone was taken by alternate 4ths and 5ths: as Ea, aD, DG, GC. Had he ſtopped here, nothing could reaſonably have been alleged againſt him. But, taking the tone as a well-known interval, of which the ear, from the compariſon of 4th and 5th, could judge with ſufficient exactneſs, he made it the meaſure of all other intervals; of the greater by addition, and of the leſs by diviſion. Thus the 4th contained, according to him, two tones and a half; the 5th, 3 and $\frac{1}{2}$; the octave, conſequently, 5 tones and 2 ſemi-tones, or 6 tones. And, further, the tone he divided into 2, 3, and 4 equal parts. By this proceſs, as it is juſtly objected to him by Ptolemy, he acted inconſiſtently with his own principles, pretending to truſt ſolely to the ear, and to exclude reaſon and calculation, at the ſame time that he was making a parade of both, in a way either totally uſeleſs and nugatory, or more complicated and difficult than that which he had rejected. If the ear is unable to determine the exact ratio of a concord, ſtill leſs is it able accurately to biſect a tone; and that a tone cannot be numerically divided into two, or more equal parts, has long been demonſtrated. It can only be done by geometrical and lineal methods, more operoſe than the calculations of Pythagoras, and which, if accompliſhed, would give only falſe, incommenſurable, and tempered intervals. Ariſtoxenus ſeems to have been led into this inconſiſtence by his deſire of diſtinguiſhing himſelf from the mere practical muſicians of his time, of whoſe inaccuracy and want of ſcience he frequently ſpeaks with great contempt.

The Pythagoreans, on the other ſide, were not without their errors. The principles were right, but they carried them too far, and forgot that they could not otherwiſe be known to be right, than as they were confirmed by the pleaſure of the ear. How, for inſtance, did they know that the ratio from 2 to 3 was that of a perfect fifth but by the ear, which, upon repeated trial, found that interval moſt harmonious when produced by ſtrings in that proportion? But it was the peculiar character of the Pythagorean philoſophy, to erect abſtract numbers and proportions into phyſical cauſes. Not content with purſuing their principle of the ſimplicity of ratios, as far as experience warranted, and the ear approved, they ſet it up as an *à priori* principle, and rejected intervals which the ear pronounces to be concords, merely becauſe they did not fall within the proportions which they choſe to admit. The compound interval, for inſtance, of the 8th and 4th, though undoubtedly concord, they would not admit as ſuch, becauſe its ratio, 3 : 8, is neither multiple nor ſuperparticular, the only proportions they admitted as conſonant, on account of their ſimplicity.

They are, beſides, charged both by Ptolemy and Ariſtoxenus, with ſometimes aſſigning ſuch ratios to intervals as the ear did not approve; but no inſtance is given. It would be injuſtice, however, to quit theſe famous muſical theoriſts, without acknowledging that their phyſical doctrines concerning the production of ſound, and the cauſes of gravity and acuteneſs, have been confirmed by modern philoſophy, and their metaphyſical ſpeculations concerning the cauſes of conſonance, adopted by modern writers of no inconſiderable reputation. Gen. Hiſt. Muſ.

ARITHMANCY. See ARITHMOMANCY.

ARITHMETIC, formed from ἀριθμος, *number*, the art of numbering; or, that part of mathematics, which conſiders the powers and properties of numbers, and teaches how to compute or calculate truly, and with expedition and caſe. By ſome authors it is alſo defined to be the ſcience of diſcrete quantity. It conſiſts chiefly in the four great rules or operations of addition, ſubtraction, multiplication, and diviſion: to which may alſo be added involution and evolution.

Beſides theſe, for the purpoſe of facilitating and expediting computations, mercantile, aſtronomical, &c. ſeveral other uſeful rules have been contrived; as, the rules of proportion, progreſſion, alligation, falſe poſition, fellowſhip, intereſt, barter, rebate, equation of payments, reduction, tare and tret, &c.—But theſe are only applications of the firſt four rules. See theſe rules under their ſeveral heads, ADDITION, &c.

Concerning the origin and invention of arithmetic, we have very little information; hiſtory fixes neither the author nor the time. Some knowledge, however, of numbers muſt have exiſted in the earlieſt ages of mankind. This knowledge would be ſuggeſted to them, whenever they opened their eyes, by their own fingers, and by their flocks and herds, and by the variety of objects that ſurrounded them. At firſt, indeed, their powers of numeration would be of very limited extent; and before the art of writing was invented, it muſt have depended on memory, or on ſuch artificial helps, as might moſt eaſily be obtained. To their ten fingers they would, without doubt, have recourſe in the firſt inſtance; and hence they would be naturally led to diſtribute numbers into periods, each of which conſiſted of ten units. This practice was common among all nations, the ancient Chineſe, and an obſcure people mentioned by Ariſtotle, excepted. But though ſome kind of computation muſt have commenced at a very early period, the introduction of arithmetic as a ſcience, and the improvements it underwent, muſt, in a great degree, have depended upon the introduction and eſtabliſhment of commerce: and as commerce was gradually extended and improved, and other ſciences were diſcovered and cultivated, arithmetic would be improved likewiſe. It is therefore probable, that if it was not of Tyrian invention, it muſt have been much indebted to the Phœnicians or Tyrians. Proclus, indeed, in his Commentary on the firſt book of Euclid, ſays, that the Phœnicians, by reaſon of their traffic and commerce, were the firſt inventors of arithmetic; and Strabo alſo informs us, that in his time it was attributed to the Phœnicians. Others, however, have traced the origin of this art to Egypt; and it has been a general opinion, ſanctioned by the authorities of Socrates and Plato, that Theut or Thot was the inventor of numbers; that from hence the Greeks adopted the idea of aſcribing to their Mercury, correſponding to the Egyptian Theut or Hermes, the ſuperintendance of commerce and arithmetic. With the Egyptians we ought alſo to aſſociate the Chaldæans, whoſe aſtronomical diſquiſitions and diſcoveries,

veries, in which they took the lead, required a conſiderable acquaintance with arithmetic.

From Aſia it paſſed into Egypt, as Joſephus ſays, by means of Abraham. Here it was greatly cultivated and improved; inſomuch that a large part of the Egyptian philoſophy and theology ſeems to have turned altogether upon numbers. Hence thoſe wonders related by them about unity, trinity; the numbers ſeven, ten, four, &c. In effect, Kircher (in his Oedip. Ægypt. tom. ii. p. 2.) ſhews, that the Egyptians explained every thing by numbers; Pythagoras himſelf affirming, that the nature of numbers pervades the whole univerſe, and that the knowledge of numbers is the knowledge of the Deity. From Egypt arithmetic was tranſmitted to the Greeks by Pythagoras and his followers; and among them it was the ſubject of particular attention, as we perceive in the writings of Euclid, Archimedes, and others; with the improvements derived from them, it paſſed to the Romans, and from them it came to us.

The ancient arithmetic was very different from that of the moderns in various reſpects, and particularly in the method of notation. M. Goguet (Origin of laws, arts, &c. vol. i. p. 218.) ſuggeſts, that the ancient Greeks firſt uſed pebbles in their calculations; and in proof of this he adduces the word ψηφίζω, (derived from ψῆφος, a *little ſtone* or *pebble*,) which ſignifies to calculate: and he alſo ſuppoſes that the word calculation is derived from the term *calculi*, *little ſtones*, uſed by the Romans in their firſt arithmetical computations. To this purpoſe it has been alſo alleged, that the Indians are at this time very expert in computing by means of their fingers, without the uſe of pen and ink; and that the natives of Peru, by the different arrangements of their grains of maize, ſurpaſs the European, aided by all his rules, with regard both to accuracy and diſpatch. The Hebrews and Greeks, however, at a very early period, and after them alſo the Romans, had recourſe to the letters of their alphabet for the repreſentation of numbers. The Greeks in particular had two different methods: the firſt reſembled that of the Romans, which is ſufficiently known, as it is ſtill uſed for diſtinguiſhing the chapters and ſections of books, dates, &c. See CHARACTERS. They afterwards had a better method, in which the firſt nine letters of the alphabet repreſented the firſt numbers from 1 to 9, and the next nine letters repreſented any number of tens, from 1 to 9, that is, 10, 20, &c. to 90. Any number of hundreds they expreſſed by other letters, ſupplying what they wanted by ſome other marks or characters: and in this order they proceeded, uſing the ſame letters again, with different marks to expreſs thouſands, tens of thouſands, hundreds of thouſands, &c.; thus approaching very near to the more perfect decuple ſcale of progreſſion uſed by the Arabians, who acknowledge, as ſome have ſaid, that they received it from the Indians. Archimedes alſo in his "Arenarius," uſed a particular ſcale and notation of his own. In the ſecond century of the Chriſtian Æra, Ptolemy is ſuppoſed to have invented the ſexageſimal numeration and notation, and this method is ſtill uſed by aſtronomers and others for the ſubdiviſion of the degrees of circles. Theſe ſeveral modes of notation above recited, were ſo operoſe and inconvenient, that they ſo limited the extent, and reſtrained the progreſs, of arithmetic, that it was applicable with great difficulty and embarraſſment to the other ſciences, which required its aſſiſtance. The Greeks (if we except Euclid, who in his Elements furniſhed many plain and uſeful properties of numbers, and Archimedes in his Arenarius) contributed little to the advancement of this ſcience towards perfection; its practical operations derived little benefit from their theory, abſtract properties, and tedious diſtinctions and diviſions of numbers; and the imperfection of the art ſufficiently appears from a treatiſe of Nichomachus, ſuppoſed to be written in the third century of Rome, and publiſhed at Paris in 1538; from the two firſt books of the Mathematical Collections of Pappus, of which only a ſmall fragment remains; and alſo from that of Boethius, written at Rome in the ſixth century after Chriſt, and ſtill extant. From Boethius we learn, that ſome Pythagoreans had invented and employed, in their calculations, nine particular characters, whilſt others uſed the ordinary ſigns, namely, the letters of the alphabet. Theſe characters he calls *apices*; and they are ſaid greatly to reſemble the ancient Arabic characters, which circumſtance ſuggeſts a ſuſpicion of their authenticity. Indeed, the MSS. of Boethius, in which theſe characters, reſembling thoſe of the Arabian arithmetic, are found, not being more ancient than three or four centuries, confirm the opinion that they are the works of a copyiſt. Upon the whole, this treatiſe of Boethius does not warrant our rejecting the commonly received ſyſtem with regard to the origin of our arithmetic; but if we ſuppoſe that the Arabians derived their knowledge of it from the Indians, it is more probable that it was one of the inventions which Pythagoras ſpread among the Indians, than that thoſe perſons ſhould have obtained it from the Greeks. See FIGURES.

A compendium of the ancient arithmetic, written in Greek, by Pſellus, in the ninth century, was publiſhed in Latin by Xylander, in the year 1556; a ſimilar treatiſe was written ſoon after in Greek, by Jordocus Willichius; and a more ample work of the ſame kind was written by Jordanus in the year 1200, and publiſhed with a comment, by Faber Stapulenſis, in 1480. The ſame author alſo wrote upon the new art of computation by the Arabic figures, and called this book "Algoriſmus demonſtratus." This book in MS. is ſtill extant, according to Dr. Wallis, in the Savilian library at Oxford, but has never yet been printed. A treatiſe on arithmetic was alſo written by Johannes de Sacro Boſco, who died about the year 1256. The introduction of the Arabian or Indian notation into Europe, about the tenth century, made a material alteration in the ſtate of arithmetic; and this, indeed, was one of the greateſt improvements which this ſcience had received ſince the firſt diſcovery of it. This method of notation, now univerſally uſed, was probably derived originally from the Indians by the Arabians, and not, as ſome have ſuppoſed, from the Greeks; and it was brought from the Arabians into Spain, by the Moors or Saracens, in the tenth century. Gerbert, who was afterwards pope under the name of Silveſter II. and who died in the year 1003, brought this notation from the Moors of Spain into France, long before the time of his death, or, as ſome think, about the year 960; and it was known among us in Britain, as Dr. Wallis has ſhewn, in the beginning of the eleventh century, if not ſomewhat ſooner. See FIGURES. As literature and ſcience advanced in Europe, the knowledge of numbers was alſo extended, and the writers in this art were very much multiplied. The next conſiderable improvement in this branch of ſcience, after the introduction of the numeral figures of the Arabians or Indians, was that of decimal parts, for which we are indebted to Regiomontanus; who about the year 1464, in his book of "Triangular Canons," ſet aſide the ſexageſimal ſubdiviſions, and divided the radius into 60,000 000 parts; but afterwards he altogether waved the ancient diviſion into 60, and divided the radius into 10,000,000 parts; ſo that if the radius be denoted by 1, the ſines will be expreſſed by ſo many places of decimal fractions as the cyphers following 1. This ſeems to have been the firſt introduction of

decimal parts. But this method was more expreſsly delivered in the extraction of the ſquare and cube roots, by Peter Ramus in his Arithmetic, written about the year 1562, and publiſhed with other treatiſes, by Lazarus Schonerus, in 1586. Dr. Wallis has ſhewn (Algebr. p. 32.) that our countrymen William Buckley and Robert Record had uſed a ſimilar method for extracting the ſquare root in fractions, about the year 1550: but the firſt perſon who profeſſedly treated on this ſubject, and introduced the name of "diſme" or "decimals," was Simon Stevinus, in a treatiſe entitled "Diſme," ſubjoined to his arithmetic, publiſhed in French, and printed at Leyden in 1585; ſince which the method of decimals has been practiſed by many others, and is now become univerſal. See DECIMAL.

To Dr. Wallis we are principally indebted for our knowledge of circulating decimals, and alſo for the arithmetic of infinites. The laſt, and perhaps with regard to its extenſive application and uſe the greateſt, improvement which the art of computation ever received, was that of logarithms, which we owe to baron Neper or Napier, and Mr. Henry Briggs. See LOGARITHMS. See alſo the ſubſequent articles.

Arithmetic, in its preſent ſtate, is variouſly divided into different kinds; *theoretical, practical, inſtrumental, logarithmical, numerous, ſpecious, decimal, dyadical, tetractical, duodecimal, ſexageſimal*, &c.

ARITHMETIC, *theoretical*, is the ſcience of the properties, relations, &c. of numbers, conſidered abſtractedly; with the reaſons and demonſtrations of the ſeveral rules. Euclid furniſhes a theoretical arithmetic, in the ſeventh, eighth, and ninth books of his Elements.—Barlaamus Monachus has alſo given a theory for demonſtrating the common operations, both in integers and broken numbers, in his Logiſtica, publiſhed in Latin by J. Chambers, an Engliſhman, in 1600.—To which may be added, Lucas de Burgo, who, in an Italian treatiſe intitled "Summa Arithmetica & Geometrica," publiſhed in 1494 at Venice, gives the ſeveral diviſions of numbers from Nicomachus, and their properties from Euclid; with the algoritum, in integers, fractions, extractions of roots, &c. Malcolm has alſo treated the ſubject very fully, in all its branches, in his "New Syſtem of Arithmetic, theoretical and practical," printed at London in 1730.

ARITHMETIC, *practical*, is the art of numbering or computing; that is, from certain numbers given, of finding certain others, whoſe relation to the former is known. As if two numbers, 6 and 8, are given, and we are to find their ſum, which is 14, their difference 2, their product 48, their quotient $1\frac{1}{3}$, or a third proportional $\frac{6^2}{8} = \frac{3^2}{2} = 10\frac{2}{3}$. Lucas de Burgo has given the practice of Arithmetic as it ſubſiſted in his time, as well as the theory. Tonſtall's practical treatiſe of Arithmetic was publiſhed in 1526; and Stifelius in 1544 wrote on the practical and other parts of arithmetic. An entire body of practical arithmetic was given by Nic. Tartaglia, a Venetian, in 1556, conſiſting of two books; the former, the application of arithmetic to civil uſes; the latter, the grounds of algebra. The principal writers on this art, theoretical and practical, have been Barlaam, Lucas de Burgo, Tonſtall, Aventinus, Purbach, Cardan, Scheubelius, Tartaglia, Faber, Stifelius, Record, Ramus, Maurolycus, Hemiſchius, Peletarius, Stevinus, Xylander, Kerſey, Snellius, Tacquet, Clavius, Metius, Gemma Friſius, Buteo, Urſinus, Romanus, Napier, Ceulen, Wingate, Kepler, Briggs, Ulacq, Oughtred, Cruger, Van Schooten, Wallis, Dee, Newton, Morland, Moore, Jeake, Ward, Leybourn, Hatton, Malcolm, &c. &c., whoſe diſcoveries and inventions, as far as they have made any, will be noticed in their proper places.

ARITHMETIC, *binary*, or *dyadic*. See BINARY *Arithmetic*.

ARITHMETIC, *common* or *vulgar*, is that which relates to integers and vulgar fractions.

ARITHMETIC, *decimal*, or *decadal*, is that which is performed by a ſeries of ten characters or figures, in a ten-fold progreſſion, as from 1 to 10, from 10 to 100, &c. including both integers and decimal fractions in the common ſcale of numbers. See DECIMAL.

The characters now uſed are the ten Arabic or Indian figures, 0, 1, 2, 3, 4, 5, 6, 7, 8, 9; for the hiſtory of which ſee FIGURES, and ARITHMETIC, *ſupra*.

ARITHMETIC, *duodecimal*, is that which proceeds from 12 to 12, or by a continual ſubdiviſion according to 12, and is much uſed by moſt artificers in calculating the value of their work; as bricklayers, carpenters, painters, tylers, &c.

ARITHMETIC, *fractional*, or of *fractions*, is that which treats of fractions both vulgar and decimal. See FRACTION.

ARITHMETIC, *harmonical*, is that part of the doctrine of numbers, which relates to the compariſon, reduction, &c. of muſical intervals.

ARITHMETIC of *infinites*, is a method of ſumming up a ſeries of quantities, conſiſting of an infinite number of terms, or of finding their ratios. This method was firſt invented by Dr. Wallis, as appears from his treatiſe on the ſubject in the "Opera Mathematica," vol. i. p. 365, &c., where he ſhews its uſe in geometry, in finding the areas of ſuperficies, and the contents of ſolids, and their proportions. This is alſo called the method of "Indiviſibles," becauſe magnitudes are here ſuppoſed to be reſolved into their indiviſible parts, or at leaſt as far as there is any occaſion to conſider them as ſuch. See INDIVISIBLES. But the method of FLUXIONS, which is an univerſal arithmetic of infinites, performs all this much more eaſily, and many other things, which the former will not reach.

ARITHMETIC, *inſtrumental*, is that in which the common rules are performed by means of inſtruments contrived for eaſe and diſpatch; ſuch are ſeveral ſorts of ſcales, and ſliding-rules; Napier's bones or rods, deſcribed under their proper article; the arithmetical machine of Paſcal and others; ſir Sam. Morland's inſtrument, the deſcription whereof was publiſhed by himſelf, in 1672: that of M. Leibnitz, deſcribed in the Miſcellan. Berolin.; that of Polenus, publiſhed in the Venetian Miſcellany, 1709: and that of Dr. Saunderſon, deſcribed in the introduction to his algebra. Such is alſo the ABACUS, or SHWAN-PAN of the Chineſe.

ARITHMETIC, *integral*, or of *integers*, is that which relates to integers, or whole numbers.

ARITHMETIC, *literal*, or *algebraic*, is that which is performed by letters, that repreſent any numbers indefinitely. See ALGEBRA.

ARITHMETIC, *logarithmical*, is that which concerns logarithms, and is performed by tables of LOGARITHMS; which ſee.

ARITHMETIC, *logiſtical*. See LOGISTICAL.

ARITHMETIC, *mechanical*, is that which is performed by means of a lever or balance. See BALANCE.

ARITHMETIC, *numerous*, or *numeral*, is that which gives the calculus of numbers, or indeterminate quantities; and is performed by the common numeral or Arabic characters.

ARITHMETIC, *palpable*, is that which is performed by the ſenſe of feeling, and practiſed by blind perſons. Dr. Saunderſon, Lucaſian profeſſor of mathematics in the univerſity of Cambridge, had contrived, for his own uſe, a commodious notation for any large numbers, which he could expreſs

expreſs on his abacus, or calculating table, and with which he could very readily perform any arithmetical operations. His calculating table was a ſmooth thin board, ſomewhat larger than a foot ſquare, raiſed upon a ſmall frame, ſo as to lie hollow; and this board was divided by a great number of equidiſtant parallel lines, and by others as many at right angles to the former. The edges of the table were diſtinguiſhed by notches, at the diſtance of about half an inch from one another, and to each notch belonged five of the afore-mentioned parallels; ſo that every ſquare inch was divided into an hundred little ſquares. At every point of interſection the board was perforated by ſmall holes, capable of receiving a pin; for it was by the help of pins, ſtuck up to the head through theſe holes, that he expreſſed his numbers. Of theſe pins he uſed two ſorts, ſome larger, and others ſmaller; or, at leaſt their heads were different, ſo that they might be eaſily diſtinguiſhed by the the touch. A large quantity of theſe pins, with the points cut off, was kept in two boxes, which were always near him when he calculated. In order to underſtand his mode of calculation, it is neceſſary to premiſe, that to every numeral figure a little ſquare was appropriated on the table, conſiſting of four of the little ſquares above deſcribed, and allowing a ſmall interval between one figure and another; and this numeral figure was different according to the different magnitude or ſituation of the one or two pins which always compoſed it; for which purpoſe the ingenious profeſſor had ſettled in his mind and ſtrictly obſerved the following analogy or notation. A great pin in the centre of the ſquare, its appropriate and invariable place, was a cypher, or 0, by which name we ſhall call it. Its chief office was to preſerve order and diſtance among the figures and lines. This cypher was always preſent, except in the caſe of an unit, for expreſſing which, the great pin in the center was changed into a little one. When 2 was to be expreſſed, the cypher was reſtored to its place, and the little pin was put juſt over it. To expreſs 3, the cypher remained in its place, and the little pin was advanced into the upper angle, on the right hand. To expreſs 4, the little pin deſcended, and immediately followed the cypher. The expreſs 5, the little pin deſcended to the lower angle, on the right hand. For 6, the little pin retreated, till it was juſt under the cypher. For 7, this pin retreated into the lower angle, on the left hand. For 8, it aſcended, till it was juſt before the cypher. For 9, the little pin aſcended into the upper angle, on the left hand. In this manner all the digits were expreſſed by an eaſy and uniform notation, which might readily enough be apprehended and diſtinguiſhed by the feeling. Theſe digits or figures are repreſented in *Plate* I. *Algebra, fig.* 1. Dr. Saunderſon was able, by this contrivance, to mark, or write down, as we may ſay, any propoſed number upon his table, and by lightly running his fingers over it, he could at any time eaſily read it, and know what it ſignified. The great pins or cyphers which were always placed at the center of the little ſquares, and moſt frequently at equal diſtances from one another, were a ſure guide to direct him in keeping the line, in aſcertaining the limits of every figure, and in preventing any ambiguity that might otherwiſe occur. As three of the erect parallels were ſufficient for a ſingle figure, ſo three of the tranſverſe parallels would ſuffice for a line of figures, and the next three for another line, and ſo on, without any danger of interfering. Thus we may conceive, without much difficulty, how he might have any number of lines of figures upon his table at the ſame time, in a deſcending order, or how he might deduce one number from another, or how he might make any computation required. It is ſaid that he could place and diſplace his pins with incredible quickneſs and facility, to the ſurpriſe and amuſement of ſpectators. He cold even break off in the middle of a calculation, reſume it when he pleaſed, and inſtantly know the ſtate of it, by only drawing his fingers gently over the table. The table might alſo be previouſly prepared by himſelf or ſome other perſon, by filling every third hole of every third parallel line with large pins or cyphers; and then, when he intended to calculate, he would only need to complete every figure by adding a ſmall pin in its proper place, except when he wiſhed to expreſs an unit, in which caſe he muſt have changed the large pin into a ſmall one. He had computed and preſerved for his own uſe certain arithmetical tables, which ſeemed to have ſome relation to the tables of natural ſines, tangents, and ſecants. Theſe were four pieces of ſolid wood, in the form of rectangular parallelipeds, each about 11 inches long, $5\frac{1}{2}$ broad, and ſomewhat above half an inch thick. The two oppoſite faces of every one were divided into little ſquares after the manner of the abacus above deſcribed; but they were perforated only in the neceſſary places, where the pins were ſtuck faſt up to the head. Each face exhibited nine ſmall arithmetical tables, of ten numbers each; and every number, generally ſpeaking, conſiſted of five places or figures. One of theſe tables is repreſented in *Plate* I. *Algebra, fig.* 2.

Beſides this arithmetical uſe of his table, for which it was primarily and chiefly deſigned, he could deſcribe upon it very neat and perfect geometrical figures, conſiſting of right lines, interſecting one another in a variety of ways. This he did by two methods; either by pins ſet in rows, which exhibited the appearance of pricked lines, or by pins placed only at the interſections. Then by winding a piece of fine thread or ſilk about their heads, he could very well exhibit any continued ſtrait lines at pleaſure, or any ſyſtem of ſuch lines. Whether he had palpable letters alſo, ſomewhat like printing types, to diſtinguiſh the ſeveral angular points, and to aſſiſt in demonſtrating the properties of theſe figures, does not now appear. It is not very difficult to conceive, how the ſame table might poſſibly be applied to the repreſentation of all kinds of algebrical equations, and to the ſeveral reductions of ſuch equations, eſpecially by the uſe of the forementioned types, or ſome ſimiliar contrivance. Dr. Saunderſon alſo might have had types, in the form of pins, for the common algebraic ſigns, and to ſerve the purpoſe of various operations; and thus his table would have had a near reſemblance to a printer's form, which he might have read by the touch, if he had thought proper to uſe it. It is ſaid that he could ſpell very well, that he knew the ſhapes of the letters, both ſmall and capital, and would ſometimes amuſe himſelf, when opportunity offered, by reading the inſcriptions upon tomb-ſtones with his fingers; and he is known to have often regretted, that he did not apply himſelf to learn to write in his younger years, which he thought he could eaſily have accompliſhed. Saunderſon's Alg. vol. i. Introd.

The deſcription of an apparatus for the improvement of this numerical board of Dr. Saunderſon, was preſented to the Society of Arts, &c. in 1786, by a blind perſon of the name of Thomas Grenville. The board is perforated with holes, in exact lines, horizontally and perpendicularly. The horizontal lines denote units, tens, hundreds, thouſands, &c. reckoning from right to left, as uſual; and the perpendicular lines allow the figures to be placed below each other, as is uſual in every account. Theſe holes are fitted with pegs, on the heads of which are painted the figures (or numbers) they reſpectively repreſent; which figures are diſtinguiſhed by the blind perſon by means of certain pins placed in the heads of theſe pegs. Between the rows of holes for theſe

thefe pegs are rows of fmaller holes, adapted to receive the blunt ends of fmall wires, which perform the part of lines, placed either horizontally or perpendicularly, as is neceffary for any arithmetical operation. The box is formed into proper divifions for holding the pegs and wires; and it is, without doubt, a very ufeful apparatus for blind perfons, who, with a little attention, may perform by means of it every arithmetical operation which they could perform if they had the ufe of fight.

Arithmetic, *political*, is the application of arithmetic to political fubjects, fuch as the ftrength and revenues of kingdoms, the number of inhabitants, births, burials, &c. See Political *Arithmetic*. To this head may be alfo referred the doctrine of Chances, Gaming, &c.

Arithmetic of *Ratios*. See Ratio.

Arithmetic, *fexagefimal*, or *fexagenary*, is that which proceeds by fixties; or the doctrine of fexagefimal fractions; fuppofed to have been invented by Ptolemy, in the fecond century. In this notation the integral numbers from 1 to 59 were expreffed in the common way; then fixty was called a *fexagena prima*, and marked I′; twice fixty, or 120, II′; and fo on to 59 times 60, or 3540, which is LIX′. Sixty times fixty, or 3600, was called *fexagena fecunda*, and marked with two dafhes, I″; twice 3600, II″; and ten times 3600, X″, &c. And in this way the notation was continued. But if a number lefs than fixty was joined with any of the fexagefimal integers, their proper expreffion was annexed without the dafh; e. gr. four times 60 and 25 is IV′XXV; the fum of twice 60, ten times 3600, and 15, is XII′XV, &c. So nearly did the inventor of this method approach to the Arabic notation: inftead of *fexagefimal* progreffion, he had only to fubftitute *decimal*; to make the figns of numbers from 1 to 9 fimple characters, and to introduce a character which fignifies nothing by itfelf ferving only to fill up places. The *fexagenæ integrorum* were foon laid afide, after the introduction of the Arabic notation; but the *fexagefimal* fractions continued till the invention of *decimals*; and are ftill ufed in the fubdivifions of circular arcs and angles.

Sam. Reyher has invented a kind of fexagenal rods, in imitation of Napier's bones, by means whereof the fexagenary arithmetic is eafily performed.

Arithmetic, *fpecious*, is that which gives the calculus of quantities; ufing letters of the alphabet inftead of figures, to denote the quantities; and coincides with what we ufually call *algebra*, or *literal arithmetic*.

Dr. Wallis has joined the numeral with the literal calculus; and by means of it demonftrated the rules for fractions, proportions, extraction of roots, &c. a compendium of which is given by Dr. Wells, under the title of Elementa Arithmeticæ, an. 1698.

Arithmetic, *tabular*, is that in which the operations of multiplication, divifion, &c. are performed by tables calculated for that purpofe; fuch as thofe of Herwart ab Hohenburg, called "the univerfal table of proftaphæreſes," publifhed in 1610; and Hutton's tables of powers and products, publifhed by order of the commiffioners of longitude, in 1781.

Arithmetic, *tractic*, is that in which only the figures 1, 2, 3, and 0, are ufed. We have a treatife of this arithmetic, by Erhard Weigel; but both this and binary arithmetic, are little better than curiofities, efpecially with regard to practice; inafmuch as the numbers may be much more compendioufly expreffed by decadal arithmetic, or the common decuple fcale, than by either of them.

Arithmetic, *vulgar*, is that converfant about integers and vulgar fractions.

Arithmetic, *univerfal*, the name given by fir Ifaac Newton to the fcience of algebra. See Algebra.

Arithmetical, denotes fomething relating to, or performed after the manner of, arithmetic.

Arithmetical *complement* of a logarithm, is what the logarithm wants of 10.0000000. Thus the arithmetical complement of 7.1079054, is 2.8920946, and it is found by fubtracting each figure but the laft from 9, and that from 10.

It is often ufed in trigonometrical calculations, when radius or 10.0000000 is the firft term, to fave the labour of fubtraction. It is diftinguifhed by placing a point before, and another after the index; thus, .2.8920946.

Arithmetical *divifion of the octave*, in *Mufic*, is that which

a
D

divides it into two portions: as A, when the middle term is a fourth to the bafe or loweft found, and which in the eccleſiaſtical modes conſtitutes thoſe that are termed *plagal*. The

d
A

harmonic diviſion conſtitutes the *authentic modes*, as D; when the middle term is a fifth to the loweſt. From theſe two diviſions of the octave all tones or modes of the church were regulated in the following manner:

Harmonic Diviſion.	Arithmetical Diviſion.
d e f g a c	a b c d e
A B C D E G	D E F G A
D E F G A C	A B C D E
Authentic modes.	Plagal modes.

The firſt of theſe diviſions conſiſts of fifths and fourths; the ſecond of fourths and fifths.

Theſe diviſions ſtill exiſt in *Canto fermo*, or plain chant; though they have been long abandoned in ſecular muſic. It is neceſſary, however, to know them, as they ſtill ſerve to regulate the anſwer to figures. See Division in *Muſic*, Figure, and Mode.

Arithmetical *inſtruments*, or *machines*. See Instrumental Arithmetic.

Arithmetical *medium* or *mean*. See Medium.

Arithmetical *progreſſion*. See Progression.

Arithmetical *proportion*. See Proportion.

Arithmetical *ratio*. See Ratio.

Arithmetical *ſcales*, a name given by M. Buffon, in the Mem. d'Acad. of 1741, to different progreſſions of numbers adapted to arithmetical computations. Beſides the common decuple ſcale, conſiſting of ten numbers, others have been deviſed, ſuch as the binary, tractic, &c. conſiſting of a different number of characters. M. Buffon lays down a conciſe and ſimple method, which ſerves to ſhew at once how to write down any given number in any ſcale whatever; and he alſo makes ſeveral obſervations on the different ſcales that have been propoſed. It is evident that any ſcale of numbers, containing fewer or more than ten, would have both its advantages and inconveniences. In a ſcale of fewer and lower numbers, a given number would require more places of figures for denoting or expreſſing it; but multiplication and diviſion would be more eaſily performed, as it is more eaſy to uſe the ſmaller numbers 2, 3, 4, than the larger ones 7, 8, 9: but in a ſcale aſcending beyond 10, or containing more than 10 characters, any given number might be expreſſed by fewer of them, and yet the arithmetical calculations would be more difficult, on account of the larger numbers 11, 12, 13, &c. Hence it may be concluded, upon the whole, that the decuple ſcale is a convenient medium between the two extremes, as the numbers which it comprehends, are neither too ſmall nor too large. The duodecimal ſcale, comprehending 12 characters, would expreſs all numbers in a more compendious manner than

the decimal ſcale; and yet no ſingle character would repreſent a number too large for ordinary computations. Accordingly the multiplication table is now made to extend to 12 numbers inſtead of 10, and the mode of multiplying and dividing by 11 and 12, is as eaſily acquired as that by 8, 9, or 10. Beſides, the number 12 has this advantage, that it admits of more ſubmultiples than 10, and therefore there would be fewer expreſſions of interminate fractions in this ſcale than in the decimal one; and hence it has been ſuggeſted that the duodecimal ſcale would be preferable to any other.

ARITHMETICAL *Triangle*. See TRIANGLE.

ARITHMOMANCY, compounded of *αριθμος*, *number*, and *μαντια*, *divination*, a kind of divinaton, or method of foretelling future events by means of numbers. Delrio diſtinguiſhes two ſorts of it; one uſed by the Greeks, who from the number and value of the letters contained in the names, e. g. of two combatants, inferred, that the perſon whoſe name conſiſted of thoſe that were moſt numerous and of greateſt value, would be victorious; and thus they concluded, it is ſaid, that Hector ſhould have been vanquiſhed by Achilles; the other was that of the Chaldæans, who divided their alphabet into three decades, and changing into numeral letters the letters of the names of thoſe who conſulted them, they referred each number to ſome planet, and in this manner formed their preſages. The Platoniſts and Pythagoreans were addicted the Arithmomancy. The gematria, which makes the firſt ſpecies of the Jewiſh Cabbala, is a ſort of Arithmomancy. See GEMATRIA, and CABBALA.

ARITIUM, in *Ancient Geography*, a town of Spain, in Luſitania, ſituate upon the Tagus, north-eaſt of Olriſipo.

ARITZAR, in *Geography*, a town of European Turkey, in the province of Bulgaria, ten miles ſouth of Viddin.

ARIVATES, in *Ancient Geography*, a people placed by Pliny in Pannonia.

ARIUS, in *Biography*, founder of the ſect called Arians, in the beginning of the fourth century, was, according to Epiphanius, a native of Lybia; but, according to Photius, of Alexandria. In early life he was probably of the ſchool of Lucian, biſhop of Antioch, who favoured the opinions of Paul of Samoſata; for Arius, in a letter to Euſebius of Nicomedia, calls him a Collucianiſt; whence Cave and others have inferred that they were fellow-diſciples of Lucian. He was appointed deacon by Peter, biſhop of Alexandria, and afterwards excommunicated, becauſe he diſapproved of the biſhop's treatment of Meletius and his adherents. After the martyrdom of Peter, he was re-admitted by Achillas, the next biſhop, to the office of deacon, and alſo ordained preſbyter. At this time he was much approved by Alexander, the ſucceſſor of Achillas, and he was not only preſbyter, but officiated in one of the churches of Alexandria. About the year 315, the conteſt commenced between Arius and Alexander, of which as to its riſe, progreſs, and conſequences, an account is given under the article ARIANS. In the year 320, he was excommunicated from the church, and expelled the city by a council convened by Alexader, upon which he withdrew into Paleſtine, where he formed a ſtrong party of perſons who favoured him and his cauſe. Whilſt he complained in a letter to Euſebius of Nicomedia, of the perſecution he ſuffered for the ſake of the truth, he derived encouragement from the number and rank of thoſe who were attached to his opinions and intereſts; among whom were ſeveral preſbyters and biſhops. The breach between him and Alexander was thus gradually widened, and parties were formed, who became inveterate and invincible in their oppoſition to each other. This mutual altercation proceeded to ſuch an extreme, that it furniſhed a ſubject of ſatirical exhibition in the public theatres. The emperor Conſtantine, in this ſtage of the diſpute, interpoſed with the beſt intention to produce mutual reconciliation. But his efforts, as a mediator, were altogether ineffectual; and he himſelf was at length induced, by the interference of ardent and bigotted eccleſiaſtics, probably againſt his judgment and diſpoſition, to take an authoritative and active part, with a view of terminating a controverſy which had diſcarded the milder methods of perſuaſion and remonſtrance. For this purpoſe, he imprudently convened the council of Nice, in order to decide whether the Logos, or only begotten Son, was of the ſame ſubſtance with the Father; and thus, inſtead of terminating, he perpetuated the diſſenſions of the church, and divided the whole Chriſtian world into "Homouſians" and "Homoiouſians." This council having decided that Chriſt is conſubſtantial with the Father, the doctrine of Arius was of courſe condemned, and the preſbyter himſelf, who was then at Nice waiting its determination, was baniſhed by Conſtantine into a remote province of Illyricum. By an edict of the ſame emperor, he and his adherents were ſtigmatized with the opprobrious name of Porphyrians, his books were ordered to be burnt, and thoſe who concealed any of them were to be put to death. In a little while, the emperor, who ſeems to have naturally poſſeſſed a candid and benevolent mind, relented, and his conduct towards Arius underwent a total change. Euſebius of Nicomedia, it is ſaid, by means of a preſbyter who enjoyed the confidence of Conſtantia, the emperor's ſiſter, gained over that lady to the intereſt of Arius. In her laſt ſickneſs, ſhe recommended to the favour of the emperor this preſbyter, by whom he was perſuaded to believe, that the faith and conduct of Arius had been miſrepreſented by his enemies. Upon this Conſtantine recalled him from baniſhment; and having received a ſatisfactory confeſſion of faith, in which he profeſſed his belief, that "the Son was beggotten of the Father before all ages," but without any acknowledgment of conſubſtantiality, recommended to the biſhops aſſembled in council at Jeruſalem, A. D. 355, to re-admit him into the communion of the church. The biſhops, who are ſuppoſed to have been concealed Arians, readily complied, and recommended Arius to a cordial reception among other churches. Attempts were made for reſtoring him to the church of Alexandria, but they were ineffectual, on account of the reſiſtance of Athanaſius, who had ſucceeded Alexander in that ſee. A day was appointed, by the expreſs command of the emperor, for his re-admiſſion into the church, at Conſtantinople; but on that very day, A. D. 336, as it is ſaid, Arius walking in the city, and retiring to obey a ſudden call of nature, he diſcharged his entrails and died on the ſpot. The ſtory of his death is related both by the hiſtorian Socrates (l. i. c. 25. ii. 38. Ep. ad Serap.) and Athanaſius, but with circumſtances which very much invalidate its credibility. The learned editor of Moſheim admits the teſtimonies of Socrates, Sozomen, Athanaſius, and others, with reſpect to the manner of his death, as unexceptionable. The cauſes of it, however, have furniſhed much matter of diſpute. The ancient writers, who conſidered this event as a judgment of heaven, miraculouſly procured by the prayers of the juſt, to puniſh the impiety of Arius, will find little credit in our times, among ſuch as have ſtudied with attention and impartiality the hiſtory of Arianiſm. "After having conſidered this matter with the utmoſt care," ſays the writer above mentioned, "it appears to be extremely probable, that this unhappy man was a victim to the reſentment of his enemies, and was deſtroyed by poiſon, or ſome ſuch violent method." He adds; "a blind and fanatical zeal for certain ſyſtems of faith has, in all ages, produced ſuch horrible acts of cruelty and injuſtice."

The

The talents and learning of Arius have been generally allowed; but his difpofition and character have been more variously reprefented by writers of different parties. To this purpofe we fhall tranfcribe an extract from the account given of him by the candid and impartial Lardner. "Arius was very tall, grave and ferious, yet affable and courteous. With good natural parts, and no inconfiderable fhare of fecular learning of all forts, he was particularly diftinguifhed by his fkill in logic, or the art of difputing. He had at leaft the outward appearance of piety. In fhort, he is reprefented as a man exceedingly well qualified to form a party, and carry on any enterprize he fhould engage in. So far as I recollect, his conduct was unblameable, excepting what relates to his zeal for maintaining his fuppofed errors: and that he is charged with difguifing his real fentiments upon fome occafions, in thofe difficult circumftances to which he was reduced by the prevailing power of his adverfaries." "I may add here," continues the fame author, "that he writes with much fpirit, and a full aflurance of the truth of his opinions; particularly in his letter to Eufebius of Nicomedia, whom he ftiles orthodox; and he tells that bifhop, that he and his friends were unjuftly perfecuted by Alexander for the truth's fake, which conquers all things; that all the bifhops of the Eaft in general had been anathematized by Alexander, except Paulogonius, Hellanicus, and Macarius, whom he calls ignorant heretics. As for himfelf, he was not able to endure their impious doctrine; nor would he ever receive it, though he were to fuffer a thoufand deaths from thofe heretics." One of his biographers fays (Gen. Biog.), that "for aught that appears upon the face of his ftory, it may be confidently aflerted, that his morals were untainted, and his piety fincere. The incidents of his life afford a ftrong prefumption, that he poffeffed a genuine love of truth, and adhered to what he judged to be its caufe with firm integrity. Had his party prevailed during his life, there can be no doubt, that after his death his name would have been recorded among the faints; having had the misfortune to be regiftered by the church which called itfelf orthodox, among heretics, he can only be found by pofterity in the humbler lift of honeft men."

The works of Arius do not appear to have been voluminous; though it is probable, that he wrote many letters. We have ftill extant his epiftle to Eufebius of Nicomedia, (Ap. Epiph. Hær. 69.); and another to Alexander, bifhop of Alexandria (Theod. l. i. c. 5, 7, 8.). He alfo wrote feveral little poems, fitted for the ufe of common people, with a view of promoting his peculiar opinions. A book called "Thalia," but whether it was written in profe or verfe, or partly in the one form and partly in the other, is not certain, is mentioned by Socrates (H. E. l. i. c. 9.) and Sozomen (H. E. l. i. c. 21.), and cenfured as wanton and diffolute. It was condemned, as they fay, by the council of Nice. Athanafius (De Sent. Dion. n. vi. p. 247.) quotes its feveral times, and is fuppofed to have read it; he fpeaks of its effeminacy and buffoonery. It muft be owned, however, that this is the teftimony of enemies, and that other writers probably took their character of it from Athanafius. Tillemont alfo imagines, that Arius alfo publifhed fome work againft the heathen, in defence of the Chriftian religion. Socr. Hift. l. i. Sozom. l. i. Cave, Hift. Lit. vol. i. p. 174. Lardner's Works, vol. iv. p. 106—110. Mofheim's Eccl. Hift. vol. i. p. 412—418 Gen. Dict. Gibbon's Hift. vol. iii. p. 328—328.

ARJUZANX, in *Geography*, a town of France, in the department of Landes, and chief place of a canton in the diftrict of Mont-de-Marfan, eleven miles north of Tartas. The place contains 559, and the canton 5235 inhabitants: the territory includes 462½ kilometres and 12 communes.

ARIZA, a town of Spain, in Arragon, feated on the Xalon, eight leagues above Calatafud.

ARK, or Arc, *arcus* in *Geometry*, *Aftronomy*, &c. See Arch.

Ark, *Arca*, in the *Scripture Language*, denotes a kind of floating veffel built by Noah, for the prefervation of feveral fpecies of animals from the deluge.

The Hebrew word, by which the ark is expreffed, is תֵּבָה, or תִּיבַת *thebath*, or *thibath*, the conftructive form of תֵּבָה, which is evidently the Greek θήκη; and fo the LXX render the word in Exod. ii. 3. where only it occurs. There they render it κιβωτὸν. Jofephus κιβωτὸς, and the Vulgate *arcam*, fignifying an ark, coffer, or chefl. Although the ark of Noah anfwered, in fome refpects, the purpofe of a fhip, it is not fo certain that it was of the fame form and fhape. It has been inconclufively argued by Michaelis and fome others, that if its form had not been like that of a fhip, it could not have refifted the force of the waves; becaufe it was not intended to be conducted, like a fhip, from one place to another, but merely "to float on the furface of the waters." Gen. vii. 17. It appears to have had neither helm, nor maft, nor oars: but was merely a bulky capacious veffel, light enough to be raifed aloft with all its contents, by the gradual rife of the deluge. Its fhape therefore, was of little importance; more efpecially as it feems to have been the purpofe of providence, in this whole tranfaction, to fignify to thofe who were faved, as well as to their lateft pofterity, that their prefervation was not in any degree effected by human means. The ark in which Mofes was expofed, was a veffel of the fame nature, and bears the fame name; and fome have thought that both were of the fame materials. With refpect to the etymology of the Hebrew word, the moft rational feems to be that of Cocdius, who derives it from the Arabic word תאב, *collegit*, from which is formed תבה, or חיבה, denoting a place in which things are collected. Forfter (De Byffo Antiquorum) deduces it from two Egyptian words, *thoi*, *a fhip*, and *bai*, a palm-tree branch; and fuch fhips are ftill to be feen not only in Egypt, but in India and other countries; particularly in fome ifles of the Pacific ocean.

The ark has afforded to the critics and naturalifts feveral points of curious inquiry relating to its form, capacity, materials, time of building, place of refting after the flood, &c.

Noah is computed to have been one hundred years in building the ark, viz. from the year of the world 1555, to the flood, which happened in the year 1656; at leaft this is the common opinion of the fathers, oriental authors, and other learned perfons; and to this purpofe they allege, that Noah is faid to be five hundred years old before any mention is made of the ark. Origen, lib. iv. contra Celf. St. Auftin, de Civit. Dei, lib. xv. c. 27. and contra Fauftum, lib. xi. c. 18. and in his Quæft. 5. and 23. on Gen. Rupert, lib. iv. in Gen. xx. affert as much; and are followed by Salian, Torniel, Spondeus, Pelletier, &c.

Yet Berofus affirms, that Noah only began to build the ark feventy-eight years before the flood: Solomon Jarchi, on the other hand, will have it to have been an hundred and twenty years in building, Tanchuma fifty-two, and the Mahometans only two years. See the texts, Gen. vi. &c.

Several interpreters of the facred writings infer from the words of St Peter (1 Ep. iii. 20.), "the long-fuffering of God waited in the days of Noah, while the ark was preparing," that Noah was employed in building the ark during the whole time of forbearance, which was 120 years: but others think the time much fhorter, becaufe Noah's three fons, the eldeft of whom was born in his 500th year, are not only mentioned before the directions given for the ark, but they and their wives are ordered, in thofe directions to be taken into the ark; a circumftance

which

which ſeems to imply that they were then married. Some, in order to evade this difficulty, have ſaid that when Noah is declared (Gen. v. 32.) to have begotten Shem, Ham, and Japheth, at the age of 500 years, it ſhould be tranſlated, "he had begotten," inſtead of "he begat." F. Fournier, in his Hydrography, adopts the opinion of the fathers; noting that the hands employed in it were only Noah and his three ſons. To this purpoſe he alleges the inſtance of Archias of Corinth, who, with the help of three hundred workmen, built Hiero's great ſhip in one year. Add, that Noah's eldeſt ſon was not born till about the time when the ark was begun, and the younger after: ſo that it was a long time before they could do their father any ſervice. Upon the whole it may be obſerved that there is no ſuch connection or exact order of time in the whole narration as to eſtabliſh any of theſe conjectures. But it is certain, that ſo large a building, and the previous preparations, could not have been the work of a few years.

The wood whereof the ark was built, is called in ſcripture עֲצֵי גֹפֶר, *eſe gopher, gopher wood:* and in the LXX. ξυλα τετραγωνα, *ſquare timbers*. Onkelos and Jonathan render gopher by קַדְרוֹם, *kedros, cedar:* St Jerom, in the Vulgate, by *ligna lævigata*, planed wood; and elſewhere, *ligna bituminata*, q. d. pitched wood, which is adopted by Delgado, a learned London Jew. Kimchi tranſlates it "wood moſt proper to float;" Vatable, "light wood," which ſwims in the water without corrupting; Junius Tremellius, and Buxtorf, a kind of "cedar," by the Greeks called κεδρελαΐη; Avenarius and Munſter, "pine;" Fuller and Bochart, "cypreſs," and the "ebony-tree;" others, "fir;" Caſtalio, "turpentine," &c. Pelletier prefers the opinion of thoſe who hold the ark made of cedar: his reaſons are, the incorruptibility of that wood; the great plenty thereof in Aſia, whence Herodotus and Theophraſtus relate, that the kings of Egypt and Syria built whole fleets of it in lieu of deal; and the common tradition throughout the Eaſt imports, that the ark is preſerved entire to this day on mount Ararat. The Mahometans explain it by the word "Sag," or the Indian plane-tree. To theſe various conjectures may be added that of Dr. Geddes (Crit. Rem. vol. i. p. 67.), who apprehends, that the Syriac tranſlator has given the true meaning in the word ערקא, rendered in the polyglot by the Latin word *vimen*, ſignifying in general a twig, rod, or wicker of any kind. In Arabic the ſame word ſignifies a cheſt, coffer, or baſket made of twigs, particularly of palm-tree leaves. And, indeed, all the firſt veſſels of capacity, whether coffer, ark, or ſhip, ſeem to have been compoſed of the ſame materials. The ſhip or ark of Noah, ſays this writer, was a large coffer formed of twigs, like baſket work, and covered over with bitumen, both within and without, to keep out the water. Whether thoſe twigs were of oſier, or palm-tree, or hazel, or poplar, or birch, or juniper, or any other kind of vimineous wood, he does not preſume abſolutely to determine; but he thinks it muſt have been the oſier, which, as we learn from Columella, was conſidered as the principal of the wicker kind. It is certain, that boats, baſkets, and ſhips, were originally made of ſuch twigs, and particularly of oſier; and even thoſe, which were externally covered with ſkins, had other ribs at leaſt of that wood, on account of its pliability. See Herodotus (Clio); or Niebuhr's Arabia, vol. ii. p. 175.

The figure of the ark was that of an oblong ſquare or parallelepiped, with a flat bottom, and it was gradually contracted at the top, in the form of a ſloping roof; and this roof roſe in the middle a whole cubit higher than its extremities. This ſlope was ſufficient, when covered with bitumen, to let the water paſs eaſily off the deck. This veſſel was, without doubt, ſo contrived as to admit air and light, though the particular conſtruction of the air-vents or windows be not mentioned. Bryant (Anal. Anc. Myth. vol. ii. p. 195.) ſuggeſts, that it was ſo cloſed up and faſtened, that the perſons within it were configned to darkneſs; having no light but what they received from lamps and torches. They could not therefore have been witneſſes to the general calamity of mankind; nor ſee the mighty eruption of the waters, nor the turbulence of the ſeas. Some, with this writer, have ſuppoſed that they had one window above a cubit in diameter; but others have thought that the term צֹהַר refers to the ſloping roof, and that the windows are not particularly mentioned.

The ark, whatever were the materials of which it conſiſted, was pitched over, or coated with bitumen, ſuch as ſome have ſuppoſed to be uſed in building the tower of Babel; and it has been obſerved, that the bitumen judaicum, or aſphaltus, was the moſt proper of all ſubſtances for this purpoſe. At firſt, it was ſoft, viſcous, and pliable, and might be thruſt into every chaſm and crevice with the greateſt eaſe; but it would ſoon acquire a tenacity and hardneſs ſuperior to thoſe of our pitch. A coat of it ſpread over both the inſide and outſide of an ark, even of wicker work, would render it perfectly water-proof and impenetrable; and the longer it was kept in the water, the harder and ſtronger it would grow. The Arabs ſtill uſe it in covering their veſſels; and mixed with a tenth part of common pitch, it is called "piſſaſphaltus," and has been employed to the ſame purpoſe in our days by M. de la Sabloniere at L'Orient. Beroſus ſays, that the people of Armenia, where it was ſuppoſed that the ark reſted, ſcraped off the aſphaltus, and uſed it as a charm; and Abydenus informs us, that ſmall pieces of the wood were carried about by way of amulet.

As to the place where the ark was built, there have been different opinions: ſome have ſuppoſed that it was built in Paleſtine, and that Noah planted the cedars, of which it is ſaid to be made, on the plains of Sodom; others imagine that it was built on mount Caucaſus, on the confines of India; and others refer it to China, where Noah was ſuppoſed to have lived before the flood; but it was probably conſtructed not far from mount Ararat, where it reſted, as it was not of a form which would allow of its being driven to a great diſtance. It is therefore moſt reaſonable to imagine, that it was built in Chaldæa, in the territories of Babylon, where, it is ſaid, there was ſo great a quantity of cypreſs in the groves and gardens in the time of Alexander, that he conſtructed a whole fleet of it for want of other timber; and this conjecture is confirmed by the Chaldæan tradition which makes Xiſuthrus, the Noah of Beroſus, ſail from that country.

The dimenſions of the ark, as delivered by Moſes, are three hundred cubits in length, fifty in breadth, and thirty in height; which, compared with the great number of things it was to contain, ſeem to many to have been too ſcanty: and hence an argument has been drawn againſt the authority of the relation. Apelles, one of Marcion's diſciples, objected to it, and Celſus ridiculed it, calling it κιβωτον αλλοκοτον, *the abſurd ark*. To ſolve this difficulty, many, both of the ancient fathers and later critics, have been very much perplexed. Origen, St. Auguſtine, and others maintain, that by the cubit here ſpoken of, we are to underſtand the Egyptian geometrical cubit, equal, according to them, to ſix vulgar cubits, or nine feet. But the truth is, it does not appear there ever was any ſuch meaſure as a geometrical cubit either among Egyptians or Jews.—Others, as ſir W. Raleigh, account for it by aſſerting the ſtature of

mankind in the firſt ages to have been much greater than in our days; and conſequently the cubit, which is taken for a part of the human body, proportionably larger. But this does not avail, ſince the ſame reaſon will infer an equal augmentation of the ſize of other animals. Others ſuppoſe the ſacred cubit to be that here ſpoken of, which was a hand's breadth longer than the civil one: but this only affords a ſmall ſupply; beſide, the ſacred cubit does not appear to have been ever uſed, except in ſacred edifices, as the temple and tabernacle.

This difficulty is much better ſolved by Buteo and Kircher, who, ſuppoſing the common cubit a foot and a half, prove geometrically that the ark was abundantly ſufficient for all the animals ſuppoſed to be lodged therein. The capacity of the ark will be doubled, if we admit with Cumberland, &c. that the Jewiſh cubit was 21.888 inches. According to this meaſure, it muſt have been 54.72 Engliſh feet long, 91.2 broad, and 54.72 high; and its ſolid contents 2,730,781.9008 feet. Snellius computes the ark to have been about half an acre in area. Cuneus and others have alſo calculated the capacity of the ark.—Dr. Arbuthnot computes it to have been 81,062 tuns.—Father Lamy ſays, that it was an hundred and ten feet longer than the church of St. Mary at Paris, and ſixty-four feet narrower; to which his Engliſh tranſlator adds, that it muſt have been longer than St. Paul's church in London, from weſt to eaſt, broader than that church is high in the inſide, and about fifty-four feet in height, of our meaſure.

The things contained in the ark were, beſide eight perſons of Noah's family, one pair of every ſpecies of unclean animals, and ſeven pair of every ſpecies of clean animals, with proviſions for them all, during the whole year.—The former appears, at firſt view almoſt infinite; but if we come to a calculation, the number of ſpecieſes of animals will be found much ſmaller than is generally imagined; out of which, in this caſe, are to be exempted ſuch animals as can live in the water; and biſhop Wilkins imagines, that only ſeventy-two of the quadruped kind needed a place in the ark. Mr. Kirwan (Iriſh Tranſ. vol. vi. p. 291.) with a view of ſolving the objection ariſing from the difficulty of collecting or finding all the various ſpecies of animals now known, ſome of which can only exiſt in the hotteſt, and others only in the coldeſt climates, apprehends that no others were collected in the ark beſides thoſe that were moſt neceſſary for the uſe of man, and thoſe only of the graminivorous or granivorous claſſes. At this early period, ravenous animals were not only unneceſſary, but would have been even deſtructive to thoſe which had juſt obtained exiſtence, and probably not in great numbers: they only became neceſſary, when the granivorous had multiplied to ſuch a degree that their carcaſes would have ſpread infection. Hence, he ſays, they appear to have been of poſterior creation; and thus he alſo accounts for the exiſtence of thoſe that are peculiar to America and the torrid and frigid zones. Such is the ſingular hypotheſis of this ingenious naturaliſt.

The ark appears to have been divided into three ſtories; and it is agreed on, as moſt probable, that the loweſt ſtory was deſtined for the beaſts, the middle for the food, and the upper for the birds, with Noah and his family; each ſtory being ſubdivided into different apartments, ſtalls, &c. Though Joſephus, Philo, and other commentators add a kind of fourth ſtory under all the reſt; being, as it were, the hold of the veſſel, to contain the ballaſt, and receive the filth and fæces of ſo many animals.

Drexelius makes three hundred apartments; father Fournier, three hundred and thirty-three; the anonymous author of the Queſtions on Geneſis, four hundred; Buteo, Temporarius, Arius Montanus, Wilkins, Lamy, and others, ſuppoſe as many partitions as there were different ſorts of animals.—Pelletier only makes ſeventy-two, viz. thirty-ſix for the birds, and as many for the beaſts: his reaſon is, that if we ſuppoſe a greater number, as three hundred and thirty-three, or four hundred, each of the eight perſons in the ark muſt have had thirty-ſeven, forty-one, or fifty ſtalls to attend and cleanſe daily, which he thinks impoſſible. But there is not much in this; to diminiſh the number of ſtalls, without a dimunition of the animals, is vain; it being perhaps more difficult to take care of three hundred animals in ſeventy-two ſtalls, than in three hundred. Buteo computes, that all the animals contained in the ark could not be equal to five hundred horſes; he even reduces the whole to fifty-ſix pair of oxen. Father Lamy enlarges it to ſixty-four pair, or an hundred and twenty-eight oxen; ſo that ſuppoſing one ox equal to two horſes, if the ark had room for two hundred and fifty-ſix horſes, there muſt have been room for all the animals. And the ſame authors demonſtrate, that one floor of it would ſuffice for five hundred horſes, allowing nine ſquare feet to a horſe.

As to the food on the ſecond ſtory, it is obſerved by Buteo, from Columella, that thirty or forty pounds of hay ordinarily ſuffice an ox for a day; and that a ſolid cubit of hay, as uſually preſſed down in our hay-racks, weighs about forty pounds; ſo that a ſquare cubit of hay is more than enough for one ox one day. Now it appears that the ſecond ſtory contained 150,000 ſolid cubits; which, divided between two hundred and ſix oxen, will afford each more hay by two-thirds than he can eat in a year.

Biſhop Wilkins computes all the carnivorous animals equivalent, as to the bulk of their bodies, and their food, to twenty-ſeven wolves; and all the reſt to two hundred and eighty beeves. For the former he allows the ſuſtenance of 1825 ſheep, and for the latter 109,500 cubits of hay: all which will be eaſily contained in the two firſt ſtories, and much room to ſpare. As to the third ſtory, no body doubts its being ſufficient for the fowls, with Noah and his ſons and daughters.

Upon the whole, the learned biſhop remarks, that of the two, it appears more difficult to aſſign a number and bulk of neceſſary things to anſwer the capacity of the ark, than to find ſufficient room for the ſeveral ſpecies of animals already known to have been there.—This he attributes to the imperfection of our liſts of animals, eſpecially thoſe of the unknown parts of the earth; adding, that the moſt expert mathematician at this day could not aſſign the proportions of a veſſel better accommodated to the purpoſe than is here done; and hence finally concludes, that "the capacity of the ark, which had been made an objection againſt ſcripture, ought to be eſteemed a confirmation of its divine authority; ſince, in thoſe rude ages, men being leſs verſed in arts and philoſophy, were more obnoxious to vulgar prejudices than now; ſo that had it been a human invention, it would have been contrived according to thoſe wild apprehenſions which ariſe from a confuſed and general view of things, as much too big, as it has been repreſented too little." If we ſuppoſe that many animals would probably become torpid during the cold of the deluge, or conſume little food whilſt they were confined in a ſtate of darkneſs, the means of ſuſtenance laid up in ſtore for them would be thus diminiſhed. Beſides, it would be ſufficient to preſerve the eggs of thoſe animals that are oviparous; and many of them would be lodged in the earth with the ſeeds of plants, kernels of fruits, &c.; and thus the labour attending ſuch as were preſerved in the ark would be leſſened; and room would be obtained for diſpoſing a

variety of inſtruments and utenſils which would be wanted immediately or ſoon after the deluge had ſubſided. So that, all circumſtances conſidered, the capacity of the ark might be found fully adequate to all the purpoſes of its conſtruction, and for preſerving an ample ſupply of every thing that would be neceſſary for raiſing a new ſtock of animals and vegetables, after the deluge had ſubſided.

Thoſe who have objected to the Moſaic hiſtory of the deluge, ought candidly to conſider the ſeveral particulars that have been above ſtated; and they ought alſo to recollect, that the ſeveral varieties and ſpecieſes of both plants and brute animals, which differ from each other by ſmall degrees, ſeem to be multiplied every day by the viciſſitudes of climates, culture, food, mixture, &c. On the ſuppoſition of an univerſal deluge, which is confirmed by the general hiſtory of the world, and by a variety of exiſting facts and monuments, ſuch a ſtructure as the ark, for the preſervation and ſuſtenance of various animals, ſeems to have been abſolutely neceſſary; for as we can trace up the firſt imperfect rudiments of the art of ſhipping amongſt the Greeks, there could be no ſhipping before the flood; and, conſequently, no animals could have been ſaved. Nay, it is highly improbable that even men and domeſtic animals could be ſaved, not to mention wild beaſts, ſerpents, &c. though we ſhould ſuppoſe, that the antediluvians had ſhipping, unleſs we ſuppoſe alſo, that they had a divine intimation and directions about it, ſuch as Moſes relates; but this would be to give up the cauſe of infidelity. Hartley's Obſ. on Man, p. 372. Dr. Bryant (Anal. Anc. Myth. vol. ii. p. 213, &c.) has collected a variety of ancient hiſtorical relations, which ſhew that ſome records concerning the ark had been preſerved among moſt nations of the world, and the general ſyſtem of Gentile mythology. Abydenus, with whom all the eaſtern writers concur, informs us that the place of deſcent from the ark was Armenia; and that its remains had been preſerved for a long time. Plutarch (De Solert. Anim. Oper. vol. ii. p. 968.) mentions the Noachic dove, and its being ſent out of the ark. Lucian (De Dea Syria. vol. ii. p. 882.) ſpeaks of Deucalion's going forth from the ark, and raiſing an altar to God. The prieſts of Ammonia had a cuſtom, at particular ſeaſons, of carrying in proceſſion a boat, in which was an oracular ſhrine, held in great veneration: and this cuſtom of carrying the deity in an ark or boat, was in uſe alſo among the Egyptians. Biſhop Pococke has preſerved three ſpecimens of ancient ſculpture, in which this ceremony is diſplayed. They were very ancient, and found by him in Upper Egypt. Vid. Diod. Sicul. l. xvii. p. 528. Pococke's Works, vol. i. p. 252. The ſhip of Iſis referred to the Ark, and its name "Baris," was that of the mountain correſponding to Ararat in Armenia. Bryant finds reference to the ark in the temples of the ſerpent-worſhip, called "Dracontia;" and alſo in that of Seſoſtris, faſhioned after the model of the ark, in commemoration of which it was built, and conſecrated to Oſiris at Theba; and he conjectures, that the city, ſaid to be one of the moſt ancient in Egypt, as well as the province, was denominated from it; Theba being the appellation of the ark. In other countries, as well as in Egypt, an ark, or ſhip, was introduced in their myſteries, and often carried about in the ſeaſons of their feſtivals. He finds alſo in the ſtory of the Argonauts ſeveral particulars, that are thought to refer to the ark of Noah. As many cities, not in Egypt only and Bœotia, but in Cilicia, Ionia, Attica, Phthiotis, Cataonia, Syria, and Italy, were called Theba; ſo likewiſe the city Apamea was denominated Cibotus, from Κιβωτος, in memory of the ark, and of the hiſtory connected with it. The ark, according to the traditions of the Gentile world, was prophetic; and was regarded as a kind of temple, or reſidence of the deity. It comprehended all mankind, within the circle of eight perſons, who were thought to be ſo highly favoured of heaven, that they at laſt were reputed to be deities. Hence in the ancient mythology of Egypt, there were preciſely eight gods (Diod. Sic. l. i. p. 12.), and the ark was eſteemed an emblem of the ſyſtem of the heavens. The conſtellation Aquarius, in particular, and the great effuſion of that element, as it is depicted in the ſphere, undoubtedly related to this hiſtory. The principal terms by which the ancients diſtinguiſhed the ark, were Theba, Baris, Arguz, Aren, Arene, Arni, Laris, Boutas, Bœotus, and Cibotus; and out of theſe they formed different perſonages. As the ſtay in the ark was an intermediate ſtate between a loſt world and a world renewed, this was alluded to in the hieroglyphical repreſentations of the Gentile writers. See Janus, Prometheus, and Saturn. As the ark was repreſented under the figure of a ſhip, ſtyled αμφι-πρυμνὰς, i. e. whoſe extremities were alike, which formed a kind of creſcent, the new moon, appearing in this ſhape, was made a type of the ark. Hence, in the mythology of the ark, and the Jönah or dove, there is continually ſome reference to the moon; and hence the moon was eſteemed by the Egyptians the mother of all beings, for the moon and the ark were ſynonymous terms.

Ark *of the Covenant*, or *of the Teſtimony*, in Scripture, denotes a kind of cheſt made of ſhittim wood, overlaid within and without with pure gold, $2\frac{1}{2}$ cubits long, $1\frac{1}{2}$ broad, and $1\frac{1}{2}$ deep, in which, by God's command, Exod. xxv. 16. were kept the two tables of ſtone, on which God had engraven the ten commandments, given to Moſes on the mount, and held in high veneration among the Hebrews. It contained likewiſe the golden pot that had manna, and Aaron's rod, and the tables of the covenant. Heb. ix. 4. The ark was repoſited in the holieſt place of the tabernacle. —It was taken by the Philiſtines, and detained twenty, ſome ſay forty years, at Kirjath-Jearim; but the people being afflicted with emrods on account of it, returned it with divers preſents. It was afterwards placed in the temple. See *Plate* I. *Miſcellany*.

The lid or covering of the ark was called the *propitiatory*, or mercy-ſeat; over which were two figures placed, called *Cherubim*, with expanded wings of a peculiar form. This covering was made of pure gold, of equal length and breadth with the ark, and kept ſteady by a crown or coronet of gold, which alſo ſerved as an ornament. The covering was called כפרת, a word which may be derived from covering or from expiating ſin, as in the language of ſcripture, when ſins are forgiven, they are ſaid to be covered. The ſeptuagint have joined both ſenſes together in their tranſlation, Ιλαςηριον επιθημα. Over this covering, and between the wings of the cherubim, was the place, where the Schechinah reſted, both in the tabernacle and temple, in a viſible cloud; hence were iſſued the divine oracles by an audible voice; and the high prieſt appeared before this mercy-ſeat once every year on the great day of expiation; and the Jews, wherever they worſhipped, turned their faces towards the place where the ark ſtood. In the ſecond temple there was alſo an ark, made of the ſame ſhape and dimenſions with the firſt, and put in the ſame place, but without any of its contents and peculiar honours. It was uſed as a repreſentative of the former, on the day of expiation, and a repoſitory of the original copy of the holy ſcriptures, collected by Ezra and the men of the great ſynagogue, after the captivity. And in imitation of this, the Jews to this day have a kind of ark in their ſynagogues, wherein their

 ſacred

facred books are repofited: this they call *aron*. Leo of Modena gives a defcription of it, in his account of the cuftoms and ceremonies of thofe of his nation: "The Jews (fays he), in the eaftern fides of their fynagogues, have an ark, or armory, called *aron*; in memory of the ark of the covenant. In this are preferved the five books of Mofes, written on vellum, with ink made on purpofe," &c. Some have fuppofed that the figure of this ark is ftill remaining on the triumphal arch of Titus at Rome; though Villalpandus and others, with greater reafon, are of opinion that it is the table of fhew-bread. Prideaux's Conn. vol. i. p. 209. Lowman's Tracts, p. 133. Tertullian calls this ark, *Armarium Judaicum*; whence the phrafe, *to be in the armory of the fynagogue*, q. d. in the number of canonical writings.

A cheft or coffer, very nearly refembling the Jewifh ark, and called the "houfe of the God," was found in Huaheine, one of the iflands of the fouthern fea. Mr. (fir Jofeph) Banks could obtain no other information concerning it than what the name imports. Hawkefworth's Account, &c. vol. ii. p. 252.

ARK is ufed for a large cheft, in which corn and fruit are depofited.

ARK, or *Arks*, in *Conchology*, the trivial Engliſh name of all fuch fhells as belong to the Linnæan genus ARCA, and correfponding with the French name ARCHE. See ARCA.

ARK *iſland*, in *Geography*, one of the two fmall iflands, which lie between the iflands of Guernfey and Sark; the other is called *Arm*.

ARKA. See ARCA.

ARKADELT, GIACOMO or JACQUES, in *Biography*, was a difciple of Jufquin, and feems to have fpent the chief part of his life in Italy, as the firft editions of his principal works were printed at Venice, between the years 1539 and 1575.

The number of his motets that was publifhed then, in different collections of the times, is very conſiderable; but his madrigals were received with fuch avidity, that five books of them were publifhed at Venice, between the years 1539 and 1541, in one of which is the celebrated madrigal, *Il bianco e dolce cigno cantando muore*, highly favoured all over Europe; and his reputation for this fpecies of compofition was fo great in Italy, that, according to Adami, who enumerates him among the fingers and compofers of the pontifical chapel, his name was fometimes prefixed to the productions of others, in order to forward their fale.

Why Du Verdier and others have called Arkadelt a Frenchman, Dr. Burney doth not know: his maſter, at leaſt, was a Netherlander, and his name has a very Flemiſh appearance. He was at Venice in the elder Doni's time, and compofed chiefly to Latin and Italian words. Whatever country gave him birth, he was an excellent compofer; and, for the time in which he lived, his melodies are uncommonly natural, fmooth, and graceful.

ARKADINSKAIO, in *Geography*, a town of Ruſſian Tartary, in the country of the Coſſacks, on the river Medveditza, 240 miles north-eaſt of Azoph, and 124 fouth-weſt of Saratov. N. lat. 50° 10'. E. long. 43° 4'.

ARKANSAS, a north-weſt branch of Miſſiſippi river, which falls in by two mouths, and forms an iſland, whoſe north-weſtern point lies in N. lat. 33° 35'. W. long. 91°. Its length is thirty-five, and breadth ten miles.

ARKEEKO, a town of Abyſſinia, ſeated on a large bay of the Arabian gulf, and conſiſting of about 400 houſes, of which ſome few are built of clay, and the reſt of coarſe graſs-like reeds. There is water enough for large ſhips cloſe to Arkeeko, but as the bay is open to the north-eaſt, it is uneaſy riding in blowing weather. The bottom is compoſed of ſoft ſand. In ſtanding in upon Arkeeko from the ſea, through the canal between Shekh Seide and the main land, it is neceſſary to range the coaſt about a third nearer the main than the iſland. The point, or Shekh Seide, ſtretches far out, and has ſhallow water upon it. The cape that forms the ſouth weſt ſide of the large bay is called "Ras Gedem," being the rocky baſe of a high mountain of that name, ſeen at a conſiderable diſtance from ſea, and diſtinguiſhed by its form, which is that of a hog's back. In the bay between Arkeeko and Maſuah are two iſlands, Toulahout and Shekh Seide; the firſt on the weſt, the other on the ſouth, both uninhabited and deſtitute of water. Shekh Seide has a marabout, or ſaint's tomb, on the weſt end. It is not half a mile in length, when not overflowed; but has two large points of ſand which run far out to the eaſt and weſt. Its weſt point runs ſo near to Toulahout, as, at low water, ſcarcely to leave a channel for the breadth of a boat to paſs. N. lat. 15° 35'. E. long. 39° 30'. Bruce's Trav. vol. iii. p. 56.

ARKEL, a diſtrict of the united provinces, in the low countries, belonging particularly to that of Holland; comprehending the town and ſeigniories of Aſperia, of Heuchelnam, and ſome villages: and otherwiſe called the country of Gorkum.

ARKI, a town of European Turkey, ſituate in Boſnia, at the mouth of the river Boſna.

ARKITES, in *Ancient Geography*, the deſcendants of Canaan, who inhabited the town of Arka or Arca.

ARKITES, were alſo a people ſo denominated, according to Bryant in his "Analyſis of Ancient Mythology," from Noah's ark, and the deſcendants of this venerable patriarch, who ſent out various colonies that eſtabliſhed themſelves in different countries of the globe. They were diſtinguiſhed by their peculiar rites, and they gave names to the different countries and towns in which they ſettled, which had a reference to the ark, and their anceſtors who were preſerved by it from the deſtruction of the deluge. Thoſe of them who came into Greece, ſettled in many parts, but eſpecially in Argolis and Theſſalia, where they introduced their rites and worſhip. In the former of theſe regions, they were commemorated under a notion of the arrival of Da-naus, or Danaus, ſuppoſed to have been a perſon who fled from his brother Ægyptus, and came over in a ſacred ſhip given by Minerva; which, like the ARGO, is ſaid to have been the firſt ſhip that was conſtructed, and he was aſſiſted in the building of it by the ſame deity, divine wiſdom. Danaus, upon his arrival, built a temple, called Argus, to Jönah, or Juno, of which he made his daughters prieſteſſes. The people of the place had an obſcure tradition of a deluge from which ſome few eſcaped, the principal of whom was Deucalion, who took refuge in the Acropolis, or temple. The Arkites who ſettled in Theſſaly carried with them the ſame memorials, concerning Deucalion and his deliverance, which they appropriated to their own country. Theſe Arkites, and their rites, extended very widely, from Chaldæa and Babylonia, where they originated; and paſſed from Egypt and Syria, to Phrygia and Pontus, Thrace and the cities of Greece; and they were likewiſe carried into Hetruria, and into the regions of the Celtæ, and traces of them are to be obſerved as high up as the Suevi. Bryant thinks, that the Arkite rites prevailed in many parts of Britain, eſpecially in the iſle of Mona, which was afterwards the chief ſeat of the Saronides or Druids: and he conceives, that this iſland had its name Mona, or Menai, Men-ai, the iſland of the god Lunus, from its rites. The ſame worſhip was probably further introduced, as he imagines, into ſome of the Scottiſh iſles, and particularly into that called Columb-kil or Columba. To the claſs of Arkite prieſts Bryant refers the Cabiri, or Curetes, Corybantes,

bantes, Telchines, and Idæi Dactyli, who belonged to the ſame order, under different denominations. See ARGOLIS, ARGONAUTS, and ARK.

ARKIT-KAN, in *Geography*, a town of Aſiatic Turkey, in the province of Caramania, eighteen miles eaſt of Akſhehr.

ARKLOW, a ſmall neat town of the county of Wicklow, in Ireland, ſituate near the mouth of the little river Ovaca, or Ovo; and having a haven for ſmall craft. The copper mine company have had thoughts of making the river navigable to Rathdrum; but the port is ſo bad, and the coaſt ſo ſhoaly, that the veſſels muſt remain about a mile off, and put out to ſea on the ſlighteſt appearance of bad weather. There was a deſperate battle fought here, on the 9th of June 1798, between the inſurgents, twenty thouſand ſtrong, and the king's troops and yeomanry under general Needham. The town was ſet fire to by the rebels, and great part of it deſtroyed; but they were finally repulſed with conſiderable loſs. Diſtance from Dublin thirty-ſix miles. N. lat. 52° 48′. W. long. 6° 8′.—In 1795, a diſcovery was made of native gold in a brook that deſcends from the north-eaſt ſide of a mountain about 600 yards above the level of the ſea called Kinſhelly, and ſituate about ſeven Engliſh miles to the weſt of Arklow. This diſcovery was made public, and the reſearches for gold began early in the month of September, and continued till the 18th of October, during which period of about ſix weeks, the quantity of gold that is ſuppoſed to have been collected amounted to 800 ounces. The gold was of a bright yellow colour, perfectly malleable; and it was found in pieces of various weights, forms, and ſizes, from the moſt minute particle to 202.7 dwts.; one piece of 2 oz. and another of 22 oz. were alſo found. Two ſpecimens of this gold were aſſayed by his majeſty's aſſay-maſter in the tower of London; one of which appeared to contain, in 24 carats, 21$\frac{6}{8}$ of fine gold, 1$\frac{7}{8}$ of fine ſilver, and $\frac{3}{8}$ of alloy, which ſeemed to be copper tinged with a little iron. The works were taken poſſeſſion of by order of government; and the operations of the peaſants, who in great numbers had been induſtrious in their reſearches, were diſcontinued. Phil. Tranſ. vol. lxxxvi. p. 34—45.

ARKLOW *bank*, denotes ſand-banks in the Iriſh ſea, about ten miles long, and ſcarcely one broad, five miles from the coaſt of Ireland, having the town of Arklow nearly oppoſite to the middle part of them.

ARKWKIGHT, SIR RICHARD, in *Biography*, an eminent manufacturer, advanced himſelf, by his mechanical inventions for carding and ſpinning cotton, from the humble ſtation of a country barber to an immenſe fortune and an honorary title. For performing theſe operations of carding and ſpinning by means of machinery, it was required either that the uſual manœuvre of the carder ſhould be effected with ſquare cards, or that cylinders, covered with a kind of metallic bruſh-work, ſhould be made to revolve in contact with each other, either to card or to ſtrip, according as the reſpective velocities, directions, and inclinations of their wires might be adjuſted. With regard to ſpinning, it would be indiſpenſably neceſſary, not only that the raw material ſhould be very nicely prepared, but alſo that it ſhould be regularly drawn out by certain parts repreſenting the fingers and thumbs of the ſpinner. The contrivance for this purpoſe conſiſted of a certain number of pairs of cylinders, each pair revolving in contact with each other. Suppoſe then that a looſe thread or ſlightly twiſted carding of cotton were made to paſs between one pair of cylinders, properly adapted with a facing for holding it, and that it proceeded from thence to another pair, whoſe ſurfaces revolved with a much greater velocity; it is evident, that this quicker revolution would draw out the cotton, and render it thinner and longer when it came to be delivered at the other ſide. This is the operation which the ſpinner performs with his finger and thumb; and if the cotton be delivered to a ſpinning apparatus, it will be converted into thread. Sir R. Arkwright contrived to make theſe rotatory carding and ſpinning engines to move by horſe, by water, and by ſteam; and thus, by the ſaving of labour, and with the advantage of a patent monopoly, he was rendered one of the moſt opulent of our manufacturers.

After he had quitted his original buſineſs, in the year 1767, he came to Warrington, where he projected a mechanical contrivance for a kind of perpetual motion. A clock-maker of this town, whoſe name was John Kay, diſſuaded him from it, and ſuggeſted that much money might be gained by an engine for ſpinning cotton, which Kay promiſed to deſcribe. Arkwright at firſt objected, but afterwards aſked Kay, if this engine might be made at a ſmall expence? Kay had been employed in making a cotton ſpinning engine; and in the trial for ſetting aſide Arkwright's patent, it was proved that he had invented ſuch an engine, but he had not brought it to perfection. Kay and Arkwright applied to Peter Atherton, eſq. of Liverpool, for aſſiſtance in the conſtruction of ſuch an engine, who, diſcouraged by the mean appearance of the latter, declined undertaking it; though he ſoon after agreed to lend Kay a ſmith and watch-tool maker to prepare the heavier part of the engine, whilſt Kay himſelf undertook to make the clock-maker's part of it, and to inſtruct the workmen. In this way Arkwright's firſt engine, for which he afterwards took out a patent, was made. Mr. Arkwright ſoon after connected himſelf in partnerſhip with Mr. Smalley of Preſton in Lancaſhire; but their property failing, they went to Nottingham, and there, by the aſſiſtance of wealthy individuals, erected a conſiderable cotton mill turned by horſes. A perſon of the name of Hayes had alſo employed himſelf in making cylindrical carding engines. Upon the whole, without minutely detailing further particulars, it appears that the cotton ſpinning was no new attempt when Mr. Arkwright embarked in it; but many difficulties occurred in bringing it to perfection. In the hands of Mr. Arkwright, the carding and ſpinning of cotton became a great national manufacture. According to his ſtatement, it appears that the advancement of it during a period of five years, coſt him and thoſe that were concerned with him 12,000*l.* before they derived from it any profit; and it muſt be allowed, that he alone ſeems to have had ſufficient perſeverance, activity, and ſkill to perfect a ſcheme, in the proſecution of which many others had failed, and to render it valuable to himſelf and the public. The merits of ſir R. Arkwright may be ſummed up with obſerving, "that the object in which he was engaged is of the higheſt public value; that though his family were enriched, the benefits which have accrued to the nation, have been incalculably greater; and that upon the whole, he is entitled to the reſpect and admiration of the world." He was knighted by his preſent majeſty on the 22d of December 1786, on occaſion of preſenting an addreſs from the high ſheriff and hundred of Wirkſworth; and died at his works at Crumford in Derbyſhire, Auguſt 3d, 1792. Gen. Biog.

ARL, GROSS, in *Geography*, a town of Germany, in the circle of Bavaria, and biſhopric of Salzburg, 10 miles S.W. of Radſtadt, and 38 S.S.E. of Salzburg.—Alſo, a river of Germany, which runs into the Salza, about 6 miles S.W. of St. John, in the biſhopric of Salzburg.

ARL, *Klein*, a river of Germany, which runs into the Salza, near the town of St. John.

ARLANT, a town of France, in the department of Puy de Dome, and chief place of a canton in the diſtrict of Am-

bert-

bert, 3 leagues ſouth of Ambert. The place contains 3,345, and the canton 10,934 inhabitants; the territory includes 167½ kiliometres, and 9 communes.

ARLANZA, a river of Spain, which runs into the Piſuerga, between Valencia and Valladolid.

ARLANZO, a town of Spain, in Old Caſtile, 3 leagues from Lerma.

ARLANZON, a river of Spain, which joins the Arlanza, near Palenzuela.

ARLAUD, James Anthony, in *Biography*, a famous painter, was born at Geneva in 1668. His principal attention was devoted to portrait painting, and he excelled in it to ſuch a degree, that the regent duke of Orleans, who favoured him with his patronage at Paris, ſaid of him, that while other miniature painters produced only images, he had found the means to paint portraits. In 1721 he viſited England, and having been recommended to the princeſs of Wales, afterwards queen Caroline, he was much favoured by the court. After leaving England, he made a tour through the provinces of France, and afterwards through Switzerland. Beſides portraits, Arlaud produced ſome hiſtory pieces, and other works. His Leda, which he copied from a bas-relief of Michael Angelo, and which at a ſmall diſtance appeared like the original marble, he deſtroyed, becauſe he thought it too licentious. After a reſidence of about 40 years at Paris, he returned with a handſome fortune and a good collection of pictures to his native place; where he died in 1743, at the age of 75 years. His valuable collection of paintings, drawings, models, and rare books, he left to the public library of Geneva. Moreri.

ARLAY, in *Geography*, a town of France, in the department of Jura, and chief place of a canton in the diſtrict of Lons-le-Saunier, five miles north of Lons-le-Saunier.

ARLBERG, a mountain of Germany, in the Tyroleſe, being a part of the Alps, between Bregentz and the lake of Conſtance.

ARLE, a river of Denmark, which runs into the North ſea, four miles ſouth of Breditede.

ARLEN, a town of Germany, in the county of Tyrol, ſituate on a mountain, 8 miles N.W. of Landeck.

ARLEQUIN, or Harlequin, in *Natural Hiſtory*, a trivial Engliſh name occaſionally applied to ſome birds, inſects, ſhells, and other objects of natural hiſtory, that are remarkable for a ſtriking variety of colours; thus the *Trochilus multicolor* of Gmelin is called by Dr. Latham the harlequin humming-bird, and the ſame may be illuſtrated by various other inſtances of the like nature.—The French naturaliſts adopt the term *arlequin* alſo; for example, *arlequin de Cayenne* is the common name of the *prionus longimanus*, *Prione longimane* (*Cerambyx longimanus* of Linnæus); *arlequin doré*, the name given by Geoffroy to their *Chryſomèle céréale* (*Chryſomela cerealis* of Linnæus); and *arlequin velue*, a name given likewiſe by Geoffroy to their *Cétoine velue* (*Cetonia hirta* of Fabricius).

ARLES, in *Geography*, a town of France, in the department of the Eaſt Pyrenées, and chief place of a canton in the diſtrict of Ceret, 18 miles S.W. of Perpignan. The place contains 1,226, and the canton 4,776 inhabitants; the territory includes 192½ kiliometres, and 11 communes. N. lat. 42° 27′. E. long. 2° 32′.

Arles, a city of France, and principal place of a diſtrict in the department of the mouths of the Rhone, and chief place of a canton, in the diſtrict of Taraſcon, was, before the revolution, the ſee of an archbiſhop. It is ſituated in the midſt of a fertile country, which produces corn, wine, manna, oil, and fruit of various kinds. This city has ſeveral monuments of antiquity, which are worthy of notice. The amphitheatre is of an oval form, and was begun by Julius Cæſar, but never finiſhed. It is in circumference about 1164 feet, and the front is 102 feet in height. The arena, or middle, is 420 feet long, and 312 broad; the porticos or piazzas are three ſtories high, built with very large ſtones, and each of them conſiſts of 60 arches, which in part ſtill remain. The obeliſk is of granite, 58 feet high, and 7 feet in diameter at the baſe, the pedeſtal is adorned with four lions in marble, and at the top is a blue ball, on which are flower-de-luces of gold, and terminated by a ſun. It was dug up near the walls of the city in 1675, erected in the following year, and dedicated to Louis XIV. Here are the ruins of two temples; the remains of a triumphal arc; two large columns of Grecian marble; the wreck of a capitol built here by the Romans; the burying place of the Pagans and Chriſtians, ſituate on the top of a hill, conſiſting of two parts, one called "Campus Elyſius," or "Eliſcamp," and the other "Moulaires;" that of the Pagans being diſtinguiſhed by two letters, D. M. "Diis manibus," and that of the Chriſtians by a croſs. Various pieces of gold, ſilver, and bronze have been found here: and alſo urns, lamps, and cups, without number. It was at Arles that the ſtatue of Diana was dug up, which was removed to the gallery of Verſailles. On a column erected in honour of Conſtantine the Great, who made this city the ſeat of empire, repaired its walls, and built a palace in it, is an inſcription, which imports that he was the reſtorer of Arelata or Arles. Thirteen councils were held in this city, between the years 353 and 1261. At Arles there is an academy of belles lettres founded in 1669; the academy of ſciences was diſcontinued after the life of Louis XIV., by whom it was founded. The marſhy land that lies in the vicinity of Arles renders it unwholeſome. The place contains 21,000, and the canton 23,020 inhabitants: the territory includes 1,047½ kiliometres, and three communes. N. lat. 43° 4′. E. long. 4° 48′.

ARLESHEIM, a ſmall but pleaſant town of Switzerland, about 4 miles from Baſle. Within a quarter of a mile from this town is a beautiful hermitage, deſigned for the employment of the poor in a ſeaſon of great ſcarcity, and furniſhing agreeable walks for the inhabitants of the town. The walks are carried along the ſides of rocks, which are richly wooded, and through a ſemicircular plain, bounded by fertile hills, and watered by a ſmall lake; ſeveral natural caverns add to the romantic ſingularity of the ſcenery; while many tranſparent ſtreams, brought from a conſiderable diſtance, fall in ſmall caſcades, or bubble from the ground like real ſprings.

ARLEUX, a town of France, in the department of the North, and chief place of a canton in the diſtrict of Douay, 8 miles N.W. of Cambray. The place contains 1,460, and the canton 9,938 inhabitants: the territory includes 105 kiliometres, and 15 communes. N. lat. 50° 17′. E. long. 3° 16′.

ARLINGTON, a townſhip in Bennington county, Vermont, 12 miles north from Bennington, containing 991 inhabitants.

Arlington *Bay*, lies on the eaſt coaſt of Ireland, within the entrance of Carlingford bay.

Arlington's *Iſland*, is ſituated not far from the ſouth ſhore of Magellan's ſtraits.

ARLON, a town of the Netherlands, in the comté of Chini, annexed to the duchy of Luxemburgh; and by the new arrangement, in the department of the Forêts, and chief place of a canton in the diſtrict of Luxembourg; ſituate on a hill near the ſource of the river Semoy, 13 miles eaſt of Luxemburgh, and 14 ſouth of Bailogne. The place contains 3,128, and the canton 11,688 inhabitants: the territory includes 310 kiliometres, and 13 communes. N. lat. 49° 53′. E. long. 5° 28′.

ARLOTTO, Il Piovano, or *the Dean*, in *Biography*, was

was born of a family named "Mainardi," at Mugello, near Florence, in 1395, and at the age of 28 years aſſumed the clerical profeſſion. By his peculiar talent of contributing to the amuſement of ſociety by his humourous extravagances and repartees in converſation, he obtained eccleſiaſtical preferment, of which the higheſt was the rural deanery of St. Creſci, in the dioceſe of Fiaſole. Leſs celebrated as a poet than a buffoon, he rambled over Italy and other countries, diverting thoſe with whom he aſſociated by his pleaſantries and ſingularities; and thus recommended himſelf even to Lorenzo and Giuliano del' Medici. After his death, which happened in 1483, at the age of 87, a collection of his jeſts, witticiſms, and adventures, was printed under the title of "Facetie Fabule e Motti del Piovano Arlotto, Prete Fiorentino," which has been frequently reprinted. Nouv. Dict. Hiſtor.

ARLY, in *Geography*, a river of Savoy, which runs into the Iſere, near Conflans.

ARLYNG, in *Ornithology*, a name by which the Linnæan *Motacilla oenanthe* is known in ſome parts of England. This is the bird, called by Ray, Willughby, and other old writers, the fallow-ſmich, or white-tail, and is the wheat-ear of modern Engliſh ornithologiſts.

ARM, *brachium*, in *Anatomy*, ſtrictly ſpeaking, ſignifies the whole of that part of the upper extremity which intervenes between the ſhoulder and the elbow.

Arm, *Amputation of*, in *Surgery*. See Amputation.

Arm-*pit*. See Axilla.

Arm-*preſentation*, in *Midwifery*, is when the arm or hand of the fœtus preſents to the orifice of the uterus, inſtead of the head. In natural labours, that is, when the head of the fœtus is the preſenting part, and frequently when the breech preſents, they may be eaſily perceived through the parietes of the uterus and vagina, at whatever period of geſtation labour comes on, even before the os uteri begins to be dilated; but when the arm, or any other part, preſents, the body of the fœtus being thruſt down with more difficulty, it frequently happens, we are not able to diſtinguiſh the preſenting parts until the os uteri is conſiderably dilated; and ſometimes they are not to be diſcovered until the membranes are ruptured, and the waters are flowing away. Whenever, therefore, on examining *per vaginam* during a pain, no part of the fœtus can be diſtinctly felt, we ſhall be generally right in concluding that the labour will be preternatural, that is, that the arm, ſhoulder, or ſome other part than the head or breech of the fœtus, will preſent to the orifice, unleſs the deſcent of the fœtus be prevented by the unnatural projection of the brim of the ſacrum, or the pelvis be in ſome other way contracted and diſtorted. In theſe caſes, by the general conſent of practitioners, the child muſt be turned and extracted by the feet. For the manner of performing this operation, ſee Præternatural Labours.

Arm *of a horſe*, is that part of his fore leg which is intercepted between his ſhoulder and knee. See Horse.

Arm, in the *Manege*, is applied to a horſe, when he endeavours to defend himſelf againſt the bit, to prevent obeying or being checked thereby.

A horſe is ſaid to *arm* himſelf, when he preſſes down his head, and bends his neck, ſo as to reſt the branches of the bridle upon his briſket; in order to withſtand the effort of the bit, and guard his bars and his mouth.

A horſe is ſaid to *arm himſelf with the lips*, when he covers the bars with his lips, and deadens the preſſure of the bit. This frequently happens in thick-lipped horſes. The remedy is by uſing a bit-mouth, forged with a cannon or ſcratch-mouth, broader near the bankers than at the place of its preſſure or reſt upon the bars.

For *arming againſt the bit*, the remedy is, to have a wooden ball covered with velvet or other matter, put on his chaul; which will ſo preſs him between the jaw bones, as to prevent his bringing his head ſo near his breaſt.

Arm, in *Geography*, is uſed for a branch of a ſea or river. Italy and Sicily are only parted by an arm of the ſea. St. George's arm, in the Mediterranean, is the Thracian Boſphorus.

Arm *Iſland*. See Ark.

Arm, among *Gardeners*, is ſometimes uſed in reſpect of cucumbers and melons, in the ſame ſenſe as branch of other plants.

Arm is alſo figuratively uſed for *power*. The ſecular arm is the lay or temporal authority of a ſecular judge; to which recourſe is had for the execution of the ſentences paſſed by eccleſiaſtical judges. The church ſheds no blood; even the judges of inquiſition, after they have found the perſon guilty, ſurrender him to the ſecular arm. The council of Antioch, held in 341, decrees, that recourſe be had to the ſecular arm to repreſs thoſe who refuſe obedience to the church; for ſecular arm, they here uſe exterior power.

Arm, in the *Military Art*, *Heraldry*, &c. See Arms, and Armor.

Arm, in *Sea Language*, a ſhip is ſaid to be *armed*, when fitted out, and provided, in all reſpects for war.

Armed ſhip more peculiarly denotes a veſſel that is occaſionally taken into the ſervice of government in time of war, and employed to guard ſome particular coaſt, or attend on a fleet. All ſhips of this ſort are commanded by an officer of the navy, and are upon the ſame eſtabliſhment with the king's ſloops.

Alſo a croſs-bar ſhot is ſaid to be *armed*, when ſome rope-yarn, or the like, rolled round about one end of the iron bar which runs through the ſhot, both that the ſhot may be the better rammed down into the gun, and leſt the ſharp end of the bar ſhould catch into any honey-combs within the cylinder of the piece.

Arm, *Yard*. See Yard.

Arm, in reſpect of the *Magnet*.—A loadſtone is ſaid to be *armed*, when it is capped, caſed, or ſet in iron or ſteel; in order to make it take up the greater weight; and alſo to diſtinguiſh readily its poles. See Armed Magnet.

ARMA, in *Geography*, a ſmall province of South America, with a town and a river of the ſame name. The ſoil is ſo fertile, that it produces maize twice in the year.

Arma *dare*, to give arms, in ſome ancient charters, ſignifies to dub or make a knight.

Arma *deponere*, to lay down arms, was a puniſhment anciently enjoined when a man had committed an offence. Leg. Hen. I.

Arma *mutare*, q. d. to change arms, was a ceremony uſed to confirm a league or friendſhip.

Arma *moluta*, were ſharp weapons: Fleta calls them *arma emolita*.

Arma *reverſata*, inverted arms, was a puniſhment when a man was convicted of treaſon or felony.

ARMADA, a Spaniſh term, ſignifying a fleet of men of war. The armada which attempted to invade England in the time of queen Elizabeth A. D. 1588, is famous in hiſtory; it was partly ſcattered by the wind, and partly ſubdued by the Engliſh fleet. On which occaſion a medal was ſtruck with this motto, *Afflavit Deus, et diſſipantur*.

The ſituation of Philip II. at the time when he projected this invaſion, was ſuch as furniſhed a variety of motives, not only to induce his undertaking it, but to flatter him with the hope of ſucceſs. Whilſt ſecretly meditating his deſign in the preceding year, and actually commencing his preparations, Drake deſtroyed a whole fleet of tranſports at Cadiz, laden with ammunition and naval ſtores; he alſo ravaged his weſtern coaſt, inſulted Liſbon, and took a rich carrack,

carrack, laden with treaſure and papers of great importance. By this ſhort expedition, the means of which had been furniſhed by the London merchants, the naval preparations of Spain were diſconcerted, the propoſed expedition againſt England was retarded twelve months, and the queen had leiſure to make more ſecure meaſures againſt that formidable invaſion. Cavendiſh had alſo, in the ſame year, committed great depredations on the Spaniards in the South-Sea; having taken nineteen veſſels, ſome of which were richly laden; and after returning by the Cape of Good Hope, he had entered the river Thames in his way to London with a kind of triumph. His mariners and ſoldiers were cloathed in ſilk, and his ſails were of damaſk, his top-ſail cloth of gold, and his prizes were eſteemed the richeſt that had ever been brought into England. Philip, provoked by theſe hoſtilities on the part of Elizabeth, had harboured for a conſiderable time a ſecret and violent deſire of revenge. His ambition alſo, and the hopes of extending his empire, were much encouraged by the preſent proſperous ſtate of his affairs; by the conqueſt of Portugal, the acquiſition of the Eaſt Indian commerce and ſettlements, and the yearly importation of vaſt treaſures from America. Beſides, his higheſt glory was connected with that perpetual object of his policy, which was the ſupport of orthodoxy and the extermination of hereſy; and as the power and credit of Elizabeth were the chief bulwark of the proteſtants, he hoped, by ſubduing that princeſs, to acquire the immortal renown of re-uniting the whole Chriſtian world in the catholic communion. Above all, his indignation againſt his revolted ſubjects in the Netherlands, inſtigated him to attack the Engliſh, by whom they were encouraged and ſupported. The period which he had choſen for this purpoſe was peculiarly favourable to his deſign; as a truce had been lately concluded with the Turks; the empire alſo was in the hands of a friend and near ally; and France, the perpetual rival of Spain, was ſo diſtracted with inteſtine commotions, that ſhe was incapable of directing her attention to her foreign intereſts. Thus circumſtanced, Philip was determined, by one bold effort, to acquire that aſcendant in Europe, to which the preſent greatneſs and proſperity of the Spaniards ſeemed ſo fully to entitle them; and he therefore proceeded immediately to the execution of his ambitious project. His preparations had been for ſome time conducted with ſtudied ſecrecy and reſerve; but when his reſolution was formed, every part of his extenſive empire reſounded with the noiſe of armaments. And all his miniſters, generals, and admirals were employed in forwarding the deſign. The marquis of Santa Croce, a ſea-officer of great reputation and experience, was deſtined to conduct the naval equipments, and to command the fleet. Accordingly the plans were laid and meaſures were taken in all the ports of Sicily, Naples, Spain, and Portugal, for fitting out ſuch a fleet and embarkation as had never before had its equal in Europe. The military preparations in Flanders were no leſs formidable. Troops were collected from all quarters for reinforcing the duke of Parma; and an army of 34,000 men was aſſembled in the Netherlands, which was kept in readineſs to be tranſported into England in boats and flat-bottomed veſſels, previouſly prepared and conveniently ſtationed for this purpoſe. To the moſt renowned nobility and princes of Italy and Spain, who were ambitious of ſharing in the honour of this great enterpriſe, might be added ſome hundreds of deſperate Engliſh renegadoes under the conduct of Stanley, who had been already proſcribed for delivering a Dutch fortreſs to Spain. The Spaniards, oſtentatious of their power, and elated with vain hopes, had already denominated their navy the "Invincible Armada."

As ſoon as the news of this propoſed invaſion reached the court of London, the queen made preparations for reſiſtance; nor was ſhe diſmayed by that power, by which all Europe apprehended ſhe muſt of neceſſity be overwhelmed. Her forces, however, ſeemed very unequal to reſiſt ſo potent an enemy. All the ſailors in England amounted at that time to about 14,000 men, and the royal navy conſiſted only of 28 ſail, many of which were of ſmall ſize. The dexterity and courage of the ſeamen far ſurpaſſed thoſe of the Spaniſh mariners, and compenſated for the inferior ſize and force of their veſſels. The alarm rouzed the exertions of the Engliſh people; and they concurred with ſingular alacrity in defending their liberty and religion againſt thoſe imminent perils with which they were menaced. The city of London ſupplied thirty ſhips and 10,000 men; other ports followed this example; the nobility and gentry, among whom were ſeveral Roman catholics, and even aliens, hired, armed, and manned 43 ſhips at their own charge; and all the loans of money which the queen demanded, were cheerfully granted. The command of the navy was entruſted with lord Howard of Effingham, a man of courage and capacity, and under him, as admiral, ſerved Drake, Hawkins, and Frobiſher, the moſt renowned ſeamen in Europe. The principal fleet was ſtationed at Plymouth; and a ſmaller ſquadron of 40 veſſels, commanded by lord Seymour, ſecond ſon of the protector Somerſet, lay off Dunkirk, in order to intercept the duke of Parma. An army of 20,000 men was diſpoſed in different bodies along the coaſt; and a body of 20,000 foot and 1000 horſe, under the command of the earl of Leiceſter, was ſtationed at Tilbury, in order to defend the capital. The principal army conſiſting of 34,000 foot and 2000 horſe, commanded by lord Hudſon, guarded the queen's perſon, and had orders to march whitherſoever the enemy ſhould appear. James, the Scots king, retained his engagements, with a fidelity that was of great importance to England and the proteſtant cauſe, and kept himſelf prepared to march with the force of his whole kingdom to the aſſiſtance of Elizabeth; and the queen obtained ſome ſecondary aid from Denmark and the Hanſe-towns. In a word, all the proteſtants throughout Europe were intereſted and anxious ſpectators on this occaſion. In order the more to excite the martial ſpirit of the nation, the queen appeared on horſeback in the camp at Tilbury; and riding through the lines, diſcovered a cheerful and animated countenance, exhorted her ſoldiers to remember their duty to their country and their religion, and profeſſed her intention, though a woman, to lead them herſelf into the field againſt the enemy, and rather periſh in battle than ſurvive the ruin and ſlavery of her people. The loyalty and enthuſiaſm of the ſoldiers were elevated into a kind of phrenzy, and they were prepared for any exertion which the cauſe in which they were engaged might require.

In the beginning of May, the armada was ready; but when it was preparing to ſail, the admiral, the marquis of Santa Croce, and the vice-admiral, the duke of Paliano, both died; and the duke of Medina Sidonia, a nobleman altogether unacquainted with naval affairs, and unexperienced in action, was appointed admiral. On the 29th of May, the Spaniſh fleet ſet ſail from Liſbon; but the next day it was diſperſed by a violent ſtorm, and ſome of the ſmalleſt ſhips were ſunk, whilſt the others took ſhelter in the Groine. As ſoon as the armada was refitted, it ſailed again towards the Engliſh coaſt. The fleet conſiſted of 130 veſſels, of which about 100 were galleons of larger ſize than any before uſed in Europe; and it carried on board 19,295 ſoldiers, 8456 mariners, 2088 galley-ſlaves, and 2630 great pieces of braſs ordnance. It was victualled for ſix months, and attended by 30 ſmaller veſſels. Superſtition too added her fanatic but powerful aid: bulls, denouncing

ing

ing hell-fire to Elizabeth and her abettors, accompanied the ſquadron; and a conſecrated banner from Rome waved over the heads of theſe new cruſaders. On the 19th of July, the armada arrived in the channel, diſpoſing itſelf in the form of a creſcent, and ſtretching to the diſtance of ſeven miles from the extremity of one diviſion to that of the other. The Engliſh admiral had juſt time to get out of port, when he ſaw it in full ſail, as Bentivoglio, an Italian writer, in a kind of poetical language, deſcribes its progreſs, and yet advancing with a ſlow motion, as if the ocean groaned with ſupporting, and the winds were tired with impelling, ſo enormous a weight. As the armada proceeded up the channel, Effingham, with the Engliſh fleet conſiſting of 140 ſhips, gave orders to avoid a cloſe fight, but to ſkirmiſh with the larger ſhips of the Spaniſh fleet, which it continued to do for ſix days. The armada, having reached Calais, caſt anchor before that place; and waited the arrival of the prince of Parma, who delayed leaving the Flemiſh ports until he was aſſured that the Spaniards were maſters at ſea. Whilſt the Spaniſh fleet lay confuſedly in this poſition, the Engliſh admiral, by a ſucceſsful ſtratagem, diſpatched eight of his ſmaller ſhips filled with combuſtibles, one after another, into the midſt of the enemy; and thus alarmed them to ſuch a degree, that they immediately cut their cables, and betook themſelves to flight with the greateſt diſorder and precipitation. The Engliſh fell upon them the next morning, took about 12 of their large ſhips, and damaged ſeveral others. The Spaniſh admiral having deſtroyed only one ſmall veſſel of the Engliſh, and perceiving that his own fleet had greatly ſuffered, and was in danger of being totally deſtroyed, prepared to return homewards: but as the wind oppoſed his paſſage through the channel, and the Engliſh veſſels haraſſed his retreat, he determined to ſail northwards, and making the tour of the iſland, to reach the Spaniſh harbours by the ocean. The Engliſh fleet for ſome time purſued him; and if their ammunition had not failed them, the whole armada muſt have been compelled to ſurrender at diſcretion; and indeed the duke of Medina was prevented from ſo doing merely by the advice of his confeſſor. The event, however, proved almoſt equally fatal to the Spaniards. A violent tempeſt aſſailed the armada after it had paſſed the Orkneys; and the mariners, unable to govern their unwieldy ſhips, yielded to the fury of the ſtorm, and allowed their ſhips to drive either on the weſtern iſles of Scotland, or on the coaſt of Ireland, where they were miſerably wrecked. At length, after the experience of inexpreſſible humiliation and diſtreſs, the ſhattered fleet, conſiſting of leſs than half its number, returned to Spain; and the ſeamen and ſoldiers, very much reduced by famine and diſeaſe, and the various hardſhips with which they had encountered, filled the country with accounts of the deſperate valour of the Engliſh, and of the tempeſtuous violence of the ocean that ſurrounds them. Philip, as ſoon as he heard of the diſaſtrous event, ſo mortifying to his pride and ambition, with an affected philoſophy fell on his knees, and rendering thanks for that gracious diſpenſation of Providence, expreſſed his joy that the calamity was not greater. The Spaniſh prieſts, who had frequently foretold the infallible ſucceſs of this holy cruſade, perplexed in accounting for the victory which had been gained over the catholic monarch by excommunicated heretics and an execrable uſurper, at laſt diſcovered, that all the calamities of the Spaniards had proceeded from their allowing the infidel Moors to live among them. The firſt Engliſh newſpaper, entitled the "Engliſh Mercurie," was printed during the time of the Spaniſh armada; the firſt number, dated the 23d of July 1588, is ſtill preſerved in the Britiſh Muſeum. Hume's Hiſt. vol. v. p. 330—345. Watſon's Hiſt. Philip II. vol. iii. p. 122. Andrews' Hiſt. Great Britain, vol. i. p. 145.

ARMADILLA, in the Spaniſh America, denotes a ſquadron of men of war, to the number of ſix or eight, from twenty-four to fifty pieces of cannon, which the king maintains to prevent foreigners from trading with the Spaniards and the Indians, both in time of war and peace.

The veſſels of this armadilla are thoſe that have been ſo much talked of, under the name of *guarda coſtas*.

They have even power to take all Spaniſh merchant-ſhips they meet with on the coaſts, that have no licences from the king.

The South ſea has its armadilla as well as the North ſea. The ordinary abode of the former is at Calao, a port of Lima; that of the latter at Carthagena.

ARMADILLO, in *Entomology*, one of the ſpecies of the ONISCUS genus, deſcribed by Linnæus in his Fauna Suecica. It is oval, cinereous brown, with a tail obtuſe and entire. This kind inhabits Europe; lurks under ſtones; and is called by Ray *aſellus lividus*.

ARMADILLO, in *Zoology*, the name given by Engliſh writers to thoſe quadrupeds which in the Linnæan ſyſtem conſtitute the genus DASYPUS: it is derived from the Spaniſh word *armadille*, and is ſynonymous with the French *tatou*. See DASYPUS.

ARMAGARA, in *Ancient Geography*, a town of India, on this ſide of the Ganges. Ptolemy.

ARMAGEDDON. See MEGIDDO.

ARMAGH, or ARDMAGH, in *Geography*, the name of one of the counties of the province of Ulſter in Ireland. It has lough Neagh on the North; the county of Down on the eaſt; Louth on the ſouth; Tyrone on the north-weſt; and Monaghan on the weſt. Its length from north to ſouth is nearly thirty-two Engliſh miles, and its breadth almoſt twenty, and the ſuperficial content 181,450 acres, or 283 ſquare miles (290,786 acres, and 454 ſquare miles Engliſh). The number of houſes, according to the laſt official return, is 22,900, in which, according to Mr. Buſhe's ſtatement, we cannot reckon fewer than 130,000 inhabitants; which is a population of near 460 perſons to every ſquare mile; a greater proportion than is found in any other county except Dublin. The number of pariſhes in this county are twenty, and, what happens only in Ulſter, the number of churches is greater, being twenty-ſix. Beſides the two county members, the city of Armagh ſends a member to the Imperial parliament. There is in this county very little flat ground; but the gentle hills which diverſify the face of it, are covered with a very rich ſoil, except in the diſtrict called the *Fews* which is full of mountains, and in the ſouth-eaſtern angle which is occupied by the lofty Sliebhgullen; but great part even of this rough ground is cultivated, and thickly inhabited. Throughout this county, the farms are ſmall, ſeldom exceeding from forty to ſixty acres, more commonly from five to twenty acres; and the tillage in general is bad, which has been obſerved to be the caſe wherever the linen manufacture ſpreads, becauſe tillage is there only a ſecondary object. To the induſtry of the people, and the flouriſhing ſtate of this manufacture which is carried on in all its branches, the extraordinary population of the county is to be attributed, and indeed there is no part of Ireland which affords ſuch pleaſing ſpectacles to a philanthropic obſerver. Yet, ſtrange to tell, this apparently happy ſpot, where induſtry ſeems to confer every bleſſing, has been the ſcene of moſt of the diſturbances which have taken place in the north; and both the Oak-boys and Defenders had their origin in it. There is no river of conſequence in Armagh, but

but the Blackwater which ſeparates it from Tyrone, on its north-weſtern boundary is navigable for ſome miles into lough Neagh; and the river Bann, and the Newry canal, afford a water-carriage from the lough to the bay of Carlingford on the eaſtern ſide. There are ſome conſiderable bogs from which the inhabitants are ſupplied with abundance of good turf, which is much uſed for firing. Some good marble is alſo found in this county. Armagh was one of the counties forfeited to the crown after the reduction of the earl of Tyrone, in the latter end of queen Elizabeth's reign, and was colonized under James the Firſt; and the northern part is ſtill called Oneil-land from the family name of that noted chieftain. The aſſizes are held at the city of Armagh. Beaufort, Young, &c.

ARMAGH, a city, and the capital of a county to which it gives name, in the province of Ulſter, Ireland. It is ſaid to have been founded by St. Patrick in the fifth century (though the very exiſtence of ſuch a perſon has been queſtioned), on an eminence from which it acquired its name, which implies a great high place or field. On the eſtabliſhment of Chriſtianity in this country, Armagh became a conſiderable city, and a celebrated univerſity, which was not only reſorted to by the natives, but alſo by the Anglo-Saxon youths from Britain. In the ſeventh century it was nearly deſtroyed by fire; and on the arrival of the Danes, was frequently plundered, and the greater part of its records taken away and deſtroyed. In 1152, cardinal Paparou being ſent to Ireland as legate, conſtituted Armagh the metropolitan ſee of Ireland; and it was provided by ſolemn ordinance, that no one ſhould be allowed to profeſs or teach theology, who had not been educated at its univerſity. This Univerſity however has been long extinct. The town was frequently plundered by the Engliſh before the reduction of that part of the iſland, and it was entirely deſtroyed by O'Neil in the reign of queen Elizabeth. It was ſoon after rebuilt and garriſoned, and has lately become a pretty town of good ſize, and well inhabited, through the attention and munificence of primate Robinſon, lord Rokeby. He built there a handſome archiepiſcopal palace, and a noble houſe for the ſchool, which is one of the royal foundations, and extremely well endowed. To theſe he added a public library for the promotion of ſcience. He alſo erected a complete obſervatory; with a liberal eſtabliſhment for the ſupport of an aſtronomer, and ſecured the permanency of his endowments by ſeveral acts of parliament. The province of Armagh contains ten dioceſes; the archbiſhop having under him, the biſhops of Dromore, Down and Connor, Derry, Raphoe, Clogher, Kilmore, Ardagh, and Meath. The archbiſhoprick extends into five counties, viz. Armagh, Tyrone, Londonderry, Louth, and Meath, and is reputed to be worth 5000l. per annum. Armagh has one of the beſt linen markets in Ulſter, and there are many bleach-greens in its neighbourhood on the banks of the Callen, a ſmall ſtream which paſſes near the foot of the riſing ground on which it is built. Its diſtance from Dublin is ſixty-two miles, N. by W. N. lat. 54° 20′ 30″. W. long. 6° 32′. Collect. de Reb. Hiber. N° 11. Beaufort. Leland.

ARMAGIA, a town of Arabia, ſixty-eight miles ſouth of Cathem.

ARMAGNAC, a province of France, in the diſtrict of Gaſcoyne, and government of Guyenne; before the late diviſion, about thirty-ſix leagues long and twenty-five broad; is bounded on the north by Angenois and Condomois, on the eaſt by Languedoc and the country of Comminges, on the weſt by Marſan and Bearn, and on the ſouth by the Pyrenees, which ſeparate it from Arragon, and Bigorre. The capital is Auch. It is divided into Upper and Lower Armagnac; the former lies among the Pyrenéan mountains, and comprehends four vallies; and the latter is more extenſive and fruitful, and contains proper Armagnac, and ſeveral counties and earldoms. The ſoil is generally fertile, and produces corn, wine, fruits, and paſture; and the commerce is conſiderable in wine, brandy, wool, flax, &c. The Armagnacs, who were the adherents of the young duke of Orleans, and ſo called from the count of Armagnac, father to this prince, formed one of the two parties into which the whole kingdom of France was divided, about the year 1415. The city of Paris, diſtracted between them and the Burgundians, but inclining to the latter, was at this time a perpetual ſcene of blood and violence; the king and royal family were often detained captives in the hands of the populace; their faithful miniſters were butchered or impriſoned before their faces; and it was dangerous for any man, amidſt theſe enraged factions, to be diſtinguiſhed by a ſtrict adherence to the principles of probity and honour. The fraternity of butchers declared for the duke of Burgundy, and committed the moſt violent outrages againſt the oppoſite party; whilſt the Armagnacs made intereſt with the fraternity of carpenters; the populace ranged themſelves on one ſide or the other; and the fate of the capital depended on the prevalency of either party. At length the Burgundians prevailed; butchered many of the faction of Armagnac, and threw the count and ſeveral perſons of note into priſon, who were afterwards murdered by the populace.

ARMAMAR, a ſmall town of Portugal, in the province of Beira and diſtrict of Lamago, containing two pariſhes and about 1300 inhabitants.

ARMAMAXI, compoſed of the Latin *arma*, and the Greek ἁμαξα, *plauſtrum*, *carriage*, in *Antiquity*, a kind of Scythian chariots, or carriages, compoſed of two wheels, variouſly adorned with crowns, ſhields, breaſt-plates, and other ſpoils, carried in proceſſion after the images of the gods and great men. Theſe were ſometimes called *amaxi*, or *amaxæ*. Pitiſc. Lex. Ant.

ARMAMENT, a large body of forces, raiſed and provided with the furniture of war, either for land or ſea ſervice.

ARMAMENTA, in *Roman Antiquity*, comprehended the rigging and tackling of a ſhip, its ſails, ſail-yards, oars, ropes, &c. Hence *arma* denotes the ſails (Virg. Æn. v. 55.) and the rudder (vi. 353).

ARMANCE, in *Geography*, a river of France, which runs into the Armançon, near St. Florentin, in the department of the Yonne.

ARMANÇON, or ARMASNSON, a river of France, which riſes near Semur-en-Auxois, and runs into the Yonne, near Ligny.

ARMANT, a village of Egypt, ſeated on the Nile, in the route from Thebes to Eſné; ſuppoſed by Savary to be the ancient Hermunthis.

ARMARCALES, in *Ancient Geography*, a name given by Abydenus to the artificial channel that connected the two branches of the Euphrates, more properly denominated by Ammianus NAARMALCHA; which ſee.

ARMARIUM *unguentum*, among *Hermetical Philoſophers*, a ſympathetic ointment, or weapon-ſalve, whereby wounds are ſaid to have been cured at a diſtance, by only dreſſing the weapon.

ARMATA, in *Entomology*, an European ſpecies of APIS, deſcribed in the Syſtema Naturæ from Muſ. Leſk. It is brown; the head and thorax grey; jaws armed with a tooth at the baſe; bottom of the feet yellow. This inſect belongs to the genus MELITTA in Kirby's Apum Angliæ, where it is thus deſcribed under the ſpecific name *armata*: "nigra,

"nigra, cinerascente-villosa; maxillis longitudine capitis, basi dente armatis."

ARMATA, a species of LEPTURA found in some parts of Europe. The thorax is black and spinous; antennæ and legs ferruginous; wing-cases yellow, with two dots, a heart-shaped spot, and three bands of black. Herbst. Gmel. &c.—This insect bears some resemblance to *leptura attenuata*; the head, feet, posterior thighs and shanks, are black.

ARMATIUM, in *Ancient Physic*, a detersive kind of *collyrium*, of great value in removing asperities of the eyelids. Its chief ingredients were *æs ustum*, gum ammoniac, and the roots of the tree *thus*. The preparation is described by Galen, Aetius, Paulus, and Scribonius.

ARMATORIUS, in *Entomology*, an insect described in the *Fbarician mantissa*. It is small, and inhabits Germany; colour black, scutel white; thorax immaculate, posterior part bidentated; abdomen and legs ferruginous.

ARMATURA, ARMATURE, in a general sense, is the same with what we otherwise call ARMOUR.

ARMATURA is more particularly used in the *Ancient Military Art*, for a kind of exercise, performed with missive weapons, as darts, spears, arrows, and the like.

In this sense, armatura stands contradistinguished from *palaria*; the latter being the exercise of the heavy-armed, the former of the light-armed.

The armatura was practised with great diligence among the Romans; they had their campidoctores, on purpose to instruct the tyrones, or young soldiers, in it. Under it were included the throwing of the spear or javelin, shooting with bows and arrows, &c.

ARMATURA is also an appellation given to the soldiers who were light-armed.

Aquinus seems, without reason, to restrain armatura to the tyrones, or young soldiers, under discipline or tutorage in the exercise above mentioned.

ARMATURA is also a denomination given to the soldiers in the emperor's retinue. Du-Cange.

Of these we find two schools mentioned in the *notitia imperii*, called the *armaturæ seniores*, and *armaturæ juniores*. Their commander was entitled TRIBUNUS *armaturarum*.

ARMATUS, in *Entomology*, a species of CIMEX that inhabits New Holland. The thorax is acutely spined; scutel black with two dots, and apex testaceous; antennæ and legs red. Fabricius. Gmelin.

ARMAVIARA, in *Ancient Geography*, a town of Asia, in the greater Armenia. Ptolemy.

ARMAXA, or ARMACA, a town of Asia, in Cappadocia. Anton. Itin.

ARME', in *Ichthyology*, a specific name given by the French naturalists to a fish of the SILURE genus, found in Asia; and according to Block, in Surinam; this is the Linnæan *Silurus militaris*. See MILITARIS.

ARMED, in *Law*. See ARMS.

ARMED, in *Sea-Language*. See ARM.

ARMED in *flute*. See FLUTE.

ARMED, in *Heraldry*, is used in respect of beasts and birds of prey, when their teeth, horns, feet, beak, talons, or tusks, are of a different colour from the rest.—He bears a cock, or a falcon, *armed* or, &c.

ARMED *at all points*, terms applied to a person who is completely covered with armour, except his face.

ARMEDON, or ARMENDON, in *Ancient Geography*, a name given by Pliny to a small island in the vicinity of Crete, opposite to the promontory of Sammonium: probably one of those nameless rocks which now encompass Candia.

ARMENA, in *Botany*, a name given by Pliny to a kind of wild asparagus; but the ancient Greeks have used the same word to express the young shoots of the common asparagus, at the time when they are eaten; and not only these, but the young sprouts of the cabbage, and of all other esculent plants.

ARMENIA, in *Ancient* and *Modern Geography*, a country of Asia, derives its name, according to the Greeks, from Armonus, one of the Argonauts, who settled in this country. Bochart (Phaleg. l. i. c. 3.) supposes Armenia to be a contraction of הַר מִנִּי, Har-mini, denoting the mountain of Mini, the name of a province of this country, mentioned by the prophet Jeremiah (ch. li. 27.) and placed by him between Ararat and Aschchenaz; and probably referred to by Amos (ch. iv. 3.) under the name of הַר מוֹנָה, Harmunah, or mountain of the moon. To this purpose Mr. Bryant (Anal. Anc. Mythol. vol. iii. p. 2.) distinguishing between this country and Aramea, or the land of Aram, which was separated from it by mount Taurus, supposed it to be denominated from Ar-men or Har-men, the mountain where the ark rested.

Armenia was anciently divided into Major and Minor, or the Greater and Lesser.

Armenia Major, or Armenia properly so called, was, according to Strabo, bounded on the south by mount Taurus, separating it from Mesopotamia; on the east by the two Medias; on the north by Iberia and Albania, or that part of Caucasus by which both are surrounded; and on the west by Armenia Minor, or the mountains Paryadres, by some Pontic nations, and by the Euphrates. Ptolemy divides the whole of Armenia into three districts: the first, comprehending that part which lies between the Cyrus and the Araxes; the second, those provinces which extend westward to the bending of the Euphrates; and the third, all the country lying between the springs of the Tigris, and that part of the Euphrates which separates Commagene from Armenia Major. The most considerable cities of ancient Armenia were Artaxata, Sebastia, Armosata, Tigranocerta, Artagera, Carcathiocerta, Colonia, and Chorsa. Strabo enumerates six rivers of principal note; viz. the Lycus and Phasis, falling into the Pontus; the Cyrus and Araxes, discharging themselves into the Caspian Sea; and the Tigris and Euphrates, which disembogue themselves into the Persian Gulf. The most considerable mountains were the Moschick, separating the western parts of Armenia from Colchis; the Paryadræ, extending from the former to the borders of Armenia Minor and Pontus; Masius, bounding the province of Sophene to the south, as Antitaurus does to the north; Niphates, Abus, and the Gordyæan mountains. As to the origin of the ancient Armenians, Herodotus, and after him Stephanus, derive them from the Phrygians, on account of several Phrygian words that had been blended with the ancient language of the Armenians. Strabo supposes, that they were originally Syrians, or that the Syrians and Armenians were two tribes of the same nation; and in this opinion Bochart acquiesces, as he discovered a great similarity between these two nations, in their manners and language. However, in process of time, many foreigners settled among them; namely, Phrygians, Greeks, and Persians.

Armenia was advanced at a very early period to the honour of a kingdom. After the death of Barzanes, the successor of its first king Scytha, it was divided into several petty kingdoms, as we learn from Pliny (H. N. l. vi. c. 9.). The Armenians were afterwards subdued by the Medes, to whom they were made tributaries by Astyages, but continued to be under the government of kings of their own country. During its subjection to the emperor of Persia,

Armenia was reduced to the form of a province, and its rulers were prefects appointed by the Perſian kings. Armenia, as a part of the Perſian empire, was ſubdued by the Macedonians under Alexander the Great; and remained in ſubjection to the Macedonians till the time of Antiochus the Great. During the minority of Antiochus, Artaxias and Zadriades, two governors of Armenia, united their forces, ſeized on the country they governed, and having added to it ſome neighbouring provinces, erected two kingdoms, viz. that of Armenia Major, which Artaxias reſerved for himſelf, and that of Armenia Minor, which was allotted to Zadriades. Antiochus made ſeveral attempts to recover the provinces, which theſe governors had appropriated to themſelves, but his efforts were unſucceſsful; and by an alliance with the Romans, they ſecured to themſelves and their poſterity the continued poſſeſſion of them. After the death of Artaxias, the Armenian hiſtory is interrupted by a chaſm of about 70 years; it is only known, that the Armenians had engaged in a war with the Parthians, which terminated to their diſadvantage. Tigranes, however, the king's ſon, who had been delivered as a hoſtage to the Parthians, was reſtored to his kingdom after his father's death, about the year before Chriſt 95; and entered into an alliance with Mithridates Eupator, againſt the Romans. Having married Cleopatra, the daughter of Mithridates, Tigranes invaded Cappadocia, and took poſſeſſion of it, but ſurrendered it to Ariarathes, the ſon of Mithridates. Soon after his expedition into Cappadocia, he ſeems to have made peace with the Romans, and abandoned the cauſe of Mithridates; and having been choſen king of Syria, he indulged his ambition by invading Armenia Minor, and reducing the whole kingdom. After ſeveral ſucceſsful expeditions, by which Tigranes enlarged the boundaries of his dominion, he was defeated with great ſlaughter by Lucullus the Roman general, in the vicinity of Tigranocerta, who at length took the town, and got poſſeſſion of the immenſe treaſures which it contained. The conſequence of a ſecond defeat was the total diſperſion of the united armies of Tigranes and Mithridates, and the flight of the former to the moſt remote part of his dominions. During a ceſſation of hoſtilities, occaſioned by the mutiny of the Roman ſoldiers againſt Lucullus, and a diſagreement between him and Pompey, by whom he was ſuperſeded in the command, Mithridates and Tigranes rallied their forces, overran Cappadocia, and recovered all Armenia, with a great part of Pontus; but Tigranes's ſon, taking up arms againſt his father, joined the Romans, and conducted Pompey into Armenia. Tigranes, diſpirited by his ſon's revolt, met Pompey on his march towards Artaxata, and ſurrendered himſelf into his hands. Pompey, after having heard the appeal of the father for juſtice againſt his ſon, reſtored the kingdom of Armenia to Tigranes, together with the greateſt part of Meſopotamia; impoſing upon him at the ſame time a fine of 6000 talents for making war againſt Rome without cauſe. Tigranes, being put in poſſeſſion of his kingdom, voluntarily yielded to the Romans Cappadocia, Cilicia, Syria, and that part of Phœnicia which he poſſeſſed, and reſerved for himſelf only his paternal kingdom. His ſucceſſor Artuaſdes, called by Joſephus, Artabazes, by Oroſius, Artabanes, and by others, Artoadiſtes, was put to death by order of Marc Antony; and the kingdom of Armenia was conferred by Antony on Alexander, his ſon by Cleopatra. Artaxias, the eldeſt ſon of Artuaſdes, who was proclaimed king by the Armenians, was obliged by the Romans to abandon his kingdom, and fly into Parthia; but he was ſoon put to death. Tiberius, whom Auguſtus had deputed to ſettle the affairs of the eaſt, beſtowed the kingdom of Armenia, after the death of Artaxias, on his younger brother, Tigranes; who was in a little while, by Tiberius's own orders, put to death. The kingdom was afterwards given by Auguſtus to Artuaſdes, ſuppoſed to have been the ſon of Artaxias II.; but the Armenians, tired with the Roman yoke, expelled him, and called in Phraates, king of Parthia, preferring ſubjection to the Parthians rather than to the Romans. Upon the approach of the Roman army, Phraates withdrew, and Artuaſdes was reſtored to the throne. After a ſucceſſion of ſeveral kings, occaſionally under the controul of the Parthians, but generally holding the crown as vaſſals of the Roman empire, being either appointed or confirmed by the emperors: the ancient kingdom of Armenia was reduced by Trajan to the form of a province; and the Tigris was made the eaſtern boundary of the empire, which Auguſtus had thought fit to extend no farther than the banks of the Euphrates; but it ſoon recovered its liberty, and was again governed by its own kings, in the reign of Conſtantine the Great, and his ſucceſſor, to whom the kings of Armenia were feudatories. In the Perſian war, A. D. 365—378, the tributary kingdoms of Armenia and Iberia, the ſovereignty and alliance of which had been ſolemnly renounced by the Romans, were expoſed, without protection, to the arms of the Perſian monarch. Armenia was reduced to the ſtate of a Perſian province by Sapor, and the adminiſtration was ſhared between a diſtinguiſhed ſatrap and a favourite eunuch. In the reign of Juſtin II. it was ſubdued by the Saracens, A. D. 687, who held it till the irruption of the Turks; and when they took poſſeſſion of it, about 755 or 884, they gave it the name of Turcomania. The Turks, by invading Perſia, and other eaſtern countries, gave the Armenians an opportunity of throwing off the Turkiſh yoke, and of chuſing kings for themſelves, by whom they were governed till the country was again ſubdued by Occadan or Heccata, the ſon of Cingis, and firſt Cham of the Tartars. The conqueſt of the Tartars, however, was not ſo complete as wholly to extirpate from Armenia the race of its own kings; as we read of ſome of them who reigned afterwards, and particularly in our own chronicles, of Leo, king of Armenia, who, in the reign of Richard II., came into England to ſolicit aid againſt the Turks, by whom he had been driven from his kingdom. In the year 1472, Uſſan Caſſanes, king of Armenia, ſucceeding to the crown of Perſia, made Armenia a province of that empire; and in this ſtate it continued till the year 1522, when it was ſubdued by Selim II. and made a province of the Turkiſh empire; from which time it has ever continued ſubject to the Turks, except the eaſtern part of it, which belongs to the Perſians.

Armenia Minor, was bounded on the eaſt by the Euphrates, which ſeparated it from Armenia Major; on the ſouth by Mount Taurus, parting it from Cilicia; on the weſt and north by a long chain of mountains, called in different places Mons Scardiſcus, Amanus, and Antitaurus, which divided it from Cappadocia. This is a very mountainous country, but ſome of the mountains are interſperſed with pleaſant and fruitful vales, abounding with oil and wine, not inferior to the beſt in Greece. This country was a part of Cappadocia, till the reign of Antiochus the Great, when the diſtinction between Armenia the Greater and the Leſſer was introduced; as we have already mentioned. In the time of the Romans it was divided into four provinces; viz. Laviana, Mariana, Aravena, and Melitene, each of which had its cities, mentioned by Ptolemy; but thoſe of chief note were Melitene, Nicopolis, Garnace, Aza, Arabyſſus, Daſcuſa, Zimara, and Ladana. The manners, cuſtoms, and religion of the inhabitants of Armenia Minor, were

were ſimilar to thoſe of Armenia Major. Its firſt king was Zadriades, who, forming an alliance with the Romans, was maintained on the throne which he had uſurped. Nero beſtowed this kingdom on Ariſtobulus, great grandſon of Herod the Great; upon whoſe death it fell to Tigranes, his near relation; and as he died without iſſue, Armenia Minor was made by Veſpaſian a province of the Roman empire, and thus continued till the diviſion of the empire, when it was ſubjected to the emperors of the Eaſt. On the decline of their power, it was ſubdued, firſt by the Perſians, and afterwards by the Turks, who called it "Geneeh," and have held it ever ſince. Anc. Un. Hiſt. vol. viii. p. 363—410. Gibbon's Hiſt. i. 435. ii. 139, &c. iii. 137. iv. 157, &c. v. 428. See ARMENIANS.

Armenia is ſtill divided into *Leſſer* and *Greater*. Armenia the Leſſer is one of the two diſtricts of ALADULIA; Cappadocia being the other. It has Greater Armenia on the eaſt, Syria on the ſouth, the Euxine on the weſt, and Cappadocia on the north. It is alſo called Weſtern or Lower Armenia, and is ſubject to Turkey.

Armenia the Greater, or Turcomania, is bounded on the ſouth by Meſopotamia, and the provinces of Diarbekir, Kurdiſtan, and Aderbijan; on the north by Georgia; on the eaſt by Perſia, and particularly the province of Shirvan; and on the weſt by Cappadocia and the Leſſer Armenia, from which it is parted by the river Euphrates. It belongs partly to the Turks and partly to the Perſians. The chief towns in that part which belongs to the Turks, are Erzerum, the capital of Armenia, Kars, Barazid, Muſh, Argiſh, Van, &c. In that part of Armenia to which the dominion of Perſia extends, are Erivan, the capital, Ganjals, near the Kur, Naciſvan, Arlabad, Aſtabad, Marend, Cors, &c. Armenia is one of the moſt healthy and fertile provinces in Aſia; it abounds with mountains and valleys, lakes and rivers, ſo that the climate is temperate, and the ſoil rich; and ſome have conceived from its fertility, as well as its central ſituation on the globe, that it was the ſeat of Paradiſe, or the garden of Eden. Beſides all ſorts of grain, it produces tobacco, cotton, flax, melons, and grapes, and formerly olives. See ARARAT. It has alſo mines of ſalt, ſufficient to ſupply all Perſia. The extreme cold of this country has been long noticed; and to this purpoſe ſir John Chardin informs us, that he found ice in the rivulets in the mornings of the month of July. The inhabitants are ſober and induſtrious; and they are deſcribed as a ſenſible and polite people. By their frugality and enterpriſe, they are ſingularly qualified for commercial tranſactions. Since the conqueſt of their country by Shah Abas, king of Perſia, they have been diſperſed through various parts of Aſia and Europe, and have devoted themſelves, as merchants and brokers, to trade, in the conduct of which they excel: hence they are become, in a great meaſure, maſters of the whole trade of the Levant, and are much concerned in that of other places. It is common to meet with Armenians at Leghorn and Venice, and even in England and Holland; whilſt they are alſo known, by their commercial dealings, in Perſia, Turkey, and Tartary, and indeed all over the Eaſt. Shah Abas the Great, it is ſaid, with a view of ſecuring the conqueſt of Armenia, removed into Perſia the firſt Armenians who ever ſettled there; and on this occaſion about 30,000 families were tranſported into the province of Ghilan only, whence we have brought the fineſt Perſian ſilks. He alſo cauſed all the inhabitants of Zulfa, a large city of Armenia, to ſettle at Iſpahan, whence the new Zulfa of Perſia took its name. This Zulfa is ſince become the center of the commerce of the Armenians; and to this ſame Shah Abas theſe people are ſaid to owe their genius and diſpoſition for trade, little of which appeared before their tranſmigration into Perſia. As Abas the Great had no other object in view but that of enriching his country, and was ſenſible that this muſt be effected by trade, he directed his views to ſilk as the moſt precious commodity, and to the Armenians as the moſt proper people to be employed in diſpoſing of it. Accordingly, the Armenians, who were at firſt mere huſbandmen, were converted by him into merchants; and theſe merchants are become ſome of the moſt able and moſt celebrated traders in the world. Such has been their extenſive and eſtabliſhed reputation in this reſpect, that the cardinal de Richlieu, we are told, had a deſign to make a ſettlement of them in France, for promoting the commerce of that country; and the chancellor Seguier granted them a printing-houſe at Marſeilles. See ARMENIANS.

ARMENIACA, in *Botany*. See PRUNUS.

ARMENIAN BIBLE. See BIBLE, and ARMENIAN *Verſion*, infra.

ARMENIAN *Bole*. See BOLE.

ARMENIAN *Language and Science*. The Armenians, according to the account given of them by Moſes Chorenenſis, were, in their original ſtate, rude and ſavage, without letters, knowledge, and culture, in a great degree ignorant of the hiſtory of their anceſtors; and indebted for the ſcanty information reſpecting them to the books of their neighbours. They had no written characters, and thoſe of their neighbours were not fit for expreſſing the ſounds of their language. At length, however, the art of writing was introduced among them. For a conſiderable time their tranſactions were recorded in the Aſſyrian language; in proceſs of time they employed that of the Greeks; and afterwards they made uſe of that of the Perſians. In the time of Moſes Chorenenſis, the names of their towns, and ſome other particulars, were expreſſed in one of theſe three languages. It was after the introduction of Chriſtianity, that Mieſrob, either towards the cloſe of the fourth or the commencement of the fifth century, invented letters that accurately expreſſed the ſounds of the Armenian language, and which are in uſe among them at this day. This invention, according to the tradition of the country, was revealed to Mieſrob in a dream, after the author had in vain attempted to make the diſcovery himſelf, and after he had taken many uſeleſs journies to procure aſſiſtance from the learned. Sir William Jones (Aſiat. Reſ. vol. iii. p. 12.) is of opinion, that the baſis of the Armenian language was ancient Perſian, of the ſame Indian ſtock with the Zend, and that it has been gradually changed ſince the time when Armenia ceaſed to be a province of Irân. However, the letters in which it now appears are allowed to be comparatively modern; and if they be not derived from the Pahlavi, they are probably, as this ingenious writer imagines, an invention of ſome learned Armenians in the middle of the fifth century. According to Strabo, the language of the ancient Armenians was ſimilar to that of the Syrians; at leaſt it is very probable, from Polyænus (l. iv.), that they uſed the Syrian characters. The modern Armenians pretend, that, beſides their vulgar language, they have a learned one, which has no affinity with the other oriental languages, and which is very expreſſive, and enriched with all the terms of religion, and of arts and ſciences. Moſes Chorenenſis informs us, that Arteſchiſch II. took great pains to civilize the Armenians, and to reſcue them from that ſtate of barbarity in which they lived; and he ſays, that agriculture was little and rarely attended to in this country. They could neither build bridges nor conſtruct boats; they had no method of dividing time, and were ſcarce able to diſtinguiſh

guiſh the ſucceſſion of the moons. If, indeed, we credit the fables recorded by Beroſus, we find that Noah left among the Armenians books of religious ceremonies; that he taught them aſtronomy, and the diſtinction of years and months; that on this account he was honoured amongſt them, under the titles of Olybama and Aſia, i. e. the "heaven" and "ſun;" that they dedicated many cities to him, under the name of Jupiter Sagus, eſteeming him the ſoul of the heavenly bodies. The Armenians alſo tell us, that Noah taught them huſbandry, and the planting of vines; that he was their firſt king; and that, when he quitted Armenia, he left his mother, wife, and ſeveral of his deſcendants, to people the country. However, in later times, the Armenians made conſiderable progreſs in the uſeful arts and ſciences; and particularly in the ſcience of commerce. See ARMENIA.

ARMENIAN *Religion.* Strabo informs us, that the ancient Armenians worſhipped the ſame deities with thoſe of the Medes and Perſians; but this muſt be underſtood with ſome latitude, and as applicable to different epochas of their empire. The chief deity of the Armenians, according to Strabo, ſeems to have been the goddeſs Tanais, or Anaitis, whom we know, from other authorities, to be the Náhéd or Venus of the Perſians; and it is for many reaſons highly probable, that one and the ſame religion prevailed through the whole empire of Cyrus. See ANAITIS. For an account of the Armenians after the introduction of Chriſtianity, ſee ARMENIANS.

ARMENIAN *Stone, lapis Armenus*, a mineral cuprous ſtone, or earth of a blue colour, ſometimes ſpotted with green, black, and yellow. It is a very ſcarce foſſil, anciently brought only from Armenia, but is now found very pure, though in ſmall quantities, in the mines at Goſſelaer in Saxony.

The *Armenian ſtone*, in its harder ſtate, bears a near reſemblance to *lapis lazuli*, from which it ſeems only to differ in degree of maturity: they are diſtinguiſhed by this, that the *lapis armenus* is ſofter, and inſtead of ſparks of gold, is often ſpeckled with green.

Boerhaave ranks it among ſemi-metals; and ſuppoſes it compoſed of a metal and earth. Woodward ſays, it owes its colour to an admixture of copper.

Mr. Kirwan ſays, that it conſiſts of calcareous earth or gypſum, penetrated with the blue calx of copper: hence it ſometimes effervelces with acids, ſometimes not; but never gives fire with ſteel; it loſes its colour when heated. Elem. of Mineral. p. 262.

Its chief uſe is in Moſaic work, though it has ſome place alſo in phyſic. It is a very valuable ſubſtance in painting, being a bright and florid blue. It was in ſo high eſteem as a paint, among the ancients, that counterfeits were continually attempted to ſerve in its place.

Both this and the *lapis lazuli* are ORES of copper.

ARMENIAN *Verſion*, in *Biblical Hiſtory*, an ancient tranſlation of the ſcriptures, for which the church of Armenia, according to the unanimous teſtimony of the Armenian writers, is indebted to Mieſrob, who is ſaid to have finiſhed it in the year 410. This is atteſted by Moſes Chorenenſis, a diſciple of Mieſrob; who adds, that he began with the Proverbs of Solomon. Moſes lived in the fifth century, and aſſiſted in the third verſion of the bible. The internal characters, and the readings of the Armenian verſion, have convinced the critics in that language, and eſpecially La-Croze, a man of the moſt profound erudition, that the antiquity aſcribed to the Armenian verſion does not exceed the truth. The learned, however, are divided in opinion, whether it was taken from the Greek original, or from the Syriac verſion. The Armenians pretend that it was taken from the Syriac; and Moſes Chor. (l. iii. c. liv. p. 300.) explicitly confirms this opinion. To which it has been added, that the Armenian verſion contains readings, which are found in no MS. or verſion, except the Syriac. But another relation from the ſame writer, (l. iii. c. lxi. p. 313.) is adduced on the other ſide of the queſtion; and this is deciſive: for it gives a full and credible account of the care beſtowed by the Armenians on their verſion of the bible, and that they tranſlated it twice from the Syriac, and a third time from the Greek. Hence may be aſſigned the reaſon, why the readings of the Armenian verſion are ſo frequently different from the Syriac. Another argument, which has been thought deciſive in favour of the opinion, that our preſent Armenian verſion was not taken from the Syriac, is, that the former contains thoſe books of the New Teſtament, which were never admitted into the latter. The Armenian verſion would be an ineſtimable treaſure, if it had deſcended to the preſent age unaltered by time and ſuperſtition. But the churches of the Leſſer Armenia, or Cilicia, ſubmitted in the thirteenth century to the authority of the pope; and Haitho, or Hethem, who reigned from 1224 to 1270, became ſhortly before his death a Franciſcan friar. This prince was not only attached to the church of Rome, but likewiſe acquainted with the Latin language; and, publiſhing a new edition of the Armenian bible, he altered, or rather corrupted it, from the Vulgate. He tranſlated, for inſtance, all the prefaces of Jerom; and as the words of 1 John v. 7. were not in the old Armenian MSS., he inſerted them probably from the Latin; for thirty-ſeven years after his death this paſſage was quoted at a council held at Cis, in Armenia, and is found in other Armenian records. Michaelis Int. N. T. by Marſh, vol. ii. p. 98, &c. See *Armenian* BIBLES.

ARMENIANS, in *Eccleſiaſtical Hiſtory*, a diviſion among the eaſtern Chriſtians, thus called from *Armenia*, the country anciently inhabited by them.

Some have ſuppoſed, that Chriſtianity was eſtabliſhed in Armenia by the apoſtle St. Bartholomew; but this is certain, that in the beginning of the fourth century the Armenian Chriſtians were in a flouriſhing ſtate. In this century Tiridates the king eſtabliſhed an hierarchy; and in the beginning of the ſixth, under the patriarch Nierſes, the Armenian church ſeceded from other eſtabliſhments, became independent, and embraced the theory of the Jacobites, ſome few articles of diſcipline excepted. The ſchiſm of the Armenians is placed eighty-four years after the council of Chalcedon, A. D. 535. It was conſummated at the end of ſeventeen years; and it is from the year of Chriſt 552, that the æra of the Armenians is dated. In the fifth century, Armenia was divided into fifteen provinces, and ſubdivided into one hundred and ninety-one dioceſes.

The Armenian church, in the ſixteenth century, was governed by three patriarchs, the chief of whom reſided in a monaſtery at Echmiazin, three leagues from Erivan. The dioceſe of this patriarch comprehends Greater Armenia; and he preſides over forty-two archbiſhops; he is elected by biſhops, and his election is confirmed by the king of Perſia. The revenues of this ſpiritual ruler are ſuch as would enable him to live in the moſt ſplendid and magnificent manner; and yet there is no mark of pomp or opulence in his external appearance, or in his domeſtic œconomy. His table is frugal, and his habit plain; nor is he diſtinguiſhed from the monks, with whom he lives, by any other circumſtance beſides his ſuperior power and authority. A ſecond patriarch, ſubject to the firſt, and called "the Catholic," reſides at Cis in Cilicia, and has twelve archbiſhops under him, who

govern

govern the churches eſtabliſhed in Cappadocia, Cilicia, Cyprus, and Syria. A third patriarch lives in the iſland of Aghtamar, in the midſt of the great lake of Varaſpuracan; he has no more than eight or nine biſhops under his juriſdiction, and is regarded by the other Armenians as the enemy of their church. Beſides theſe prelates, who are patriarchs in the true ſenſe of the term, the Armenians have other ſpiritual leaders who are honoured with the title of patriarchs, though it be unattended with the authority and prerogatives of the patriarchal dignity. Thus, the archbiſhop of the Armenians, who lives at Conſtantinople, and whoſe authority is reſpected by the churches eſtabliſhed in thoſe provinces that form the connection between Europe and Aſia, enjoys the title of patriarch. The ſame denomination is given to the Armenian biſhop who reſides at Jeruſalem; and to the prelate of the ſame nation, who has his epiſcopal ſeat at Caminec in Poland, and governs the Armenian churches that are eſtabliſhed in Ruſſia, Poland, and the adjacent countries. They aſſume the title of patriarchs, on account of ſome peculiar privileges conferred on them by the great patriarch of Echmiazin; for by an authority derived from this ſupreme head of the Armenian church, they are allowed to conſecrate biſhops, and to make every third year, and diſtribute among their congregations, the holy chriſm or ointment, which, according to a conſtant cuſtom among the eaſtern chriſtians, is the excluſive privilege of the patriarchs. After the death of Abas the Great, the Armenian exiles, who, under his protection, had enjoyed the ſweets of liberty and abundance, were involved in various kinds of calamity. The ſtorm of perſecution ſhook their conſtancy; and many of them apoſtatiſed to the Mahometan religion, ſo that it was apprehended that that branch of the Armenian church, which had been planted in Perſia, and eſpecially in Iſpahan, would gradually periſh. On the other hand, the ſtate of religion in that church derived conſiderable advantages from the ſettlement of Armenians in different parts of Europe, for the purpoſes of commerce. Theſe merchants, who had fixed their reſidence during the ſixteenth century, at London, Amſterdam, Marſeilles, and Venice, were not unmindful of their brethren in their native country; but ſupplied them with Armenian tranſlations of the holy ſcriptures, and of other theological books, from the European preſſes, which prevented the illiterate and ſuperſtitious people, who lived under the Perſian and Turkiſh governments, from ſinking into the moſt conſummate and deplorable ignorance.

The Armenians, though they agree with the other Monophysites in the main doctrine of that ſect, relating to the unity of the divine and human nature in Chriſt, differ from them, nevertheleſs, in many points of faith, diſcipline, and worſhip; and hence it comes to paſs, that they hold no communion with that branch of the Monophyſites, who are Jacobites, in the more limited ſenſe of that term. As to the euchariſt, they agree with the Greeks, except in this that they mix no water with their wine, and uſe unleavened bread after the manner of the Latins. Infants of two or three months old are admitted to the communion; and the conſecrated bread, ſoaked in the conſecrated wine, is diſtributed with peculiar ceremonies. When the prieſt takes the chalice and pattin, he is followed by his deacons and ſub-deacons, with flambeaux and plates of copper furniſhed with bells: thus accoutred, with a cenſer before him, he goes in proceſſion round the ſanctuary; he then places them on the altar, pronounces the words of conſecration, and turns himſelf to the people, who fall down, kiſs the earth, and beat their breaſts; then, after taking the bread himſelf, he diſtributes it to the people. In the baptiſm of children, they practiſe trine immerſion; and then the prieſt binds a ſmall cord of ſilk and cotton round the neck of the child, anoints his forehead, ſtomach, arm-pits, hands, and feet, and makes on each part the ſign of the croſs. The child, after baptiſm, is carried home by the godfather with the ſound of drums and trumpets. The women do not go to church for forty days after delivery; and they obſerve many Jewiſh cuſtoms. The Armenians celebrate an annual feſtival, called Cachacouran, which, half Armenian and half Perſian, ſignifies the baptiſm of the croſs. It is generally ſuppoſed that this is a religious ceremony, like the theophany of the Greeks, and the epiphany of the Roman catholics. It is celebrated on the ſixth of January, and the terms ſignify "manifeſtation;" but it is not agreed, whether it commemorates the birth of Chriſt in his manifeſtation in the fleſh; or his appearance to the wiſe men when he was manifeſted to the Gentiles; or his manifeſtation to the Jews by the voice from heaven at his baptiſm. Perhaps it is merely a civil inſtitute, reſembling the Roman luſtrum. The Perſians mark this Armenian feſtival in their almanacks; their Mahometan kings attend it; and ſome ſay, it is an imitation of the Abhirkan of the Guebres, or Gaurs, i. e. the feſtival of luſtral water, in uſe among the ancient Perſians.

The Armenians abſtain very rigorouſly from eating of blood, and meats ſtrangled, and are much addicted to faſting; inſomuch that from their diſcourſe, one would conclude that almoſt their whole religion conſiſted in faſting; and the higher the rank of their clergy, ſo much the greater muſt be their abſtinence. Their monks, every Wedneſday and Friday, eat neither fiſh, nor eggs, nor oil, nor any thing made of milk; and during Lent, they live upon nothing but roots; they are allowed wine only on the Saturday in the holy week, and meat on Eaſter Sunday. Beſides the great Lent, they have four or five others of eight days each, preparatory for the four great feſtivals of the Nativity, the Aſcenſion, the Annunciation, and of St. George, during which they are not allowed ſo much as to ſpeak of eggs, fleſh, oil, or butter.

Their monaſtic order is in great repute among them, ſince one of their patriarchs introduced that of St. Baſil; but part of them, which have united with the church of Rome, have changed their ancient rule for that of the Dominicans.

ARME'NISTAIRE, in *Zoology*, a term occaſionally given by ſome French writers to the Medusa tribe of *Vermes Mollusca*. See Medusa.

ARMENTA, one of the ſynonymous names of Bos *Americanus* of Gmelin, an animal which Dr. Shaw conſiders a variety only of Bos *Taurus*. "The American Biſon," ſays that author, "ſeems to differ in no reſpect from the European, except in being more ſhaggy, and in having a more protuberant bunch or fleſhy ſubſtance over the ſhoulders: the fore-parts of the body are extremely thick and ſtrong; the hinder parts comparatively weak. The colour of the American Biſon is reddiſh brown, and the hair in winter is of a woolly nature, falling down over the eyes, head, and whole fore-part of the animal. In ſummer, it often becomes almoſt naked, but particularly on the hind part of the body. It grows, according to Lawſon, to a vaſt ſize, and has been found to weigh ſixteen hundred, and even two thouſand four hundred pounds; and the ſtrongeſt man cannot lift one of the ſkins from the ground." Gen. Zool. Gmelin, who expreſſes ſome doubt whether it be diſtinct from Bos *Taurus*, aſſigns it the ſame character as

Linnæus

Linnæus had previouſly given to the variety of that ſpecies, *ferus*; namely, cornibus divaricatis, juba longiſſima, dorſo gibboſo, only making it a ſecond variety β. (horns divaricate, mane long, back gibbous, var. β.) This is Bos (*Biſon Americanus*) cornibus furſum reflexis, dorſo gibboſo, capitis piis longiſſimis obtito. Briſſ. regn. an. *Biſon d'Amerique* of Buff. *Buffalo*, Lawſ. Carol. *Buffalo*, Cateſby. *American oxen or beeves*, Dobbs. Hudſ. *American bull*, Pennant. See Taurus.

ARMENTEQUI, or Armenza, in *Geography*, a village of Spain, in the country of Alava, once a city and ſee of an archbiſhop, one mile from Vittoria.

ARMENTIERES, a town of France, in the department of the North, and chief place of a canton in the diſtrict of Lille, ſeated on the Lys. It was taken and diſmantled by the French in 1687. The place contains 7598, and the canton 14,914 inhabitants: the territory includes 55 kiliometres and 6 communes. N. lat. 50° 40′. E. long. 3° 3′.

ARMENTO, a town of Italy, in the kingdom of Naples, and province of Baſilicata, 20 miles S. S. E. of Potenza.

ARMERIA, in *Botany*. See Dianthus.

ARMERIUS. See Dianthus, and Silene.

ARMET, in *Geography*, a town on the iſland of Nouſſa-Laout, one of the Molucca iſlands.

ARMIDA, in *Entomology*, the name of a ſpecies of Phalæna, in the *Bombyx* family, that inhabits Cayenne. The wings are yellow, ſpeckled, and ſpotted with violet, and a ſtreak behind of the ſame colour. Fabricius, Gmelin, &c. *Obſ.* This is a large inſect; the antennæ are yellow; the thorax yellow with a violet coloured ſpot on the back; abdomen yellow with a violet-coloured ſpot on the firſt ſegments; wings beneath yellow, with a violet ſpot in the middle. *Obſ.* This muſt not be confounded with the moth figured by Cramer, t. 197. *fig.* A., under the ſpecific name of Armida, that being Phalæna *Erythrina* of Fabricius and Gmelin.

ARMIERES, in *Geography*, a ſmall town of Hainault, on the Sambre.

ARMIGER, *armour-bearer*, in *Modern Writers*, denotes a title of dignity, rendered in Engliſh by *Eſquire*.

Armiger, in *Entomology*, a ſpecies of Cimex found in Africa. It is grey; thorax acutely ſpined; two dots on the ſcutel, the antennæ and legs pale. Gmelin and Fabricius. *Obſ.* This is Coreus *armiger* of the latter author, and was firſt deſcribed by him in his Species Inſectorum.

Armiger, a name given by Fabricius to a ſpecies of Cancer that inhabits the Southern ocean. The thorax is ſomewhat ſmooth, with eight teeth on each ſide, and five lobes in front; the arms are toothed on each ſide. Fab. Mant. Inſ.

Armiger, a ſpecies of Monoculus, in the ſixth ſection of the Gmelinian ſyſtem, or thoſe furniſhed with an univalve ſhell; eyes two, and placed beneath; two antennæ, and from four to eight legs. In this ſection (*Arguli*) are only three ſpecies, and the preſent is diſtinguiſhed from the two others by having ſix legs. Slabb. microſc. Gmel. &c.

ARMILAUSA, in *Antiquity*, a ſhort military coat, reaching down only to the knee. Aquin. and Pitiſc. Lex. Ant.

It was thus called, as being divided both before and behind, and only cloſe about the ſhoulders, *in armos tantum clauſa*, quaſi *armiclauſa*. Iſid. Orig. l. xix. c. 22.

The word is ſometimes alſo written, armelauſa, armelauſia, armicaſia, and armilcaſia.

Armilausa is alſo applied, in *Eccleſiaſtical Writers*, to the ſcapular of monks and canons; thus called on account of its hanging from the arms or ſhoulders. Schmid. Lex Eccleſ. p. 73.

The ſame habit is vulgarly called patience.

ARMILLA, in *Zoology*, one of the Vermes *infuſoria*, belonging to the genus Leucophra, and both figured and deſcribed by Müller in his Zool. Dan. It is inviſible to the naked eye, round, and annular; it is rather thickened above, and bent into the form of a ring.

Armilla *membranoſa* is a name given by ſome *Anatomiſts* to the annular ligament.

ARMILLARIS, in *Zoology*, a creature of the Vermes *Molluſca* kind, in the genus Nereis. It is ſubdepreſſed; peduncles conic; cirri lenticular. This ſpecies inhabits the North ſeas, where it buries itſelf deep in the ſands. The ſhape is filiform; length an inch and a quarter; on each ſide of the head are three moniliform feelers; in the body are a hundred and twenty joints, each of which is furniſhed with a ſmall peduncle on both ſides; and the tail terminates in two long filaments or threads. Müll. O. Fabr. Gmel. &c.

ARMILLARY, Armillaris, formed of *armilla*, a bracelet or ring, in *Aſtronomy*, an epithet given to an artificial ſphere compoſed of a number of metalline circles, repreſenting the ſeveral circles of the mundane ſphere put together in their natural order.

Armillary ſpheres ſerve to aſſiſt the imagination in conceiving the arrangements and the motions of the heavenly bodies.

Such is that repreſented (*Plate* II. *Aſtron. fig.* 14.)—Where P and Q repreſent the poles of the world, A D the equator, E L the ecliptic and zodiac, P A G D the meridian, or the ſolſtitial colure, T the earth, F G the tropic of cancer, H T the tropic of capricorn, M N the arctic circle, O V the antarctic, N and O the poles of the ecliptic, and R S the horizon.

The armillary ſphere conſtructed by Dr. Long, in Pembroke-hall, Cambridge, is eighteen feet in diameter; and more than thirty perſons may conveniently ſit in it. The lower part of the ſphere inviſible in England is cut off; the whole apparatus is ſo contrived, that, when in order, it may be turned round with as little labour as it takes to wind up a jack.

Armillary *trigonometer*, an inſtrument firſt contrived by Mr. Mungo Murray, and improved by Mr. Ferguſon, conſiſting of five ſemicircles; viz. meridian, vertical circle, horizon, hour circle, and equator; ſo adapted to each other by joints and hinges, and ſo graduated and divided, as to ſerve for expeditiouſly reſolving many problems in aſtronomy, dialling, and ſpherical trigonometry. For the drawing, deſcription, and method of uſing it, ſee Ferguſon's Tracts, p. 80, &c.

ARMILLATI Milites, in *Antiquity*, thoſe who wore bracelets on their left arms, bellowed on them by their generals or emperors. But the term is more frequently applied to ſoft and effeminate ſoldiers, who wore bracelets on their arms, not as the rewards of their proweſs, but marks of their foppery. Aquin. Lex.

ARMILLATUM, in *Conchology*, a ſpecies of Buccinum, figured and deſcribed by Liſter and others. The ſhell is oblong; the aperture large and toothleſs; the whorls crowned with a ſingle row of tubercles. Its native place is unknown.

ARMILLATUS, in *Entomology*, a ſpecies of Curculio that inhabits the Cape of Good Hope. The thorax is ſomewhat ſpinous on the ſides; a grey belt near the tip of the thighs; ſhanks dentated. Sparm. nov. act. Stock. There is a variety of this inſect entirely of a browniſh grey colour, and

and another in which the wing-cafes are clouded with grey, and an oblong fpot placed obliquely on each fide.

ARMILLATUS, a fpecies of CERAMBYX, of a large fize, that is found in India. On each fide of the thorax are four fpines; wing-cafes ferruginous, with a black margin; a fingle tooth on the poſterior thighs. Gronov. Fabr. &c.

ARMILUSTRIUM, in *Antiquity*, a feaſt held among the Romans; wherein they ſacrificed, armed at all points, and with the ſound of trumpets.

Some define *armiluſtrium* to have been a feaſt, wherein a general review was made of all the forces, in the Campus Martius. But this does not come up to the point; for Varro does not derive the word from the Latin *arma* and *luſtrare, to make a review*; but from the cuſtom of holding this feaſt in the place where the reviews were uſed to be made, or rather from their going round the place armed with bucklers.

The ſacrifice was intended for the expiation of the armies, and the proſperity of the arms of the people of Rome; and was celebrated on the fourteenth of the calends of November. This feaſt may be conſidered as a kind of benediction of arms. It was firſt obſerved among the Athenians.

ARMINIACHA, in *Geography*, a ſmall town of Aſia Minor, in Aladulia, at the foot of mount Taurus; ſuppoſed to have been the ancient Cybiſtra.

ARMINGS, in a ſhip, are the ſame with *waſt-cloths*, being red cloths hung about the outſides of the ſhip's upper works fore and aft; and before the cubbridge-heads.

There are ſome alſo hung round the tops, and called *top-armings*. See TOP.

ARMINIA, in *Ancient Geography*, a river of Italy, in Etruria, flowed from north to ſouth between Saturnia and Vulſinii, and diſcharged itſelf into the ſea near Forum Aurelii.

ARMINIANISM, the doctrine of Arminius and of his followers. See ARMINIANS.

ARMINIANS, in *Eccleſiaſtical Hiſtory*, the followers of Arminius, who, though educated at Geneva, and having imbibed the doctrines concerning predeſtination and grace, maintained by Calvin, Beza, Zanchius, &c. began to expreſs his doubts concerning them in the year 1591; and upon farther inquiry, adopted ſentiments more nearly reſembling thoſe of the Lutherans, than of the Calviniſts. After his appointment to the theological chair at Leyden, he thought it his duty to avow and vindicate the principles which he had embraced; and the freedom with which he publiſhed and defended them, expoſed him to the reſentment of thoſe who adhered to the theological ſyſtem of Geneva, which then prevailed in Holland; but his principal opponent was Gomar, his colleague. The controverſy which was thus begun, became more general after the death of Arminius in the year of 1609, and threatened to involve the United Provinces in civil diſcord. The Arminian tenets gained ground under the mild and favourable treatment of the magiſtrates of Holland, and were adopted by ſeveral perſons of merit and diſtinction. The Calviniſts, or Gomariſts as they were now called, appealed to a national ſynod; accordingly the ſynod of Dort was convened by order of the States General, in 1618; and was compoſed of eccleſiaſtical deputies from the United Provinces, as well as from the reformed churches of England, Scotland, Heſſe, Bremen, Swiſſerland, and the Palatinate. The principal advocate in favour of the Arminians was Epiſcopius, who at that time was profeſſor of divinity at Leyden. It was firſt propoſed to diſcuſs the principal ſubjects in diſpute, and that the Arminians ſhould be allowed to ſtate and vindicate the grounds on which their opinions were founded; but ſome difference ariſing as to the proper mode of conducting the debate, the Arminians were excluded from the aſſembly; their caſe was tried in their abſence; and they were pronounced guilty of peſtilential errors, and condemned as corrupters of the true religion. In conſequence of this deciſion, they were treated with great ſeverity; they were deprived of all their poſts and employments; their miniſters were ſilenced, and their congregations were ſuppreſſed. However, after the death of prince Maurice, who had been a violent partiſan in favour of the Gomariſts, in the year 1625, the Arminian exiles were reſtored to their former reputation and tranquillity; and under the toleration of the ſtate, they erected churches and founded a college at Amſterdam, appointing Epiſcopius to be the firſt theological profeſſor. The Arminian ſyſtem has very much prevailed in England ſince the time of archbiſhop Laud, and its votaries in other countries are very numerous.

The diſtinguiſhing tenets of the Arminians may be comprized in the following five articles; relating to predeſtination, univerſal redemption, the corruption of man, converſion, and perſeverance. With reſpect to the firſt, they maintained, "That God, from all eternity, determined to beſtow ſalvation on thoſe, who he foreſaw would perſevere unto the end in their faith in Chriſt Jeſus; and to inflict everlaſting puniſhments on thoſe who ſhould continue in their unbelief, and reſiſt unto the end his divine ſuccours; ſo that election was conditional, and reprobation in like manner the reſult of foreſeen infidelity, and perſevering wickedneſs."

On the ſecond, the Arminians taught, "That Jeſus Chriſt, by his ſufferings and death, made an atonement for the ſins of all mankind in general, and of every individual in particular; that, however, none but thoſe who believe in him can be partakers of their divine benefit."

On the third article, they held, "That true faith cannot proceed from the exerciſe of our natural faculties and powers, nor from the force and operation of free-will, ſince man, in conſequence of his natural corruption, is incapable either of thinking or doing any good thing; and that therefore it is neceſſary, in order to his converſion and ſalvation, that he be regenerated and renewed by the operation of the Holy Ghoſt, which is the gift of God through Jeſus Chriſt."

Fourthly, "That this divine grace, or energy of the Holy Ghoſt, begins and perfects every thing that can be called good in man, and conſequently all good works are to be attributed to God alone; that nevertheleſs this grace is offered to all, and does not force men to act againſt their inclination, but may be reſiſted, and rendered ineffectual by the perverſe will of the impenitent ſinner." Some modern Arminians interpret this and the laſt article with a greater latitude.

Fifthly, "That God gives to the truly faithful, who are regenerated by his grace, the means of preſerving themſelves in this ſtate;" and though the firſt Arminians made ſome doubt with reſpect to the cloſing part of this article, their followers uniformly maintain, "that the regenerate may loſe true juſtifying faith, forfeit their ſtate of grace, and die in their ſins."

The modern ſyſtem of Arminianiſm likewiſe, founded on a comprehenſive plan projected by Arminius himſelf, as appears from a paſſage in his laſt will, extends the limits of the Chriſtian church, and relaxes the bonds of fraternal communion in ſuch a manner, that Chriſtians of all ſects and denominations, whatever their ſentiments and opinions may

be, papiſts excepted, may be formed into one religious body, and live together in brotherly love and concord. But, in order to avoid the reproach of being altogether unconnected by any common principles, Epiſcopius drew up a confeſſion of faith, expreſſed for the moſt part in words and phraſes of Holy Scripture, which the Arminians have generally adopted, though not enjoined upon them by any authoritative obligation.

The Arminians are alſo called *Remonſtrants*, from an humble petition intitled their *Remonſtrance*, which, in the year 1610, they addreſſed to the ſtates of Holland. Their principal writers are, Arminius, Epiſcopius, Voſſius, Grotius, Curcellæus, Limborch, Le Clerc, and Wetſtein; not to mention many others of more modern date. Brandt's Hiſt. of the Reformation in the Netherlands; and Moſheim's Eccleſ. Hiſt. by Dr. Maclaine, vol. v.

The progreſs of Arminianiſm has been ſomewhat retarded, and its prevalence reſtrained, more eſpecially in Germany, and ſeveral parts of Swiſſerland, in conſequence of the aſcendant which the Leibnitian and Wolfian philoſophy hath gained in theſe countries, particularly among the clergy and the men of learning. Leibnitz and Wolf, by attacking that liberty of indifference which is ſuppoſed to imply the power of acting, not only without, but againſt motives, ſtruck at the very foundation of the Arminian ſyſtem. Beſides, by conſidering the multiplicity of worlds that compoſe the univerſe as one ſyſtem or whole, whoſe greateſt poſſible perfection is the ultimate end of creating goodneſs, and the ſovereign purpoſe of governing wiſdom, they removed from the doctrine of predeſtination thoſe arbitrary procedures and narrow views with which the Calviniſts have been charged with loading it, and gave it a new, a more pleaſing, and a more philoſophical aſpect. As the Leibnitians laid down this great end as the ſupreme object of God's univerſal dominion, and the ſcope to which all his diſpenſations are directed, ſo they concluded, that if this end was propoſed, it muſt be accompliſhed. Hence the doctrine of neceſſity, to fulfil the purpoſes of a predeſtination founded in wiſdom and goodneſs: a neceſſity phyſical and mechanical in the motions of natural and inanimate things, but a neceſſity moral and ſpiritual in the voluntary determinations of intelligent beings, in conſequence of prepollent motives which produce their effects with certainty, though theſe effects be contingent, and by no means the offſpring of an abſolute and immutable fatality. Theſe principles are evidently applicable to the main doctrines of Calviniſm; by them predeſtination is confirmed, though modified with reſpect to its reaſon and end; by them irreſiſtible grace, irreſiſtible in a moral ſenſe, is maintained upon the hypotheſis of prepollent motives and a moral neceſſity. The perſeverance of the ſaints is alſo explicable upon the ſame ſyſtem, by a ſeries of moral cauſes producing a ſeries of moral effects. The learned Canzius has written a book for the expreſs purpoſe of ſhewing the eminent uſe that may be made of the Leibnitian and Wolfian philoſophy, in throwing light upon the chief articles of our faith, "Philoſophiæ Leib. et Wolf. uſus in theologia per præcipua fidei capita." Francof. and Leipſ. ed. 2. 1749. The ſcheme of neceſſity, and of partial evil tending to univerſal good, has been foſtered in ſome parts of Great Britain, and has converted ſome zealous Arminians into moderate and philoſophical Calviniſts. But "the zealous Calviniſts (ſays Dr. Maclaine) have for the moſt part held firm to their theology, and blended no philoſophical principles with their ſyſtem; and it is certain that the moſt eminent philoſophers have been found, generally ſpeaking, among the Arminians. If both Calviniſts and Arminians claim a KING, it is certain that the latter alone can boaſt of a NEWTON, a LOCKE, & CLARKE, and a BOYLE.

ARMINIUS, or HARMANSEN, JAMES, in *Biography*, founder of the ſect called *Arminians*, was born at Oude-Water in Holland, in 1560; and he loſt his father in his infancy. He was firſt inſtructed by a Catholic prieſt, who was ſecretly a friend to the reformed religion, and by his liberality encouraged as a ſtudent at Utrecht. Upon the death of this patron, he obtained aſſiſtance from Rodolphius Snelbius, his countryman, and in 1575 accompanied him to Marpurgh. During his abode in this place, he received information that his native town was pillaged by the Spaniards; and haſtening thither to viſit his family, he found that his mother, ſiſter, brother, and other relations, had been put to the ſword. At Leyden he afterwards proſecuted his ſtudies with reputation; and at length the magiſtrates of Amſterdam provided him with the means of finiſhing his education at Geneva. The lectures of Theodore Beza on the epiſtle to the Romans, are ſuppoſed to have firſt ſuggeſted to Arminius thoſe ſpeculations, which led him to form a new ſect. As he adopted and privately taught the philoſophical ſyſtem of Peter Ramus, he was obliged to withdraw from Geneva; and he then removed to Baſil, where he gained great credit by his lectures: after a ſhort interval he returned to Geneva, and enjoyed in tranquillity the ſociety of the learned. Deſirous of farther improvement, he viſited Padua, in order to attend the philoſophical lectures of the celebrated Zabarella; and after having travelled in Italy for five or ſix months, he returned, in 1588, to Amſterdam, where he found his patrons much prejudiced againſt him. "It was reported and believed, that Arminius had kiſſed the Pope's toe, whom he had only ſeen in a crowd; that he had contracted an intimacy with Jeſuits, whom he had never heard of; that he had introduced himſelf to Bellarmin, whom he had never ſeen; and that he had abjured the reformed religion, for which he was prepared to die." Theſe prejudices, however, as they were occaſioned by groundleſs rumours and calumny, gradually ſubſided; and the talents and zeal of Arminius, as a ſtrenuous advocate for the reformed religion, and an eloquent preacher, raiſed him to diſtinguiſhed notice; accordingly he was engaged to refute a work which had been written againſt Beza's doctrine of predeſtination. In the courſe of his examination, he became a proſelyte to the opinions which he had undertaken to refute; and renouncing the Calviniſtic doctrine concerning the decrees of God and divine grace, he maintained, that the merits of Chriſt extended to all mankind, and that the grace of God, which is neceſſary to ſalvation, is attainable by all. This change in the ſentiments of Arminius took place in the year 1591; and his undiſguiſed and honeſt avowal of it excited hoſtilities, which would have been injurious to Arminius, if the magiſtrates of Amſterdam had not interpoſed and ſuppreſſed the conteſt. After having officiated as a miniſter in the church of Amſterdam for fifteen years, Arminius, notwithſtanding the heretical opinions which he had adopted, was elected, in 1603, to the profeſſorſhip of divinity in the univerſity at Leyden, and admitted to the degree of doctor in divinity. In his lectures, and alſo in his writings, the profeſſor ſtrenuouſly aſſerted and defended his opinions, and made many converts both among the clergy and the laity. His adverſaries, however, were very numerous; and of theſe the moſt violent was his colleague, Francis Gomar. Unable to contend with the various modes of attack by which his enemies perſecuted him, he ſunk under a complication of diſeaſes, and departed this life in the year 1609. Arminius was eminently diſtinguiſhed by his piety and integrity,

integrity, and conciliated the eſteem even of his enemies, by his modeſty and diffidence, by the candour of his temper, and the affability of his manners. He choſe rather, ſays Brandt, his biographer, to be religious in reality than in appearance, and preferred the approbation of his own mind to the opinion of the world. His motto was "Bona conſcientia paradiſus." "A good conſcience is a paradiſe." Peter Bertius concludes his funeral oration upon him with theſe words: "He was a man who could not be ſufficiently eſteemed by thoſe who knew him, and thoſe who did not eſteem him, never knew him ſufficiently." He was a friend to univerſal toleration, and with him it was a fundamental principle, that Chriſtians are accountable only to God for their religious ſentiments, and that no individual can be juſtly puniſhed by the magiſtrate for erroneous opinions, while he conducts himſelf as a virtuous and obedient ſubject, and makes no attempt to diſturb the peace and order of civil ſociety. As a writer, his manner of reaſoning and his ſtyle are ſomewhat ſcholaſtic; but he is diſtinguiſhed by ſimplicity and perſpicuity. His works are compriſed in one volume, 4to. printed at Frankfort in 1631 and 1634, &c. His "Diſputationes publicæ et privatæ" afford a juſt and accurate notion of the doctrine and character of Arminius. Moſheim's Eccl. Hiſt. vol. v. p. 439, &c. Gen. Dict. See ARMINIANS.

ARMIRO, in *Geography*, a ſea-port town of European Turkey, in the province of Theſſaly or Janna, on the ſouth-weſt ſide of the gulf of Volo; ſuppoſed to be the Eretria of the ancients. N. lat. 39° 42′. E. long. 23° 30′.—Alſo, a river in the iſle of Candia, near Caſtel-Malveſi, which empties itſelf into the Mediterranean near Paleo-Caſtro, ſaid to be the "Oaxes" of the ancients.—Alſo, a town of South America, in Guiana, four leagues from Cayenne.

ARMISTICE, ARMISTITIUM, in *Military Language*, from *arma ſtare*, or *ſiſtere*, a ſhort truce, or a ceſſation of arms for a ſmall time.

ARMOA, in *Geography*, a river of Arcadia, which diſcharges itſelf into the Alpheus, ſuppoſed to be the Amarynchus of the ancients.

ARMOACHIQUOIS, a tribe of wandering Indians on the borders of Canada.

ARMOISIN, in *Commerce*, a ſilk ſtuff, or kind of taffety, of an indifferent goodneſs; made at Lyons, and at ſeveral places in Italy. There are half armoiſins, made at Avignon, which are of inferior quality, and leſs price than the others. Some pretend that the word *armoiſin* comes from the Italian *armeſino*; or that theſe ſilks were thus called, becauſe there were coats of arms delineated on the cloths in which they were wrapped.

There is alſo a taffety of this name manufactured in the Eaſt Indies; but of an inferior quality to thoſe made in Europe.

ARMONA, in *Geography*, a town of the iſland of Negroponte.

ARMONIAC. See AMMONIA.

ARMONICA, from ἁρμονία, *harmony*, is a name which Dr. Franklin has given to a muſical inſtrument conſtructed with drinking-glaſſes. It is well known that a drinking-glaſs yields a ſweet tone, by paſſing a wet finger round its brim. Mr. Pockrich, of Ireland, was the firſt who thought of playing tunes formed of theſe tones. He collected a number of glaſſes of different ſizes, fixed them near each other on a table, and tuned them by putting into them water, more or leſs, as each note required. Mr. Delaval, F. R. S. made an inſtrument in imitation of that which was contrived by Mr. Pockrich: and from this inſtrument Dr. Franklin took the hint of conſtructing his *armonica*.

The glaſſes for this muſical inſtrument are blown as nearly as poſſible in the form of hemiſpheres, having each an open neck or ſocket in the middle. The thickneſs of the glaſs near the brim is about one tenth of an inch, increaſing towards the neck, which in the largeſt glaſſes is about an inch deep, and ½ inch and a half wide within; but theſe dimenſions leſſen as the ſize of the glaſſes diminiſhes, only obſerving that the neck of the ſmalleſt ſhould not be ſhorter than half an inch. The diameter of the largeſt glaſs is nine inches, and that of the ſmalleſt three inches: between theſe there are twenty-three different ſizes, differing from each other a quarter of an inch in diameter. For making a ſingle inſtrument, there ſhould be at leaſt ſix glaſſes blown of each ſize, and out of theſe thirty-ſeven glaſſes (which are ſufficient for three octaves with all the ſemitones) may be found, that will either yield the note required, or one a little ſharper, and fitting ſo well into each other, as to taper regularly from the largeſt to the ſmalleſt. The glaſſes being choſen, and the note for which each glaſs is intended being marked upon it with a diamond, they are to be tuned by diminiſhing the thickneſs of thoſe that are too ſharp, which is done by grinding them round from the neck towards the brim, comparing, by means of a well-tuned harpſichord, the tone drawn from the glaſs by your finger with the note you want, as ſounded by the correſponding ſtring of the harpſichord. The largeſt glaſs in the inſtrument is G, a little below the reach of a common voice, and the higheſt G, including three complete octaves: and they are diſtinguiſhed by painting the apparent parts of the glaſſes within ſide, every ſemi-tone white, and the other notes of the octave with the ſeven priſmatic colours: ſo that glaſſes of the ſame colour (the white excepted) are always octaves to each other.

When the glaſſes are tuned, they are to be fixed on a round ſpindle of hard iron, an inch in diameter at the thickeſt end, and tapering to a quarter of an inch at the ſmalleſt. For this purpoſe, the neck of each glaſs is fitted with a cork, projecting a little without the neck; theſe corks are perforated with holes of different diameters, according to the dimenſion of the ſpindle in that part of it where they are to be fixed. The glaſſes are all placed within one another, the largeſt on the biggeſt end of the ſpindle with the neck outwards; the next in ſize is put into the other, leaving about an inch of its brim above the brim of the firſt; and the others are put on in the ſame order. From theſe expoſed parts of each glaſs, the tone is drawn, by laying a finger upon one of them, as the ſpindle and glaſſes turn round. The ſpindle thus prepared, is fixed horizontally in the middle of a box, and made to turn on braſs gudgeons at each end. A ſquare ſhank comes from its thickeſt end through the box, on which ſhank a wheel is fixed by a ſcrew: this will ſerve, like a fly, to make the motion equable, when the ſpindle is turned by the foot like a ſpinning-wheel. The wheel is eighteen inches in diameter, and conceals near its circumference about twenty-five pounds of lead, and may be made of mahogany. An ivory pin is fixed in the face of the wheel, about four inches from the axis; over which is put the loop of the ſtring, that comes up from the moveable ſtep to give it motion. The box is about three feet long, eleven inches wide at the biggeſt end, and five inches at the ſmalleſt end; it is made with a lid, which opens at the middle of its height, and turns up by back hinges. The inſtrument, thus completed, ſtands on a neat frame with four legs. This inſtrument is played upon by fitting before it, as before the keys of a harpſichord, turning the ſpindle with the foot, and wetting the glaſſes now and then with

a ſponge and clean water. The fingers ſhould be firſt ſoaked in water; and rubbed occaſionally with fine chalk, to make them catch the glaſs, and bring out the tone more readily. Different parts may be played together by uſing both hands; and the tones are beſt drawn out when the glaſſes turn from the ends of the fingers, not when they turn to them.

The advantages of this inſtrument, ſays Dr. Franklin, are, that its tones are incomparably ſweet beyond thoſe of any other; and that they may be ſwelled and ſoftened at pleaſure by ſtronger or weaker preſſures of the finger; and continued to any length: and when it is once well tuned, it never again wants tuning. Franklin's Letters, &c. on Philoſophical Subjects, p. 428.

Mr. Pockrich, the firſt performer on rummer glaſſes, by a fatal accident was burned in his bed at his lodgings in Swithin's Alley near the Royal Exchange, in 1759, by the houſe in which he lodged taking fire in the night, and being deſtroyed, before any aſſiſtance could arrive.

Mr. Schuman, a German harpſichord-maſter, played publickly afterwards with conſiderable ſucceſs in ſeveral parts of London and Weſtminſter. But the firſt and only performer on the Armonica, conſtructed and ſo accurately deſcribed by Dr. Franklin, in a letter to Padre Beccaria of Turin, was the eldeſt Miſs Davies, ſiſter to Miſs Cecilia Davies, the celebrated opera ſinger, but beſt known in Italy by the title of *l'Ingleſina*.

The talents of our two countrywomen, the Miſs Davieſes, who reſided a conſiderable time at Vienna, in the ſame houſe as the celebrated Haſſe and Fauſtina (ſee Preſent State of Muſic in Germany, Art. Vienna, vol. i.), have been deſcribed by the admirable lyric poet, Metaſtaſio; the eldeſt for her performance on the Armonica, at that time a new inſtrument; and the youngeſt, for her vocal abilities. The Empreſs-queen had been ſo pleaſed by their ſeveral talents, that in the year 1769, on the marriage of the infant duke of Parma with the arch-ducheſs Maria Amelia, ſhe deſired Metaſtaſio to write a cantata, which was ſet by Haſſe, in order to diſplay their ſeveral talents. This cantata has been publiſhed in late editions of the poet's works, under the title of *l'Armonica*, the name of the new inſtrument on which the eldeſt Miſs Davies accompanied her ſiſter, in the performance of the cantata.

A letter written by the poet to the princeſs di Belmonte, at Naples, recommending theſe performers to her protection, will ſerve as a comment to the cantata juſt mentioned.

"The bearers of this moſt reverential addreſs, are two Engliſh young perſons, travelling under the conduct of their worthy parents, in order to give teſtimonies at Naples of their ſeveral abilities in muſic; their names are Miſs Mary, and Miſs Cecilia Davies: the firſt performs with admirable ſkill on an inſtrument of new invention called the Armonica. It is compoſed of glaſſes of different ſizes, revolving, by means of a pedal, on a ſpindle. Theſe glaſſes, forming a regular ſcale of tones and ſemi-tones, being delicately touched with wet fingers during their revolution, produce the moſt uncommonly ſweet and celeſtial tones imaginable; particularly in pathetic ſtrains, for which the inſtrument is eminently calculated. The other ſiſter, who is poſſeſſed of a very pleaſing and flexible voice, ſings extremely well, with much art and natural expreſſion; and when accompanied by her ſiſter on the Armonica, ſhe has the power of uniting her voice with the inſtrument, and of imitating its tones ſo exactly, that it is ſometimes impoſſible to diſtinguiſh one from the other. They have been here univerſally admired and applauded: and my moſt auguſt patroneſs, who has deigned to hear them frequently, has honoured them with munificent teſtimonies of imperial approbation."

Miſs Cecilia Davies performed in the theatre of San Carlo at Naples, the part of *Bradamante*, in Metaſtaſio's new opera of Ruggiero.

In the firſt fol. edit. of the French *Encyclopedie*, t. xvii. printed in 1765, under the article VERRES, MUSIQUE DES, Muſical glaſſes, it is ſaid; "they have contrived within theſe few years to produce a new ſpecies of harmony from glaſſes, which is extremely pleaſing to the ear.

"It is pretended that an Engliſhman of the name of Puckridge is the inventor. However this method has been long known in Germany. The inſtrument uſed on this occaſion is an oblong ſquare box, in which are arranged and fixed many round glaſſes of different diameters. In theſe there is water of different quantities. By rubbing the edge of the glaſſes with a wet finger very gently, the ſweeteſt, moſt melodious, and ſuſtained tones are produced, and with theſe the moſt agreeable airs are performed.

"The Perſians, in very high antiquity, have produced muſical ſounds by a ſimilar contrivance; by ſtriking ſeven porcelain cups, tuned by water, with little ſticks, a regular ſcale is produced." No authority is given for theſe aſſertions. Metaſtaſio, who had reſided near fifty years in Germany, calls the Armonica, "an inſtrument of new invention." The producing muſical tones from drinking-glaſſes has been long known to the natives of Great Britain and Ireland; but the forming different toned glaſſes into an inſtrument, and tuning them by water, we have not the leaſt doubt was the invention of a native of Ireland, of the name of Pockrich; as the placing a ſeries of glaſſes on a cylinder, or ſpindle, turned with a pedal, was the invention of Dr. Franklin, who tuned his glaſſes by grinding, not by water. A drawing of Miſs Davies's inſtrument will be found in one of the plates of muſical inſtruments. Her performance on this muſical inſtrument ſo pleaſed the great maſters on the Continent, that Padre Martini, Haſſe, Galuppi, Jomelli, Mozart, &c. preſented her with original compoſitions, purpoſely produced for the Armonica, upon which ſhe often plays, extempore, ſtill more exquiſite ſtrains than theſe great compoſers, at an early period of its invention, thought this inſtrument capable of expreſſing.

ARMOR, or ARMOUR, in a general ſenſe, is a term that may be applied to any defenſive habit, uſed to protect the perſon of the wearer from the attack of an enemy; or abſtractedly, to any part of ſuch habit. Armour, in the aggregate ſenſe of the word, is frequently called *harneſs* by the Engliſh writers of the fifteenth and ſixteenth centuries, as well as in our ancient ſtatutes.

The materials anciently uſed for the making of armour were exceedingly multifarious; depending in ſome inſtances upon the produce of the country in which it was fabricated, but more generally upon the judgment or experience of the inhabitants. Among the more civilized nations, braſs, iron, and other metals were preferred; and in the time of Aſiatic magnificence, even gold was not ſpared: on the other hand, the Libyans, according to Herodotus (in Polymnia), who aſſiſted Xerxes when he invaded Greece, were clothed in tunics of leather, to ſupply the place of body armour; and the ſame author (in Clio) aſſures us, that the military dreſs of the ancient Perſians was compoſed of leather, and girt about the body with a leathern girdle; and ſpeaking of the Aſiatic Indians (in Polymnia), he tells us, that ſome of them uſed a ſpecies of armour made with wood; others again plaited ruſhes upon each other like mats, and worked them into the form of a *thorax*, or *breaſt-plate*; he alſo mentions (in Melpomene) a people who inhabited the maritime

parts to the weſtward of the Garamantes, who, "when they make war," (ſays he,) "wear the ſkins of oſtriches inſtead of armour."

The ſhield, the helmet, and the breaſt-plate, may claim precedence of every other part of the ancient defenſive armour; the firſt, from the obvious uſe of ſuch an inſtrument and the extenſiveneſs of its ſervice; and the other two, from the protection they afforded to the ſources of life and ſenſation. We muſt refer to the ſacred writings for the earlieſt memorials of the ancient military habit; little more, indeed, than the names of the different parts of this habit occur; but with the aſſiſtance of more modern authority, we may be enabled to form ſome idea of the nature and uſefulneſs of thoſe parts, when applied to the protection of the wearer.

The defenſive armour of the Iſraelites conſiſted of a ſhield, a helmet, a military veſt, a thorax or breaſt-plate, and belts of metal, or plated with metal, to gird upon the body, beneath the breaſt-plate. It does not appear that they wore greaves or military boots for the defence of their legs; though the greaves are mentioned as a part of the armour belonging to Goliath, the giant of Gath (1 Samuel, chap. xvii. ver. 6.): they were alſo worn by other Aſiatic nations; and at the ſiege of Troy, by the Grecians in general. Homer frequently diſtinguiſhes his countrymen by the epithet of well-greaved or well-booted Grecians. The greaves attributed by the author of the book of Samuel to Goliath, are called (מִצְחָה), literally, the ſhiners, or ſhining plates, and were made of braſs, reſembling probably thoſe upon the legs of the little figure marked A. *Plate* I. of *Armour*, which reach from the top of the knee, to the inſtep, but do not cover the feet; ſo thoſe of the giant are expreſsly ſaid to have been placed above his feet. The figure B. upon the ſame plate, of which we have two views, exhibits the greaves of a thicker conſiſtency, and from the manner in which they are faſtened upon the back part of the legs, they appear to have been made with the ſkins of animals, having the fur upon them. See GREAVES.

In the book of Exodus (chap. xxviii. ver. 32. and chap. xxxix. ver. 23), Moſes mentions a garment, which our tranſlators conſidered as a military one, and accordingly have rendered it an *habergeon*; that is, a ſhort tunic of mail, fitted cloſe to the neck, without ſleeves, and deſcending ſomething lower than the breaſt. The ſacred penman, ſpeaking of "the robe of the Ephod," ſays, "there ſhall be a hole in the top, in the midſt thereof, and it ſhall have a binding of woven work round about the hole of it, as it were the hole of תחרא an *habergeon*, that it be not rent." But the deduction of the original word, from a root which ſignifies to make hot, juſtifies the lexicographers in conceiving it to have been a thick or quilted garment fitted cloſe to the body; and probably it was the ſame as the veſt which Saul put upon David, previouſly to his arming him with the thorax and girdle (1 Samuel, chap. xvii. v. 38, 39.). This veſt, indeed, is diſtinguiſhed by another name (יְרָד), but the objection is of little moment, for a redundancy of names applied to ſingle objects, is common enough to be met with in the Hebrew, and other Aſiatic languages. Saul's tunic was evidently placed under the body armour, to prevent the plates of metal from preſſing too cloſely on the ſkin, and hurting it; and anſwered preciſely the purpoſe of the doublet, or pourpoint, worn beneath the coat of mail in more modern times (ſee DOUBLET); and perhaps, like that, was made without ſleeves. Upon the *fig.* B. *Plate* I. we find a ſimilar kind of military garment which is worn without the breaſt-plate, and has only one ſleeve occupied by the left arm; this tunic appears to have been fabricated with ſome rigid material, perhaps of thick leather, and might have anſwered the double purpoſe of the pourpoint and the pectoral: the right ſleeve, which is full of folds, is evidently made of more pliant ſtuff than the body garment, and probably belonged to an inner tunic; it was ſubſtituted for the leather ſleeve, becauſe it was leſs rigid, and did not equally impede the motions requiſite for the ſword-arm. This curious ancient figure is preſerved in the Britiſh Muſeum; it is of Greek workmanſhip, and was found in the ruins of Herculaneum.

The *thorax* or *breaſt-plate*, called in the Hebrew שִׁרְיָן or שִׁרְיוֹן, derived from a word ſignificant of *ſtrength*; and uſually rendered by our tranſlators, *coat of mail*; formed another part of the Jewiſh military habit; it is firſt mentioned as ſuch, 1 Samuel, chap. xvii. v. 38. and the ſame word is uſed for the body armour of Goliath the Philiſtine (ibid. ver. 5.), joined with an adjective, expreſſive of its having been covered with plates of braſs in the form of ſcales. This word is totally omitted in our tranſlation, but it is a very important one; and the paſſage may be rendered, "a thorax or breaſt-plate of ſcales of braſs." Herodotus (in Polymnia) informs us, that the Median and Perſian ſoldiers belonging to the army of Xerxes, had each of them a tunic covered with plates of iron like the ſcales of a fiſh, and adorned with ſleeves of various colours; but over the tunic, it appears from the hiſtorian, they wore an Egyptian pectoral. This kind of ſcale armour conſiſted of ſmall plates of metal faſtened upon a garment fitted to the body and limbs of the wearer, and contrived to hang over each other like a fiſh's ſcales, but in ſuch a manner, as not to prevent the flexibility of the garment, nor obſtruct the exertions of the ſoldier's agility. The form and nature of this equipment are admirably repreſented by the Sarmatian horſemen, upon the Trajan column; a dreſs, ſomewhat ſimilar, was partially adopted in the weſtern parts of Europe by the heroes of the middle ages; but it was ſoon ſuperſeded by the chain, or ring mail, which became univerſal.

It is highly probable, that the *thorax* of the Philiſtine was much longer in proportion to his ſize than that of Saul, and might cover the greater part, if not the whole of the front of his body; at leaſt one may ſo judge from its great weight, equal, it is ſaid, to 189 pounds Troy weight; for had the breaſt-plate of Saul been longer or larger than the ancient pectorals uſually were, and proportionate to his ſize, it would have been an abſurdity in him to have attempted to put it upon David, who was a ſtripling, and at leaſt a full head and ſhoulders beneath his ſtature. Yet we are told, he did put it upon David, and girded his ſword upon the tunic beneath it. When David rejected the dreſs, it is not ſaid he did it becauſe it was too large or too long, or that he appeared ridiculous in it, but becauſe he had not eſſayed, tried, or been uſed to ſuch an equipment; for which reaſon, inſtead of being uſeful, it was an incumbrance to him, and obſtructed the free uſe of his arms. See BREAST-PLATE.

If we turn to the little figure A. *Plate* I. we may meet with ſomething reſembling the body armour of Saul, and may eaſily conceive how it might be applied to a perſon of ſmaller ſtature, without the leaſt inconſiſtency; firſt, we obſerve the ſhort ſkirts of the tunic (above mentioned) with which David was firſt inveſted; ſecondly, the thorax or breaſt-plate, here apparently one ſolid plate of metal, worked into the form of a man's breaſt, and faſtened upon the tunic; beneath the thorax, are two belts plated with metal, from one of which the ſword was uſually ſuſpended. If we look to the ſacred text, we ſhall find that Saul girded David with his own ſword upon the tunic; and as he had been previouſly inveſted with the thorax, it reaſonably follows that

that the ſword was girded "upon" a portion of the tunic which hung below the thorax, agreeably to the repreſentation of the belts upon the bronze. There is only one girdle mentioned in this paſſage of the ſcripture; and perhaps one was ſufficient for David, though Saul, a much taller man, might require two or more. The little figure here engraved perfectly explains the manner in which Ahab king of Iſrael received his death's wound; we are told (1 Kings, chap. xxii. ver. 34.), that he was ſmitten by an arrow, "between the joinings of the belts, and between the breaſt-plate," that is, in the opening where the lower part of the breaſt plate was joined with the uppermoſt belt or girdle. See BELT.

Xenophon (Cyrop. lib. vi.), deſcribing the military dreſs of Abradates king of Suſa, mentions *arm-pieces* as part of it; and the Ancient Grecian ſculptures exhibit broad plates of metal for the protection of the ſhoulders (ſee the *figures* marked C. C. *Plate* I. *of Armour*); and alſo *cuiſſes* for the thighs; and *taſſes*, or plated ſtraps, attached to the thorax, for the protection of the lower parts of the body. In proceſs of time the thorax was gradually enlarged, and from its aggrandiſement originated a complete ſuit of body armour, ſuch as was introduced by the Grecians, and occaſionally uſed by the Romans. In the middle ages, this cuſtom of caſing of men in braſs or iron was revived, and carried in more modern times to a greater extent than it had been before. A front and a back view of a cloſe-armed man according to the ancient Grecian faſhion, is given, *Plate* I. marked C.C.; the ſucceeding alterations will appear hereafter, under the article *Coat of Mail*. We may here add, that the *lorica* or *mail*, a ſpecies of armour ſo famous in the ages of chivalry, is by no means of modern invention. The thorax of the Philiſtine giant appear to have been ſomewhat of this kind, conſiſting of ſmall plates of metal quilted over each other like the ſcales of a fiſh; and if we turn to *Plate* I. and examine the body of the *figure* marked D. we ſhall find ſtrong indication of a chain-mail or net-work of wire rings. If it ſhould be thought, from the ſmoothneſs of the bronze upon the left ſide, that the armour was only made to cover the right, it will be neceſſary to obſerve, that this figure in its original ſtate was ſupported by another figure, whoſe right arm, broken away near the elbow, appears beneath its left ſhoulder, and the part of the arm which is loſt covered that portion of the body where we remark the deficiency of the mail; in the preſent caſe, the left hand of the ſupporting figure is alſo ſeen upon the right hip.

The Egyptian armour of defence for the perſon conſiſted of a *brazen helmet*, and a *thorax* or coat of linen ſo plaited and folded as to reſiſt the point of the enemy's weapon; the whole ſeems to be formed of rolls of linen or cotton faſtened together like the ſtockings worn at preſent by the Tyroleſe, or like the hay-bands which a countryman twiſts round his legs to ſerve inſtead of boots. *Fig.* 1 and 2. *Plate* II. were copied from the tombs of the kings of Thebes. Denon's Egypt. Herodotus.

In the earlieſt defenſive armour for the perſon, the Greeks ſeem to have uſed the ſkins of animals. Hercules wore the lion's ſkin, which, in very ancient ſculpture and painting, is tied round his neck by the paws, and again faſtened round his loins with a ligature, in ſuch a manner as to form a kind of coat. Jupiter wore the ægis, or goat-ſkin, for both breaſt-plate and ſhield, to which afterwards was added a cover of metal ſcales for better defence, and it was farther decorated with the Meduſa's head to terrify the beholder; the κυνέη, or dog's ſkin, was the ancient hat and helmet.

The κυνέη, or *dog's ſkin*, is the name generally given to the helmet by the Greeks. Homer frequently uſes it, but it is particularly given to that worn by Ulyſſes in the night expedition. Τρυφάλεια, *tryphalia*, is the triple-creſted helmet; the creſts were principally made of horſe-hair. *Fig.* 4. *Plate* II. is of the firſt deſcription. Κόρυς, *korus*, a word derived from κάρη the head, is properly applied to N° 13 and 16. *Plate* III. and the helmets of 7 and 8. *Plate* II. becauſe this ſpecies of helmet being drawn over the face, at the ſame time that the form of the head was preſerved, the features of the wearer appeared through the front of the helmet.

The Greeks made the thorax, or armour for the body, of braſs, linen, or leather. Homer calls his heroes, braſs-coated.

The plate-armour for the body conſiſted of four principal diviſions, the breaſt-plate, the back-plate, the ſhoulder-plates and the ζῶμα, or the *zone*.

The breaſt and back-plates were formed to reſemble the naked body (ſee *fig.* 8. *Plate* II. and *fig.* 14 and 18. *Plate* III.): theſe two pieces were faſtened together by haſps on each ſide.

The ſhoulder-plates were tied to the paps of the breaſt, in ſome inſtances, which projected like high buttons, to allow room for the knot; ſee *fig.* 8. *Plate* II.

The ζῶμα, or *zone*, comprehended the belt and hanging ſtraps which formed the loweſt part of the thorax; ſee *fig.* 3, 7, and 8. *Plate* II.

Fig. 6 and 7. are coats of mail; in *fig.* 6. the ſhoulder-plates are faſtened by ſtrings to a ſmall circle or *umbilicum*, cloſe to the girdle. *Fig.* 3. *Plate* II. has the appearance of linen armour or a coat of mail.

Κνημῖδες, *ocreæ*, were greaves of braſs or tin to defend the legs; theſe were faſtened behind the leg with two ſtraps and buttons each.

The *aſpis* was the large round ſhield, ſee *fig.* 9. *Plate* III. The *pelta* was a ſmaller ſhield, *fig.* 10. *Plate* III.

There were ſeveral other ſhields, but thoſe of the large round, and large oval forms, ſeem to have been moſt commonly uſed.

Fig. 12. *Plate* III. is one of the Roman heavy-armed ſoldiers called *principes;* his armour conſiſts of plates of iron or braſs. *Fig.* 20. *Plate* III. is one of the Roman *velites*, or light-armed ſoldiers, his covering conſiſts of a leather jacket, breeches or femoralia, and ſandals. *Fig.* 15. ſame plate, is a Roman general (the emperor Trajan), whoſe dreſs is ſufficiently explained in the account of Grecian plate armour; the only peculiarity in this figure worthy of obſervation is, that he wears the military *chlamys* or cloak.

Fig. 11. and 19. *Plate* III. are two brazen ſwords in the Britiſh Muſeum, the latter is ſheathed in the ſame metal; theſe with the helmets 13 and 16. and the breaſt and back-plates 14 and 18. were found in the field of Cannæ, and are believed to have belonged to the Carthaginians.

Fig. 5. *Plate* II. is a figure in an elegant ſuit of armour, copied from an antique paſte in the collection of Mr. Taſſie; but whether it is Etruſcan or Roman would be difficult to determine, as it bears but little reſemblance to any other ancient work of art that is known.

Although the foregoing obſervations will throw conſiderable light on the ſubject of Greek and Roman armour in general, yet it muſt be acknowledged that their ſpecies is almoſt infinite; and that all the antique ſtatues, pictures, and gems of armed warriors, of which many hundred exiſt, exhibit thoſe differences and peculiarities which muſt naturally be expected from the variety of times, countries, geniuſes of men, and the gradual progreſs of improvement. In the repreſentations of armour for the body made of leather, we ſee the imitations of that covered with hair, and made with plaited thongs: in the linen mail, we ſee thoſe doubly and triply plaited, and others worked in oilet holes: in the mail of braſs and iron, we ſee different kinds of ſcales and chain-works, with

with the various combinations of rings; theſe differences may be obſerved in the ſtructure of the armour itſelf, beſides the great variety of animals, foliage, and devices, with which the different ſpecimens are decorated. Concerning the magnificent *thorax* of Menelaus deſcribed by Homer in the beginning of the eleventh book of the Iliad, it is ſaid to have had ten ſtripes of black ſteel, twelve of gold, and twenty of tin, beſides three dragons on each ſide, which roſe up to the neck of the thorax; all this could be only decoration, the general form reſembling ſome one of thoſe repreſented in *Plate* II.

Homer and Heſiod's deſcriptions of the ſhields of Achilles and Hercules ſtrike the reader with aſtoniſhment, and bewilder his imagination; but we may form a ſimple and ſatisfactory conception of both, by remembering they were large circles, decorated with baſrelieves of figures, the ſubjects of which followed in ſucceſſion until the laſt reached the firſt. In an enumeration of the magnificent examples of ancient armour, the trophies of Auguſtus, formerly called thoſe of Marius, in the capitol, excite our aſtoniſhment by the extreme richneſs and beauty of the helmets, coats of mail, ſhields, &c. which compoſe them; and the knowledge of theſe noble works has been widely communicated by Piraneſi's admirable prints. In concluding this ſubject, it is to be remarked, that the excavations of Pompeia have furniſhed a great quantity of curious and intereſting information on the ſubject of ancient armour, totally unknown to the moderns before. There are in the king of Naples' muſeum of Portici ancient Roman helmets made of braſs, with viſors to cover the face and guard the eyes; armour for the upper and lower arms, ſhoulders, elbows, and thighs, of a kind not to be ſeen in any of the antique ſtatues or baſrelieves. Some of theſe pieces are adorned with figures, groups, and other ornaments; but as no drawings are permitted to be made from them, except by thoſe perſons employed for the publication of the Herculanean antiquities, by the Neapolitan government, we muſt wait for the next volume of that work to ſatisfy our curioſity.

In *Plate* I. the *figures* C, C, and D. will be ſufficiently explained by what has been ſaid concerning the different articles in *Plates* II. and III. there being nothing particular in theſe figures excepting the ſwan or gooſe's head which forms the creſt of *fig.* C. The *fig.* A. and B. wear helmets with viſors; the helmet of *fig.* A. has a high cone and two horns; the ſhield, which was originally a long ſquare, is broken.

Vegetius obſerves (De re militari, l. i. c. 10.), that the Roman infantry was invariably covered with defenſive armour, from the foundation of the city to the reign of the emperor Gratian. The relaxation of diſcipline, and the diſuſe of exerciſe, rendered the ſoldiers leſs able and leſs willing to ſupport the fatigues of the ſervice; they complained of the weight of the armour, which they ſeldom wore; and they ſucceſſively obtained permiſſion for laying aſide both their cuiraſſes and their helmets. The heavy weapons of their anceſtors, the ſhort ſword and the formidable *pilum*, which had ſubdued the world, inſenſibly dropped from their feeble hands. As the uſe of the ſhield is incompatible with that of the bow, they reluctantly marched into the field. The cavalry of the Goths, the Huns, and the Alani, had felt the benefit and adopted the uſe of defenſive armour; and as they excelled in the management of miſſile weapons, they eaſily overwhelmed the naked and trembling legions, whoſe heads and breaſts were expoſed, without defence, to the arrows of the barbarians. The loſs of armies, the deſtruction of cities, and the diſhonour of the Roman name, ineffectually ſolicited the ſucceſſors of Gratian to reſtore the helmets and cuiraſſes of the infantry. The enervated ſoldiers abandoned their own and the public defence, and their puſillanimous indolence may be conſidered as the immediate cauſe of the downfal of the Roman empire. Gibbon, vol. iii. p. 67, 68.

Thus far we have chiefly conſidered the defenſive *Armour* of the *ancients*; and ſhall now preſent our readers with a correct ſketch of its hiſtory as it relates to Britain.

The early *Britons*, though by no means unacquainted with the ſtratagems of war, ſeem to have had no defenſive armour; merely endeavouring to make their appearance dreadful, by tracing wild and horrid images upon the ſkin; and though they afterwards adopted many of the Roman cuſtoms, arts, and habits, they do not ſeem to have availed themſelves of armour, perhaps thinking the freedom of exertion oppreſſed by ſuch an incumbrance; and it muſt likewiſe be remembered, that it was the conſtant policy of the Romans to deprive all thoſe nations whom they ſubdued of the uſe of arms, and to accuſtom them to a ſoft, effeminate way of life, that they might have neither ability nor inclination to ſhake off their yoke (See Tac. vit. Agr.). And the Britons perhaps had little inclination to adopt the Roman method of defence, ſince it could be no honour to wear the military habit of their conquerors. The *Saxons*, on the other hand, were a ſtout and hardy people, whoſe chief delight was war, and though among the earlieſt of them who arrived in Britain, we hear of nothing like what is now called armour, yet there ſeems ſome ground for thinking that it was not entirely unknown to them, ſince the firſt ſpecies of military habit they afterwards made uſe of, was the ſcale armour, ſimilar to that which Xenophon deſcribes among the Sarmatians, from whoſe neighbourhood it is now believed the anceſtors of the Saxons had their origin. In manuſcripts of the tenth century, the Saxon ſoldiers appear habited in a kind of mail, or ſcale armour, ſimilar to that worn by the ancient Normans (Strutt's Manners and Cuſtoms of the Engliſh, vol. i. p. 29.), already deſcribed. And another kind of mail in uſe appears to have been compoſed of ſtrong wires cloſely interwoven with each other, like fine wicker, with which the ſoldiers were cloathed from head to foot (ſee *Pl.* IV. *f.* 1. 2.); others, however, appear to have been cloathed with it in part only, its inflexibility ſeeming to require that it ſhould be confined to the body, ending at the bottom of the ſtomach, and a little below the ſhoulders (Ibid. vol. i. p. 30.). The helmets uſually worn with this latter ſpecies ſeem to have been of ſkins. A manuſcript in the Cotton library (Cleop. c. 8.) univerſally allowed to be as old as the reign of king Canute, repreſents the *Daniſh* ſoldiers in complete ſuits of armour (ſee *Pl.* IV. *fig.* 3, 4.), from the bends and folds of which they are ſuppoſed to have been made of leather, with a diamond croſſing of ſtrong wires, interwoven with each other, and made with ſtrong joints in proper places. This armour covers the whole body, legs, and arms, half the left hand being left uncovered, for the better purchaſe in holding either the ſword, the ſpear, or the ſhield. Their heads are covered with helmets, much ſuperior to thoſe we have mentioned of the Saxons, and ſtill better faſhioned to ſuſtain the ſhock of a violent blow. A projection alſo croſſes the face, to prevent the perſon armed from receiving any hurt from the croſs ſtroke of an enemy's ſword, not unlike what is ſometimes ſeen in the ancient Greek and Roman helmets; and, with a little variation, in the modern helmets of the Mamalukes.

The defenſive armour of the *Normans* was chiefly the coat of fence called *Mail*, eſpecially for the better ſort; others had body armour of iron or leather. The mail was made of ſmall iron links, with joints at a convenient diſtance, and ſo contrived as to move upon each other with the greateſt

facility (see *Pl.* IV. *fig.* 5.). With this defenſive armour both the horſemen and better ſort of foot were covered, the face and left hand excepted. When the mail itſelf did not compoſe the guard for the head, they wore helmets, either of iron or braſs; the leaders and ſtandard-bearers had generally beavers, compoſed of thin plates of iron, faſtened on the mail before the face; and a few, apparently of an higher rank, wore helmets elumſily conſtructed.

Mail armour maintained its ground from the Norman invaſion to the fifteenth century. Henry IV. is the laſt of our kings who appears in it on his great ſeal (Gough's Sep. Mon. I. cxliii.). Many inſtances, however, of perſons armed *mi-partie*, plated and mail, occur about the middle of the fourteenth century (Ibid. cxliv.); at which time Mr. Groſe affirms, that plated armour was completely introduced both here and in France. The tranſition from mail to plate armour is ſhewn (*Pl.* IV. *fig.* 6.), from the monument of Thomas Beauchamp, earl of Warwick, 1370. When *plated armour* came into faſhion, it was compoſed of different pieces for the back, breaſt, ſhoulders, arms, hands, thighs, legs, and feet, under the ſeveral names of *cuiras*, conſiſting of a back and breaſt-piece; *pouldrons*, *braſſarts*, or gondebraſs or avant-braſs, (corruptly, in Engliſh, *vambraces*); *gauntlets*, *cuiſſarts*, with *genouillieres*; *greaves*, and iron ſhoes. Such was the ſuit of armour in the tower, ſaid to have been made for Henry the VIII., when eighteen years of age (*Pl.* V. *f.* 1.). Plate armour continued in uſe, with few variations, to the cloſe of the ſeventeenth century; when the introduction of firelocks, with the improvement of artillery, and a more active mode of warfare, ſuperſeded the incumbrance of heavy armour. Of all this furniture of war, ſcarce any thing is now retained, except the *cuiraſs*; the gorget or neck-piece, worn by officers, being at preſent only a badge of honour, and of no defence. The minute changes of our ancient armour may perhaps be beſt traced, by the inquiſitive reader, upon ſepulchral monuments.

The different articles of which the ancient armour was compoſed will be found under their reſpective heads.

ARMOR, or ARMOUR, *Horſe*. The horſe belonging to the cavalry, in the army of Cyrus, according to Xenophon (Cyrop. l. vii.), were armed with forehead-pieces, breaſt-plates, and ſide-pieces, and the ſide-pieces ſerved as thigh-pieces to the horſemen. The Sarmatian war-horſes were covered with ſmall plates, in imitation of the ſcales of a fiſh, after the manner of their riders. And Plutarch informs us, that when the Parthians oppoſed the younger Craſſus, they were not only cloathed with defenſive armour themſelves, but that their horſes were completely armed in braſs and ſteel (οἱ δ' ἵπποι καταπεφραγμένοι χαλκοῖς καὶ σιδηροῖς ὑφάσμασιν), poliſhed to the higheſt perfection (Plut. Vit. v. iii. p. 280. ed. 1723.). The inveſting of horſes with defenſive armour was common enough in the middle ages, and was perhaps introduced into England by the Normans (See Hoveden Annal. p. 446.). It continued to the cloſe of the ſixteenth century, when the horſe-armour appears to have conſiſted of a *chanfron*, or kind of maſk, which incloſed the face and ears, with ſometimes a ſpike iſſuing from the center of the forehead; a *criniere*, to guard the mane; a *poitrinal*, or breaſt-plate; and a *croupiere*, or buttock-piece, that uſually deſcended to the hocks. (See *Pl.* V. *fig.* 2.) After this time the *barde*, or horſe armour, appears to have been neglected; except that in the thirteenth and fourteenth years of Charles the ſecond, the horſes of the militia were ordered to be provided with a pectoral and crupper (Groſe's Milit. Antiq. ii. 338.). To prevent their horſes from being fatigued under all their own incumbrances, and the enormous weight of their riders, and to preſerve their vigour for the charge, the men at arms in ancient times had commonly hackneys for riding on a march, and did not mount their war horſes till they were certain of coming to action; a circumſtance which ſometimes occaſioned them to be ſurpriſed and defeated, before they could mount their chargers and form.

ARMOR, or ARMOUR, *for the Tilt Yard*. The ſplendor in which the tournaments of antient times were held, will account for our making the armour of the tilt-yard a ſeparate article. In the middle ages, the common armour ſeems to have been uſed, only ſumptuouſly covered with drapery, both as to man and horſe, and occaſionally charged with the armorial bearings of the combatants. The bridle and furniture were oftentimes of goldſmiths' work, and the capariſons richly embroidered. Toward the reign of Henry the Eighth, the drapery was in a great meaſure thrown aſide; and the taſte of the combatants was uſually diſplayed in the elegance and lightneſs of their tilting armour. Under Elizabeth, it ſeems to have been extravagantly ornamented, and, in many caſes, materially to have differed from the military habit of defence. Mr. Pennant, in the hiſtory of London, has engraved the portrait of Robert Dudley, earl of Leiceſter, clad for the tilt-yard; from which it appears very plainly, that taſte and ſhow were chiefly conſulted (See *Pl.* V. *fig.* 3). Mr. Strutt too, in his Manners and Cuſtoms of the Engliſh, has engraved a portrait of Prince Henry, eldeſt ſon of James the Firſt, in a ſort of half-tilting habit, worn when the pike was exerciſed on foot (ſee *Pl.* V. *fig.* 4).

The gallantry of going to the battle naked, without any defenſive armour, prevailed ſo far, that the French, during the reign of Louis XIV. were obliged to be continually iſſuing ordonnances to reſtrain it; in conſequence of which, the general officers, and thoſe of the cavalry, were obliged to reſume their cuiraſs, which yet has been but ill obſerved.

And now we conclude the article of armour; but not without informing our readers, that the firſt part of it was furniſhed by a hand of which death has now deprived us. The perſon we allude to was Mr. Joſeph Strutt, of whoſe ability as an antiquary the world has been long convinced.

ARMOR, *Coat*, is the eſcutcheon of any perſon or family, with its ſeveral charges, and other furniture; as mantling, creſt, ſupporters, motto, &c.

Thus we ſay, a gentleman of *coat-armor*, meaning one who bears arms. See ARMS.

ARMORACIA, in *Botany*. See COCHLEARIA.

ARMORACIÆ, in *Entomology*, a ſpecies of CHRYSOMELA, deſcribed in the Linnæan Fauna Suecica, by Fabricius, Herbſt, Gmelin, and others. It is very gloſſy; blueiſh black above; beneath black. Degeer names it chryſomela plantaginis, from its being found chiefly on the plantain. Cochlearia armoracia ranunculo aquatili, flammula.

ARMORIAL, ſomething that relates to arms, or heraldry.

In this ſenſe we ſay an armorial figure, armorial bearing, armorial enſign, the armorial lily of France, armorial lion or leopard of England, &c.

ARMORIAL is alſo a title given to ſeveral books, which contain the arms of a number of perſons of quality.

In this ſenſe we meet with the French armorial, the Spaniſh armorial, &c.

ARMORIC, or AREMORIC, ſomething that belongs to the province of Bretagne, or Britany, in France. See ARMORICA.

ARMORIC, abſolutely uſed, denotes the language in uſe among the inhabitants of Britany.

The French uſually call this language *Bas-breton*; compounded, ſays M. Menage, of *ar*, *upon*, and *mor*, *ſea*.

The Armoric is a dialect of the Welch, and ſiſter of the Corniſh language.

The

The inhabitants of Britany, of Cornwall, and of Wales, formerly underſtood each other's ſpeech; though conſiderable diverſities have crept in between theſe languages, ſince their ſeparation from each other.

The inhabitants of Britany, Mr. Lluyd obſerves, by their intercourſe with the French, have much altered their ancient orthography; beſides that there are ſeveral words in the Armoric which have no affinity with the Welſh; and that both the Armoric and Corniſh retain ſeveral ancient words and phraſes which are loſt in the Welſh. Julian Manoir, a Jeſuit, has publiſhed an Armoric grammar and vocabulary, in French, which has been tranſlated into Engliſh by Mr. Williams, and publiſhed with notes by Mr. Lluyd. In Archæol. tit. 3. and 4. p. 180, &c. Before him, Yvon Quillevere had publiſhed an Armoric vocabulary at Paris, 1521.

Toland has given a catalogue of ſeveral Armoric words, which prove to be Iriſh; alſo a vocabulary Armoric and Iriſh.

ARMORICA, in *Ancient Geography*, the name given by the Romans, after the conqueſt of Gaul, to that portion of its maritime countries that is ſituate in the north-weſt corner between the rivers Seine, the Loire, and the Atlantic. The name Armorica was anciently given to the whole northern and weſtern coaſt of Gaul, from the Pyrenæans to the Rhine; under which name it was known in Cæſar's time. Cæſ. De Bell. Gall. lib. vii. c. 14. During the firſt three centuries of the Chriſtian æra, this remote corner was with little interruption in tranquil ſubjection to the reſiſtleſs dominion of Rome. But its ſubmiſſion was the exaction of force, not the acquieſcence of content. The Armoricans were impatient of ſlavery, and when the northern hordes ſhook the tottering fabric of the weſtern empire, they were eager to revolt. They expelled the Roman magiſtrates who acted under the authority of the uſurper Conſtantine; and a free government was eſtabliſhed among a people who had ſo long been ſubject to the arbitrary will of a maſter. The independence of Armorica was confirmed by Honorius himſelf; but after the northern conquerors of Gaul had ſucceſſively fallen, the maritime provinces were reſtored to the empire. Employed on this portion of hiſtory, Gibbon (Hiſt. vol. v. p. 363.) in a few lines marks the character of a people "reſtleſs under conſtraint, but unfit for liberty." Yet their obedience was imperfect and precarious; the vain, inconſtant, rebellious diſpoſition of the people, was incompatible either with freedom or ſervitude; and Armorica, though it could not long maintain the form of a republic, was agitated by frequent and deſtructive revolts. In the end of the fifth century, when Clovis eſtabliſhed his Franks in Gaul, Armorica, after a long and obſtinate oppoſition, at length capitulated on honourable terms, by which the people were admitted to be a part of the newly-formed kingdom of France. The Britons, when finally ſubdued by the Saxons, and expelled from their native land, ſought and found refuge in Armorica, and coaleſcing with the natives, became a powerful though vaſſal ſtate. This territory, ſays Warton (Hiſt. Eng. Poet. vol. i. diſſ. 1.), was, as it were, newly peopled in the fourth century, by a colony or army of the Welſh, who migrated thither under the conduct of Maximus, a Roman general in Britain, and Conan, lord of Meiriadoc or Denbighland. Milton more than once alludes to this Welſh colony:

"Et tandem Armoricos Britonum ſub lege colonos."
Manſus.

And, in the "Paradiſe Loſt," (b. i. 579.), he mentions indiſcriminately the knights of Wales and Armorica, as the cuſtomary retinue of king Arthur:

"——What reſounds
In fable or romance, of Uther's ſon
Begirt with Britiſh and Armoric knights."

This migration of the Welſh into Armorica, which had thrown off its dependence on the Romans during the diſtractions of the empire, ſeems to have occaſioned a cloſe connection between the two countries for many centuries. From this connection of Wales with Armorica, the ſcene of ancient romances, we are able to deduce the reaſon why Wales was ſo conſtantly made the theatre of the old Britiſh chivalry, and alſo why ſo many of the favourite fictions which occur in the early French romances, ſhould alſo literally be found in the tales and chronicles of the elder Welſh bards. It was owing to the perpetual communication kept up between the Welſh and the people of Armorica, who abounded in theſe fictions, and who naturally took occaſion to interweave them into the hiſtory of their friends and allies.

Armorica, or Britany, was not annexed to the crown of France till the cloſe of the fifteenth century, and the inhabitants retained various privileges and immunities, which continued in force until the revolutionary eſtabliſhment of departments put an end to all local or provincial privileges, and amalgamated all former diverſities into one maſs.

From the ſettlement of the refugee Britons, Armorica received the name of Leſſer Britain or Britany, and was governed by dukes. See BRITANY, and GAUL.

ARMORIST, a perſon ſkilled in the knowledge of arms.

ARMORUM CONCUSSIO, in *Antiquity*, the claſhing of arms, practiſed by the Romans before an engagement, deſigned for ſtriking a panic into their enemies. It always followed the *claſſicum*, and *barritus*.

ARMORY, or ARMOURY, a ſtore-houſe of arms, or a place where military habiliments are kept to be ready for uſe. There are armories in the Tower, and in all arſenals, citadels, caſtles, &c. Imbezzling or deſtroying the king's armour or warlike ſtores, is declared to be felony without benefit of clergy, by ſtat. 31 Eliz. c. 4. 22 Car. II. c. 5. 12 Geo. III. c. 24.

ARMORY, is alſo uſed for a branch of HERALDRY: being the knowledge of coat-armors, as to their blazons and various intendments.

ARMOSATA, or ARSAMOSATA, in *Ancient Geography*, a very conſiderable city of Armenia, and next in importance to Artaxata; ſituate between the Tigris and the Euphrates. It took its name from the river Arſamus of Pliny, or Arſamatus of Tacitus, on which it was built. It was by turns taken and ſacked by the Huns, Arabs, and other neighbouring nations.

ARMOSON, a promontory of Aſia, in Carmania, near a place called Armaſia, at the entrance of the Perſian Gulf.

ARMOT, in *Geography*, a ſmall iſland in the ſea of Gaſcogny, on the coaſt of Saintonge.

ARMOURER, a maker of arms, or armour. The profeſſion of an armourer, which was formerly an office of great importance in this kingdom, is now totally extinct.

The Roman armourers were diſpoſed in certain places in the empire, it being forbid, either to ſell, to buy, or make arms elſewhere. They were exempt from all offices and taxes, and received a ſalary from the public.

When once they had taken that employment on themſelves, neither they nor their children were allowed to quit it. To prevent this, they had a kind of note, or ſtigma, impreſſed on the arm, whereby they might be known.

known. If any of them fled, or fecreted their ware, the reſt were obliged to anſwer for him; on account of which, the effects of ſuch as died without a legal heir went to the college.

There were fifteen *armamentaria* or repoſitories of arms in the Eaſtern empire, placed near the frontiers; and nineteen in the Weſtern. Pitiſc. Lex. Aut.

ARMOURER *of a ſhip*, a perſon whoſe office is to take care that the arms be in a condition fit for ſervice.

ARMS, ARMA, in a general ſenſe, include all kinds of weapons, whether for offence or defence. Nicod derives the word from the Latin phraſe, *quod ſuperſint armos*, becauſe they cover the ſhoulders or ſides; but Varro derives *arma, ab arcendo, eo quod arceant hoſtes*. It is ſuppoſed, that the firſt artificial arms were of wood, and were employed only againſt beaſts; and that Belus, the ſon of Nimrod, was the firſt that waged war; whence, according to ſome, came the appellation *bellum*. Diodorus Siculus takes Belus to be the ſame with Mars, who firſt trained ſoldiers up to battle. Lucretius is minute on this ſubject:

"Arma antiqua manus, ungues dentesque fuere
Et lapides, & item ſylvarum fragmina, rami.
Et flammæ atque ignes poſtquam ſunt cognita primum.
Poſterius ferri, vis eſt æriſque reperta,
Et prior æris erat quam ferri cognitus uſus."

The moſt ancient and univerſal arms of offence ſeem to have been bows and arrows; to which ſucceeded the ſling. See Gen. xxi. 20. xxvii. 3. Job, xli. 19. Heſiod expreſsly tells us, that in the early ages, the arms and inſtruments of the primitive heroes were compoſed entirely of braſs.

The arms of the early Greeks were heavy, and principally defenſive, conſiſting of an helmet, a breaſt-plate, and greaves, all of braſs; with a ſhield, commonly of bull's hide, but often ſtrengthened with the metal juſt mentioned; the ſhield being a ſuperadded protection for every part. The Locrians, however, under Oilean Ajax, were all light-armed; bows were their principal weapons, and they never engaged in cloſe fight. Mitford's Greece, vol. i. p. 102.

The infantry which compoſed the Roman legions were of three kinds, the *haſtati*, the *principes*, and the *triarii*. Their arms, both offenſive and defenſive, were in a great meaſure the ſame. They wore an head-piece of braſs or iron, coming down to the ſhoulders, but leaving the face uncovered; a coat of mail, generally made of leather, covered with ſmall plates of iron, in the form of ſcales, or iron rings twiſted within each other; greaves for the legs, or ſometimes only on the right leg; an oblong ſhield, with an iron boſs; a ſword; and two long javelins. Adams Rom. Antiq. 367. There was alſo a fourth kind of troops, called *velites*, from their ſwiftneſs and agility; they were firſt inſtituted in the ſecond Punic war. They were aſſigned no regular poſt, but fought in ſcattered parties, wherever occaſion might require, uſually before the lines. They were equipped with bows, ſlings, and javelins, a ſmall round ſhield, a ſword, and a helmet of the ſkin of ſome wild animal. (Ibid. 368.) What contributed moſt to render the Romans maſters of the world was, that having ſucceſſively waged againſt all nations, they conſtantly renounced their own methods, arms, &c. whenever they met with better. Thus Romulus, during his war with the Sabines, a bold and warlike nation, adopted their broad buckler in lieu of the ſmall Argian buckler, which he had uſed till that time.

The arms in uſe among the ancient Britons were ſlight, and unfit to withſtand the Romans in a cloſe encounter; though in light ſkirmiſhes, prudently made, the Britons generally gained conſiderable advantage (Strutt, Manners and Cuſtoms, vol. i. p. 3.). Their young men were not only trained to the uſe of arms in early youth, but continued in the exerciſe of them to the very cloſe of age; and were always ready to appear, when called by their leaders into actual ſervice. Their very diverſions and ſports were of a martial and a manly caſt; and the javelin they uſed in hunting was a principal weapon in the field of war. They had neither helmets, breaſt plates, nor defenſive armour, but a light ſhield. Cæſar tells us they had a dart or javelin, which they threw from their war chariots to annoy the enemy; with a ſhort ſpear for the infantry, that had a ball at the nether end fill'd with braſs; this they ſhook with great violence before the battle, in hope to intimidate the enemy; and again when they engaged the cavalry: to the upper end of it a thong was fixed, that when uſed as a miſſile weapon, it might be recovered, and again uſed in the cloſe encounter. They had alſo long and broad ſwords, without points, deſigned only for cutting, which were ſlung by a chain over the left ſhoulder; and occaſionally a ſhort dirk fixed in their girdles. The ſcythes that were ſometimes faſtened to their chariot-wheels, may perhaps be ranked among their offenſive arms.

The anceſtors of the Saxons, in their native woods, we are told, tranſacted no buſineſs, public or private, without being completely armed (Tac. De Morib. Germ. § xiii.); and the cuſtom of wearing ſwords on all occaſions prevailed in every country where the Germans took poſſeſſion.

The early Saxons, previous to their arrival in Britain, beſide the buckler and the dagger, uſed a ſword bent in the manner of a ſcythe; but their deſcendants ſoon changed it for one that was long, ſtraight, and broad, double-edged, and pointed.

The Saxon infantry were not all furniſhed with the ſame offenſive weapons; ſome being provided with ſpears, others with axes, and not a few with clubs, beſide ſwords, which were common to them all. Their ſhields were generally of the middle ſize, for the moſt part oval, always convex, and having a ſharp ſpike projecting from the center; with which, while they defended themſelves, they annoyed their enemies. They fought with their ſwords and ſhields, much like the gladiators of the Romans; and in the earlieſt times had nothing like defenſive armour, which they ſeem to have adopted about the eighth or ninth century. Some alteration in our national arms probably took place on the arrival of the Danes. Their ſwords were both longer and larger than the Saxon ſwords; the lance had a ſlight difference; and they appear to have brought the battle-axe into more general uſe. Verſtegan enumerates the croſs-bow as a Saxon weapon, but had no good authority for the aſſertion; as it neither appears in any ancient hiſtory or delineation, that the Saxons ever were acquainted with it. And though they uſed the common bow when following the chace, they never brought it to the field of action. Their cavalry were armed with greater uniformity than they who fought on foot; carrying in their right hands long ſpears, and at their left ſides a ſword. They were alſo better provided with defenſive armour.

The Saxon and the Daniſh troops were chiefly infantry; and though not entirely for the introduction, we are certainly indebted to the Normans for the more general uſe of cavalry. In regard to defenſive arms among the Normans, both horſe and foot ſoldiers were differently clad; ſome to ſupport the ſet battle, and ſome the lighter ſkirmiſhes (Strutt, Man. and Cuſtoms, vol. i. p. 96.). The offenſive arms the cavalry uſed were long ſpears or lances, ſwords like thoſe of the Saxons, and ſhort dirks or daggers.

Thoſe of the foot ſoldiery were a ſpear, or a bow and arrow, or a ſling, with a ſword; to whom were added the arcubalistarii, or ſhooters with the croſs-bow, an inſtrument entirely of Norman introduction. By the famous aſſize of Henry II. the arms of the infantry are expreſsly ordered neither to be ſold nor pledged, nor ſeized for debt, nor any way alienated, but to be tranſmitted by every man to his heir. Beſide their lances, ſpears, darts, croſs-bows, and ſlings, which may be called the ſmall arms of the middle ages, the Normans introduced a kind of field artillery, which they uſed in battle, conſiſting of various machines of wood, which, by different contrivances and combinations of mechanic powers, threw darts and ſtones to a conſiderable diſtance (See ARTILLERY.). To all which they added *ſpicula ignita*, arrows headed with combuſtible matter for firing towns or ſhipping (Henry's Hiſt. of Britain, iii. 470. 475.). And here we mention, *en paſſant*, the Greek fire, probably brought to Europe immediately after the firſt cruſade. From this period to the reign of Edward I. our military weapons were but little altered: about this time we date the introduction, or perhaps the proper uſe of the Engliſh long-bow; which, as we have mentioned in a former article (ſee ARCHERY), rendered our anceſtors, in one inſtance, ſuperior to all the world.

The introduction of chemiſtry in the thirteenth century gave riſe to many uſeful and curious diſcoveries, ſuch as would have excited the admiration of a more enlightened age. One of theſe was the compoſition of gunpowder, whoſe ingredients and terrible effects were accurately, though under an humane concealment, diſcovered by friar Bacon. The art, however, was neither commonly known nor practiſed; and that of making inſtruments proper for applying it to the purpoſes of war, was ſtill leſs known. See GUNPOWDER.

The exact time when gunpowder and fire-arms were firſt employed in war by the Britiſh nation, is difficult to be diſcovered. If the metrical life of Robert Bruce may be believed, Edward III. had cannon *(crakkys of war)* in his firſt campaign againſt the Scots, 1327. The French undoubtedly uſed them in 1338, as well as Edward, at the battle of Creſſy, in 1346. By degrees, the uſe of cannon became more and more common, ſo that, in a few years, the conſternation that was at firſt produced by their exploſion, was very much abated (Henry, vol. iv. p. 502.). Beſide the greater guns or cannon, a ſmaller kind, called hand cannon, came in uſe, which were carried by two men, and fired from a reſt fixed in the ground. Such, it is ſuppoſed, were the four hundred cannon with which the Engliſh beſieged St. Malo, in 1378 (Ibid. 505.). The invention of gunpowder however, for a long time, made little alteration in the art of war. The Greek fire ſtill continued in occaſional employment; and ſo late even as the time of Elizabeth, the ſtrength of our armies conſiſted in the archers, who having added halberts to their arms, firſt fixed them in the ground till they had diſcharged their arrows, and then reſiſted the impreſſion of the cavalry. The cannon of the fifteenth century were of different kinds, ſhapes, and ſizes; ſome exceeding large, and others very ſmall, diſtinguiſhed from each other by different names, and all made of iron. The writ of Edw. IV. for the protection of the kingdom againſt the Scots, in 1481, enumerates bumbards, cannons, culverynes, fowelers, ſerpentines, and other ordnance; together with ſulphur powder, ſaltpetre, ſtones, iron, lead, and all other materials neceſſary for charging them (omnimodas alias ſtuffuras pro eiſdem cannonibus neceſſariis. Rym. Fœd. xii. 140.): which reminds us that the firſt invention of cannon, not only iron and lead, but quarrels, ſtones, and even arrows, were thrown from them. Strutt's Manners and Cuſtoms, ii. 32.

The improvements in artillery are, at this diſtance, neither perceptible nor of much importance. Having ſtated that mortars and bombs were invented in 1544, by foreigners whom Henry the VIIIth employed (Henry, vi. 399.), we ſhall refer our readers to the article ARTILLERY.

Fire-arms of a portable conſtruction were not invented till the beginning of the ſixteenth century. In 1521, the muſket, mounted on a ſtock, was uſed at the ſiege of Parma; and probably ſoon adopted in England (Henry, vi. 398.). Its form, however, was clumſy, and its weight very inconvenient; while the bow, in the hands of an Engliſh archer, retained the credit of having, within a determinate range, a ſteadier aim and a greater execution. See ARCHERY.

The protector Somerſet, who knew the importance of fire-arms, had above 3,000 foreigners in his pay, of whom the greater part were muſketeers. Andrews' Hiſt. of England.

The firſt bayonets were daggers, which, after the ſoldiers had exhauſted their ammunition, they fitted to the bore of their muſkets. They were introduced in France about 1675; and among the Engliſh grenadiers in the ſhort reign of James the ſecond (Groſe, Milit. Hiſt. ii. 339.). Many ſuch are yet to be ſeen in the ſmall armoury at the Tower. The uſe of them, faſtened to the muzzle of the firelock, was alſo a French improvement, firſt adopted about 1690; it was accompanied, in 1693, at the battle of Marſeille in Piedmont, by a dreadful ſlaughter (De Limiere, Hiſt. Louis XIV. vol. vi. p. 88.); and its uſe was univerſally followed by the reſt of Europe in the war of the ſucceſſion. See BAYONET.

The piſtol had its origin from Piſtoye, a town of Tuſcany (Moreri Dict. v. il Bayonette); and was introduced into England about the middle of the ſixteenth century. Many of the ſhields, ſaid to have been the ſpoils of the armada in 1588, have piſtols in the center, with little gratings for the aim. They were ſometimes introduced at the butt-end of the pike; as well as in the time of Edward VI. at the lower end of the battle-axe. Groſe, i. 123.

In the reign of James I. no great alterations were made in our defenſive arms; and with regard to thoſe of the offenſive kind, all the pikes, except the common pike, grew into gradual diſuſe; the chief weapons of the infantry were muſkets, calivers, pikes, and ſwords; ſwords, carabines, and piſtols of the cavalry. Under Charles I. our fire-arms ſeem to have been without improvements, and there was even ſome inclination to reſtore the bow. About 1625, Walter Neade preſented his majeſty with a book, explaining a new exerciſe for the ſoldiery, whereby the bow and pike being faſtened together, might be uſed at the ſame time. The exerciſe was adopted for trial in the artillery garden, but was afterwards rejected (Neade's double-armed man by the new invention, Lond. 1625, 4to.). The great alteration, when matchlocks were no longer uſed, took place about the third or fourth year of William III. (Groſe, ii. 342.); ſince which time their efficient uſe has proved indiſpenſable.

The progreſs of fire-arms in France was not diſſimilar to that in England. It was not till after the acceſſion of Francis the firſt, 1515, that any conſiderable charge was effected. Between that time, and the death of Henry the third, in 1589, pikes, the ancient weapon of the French infantry, gave place to the arquebuſs; while in the cavalry, lances were gradually and reluctantly exchanged for the piſtol (Wraxall's Hiſt. of France, vol. ii. p. 241.). At that period, the Spaniards were far ſuperior to the French in the art of war. No general could emulate the fame of

the duke of Parma, who ſtudied and conducted war as a ſcience to which mathematical, geographical, and even hiſtorical aid was indiſpenſable. The infantry of Philip the ſecond and third ſpread terror over Europe.

In the middle ages, and even ſo late as the ſixteenth century, the chief national weapon of the Scots was the ſpear, ſeventeen feet in length. It was undoubtedly formidable, when projected by a ſteady and complete battalion. But the Scottiſh troops were deficient in point of diſcipline. In pitched battles, they might have equal bravery, but ſeldom ſucceeded againſt the diſciplined archers.

By the ancient laws of England every man was obliged to bear arms, except the judges and clergy. Under Henry VIII. it was expreſsly enjoined on all perſons to be regularly inſtructed, even from their tender years, in the exerciſe of the arms then in uſe; viz. the long bow and arrows, and to be provided with a certain number of them. 33 Hen. 8.

ARMS, *Arma*, in *Law*, are extended to any thing which a man takes in his hand in his wrath, to caſt at or ſtrike another.—So Crompton—*Armorum appellatio non ubique ſenta, & gladios, & galeas ſignificat, ſed & ſuſtes & lapides.* See VI & *armis*.

By the common law, it is an offence for perſons to go or ride armed with dangerous weapons: but gentlemen may wear common armour, according to their quality, &c. 3 Inſt. This is alſo declared by ſtat. 1 W. and M. ſt. 2. c. 2. The king may prohibit force of arms, and puniſh offenders according to law; and herein every ſubject is bound to be aiding, ſtat. 7 Edw. I. None ſhall come with force and arms before the king's juſtices, nor ride armed in affray of the peace, on pain to forfeit their armour, and to ſuffer impriſonment, &c. 2 Ed. III. c. 3.

The importation of arms and ammunition is prohibited, by 1 Jac. II. c. 8. and by 1 W. and M. ſtat. 2. c. 2. Proteſtant ſubjects may have arms for their defence. So likewiſe, arms, &c. ſhipped after prohibition, are forfeited by 29 Geo. II. c. 16. ſect. 2.

It is one branch of the royal prerogative veſted in his majeſty by ſtatutes 12 Car. II. c. 4. and 29 Geo. II. c. 16. to prohibit the exportation of arms and ammunition out of the kingdom, under ſevere penalties.

Arms of offence in uſe among us at preſent are, the ſword, piſtol, muſket, bayonet, pike, &c.

The arms of the Highlanders are, the broad-ſword, target, poniard, and whinyar or dirk, &c.

There are ſeveral acts of parliament for diſarming the Highlanders: ſee 1 Geo. I. c. 54. 11 Geo. I. c. 26. 19 Geo. II. c. 39. 21 Geo. II. c. 34. 26 Geo. II. c. 22 and 29.

ARMS *of Defence*. See ARMOR and ARMS.

ARMS, *Fire*, are thoſe charged with powder and ball: ſuch are cannon, mortars, and other ordnance; muſkets, carabines, piſtols, and even bombs, granadoes, carcaſſes, &c. Fire-arms diſcharged by hand were firſt called hand-cannons, hand-culverines, and hand-guns; they afterwards acquired the appellations of hackbuts, arquebuſſes, muſkets, and calivers; and, laſtly, their preſent name of fire-locks.

In the hiſtory of the Royal Academy for the year 1707, we have an account of ſome experiments made with fire-arms differently loaded, by M. Caſſini. Among other things, he obſerves, that by loading the piece with a ball which is ſomewhat leſs than the calibre, and only laying a little gunpowder below the ball, and a good deal above it, it will yield a vehement noiſe, but have no ſenſible effect or impulſe on the ball. This he takes to have been all the ſecret of thoſe people who pretended to tell the art of rendering one's ſelf invulnerable, or ſhot-proof.

ARMS, *Bells of*, or *Bell-tents*, denote a kind of tents in the ſhape of a cone, where the company's arms are lodged in the field. They are generally painted with the colour of the facing of the regiment, and the king's arms in front.

ARMS, *Paſs of*, was a kind of combat in uſe among the ancient cavaliers. See PASS.

ARMS, *Stand of*, ſignifies a muſket, a bayonet, a ſword, belt, and cartridge-box.

ARMS *of Parade*, or *Courteſy*, were thoſe uſed in the ancient juſt, and tournament; which were commonly unſhod lances, ſwords without edge or point, wooden ſwords and even canes.

ARMS, *to*, a beat of the drum, is a ſignal to ſummon the ſoldiers to their alarm-poſts on ſome ſudden occaſion.

ARMS denote the natural weapons, or parts of defence of beaſts, as claws, teeth, tuſks, of elephants, beaks of birds, &c.;—and alſo the defenſive weapons of plants, as thorns, prickles, &c.

ARMS are alſo uſed figuratively for the profeſſion of a ſoldier.—Thus we ſay, he was bred to arms.—See FRATERNITY, LAW, PLACE, SUSPENSION *of Arms*.

ARMS, or *Armorial Enſigns*, in *Heraldry*, are marks or badges of dignity and honour regularly compoſed of certain figures and colours, given or authorized by ſovereigns, and borne on banners, ſhields, &c. &c. &c. for the diſtinction of perſons, families, and ſtates.

Concerning the origin and uſe of arms, or armorial enſigns, many authors, who have thought that comparative antiquity muſt neceſſarily decide on the merit of their favourite ſcience, have traced it far beyond the ſcope of chronology, to the Egyptians, and "the land of darkneſs." Diodorus Siculus is cited as an authority, aſſerting, that armorial diſtinctions were firſt adopted by Anubus and Macedo, ſons of Oſiris, under the emblems of a wolf and a dog. To the Greeks they are likewiſe attributed, and if the poetic delineations of the "ſhields" of heroes deſcribed by Homer, Æſchylus, and Virgil, be not inapplicable to the devices of the middle centuries, with apparent propriety; theſe, however, were not analogous, being the perſonal furniture of the chiefs, only embelliſhed according to the fancy of the artiſt, and alluſive to ſome exploit paſt or predicted, but neither hereditary nor gentilitial. Some deduce the introduction of arms from the ancient mythology, and conſider the hieroglyphics and emblems of Greece and Rome impreſſed on the reverſes of their medals, as the indubitable prototypes of modern armories. It has likewiſe been ſuppoſed, that arms were attributed to individuals, and confirmed to them by the Romans; and it is further urged, that in their code of laws under Auguſtus, and in that ſelected by Juſtinian, the "Jus imaginum," unequivocally referred to thoſe rights, this diſtinction of families, or the right of having the images and ſtatues of their anceſtors, an honour which was allowed to thoſe Romans only whoſe anceſtors had borne ſome office in the ſtate, as cenſor, prætor, conſul, &c. He who had the privilege of uſing the images or ſtatues of his anceſtors, was termed "nobilis;" he to whom it was permitted to have his own ſtatue or image only, was called "novus;" and the perſon who was not allowed to have the image or ſtatue either of his anceſtors or of himſelf, paſſed under the appellation of "ignobilis," as do the common people amongſt us who have no right to armorial enſigns. Theſe images or ſtatues were made either of wood, braſs, marble, or wax, painted the better to repreſent the perſons intended, and were dreſſed out according to the quality of the perſons they repreſented, being adorned with the robes of the offices they had borne, and the marks of their magiſtracy. Theſe images were uſually placed by the Romans in cabinets, which

which ſtood in the court before the entrance into their houſes; and on ſolemn days were uſually expoſed to view, not only that the people might be reminded of the nobility and honours of the family to whom they belonged, but in order to excite the poſterity of the poſſeſſors to imitate the virtues of their anceſtors. When any of the family died, the ſtatues and images were not only thus expoſed, but in the funerals were placed on beds, and carried before the corpſe, as enſigns of the nobility of the defunct. Thus, at the funeral of Marcellus, Auguſtus ordered ſix hundred beds of images to be carried before the corpſe; and no leſs than ſix thouſand are reported to have attended that of Sylla the dictator. The right of keeping and exhibiting the images and ſtatues being hereditary, and allowed proofs and evidences of nobility and ancient deſcent, they partook ſo much of the nature of coat-armour, as in ſome meaſure to countenance a probability that the latter were contrived and introduced in lieu of the former. The jus nobilitatis of the moderns, ſay the advocates for this ſuggeſtion, is nothing elſe but the jus imaginis amongſt the Romans; for as they placed the images and ſtatues before the porches and gates of their houſes, ſo our nobility and gentry uſed to have their banners, helmets, and other armour placed in ſome conſpicuous parts of their caſtles or manſions, and their armorial enſigns, either cut in ſtone, or painted on eſcutcheons, over their gates, not only as monuments of their nobility and ancient deſcent, but with intent thereby to encourage the beholders to imitate the virtues and bravery of their anceſtors. The analogy between this and the ſubſequent uſe of armorial enſigns, extends only to the ſingle circumſtance of hereditary appropriation. Acquired as they were by actual ſervices to the ſtate, ſo they were preſerved to the deſcendants of illuſtrious characters by the ſanction of the laws, and thus became a certain ſpecies of right and property, which at once endeared them to the poſſeſſors, and rendered them objects of honourable ambition. Beſides, the pride of the Romans was remarkable, and on every occaſion carried to the higheſt pitch; inſomuch that, in caſe any particular hereditary tokens or marks deſigned for diſtinguiſhing one family from another, and eſtabliſhed by public authority, had been uſed by them, they never would have ſuffered ſuch pleaſing teſtimonies of family honour and aggrandiſement to have ſunk into oblivion; but, on the contrary, would have endeavoured to perpetuate the memory of them, by repreſenting ſome of thoſe honourable badges in the paintings and ſculpture of their villas, ſepulchral monuments, triumphant arches, columns, temples, or other edifices: whereas no ſuch have ever been hitherto diſcovered: conſequently the difference between the jus imaginum of the Romans, and the bearing of coat-armour of later times, is wide and eſſential. Armorial enſigns are military, but the jus imaginum appears to have been a civil inſtitution, eſtabliſhed to do honour to ſuch particular families only. Much honour muſt be attributed to thoſe enſigns which were firſt adopted by the ſtipendiary bands of German ſoldiers; for their chiefs having the power of inveſting them, conſidered them not ſolely with reſpect to gentilitial diſtinction, but as perſonal appendages; and this in the very early centuries. When the Saxons, after their invaſion of this kingdom, ratified the partitions of the whole territory, and eſtabliſhed the heptarchy, to each principality its peculiar badge was aſſigned, and borne upon the banners; and it appears, that whenever any of the provincial kings became monarchs of the iſland, they retained the gentilitial bearing, as perſonal, not adopting any new device. This, however, applies only to a period prior to 959, when Edgar, ſurnamed the Peaceable, added to the "Croſs Floretté" four martlets; in 1042, five were uſed by Edward the Confeſſor, which remains the general armorial bearing of the Saxon nation.

Whether armorial enſigns were uſed by the Merovingian kings, whoſe race became extinct in the perſon of Childeric the Third in 754, or not till the cloſe of the ninth and commencement of the tenth centuries, who ſhall determine? The faireſt conjecture ſeems to be, that the tournaments held with ſuch magnificence towards the end of the tenth century, under the auſpices of Hugh Capet, were introductory of the more general uſage and aſſumption of arms. No ſatisfactory account is preſerved whether, after the perſonal uſe of arms, they were firſt painted or embroidered on rich ſtuffs in the form of pennons, or enamelled on ſhields. The more probable conjecture inclines to the former mode. The victorious William, who had been educated in the courts of Robert and Philip the Firſt, ſucceſſors of Hugh Capet, had imbibed an early taſte for the martial exerciſes of which France was then the moſt magnificent and frequented theatre. After his ſucceſsful enterpriſe, and eſtabliſhment on the throne of England, together with his deſire of ſignalizing his followers, he encouraged, but under great reſtrictions, the individual bearing of arms. About the year 1189, it was uſual to bear a ſmall ſhield faſtened to a belt, upon which arms were painted; and there is proof of this cuſtom obtaining in England prior to Richard the Firſt, upon whoſe great ſeal the ſhield is charged with three lions paſſant, or, as ſome term them, leopards.

The more general uſe of arms, and that which affords the beſt information concerning them, was the cuſtom of engraving them on ſeals for the purpoſe of ratifying deeds and charters. This mode is ſaid to be introduced by Edward the Confeſſor from Normandy, where he was educated, and to have been confirmed by him to the royal uſe. In the year 1095, being the commencement of the croiſades, a period the moſt intereſting in the hiſtory of heraldry now opens, when all Chriſtendom united in one common and infatuated cauſe; when even rival princes engaged in the ſame enterpriſe, not merely becauſe ſanctioned by the church, but rather as being highly delightful to the romantic and warlike genius of that age. The great council of Clermont had determined in that year to recover the holy city from the Saracens, by enliſting the church under the conſecrated banner from which they were to derive ſupernatural aſſiſtance. In the following year this immenſe army began their expedition; and, as a flattering badge, every private ſoldier wore a croſs of red ſtuff ſewed to his ſurcoat, from which circumſtance theſe atchievements were called "croiſades." The hereditary uſe of arms, ſays Camden, was not eſtabliſhed till the reign of Henry III. The laſt earls of Cheſter; the Quinceys, earls of Winchester; and the Lacies, earls of Lincoln; varied ſtill the father from the ſon. The Veres and Berkleys altered their paternal coats, "when they had taken up the croſs," the phraſe of that day for engaging in the holy wars.

The application of arms to the coin of this realm is of great antiquity; the ſcutagium being paid with eſcues, a ſilver coin upon which a ſhield was impreſſed (ſee Coin). The firſt inſtances of ſculpture of arms upon the effigies placed on ſepulchral monuments remain in the Temple Church, London, of the date 1144. The nobility and principal gentry not only continued their armorial enſigns on their ſhields, but in order to be better known and diſtinguiſhed, had them depicted on the breaſts and backs of the tunics and ſurcoats which they wore over their armour, as alſo on the capariſons of their horſes. This faſhion of ſurcoats ſpread over their coats of mail, and hanging down

to

to their heels, appears by the figure of Guido, earl of Richmond, who died in 1136, and is fo repreſented in that dreſs on his ſeal; the figure alſo of William de Valance, earl of Pembroke, in Weſtminſter abbey, who died in 1306, has the ſurcoat fo charged with armorial enſigns. The cuſtom of embroidering arms upon canopies of ſtate prevailed from the fourteenth century: they were likewiſe introduced into caſtles and private houſes, as well as churches, painted in compartments upon the wainſcot, or ſtained in glaſs, and inſerted in the windows of the chief rooms, and painted in the choiceſt ſtyle on vellum rolls. Armorial bearings upon plate were in uſe as early as the beginning of the thirteenth century, as appears by an inventory of the crown jewels taken in 1334. In the reign of Richard II. the armorial device was no longer confined to the gorgeous array of warriors completely armed, but emboſſed and embroidered on the common habits of thoſe who attended the ſumptuous court. Upon the mantle, the ſurcoat, and the juſt-au-corps or bodice, the charge and cognizance of the wearer were profuſely ſcattered, and ſhone reſplendent in taffie and beaten gold. The wardrobe of a nobleman became no ſmall part of his wealth, the articles of which were ſubjects of teſtamentary bequeſt. Even the ladies were as well verſed in mantling their hereditary atchievements, as in the ſervice of oratory: the ſumptuous veils and mantles, which they were employed in embroidering, were made in the form of eſcocheons joined together, and were of velvet, ſattin, and tafferee, according to the rank of the perſon, and were worn as the court dreſs till the commencement of the ſixteenth century; ſince which they have been uſed only as the ſtate dreſs of the officers of arms; from this cuſtom we have the modern phraſe "coat arms, or coats of arms."

The eſcocheon was now no longer ſingly charged with the hereditary bearing, but admitted thoſe of the wife by dimidiation or impalement, and of heirs general by quartering. The firſt that bore arms quarterly in England appears to be John Haſtings, ſecond earl of Pembroke, in 1348. Creſts and cognizances were multiplied, and a mode of decorating the armories introduced, that of placing the ſhield of arms between two animals as ſupporters. Arms were firſt borne on a ſhield by king Richard I., on the capariſons for horſes by Edward I., and the cuſtom of embroidering them on the juſt-au-corps, or bodice, by Richard II.

Originally, none but the nobility had a right of bearing arms; but king Charles V. by his charter in 1371, permitted the Pariſians "to bear arms;" from whoſe example the more eminent citizens of other places did the like. The uſe of arms became more cloſely connected with the ſtudy of genealogy; and when the mode of including in the ſame eſcocheon the armorial bearing of every heir female, with whom an intermarriage had been made, was univerſally followed, they were the more neceſſary to each other. By the fully quartered eſcocheon, a compendious ſcheme of connection preſented at one view, and a general idea communicated of the comparative claims of each family in the ſcale of hereditary dignity. To determine the right of introducing the arms of others into the eſcocheon, and to diſtribute them when altered in their proper gradation, opened a new field of profeſſional ability, which required the moſt diligent application to the laws and confirmed practice of arms. No ſyſtematic or elementary treatiſe, by which the ſcience could have been taught, was made public till the avenues to univerſal information were laid open by the typographic art. It was confined to the heralds, or painter-ſtainers whom they employed, who conſidered it as the myſtery of their trade, and therefore not to be divulged. Henry V. ſeems to have held a juſt opinion of the neceſſity of aſcertaining thoſe who were legally appointed to armorial diſtinctions, and of prohibiting an undue aſſumption of them: in 1417, the 7th of his reign, he iſſued an edict directed to the ſheriff of each county, to ſummon all perſons bearing arms to prove and eſtabliſh their right to them. Many claims, examined in conſequence of this inquiry, were referred to heralds, as commiſſioners; but the firſt regular chapter held by them in a collegiate capacity was at the ſiege of Rouen, on the 5th Jan. 1420. King Richard III. by his letters patent, dated 2d March 1483, the firſt of his reign, directs the incorporation of heralds, and eſtabliſhed the "College of Arms" on its preſent foundation, inveſting them with full powers of ſummoning thoſe that aſſumed the arms of others to appear in the earl-marſhal's court, and of granting eſcocheons to new families. This privilege multiplied the figures of courſe, and varied the differences. Forms of every deſcription in the infancy of the graphic art, without any exact reſemblance, if we may judge from the ſpecimens now remaining, were univerſally introduced. The creation was exhauſted in the repreſentation of the different parts of it, and to Gothic fancy alone we owe the introduction of gryphons, mermaids, wyverns, and harpies. Every invention of art, whether military or mechanic, has been at one time or other a badge of heraldic honour. Arms at preſent follow the nature of titles, which being the ſeveral marks for diſtinguiſhing of families and kindred, as names are of perſons and individuals; they alſo ſhew who were the founders of towns, caſtles, churches, ancient abbeys, and colleges, by having their arms affixed to them; and it is well known, during a war, that a ſhip taken carrying the armorial enſigns of an enemy, is declared a prize, though belonging to a power at amity. Arms are alſo variouſly diſtinguiſhed by the heralds under the following heads.

ARMS *of Dominion*, are thoſe which belong to ſovereign princes and commonwealths in right of their ſovereignty. In regard to ſuch enſigns, it may be obſerved, that if the perſon aſcending the throne by legal ſucceſſion be a ſovereign, he marſhals his arms with thoſe of the dominion to which he ſucceeds. If he who aſcends the throne by legal ſucceſſion, be of the quality of a ſubject, he then lays aſide his own arms, and uſes only thoſe of the dominion to which he ſucceeds. Thoſe who aſcend a throne by election, carry their arms on an eſcocheon placed on the center of the arms of the dominion to which they are elected. William, prince of Orange, placed thoſe of Naſſau over thoſe of England and Scotland, as an elective king.

ARMS *of Patronage*, are part of the arms of thoſe lords of whom the perſons bearing them held in fee, either added to the paternal arms of the perſon aſſuming ſuch addition, or borne as feudal arms in order to ſhew the dependence of the parties bearing them: thus, as the earls of Cheſter bore *garbs*, many gentlemen of the county bore *garbs* alſo. The late earls of Warwick bore *chequy or & blue*, or *chevron ermine*, and therefore many gentlemen of Warwickſhire bore *chequy*.

ARMS, *Feudal*, are thoſe annexed to dignified fees, as dukedoms, marquiſates, earldoms, &c. and which arms the poſſeſſors of thoſe fees carry in order to ſhew their dignities, in imitation of ſovereigns diſplaying the enſigns of their dominions. In England there have been but few inſtances of feudal bearings, but there are many in Spain and in Scotland.

ARMS *of Pretenſion*, are thoſe borne by ſovereigns who are not in poſſeſſion of the dominions to which ſuch arms belong,

long, but who claim or pretend to have a right to thofe territories; thus the kings of Spain quarter the arms of Portugal and Jerufalem; and England thofe of France, till lately.

Arms *of Conceffion*, are augmentations granted by the fovereign or part of his arms; thus the royal augmentation in the arms of the duke of Rutland, were granted by Henry the Eighth.

Arms *of Community*, are thofe of bifhopricks, cities, univerfities, and other bodies corporate. (See Impalement.)

Arms, *Canting*, or as the French call them "armes parlantes," or punning arms, alluding to names, a *trivet* for Trevet, *three herrings* for Herring, &c. Thefe, though fome ancient precedents exift, were not common till the commencement of the feventeenth century, when they prevailed under the aufpices of king James I.

Arms *Paternal and Hereditary*, are fuch as belong to a particular family, and which no other has a right to aflume.

Arms *of Succeffion*, are thofe taken by inheriting certain fiefs or manors, either by will, entail, or duration; as we find that Hubertus de Burgo, earl of Kent, who bore for his arms "gules feven lozenges vairè," granted the manor of Elmore in the county of Glocefter, in 1274, to Anfelmus de Guife, at the yearly rent of a clove-gilliflower in acknowledgment of the gift, with the conceffion of his coat-armour: whereupon the faid Anfelmus de Guife bore the coat with a canton, or charged with a mullet pierced fable; and which arms have been continued by the family, and are now borne by the baronet of that name.

Arms *of Alliance*, are fuch as when an heirefs marries, her iffue quarter her arms to fhew their maternal defcent. By this means the memory of many ancient and noble families, extinct in the male line, is preferved and conveyed to pofterity; which is the principal reafon of marfhalling feveral coats in one fhield.

Arms *of Adoption*, are thofe which you take from another family quarterly with your own. The laft of a family may by will adopt a ftranger to take his furname, arms, and eftate, thereby to continue to the world his name and family after his deceafe; permiffion for which is obtained by petition to his majefty for his royal licence and authority to comply with the requeft of the teftator, and the fign manual is then recorded in the college of arms.

A teft of the antiquity of a coat of arms is in general its fimplicity; a fingle ordinary, or two at moft, conftituting the moft noble.

Arms, in *Falconry*, denote the legs of a hawk, from the thigh to the foot. See Hawking.

Arms, *King of*. See King *of arms*.

Arms, *Herald at*. See Herald.

Arms, *Purfuivant at*. See Pursuivant.

ARMSON, in *Geography*, a town of Germany, in the circle of Weftphalia, and county of Verden, feven miles eaft-fouth-eaft of Verden.

ARMSTRONG, John, in *Biography*, was born in the year 1709, at Caftleton in Roxburghfhire, where his father was minifter, under whom he received the rudiments of his education. Being intended for the practice of medicine, he was fent to Edinburgh, and in 1732, took the degree of Doctor, and publifhed for his thefis on that occafion, a differtation "De tabe purulenta." He foon after came to London, where his wit procured him the notice of fome of the moft eminent men of the time; particularly he became acquainted with John Wilkes, who was then rifing to celebrity. In 1735, he publifhed "An Eflay for abridging the Study of Phyfic, with a Dialogue," written with much humour, "between Hygeia, Mercury, and Pluto, relating to the practice of phyfic, as it is managed by a certain illuftrious focicty;" which gained him credit as a wit, but was probably one of the caufes of his being but little noticed as a phyfician. To repair the injury this might have done him, in 1737, he publifhed "A Synopfis of the hiftory and cure of the Venereal Difeafe." This was however foon followed by the "Œconomy of Love," as more ingenious, and licentious, and calculated entirely to efface any favourable impreffions of his fitnefs for the medical profeffion which his former work might have excited. Its luxuriancies were confiderably pruned by the author in an edition printed in 1768. But the work for which he is indebted for his fame as a poet, is his beautiful "Eflay on the Art of preferving Health," which appeared in 1744. It is written in blank verfe, and is deervedly efteemed one of the fineft fpecimens of didactic poetry in our language. Indeed he feems to have exhaufted his ftock of genius in the compofition of this chef d'œuvre: his poems on "Benevolence," in 1751; "Tafte," in 1753; and "Day," an epiftle to John Wilkes, efq. the laft of his effufions in this line, fcarcely rifing above mediocrity. His epiftle to Mr. Wilkes was written in Germany, in the year 1761, while he was phyfician to the Britifh army there; a poft for which he was indebted to fome of the friends his wit had procured him. In this poem he unfortunately hazarded a reflection on Churchill, which drew from that irritable bard a fevere retort in his "Journey." Before this time, viz. in the year 1758, he had publifhed a volume in profe, of "Sketches and Eflays," under the name of Launcelot Temple, efq. which was well received. His friend Wilkes contributed fome of the eflays in this collection. In the year 1763, he returned to London, and found his practice in medicine fomewhat increafed, through the connections he had formed in the army: but that his calls that way were not very numerous, appears by his being able, in the year 1771, to make a tour through France and Italy, in company with the celebrated artift M. Fufeli. In his journey he met his friend Dr. Smollet, to whom he was much attached. On his return, he publifhed an account of his ramble, under the name he had before aflumed of Launcelot Temple, efquire. His laft work, a 4to. pamphlet, intitled, "Medical Eflays," appeared in 1773. In this he complains of the little attention that had been paid to him, while fo many other phyficians of inferior abilities had rifen to fame and fortune, forgetting that the levity of his own conduct, and not the ficklenefs or want of difcernment of the public, occafioned the neglect. A large portion of his time was fpent at Slaughter's coffee-houfe in St. Martin's lane, where he ufually took his meals, and where meffages to him were ordinarily directed to be addreffed. He died September 1779; and left about 3000 l., a larger fum than his friends fuppofed he could have amaffed out of his very moderate income.

The reputation of Armftrong, as a poet, is almoft folely founded on his "Art of preferving Health." Of his ftyle and manner we have the following character by a very competent judge, in an eflay prefixed to an ornamented edition of the poem, printed in 1795. "It is diftinguifhed by its fimplicity, by a free ufe of words which owe their ftrength to their plainnefs, by the rejection of ambitious ornaments, and a neat approach to common phrafeology. His fentences are fhort and eafy; his fenfe clear and obvious. The full extent of his conceptions is taken in at the firft glance; and there are no lofty myfteries to be unravelled by a repeated perufal. What keeps his language from being profaic, is the vigour of his fentiments. He thinks boldly,

feels

feels ſtrongly, and therefore expreſſes himſelf poetically. Where the ſubject ſinks, his ſtyle ſinks with it; but he has for the moſt part excluded topics incapable either of vivid deſcription, or of the oratory of ſentiment. He had from nature a muſical ear, whence his lines are ſeldom very harſh, though apparently without much ſtudy to render them ſmooth. On the whole, it may not be too much to aſſert, that no writer in blank verſe can be found more free from ſtiffneſs and affectation, more eaſy and graceful without harſhneſs, and more dignified without formality."

He left his fortune by his will to his three nieces, daughters of his brother Dr. George Armſtrong; who, after having practiſed pharmacy ſucceſsfully ſeveral years at Hampſtead, at length obtained a diploma conſtituting him Doctor in Medicine, and came to London, and was made phyſician to a diſpenſary for the benefit of infant poor, opened at a houſe taken for him by the ſubſcribers in Soho ſquare. To aid the deſign, he publiſhed a ſmall treatiſe on the diſeaſes of children, in which he was ſuppoſed to have been aſſiſted by his brother John. The work was well received, and contained ſome obſervations on the ſubject that were new and ingenious. The diſpenſary, however, did not ſucceed; and the Doctor died ſome years after in obſcurity.

ARMUA, in *Ancient Geography*, the modern *Sei-bouze*, a river of Africa mentioned by Pliny, emptied itſelf into the Mediterranean between Aphrodiſium and Hippo Regius, ſouth-eaſt of the former, and north-weſt of the latter.

ARMUS, in *Entomology*, a ſpecies of CURCULIO, found in France. It is black; the ſcutel whitiſh; wing-caſes with denticulated ſtriæ on each ſide.

ARMUYDEN, or ARNEMUDEN, in *Geography*, a ſtrong ſea-port town of Zealand, in the Low Countries, ſituate on the eaſtern ſide of the iſle of Walcheren. It was anciently a large place, and divided into the Old and New Town. The convenience of the port, the depth of water, and its nearneſs to the ſea, drew to it much commerce, eſpecially in ſalt. But it has often been damaged by the ſea, and the harbour is now choaked up with ſand, ſo that the ſea is made navigable by means of a canal to Middleburg, from which Armuyden is diſtant about a league to the eaſt. N. lat. 51° 31′. E. long. 3° 42′.

ARMUZA, ARMOZUM, or ARMUZIA, in *Ancient Geography*, a city of Aſia, in Carmania, near the promontory Armozon, to which it gave name, as well as to the iſland of Ormuz. Pliny, and Ptolemy.

ARMY, a large body of ſoldiers, conſiſting of horſe and foot, under the command of a general, with ſeveral ranks of ſubordinate officers under him.

An army conſiſts of brigades, regiments, battalions, and ſquadrons, and is uſually divided into three corps; which are ranged in three lines. The firſt line is called the front-line, and part of it forms the van-guard; the ſecond, the main body; and the third, the rear-guard, or body of reſerve.—The middle of each line is generally poſſeſſed by the foot; the cavalry forms the wings on the right and left of each line; and ſometimes they alſo place ſquadrons of horſe in the intervals betwen the battalions.

The Britiſh army, when it takes the field, is divided into brigades, and theſe brigades into battalions, ſquadrons, companies, and troops, both in the infantry and cavalry reſpectively. The French have lately made a different diſtribution. Their infantry is divided into half-brigades, each half-brigade conſiſting of three battalions, and each battalion of nine companies. A company of artillery is attached to each half-brigade, for the management of its field-pieces. The half-brigade are either of the line, or light infantry; each battalion of thoſe in the line has its company of grenadiers, and each battalion of light infantry one of carabineers. For the arrangement of the army in order of battle, ſee *Order of* BATTLE.

The number of ſoldiers is neceſſarily much ſmaller, and bears a leſs proportion to the whole number of the people, in a civilized than in a rude ſtate of ſociety. Among the civilized nations of modern Europe, it has been ſtated, as the reſult of long experience, that a prince with a million of ſubjects cannot keep an army of above ten thouſand men, without ruining himſelf. It was otherwiſe in the ancient republics: the proportion of ſoldiers to the reſt of the people, which is now about one to a hundred, might then be as about one to eight: and in ſome of the little Grecian ſtates of ancient Greece, a fourth or fifth part of the whole body of the people conſidered themſelves as ſoldiery, and would ſometimes take the field. The reaſon ſeems owing to that equal partition of lands, which the ancient founders of commonwealths made among their ſubjects; ſo that every man had a conſiderable property to defend, and had means to defend it with. Whereas among us, the lands and riches of a nation being ſhared among a few, the reſt have no way of ſubſiſting, but by trades, arts, and the like; and have neither any free property to defend, nor means to enable them to go to war in defence of it, without ſtarving their families. A large part of our people are either artiſans or ſervants, and ſo only miniſter to the luxury and effeminacy of the great. While the equality of lands ſubſiſted, Rome, though only a little ſtate, being refuſed the ſuccours which the Latins were obliged to furniſh after the taking of the city in the conſulate of Camillus, preſently raiſed ten legions within their own walls: which was more, Livy aſſures us, than they were able to do in his time, though maſters of the greateſt part of the world. A full proof, adds the hiſtorian, that we are not grown ſtronger; and that what ſwells our city is only luxury, and the means and effects of it. Vide Liv. dec. 1. lib. vii.; and Conſid. ſur des Cauſ. de la Grand. des Rom. chap. iii. p. 24.

In the republics of ancient Greece and Rome, during the whole period of their exiſtence, and under the feudal governments for a conſiderable time after their firſt eſtabliſhment, the profeſſion of a ſoldier was not ſo ſeparate and diſtinct, as to conſtitute the ſole or even the principal occupation of a particular claſs of citizens. In proceſs of time, however, that induſtry which produces, and that wealth which follows, the improvements of agriculture and manufactures, provoked the invaſion of neighbours, and rendered it neceſſary for a ſtate, likely and liable to be attacked, to adopt ſome regular meaſures for the public defence, more eſpecially as the people, by their natural habits, were incapable of defending themſelves. In theſe circumſtances, there ſeem to be but two methods to which the ſtate can have recourſe for its own ſecurity: one of theſe is the introduction of a military force under the denomination of a MILITIA; and the other, the eſtabliſhment of a *ſtanding army*. The ſoldiers of this latter deſcription are ſolely or principally occupied in the practice of military exerciſes; and the maintenance or pay which the ſtate affords them is the principal and ordinary fund of their ſubſiſtence. In a ſtanding army, the character of a ſoldier predominates over every other; and the mode of their diſcipline, as well as the conſtancy of their exerciſe, renders the ſoldiers of this claſs ſuperior to a militia, in whatever manner it may be either diſciplined or exerciſed. This ſuperiority of a well-regulated ſtanding army is atteſted by the hiſtory of all ages. One of the firſt ſtanding armies of which we have any diſtinct account, in any well-authenticated hiſtory, is that of Philip

of Macedon. His frequent wars with the Thracians, Illyrians, Theſſalians, and ſome of the Greek cities in the neighbourhood of Macedon, gradually formed his troops, which were probably at firſt militia, to the exact diſcipline of a ſtanding army, which, as he was ſeldom, or never for any long time, at peace, he was careful not to diſband. With this army he vanquiſhed, after repeated and violent conflicts, the gallant and well-exerciſed militias of the principal republics of ancient Greece; and afterwards, with very little ſtruggle, the effeminate and ill-exerciſed militia of the great Perſian empire. The fall of the Greek republics, and of the Perſian empire, was the firſt great revolution in the affairs of mankind, which hiſtory has circumſtantially recorded; and it was the effect of the irreſiſtible ſuperiority which a ſtanding army has over every ſort of militia. The fall of Carthage, ſucceeded by the elevation of Rome, is the ſecond, which may be aſcribed to the ſame cauſe. From the end of the firſt to the beginning of the ſecond Carthaginian war, the armies of Carthage were continually in the field, and employed under three great generals, who ſucceeded one another in the command. Theſe were Hamilcar, his ſon-in-law Aſdrubal, and his ſon Hannibal. The army led by Hannibal from Spain into Italy, muſt neceſſarily have been gradually formed to the exact diſcipline of a ſtanding army. The Roman armies on the other hand, which Hannibal encountered at Trebia, Thraſymenus, and Cannæ, were militia oppoſed to a ſtanding army; and this circumſtance, perhaps, contributed more than any other to determine the fate of thoſe battles. The ſtanding army which Hannibal left behind him in Spain, had the like ſuperiority over the militia which the Romans ſent to oppoſe it, and in a few years, under the command of his brother Aſdrubal, expelled them almoſt entirely from that country. The Roman militia, being continually in the field, became in the progreſs of the war a well-diſciplined and well-exerciſed ſtanding army; and the ſuperiority of Hannibal was gradually diminiſhed. Aſdrubal judged it neceſſary to lead almoſt the whole of the ſtanding army which he commanded in Spain, to the aſſiſtance of his brother in Italy, but being ſurpriſed and attacked by another ſtanding army, in every reſpect equal or ſuperior to his own, he was entirely defeated. When Aſdrubal had left Spain, the great Scipio was oppoſed merely by a militia, inferior to his own; and having conquered and ſubdued that militia, his own militia neceſſarily became, in the courſe of the war, a well-diſciplined and well-exerciſed ſtanding army. That ſtanding army was afterwards tranſported to Africa, where it was oppoſed only by a militia; and in order to defend Carthage, it became neceſſary to recal the ſtanding army of Hannibal. The diſheartened and frequently defeated African militia joined it; and at the battle of Zama, compoſed the greater part of the troops of Hannibal. The event of that day determined the fate of the two rival republics. From the end of the ſecond Carthaginian war, till the fall of the Roman republic, the armies of Rome were in every reſpect ſtanding armies: and to theſe the militias of all the civilized nations of the ancient world, of Greece, of Syria, and of Egypt, made but a feeble reſiſtance. The militias of the barbarous nations defended themſelves much better. The Scythian or Tartar militia, and alſo the Parthian and German militias, were formidable enemies to the Roman armies, and gained conſiderable advantages over them. In general, however, and when the Roman armies were well commanded, they appear to have been very much ſuperior. Many different cauſes contributed to relax the diſcipline of the Roman armies. One of theſe cauſes was its extreme ſeverity. Beſides, under the Roman emperors, the ſtanding armies of Rome, thoſe eſpecially which guarded the German and Pannonian frontiers, became dangerous to their maſters, by ſetting up their own generals againſt them. To remedy this evil, and to render them leſs formidable, Dioclesian, as ſome ſay, or, according to others, Conſtantine, firſt withdrew them from the frontier, and diſperſed them in ſmall bodies through the different provincial towns, where ſome of them became tradeſmen, artificers, and manufacturers: and thus the civil acquired a predominance over the military character, and the ſtanding armies of Rome gradually degenerated into a corrupt, neglected, and undiſciplined militia, incapable of reſiſting the attack of the German and Scythian militias, which ſoon afterwards invaded the Weſtern empire. The fall of this empire, which is the third great revolution in the affairs of mankind, diſtinctly recorded in ancient hiſtory, was brought about by the irreſiſtible ſuperiority which the militia of a barbarous has over that of a civilized nation. But the victories which have been gained by militias have generally been, not over ſtanding armies, but over other militias, in exerciſe and diſcipline inferior to themſelves. Such were the victories which the Greek militia gained over that of the Perſian empire; and ſuch were alſo thoſe which in later times the Swiſs militia gained over that of the Auſtrians and Burgundians. As arts and induſtry advanced, the authority of the chieftains gradually decayed, and the great body of the people had leſs time to ſpare for military exerciſes. Hence, the diſcipline and the exerciſe of the feudal militia gradually declined and ſunk to ruin, and ſtanding armies were at length introduced in order to ſupply its place. When once the expedient of a ſtanding army was adopted by one civilized nation, it became neceſſary that all its neighbours ſhould follow the example. They found that their ſafety depended upon their doing ſo, and that their own militia was altogether incapable of reſiſting the attack of ſuch an army. The ſoldiers of a ſtanding army, though they may have never ſeen an enemy, have nevertheleſs frequently appeared to poſſeſs all the courage of veteran troops, and the very moment in which they have taken the field have been fit to face the hardieſt and moſt experienced veterans. A well-regulated ſtanding army, as it is ſuperior to every militia, and as it can beſt be maintained by an opulent and civilized nation, can alone defend ſuch a nation againſt the invaſion of a poor and barbarous neighbour. Moreover, as a civilized country can only be defended by means of a well-regulated ſtanding army, it is only by means of ſuch an army that a barbarous country can be ſuddenly and tolerably civilized.

The firſt ſtanding army that appeared in Europe, after the fall of the Roman legions, was that eſtabliſhed in France by Charles VII. A. D. 1445. Such an eſtabliſhment, however, was ſo repugnant to the genius of feudal policy, and ſo incompatible with the privileges and pretenſions of the nobility, that during ſeveral centuries no monarch was either ſo bold, or ſo powerful, as to venture on any ſtep towards introducing it. Charles VII. under pretence of keeping always on foot a force ſufficient to defend the kingdom againſt any ſudden invaſion of the Engliſh, when he diſbanded his other troops, retained under arms a body of 9,000 cavalry, and of 16,000 infantry. He alſo appropriated funds for the regular payment of theſe; he ſtationed them in different places of the kingdom, according to his own pleaſure; and appointed the officers who commanded and diſciplined them. By this meaſure he occaſioned an important revolution in the affairs and policy of Europe. By depriving the nobles of that direction of the military force of the ſtate, which had raiſed them to ſuch high authority and importance, a deep wound was given to the feudal ariſtocracy, in that part where its power ſeemed to be moſt complete. The inſtitution of ſtanding armies hath ſince become general; and this can only be attributed to the ſuperiority and ſucceſs which are

every where obſerved to attend it. The truth is, the cloſeneſs, regularity, and quickneſs of their movements; the unreſerved, inſtantaneous, and almoſt mechanical obedience to orders; the ſenſe of perſonal honour, and the familiarity with danger, which belong to a diſciplined, veteran, and embodied ſoldiery, give ſuch firmneſs and intrepidity to their approach, as well as ſuch weight and execution to their attack, as are not to be withſtood by looſe ranks of occaſional and newly-levied troops, who are liable by their inexperience to diſorder and confuſion, and in whom fear is conſtantly augmented by novelty and ſurpriſe. From the acknowledged ſuperiority of ſtanding armies, it follows, not only that it is unſafe for a nation to diſband its regular troops, whilſt neighbouring kingdoms retain theirs, but alſo that regular troops provide for the public ſervice at the leaſt poſſible expence. A ſtanding army adds more than any other force that can be provided to the common ſtrength, and takes leſs from that which compoſes the wealth of a nation, or its ſtock of productive induſtry. Beſides, when the ſtate relies for its defence upon a militia, formed from the maſs of the people, ſuch as huſbandmen, and artiſans, and manufacturers, it is neceſſary that arms be put into the hands of the people at large. Such a militia, inferior indeed in diſcipline and force to a ſtanding army, muſt be ſupplied by rotation, allotment, or ſome mode of ſucceſſion, which replaces freſh draughts from the country; and of courſe a much greater number will be inſtructed in the uſe of arms, and will have been occaſionally embodied together, than are actually employed, or than are ſuppoſed to be wanted at the ſame time. The effect of this diffuſion of the military character upon the civil condition of the country, becomes a ſubject of inquiry, peculiarly delicate and important. "To me," ſays the ingenious archdeacon Paley, "it appears doubtful, whether any government can be long ſecure, where the people are acquainted with the uſe of arms, and accuſtomed to reſort to them. Every faction will find itſelf at the head of an army. Every diſguſt will excite commotion; and every commotion become a civil war. Nothing perhaps can govern a nation of armed citizens, but that which governs an army—deſpotiſm." "I do not mean," continues this writer, "that a regular government would become deſpotic by training up its ſubjects to the knowledge and exerciſe of arms, but that it would ere long be forced to give way to deſpotiſm in ſome other ſhape; and that the country would be liable to what is even worſe than a ſettled and conſtitutional deſpotiſm, to perpetual rebellions, and to perpetual revolutions; to ſhort and violent uſurpations; to the ſucceſſive tyranny of governors, rendered cruel and jealous by the danger and inſtability of their ſituation."

The ſtrength and efficacy of a ſtanding army depend, in mixed governments, on its being ſubmitted to the management and direction of the prince. A popular council, however well qualified for the purpoſes of legiſlation, is altogether unfit for the conduct of war; in which ſucceſs uſually depends upon vigour and enterpriſe, upon ſecrecy, diſpatch, and unanimity, upon a quick perception of opportunities, and the power of ſeizing every opportunity immediately. The obedience of an army ſhould alſo be as prompt and active as poſſible; and it ought, therefore, to be an obedience of will and emulation. Upon this conſideration is founded the expediency of leaving to the prince not only the government and deſtination of the army, but the appointment and promotion of its officers; becauſe a deſign is then alone likely to be executed with zeal and fidelity, when the perſon who iſſues the order, chuſes the inſtruments, and rewards the ſervice. There is, however, a danger to the liberty of a ſtate, that is inſeparable from ſtanding armies, which ought not to be concealed nor diſſembled, and which has been thought by ſome to counterbalance its acknowledged advantages. Theſe properties of their conſtitution, the ſoldiery being ſeparated in a great degree from the reſt of the community, their being cloſely linked among themſelves by habits of ſociety and ſubordination, and the dependency of the whole chain upon the will and favour of the prince, however eſſential they may be to the purpoſes for which armies are kept up, give them an aſpect in no wiſe favourable to public liberty. The ſtanding army of Cæſar deſtroyed the Roman republic. The ſtanding army of Cromwell turned the long parliament out of doors. This danger, however, is diminiſhed by maintaining, upon all occaſions, as much alliance of intereſt, and as much intercourſe of ſentiment, between the military part of the nation and the other orders of the people, as are conſiſtent with the union and diſcipline of an army. For which purpoſe, the officers of the army ſhould be ſelected from the principal families of the country, and be encouraged to eſtabliſh in it families of their own, as well as be admitted to ſeats in the ſenate, to hereditary diſtinctions, and to all the civil honours and privileges that are compatible with this profeſſion; that by ſuch circumſtances of connection and ſituation they may have a ſhare in the general rights of the people, and their inclination may be engaged on the ſide of public liberty, ſo as thus to afford a reaſonable ſecurity that they cannot be brought, by any promiſes of perſonal aggrandiſement, to aſſiſt in the execution of meaſures which might enſlave their poſterity, their kindred, and their country. To prevent the executive power from being able to oppreſs, ſays baron Monteſquieu, it is requiſite that the armies with which it is entruſted ſhould conſiſt of the people, and have the ſame ſpirit with the people; as was the caſe at Rome, till Marius new-modelled the legions, by inliſting the rabble of Italy, and laid the foundation of all the military tyranny that enſued. Nothing then, according to theſe principles, ſays judge Blackſtone, ought to be more guarded againſt in a free ſtate, than making the military power, when ſuch a one is neceſſary to be kept on foot, a body too diſtinct from the people. Like ours, it ſhould be wholly compoſed of natural ſubjects; it ought only to be inliſted for a ſhort and limited time; the ſoldiers alſo ſhould live intermixed with the people; no ſeparate camp, no barracks, no inland fortreſſes ſhould be allowed. And perhaps it might be ſtill better, if, by diſmiſſing a ſtated number, and inliſting others at every renewal of their term, a circulation could be kept up between the army and the people, and the citizen and the ſoldier be more intimately connected together.

Since the general introduction and prevalence of ſtanding armies in Europe, it has alſo for many years paſt been annually judged neceſſary by our legiſlature, for the ſafety of the kingdom, the defence of the poſſeſſions of the crown of Great Britain, and the preſervation of the balance of power in Europe, to maintain even in the time of peace a ſtanding body of troops, under the command of the crown; who are however *ipſo facto* diſbanded at the expiration of every year, unleſs continued by parliament. See MUTINY BILL.

It is probable, ſays Andrews (Hiſt. of Great Britain, vol. i.), that the firſt ſtanding military force in Britain was that garriſon in Dover Caſtle, which, by reſiſting the arms of the Dauphin of France, invited by the barons to their ſuccour in their conteſt with king John, ſaved the kingdom of England from a foreign dynaſty. For, as Camden quotes from an ancient hiſtorian, "Sir Hubert de Burgo, when made conſtable of the caſtle, conſidering that it was not for the ſafety of the fortreſs to have new guards every month, procured, by the aſſent of the king, and of all that held of the caſtle, that every tenant for one month's guard ſhould find his ten ſhillings, out of which certain perſons

perſons elected and ſworn, both of horſe and foot, ſhould receive pay for guarding the caſtle."

If we advert to the ancient hiſtory of this country, we ſhall find, that by the Saxon laws, every freeman of an age capable of bearing arms, and not incapacitated by any bodily infirmity, was obliged, in caſe of a foreign invaſion, internal inſurrection, or other emergency, to join the army: that being one of the three ſervices comprehended under the title of the *trinoda neceſſitas*: and all ſuch as were qualified to bear arms in one family, were led to the field by the head of that family. Every landholder was obliged to keep armour and weapons, according to his rank and poſſeſſions, which he was prohibited from ſelling, lending, or pledging, or even alienating from his heirs. For their inſtruction in the uſe of arms, they had ſtated times for performing military exerciſe, and once in the year there was a general review of arms throughout each county. The greater part of the Anglo-Saxon forces conſiſted of infantry; which ſeems to have been of two ſorts, the heavy and light-armed; and the cavalry was chiefly compoſed of the thanes, ſuch men of property as kept horſes. The Anglo-Saxon mode of drawing up their armies for battle, was in one large denſe body ſurrounding their ſtandard, and placing their foot, with their heavy battle-axes, in the front. The military eſtabliſhment of the nation underwent a conſiderable change, when the feudal ſyſtem was introduced about the year 1086. By this ſyſtem, all the lands of the realm were conſidered as divided into certain portions, each producing an annual revenue, denominated a KNIGHT'S *Fee:* and every tenant *in capite,* or perſon who held from the king land amounting to a knight's fee, was bound to hold himſelf in readineſs, with horſe and arms, to ſerve the king in his wars, either at home or abroad, at his own expence, for a ſtated time, generally forty days in a year. When this ſervice was accompliſhed, they were at liberty to return home; but if they remained with the army, they were paid by the king. Perſons of this deſcription, unable to ſerve, were by proclamation directed to find unexceptionable ſubſtitutes. Soon after the conqueſt, the conſtitutional military force of England conſiſted of ſuch feudal troops, and of the POSSE *Comitatus,* including every freeman above the age of fifteen and under the age of ſixty, who were only liable to be called out in caſe of internal commotions or actual invaſions. That this body of men might be ready to take the field, a law, called the aſſiſe of arms, was enacted by Henry II., A. D. 1181, in the 27th year of his reign; which law was further corroborated and enforced by the 13th of Edw. I., called the ſtatute of Wincheſter, 33 Hen. VIII., c. 5. 2 & 3 Edw. VI. In the reigns of Richard II., Hen. VII., and Henry VIII., four military bodies, ſtill exiſting, were inſtituted, viz. the SERJEANTS *at Arms,* the GENTLEMEN *Penſioners,* the YEOMEN *of the Guard,* and the ARTILLERY *Company.*

During the troubles under Charles I. the royal army conſiſted chiefly of regiments raiſed by the nobility and gentry who adhered to the royal cauſe, from among their tenants and dependants. After the reſtoration of Charles II. when feudal tenures were aboliſhed by act of parliament, a national militia was eſtabliſhed; which was declared, by an act of parliament, to be under the immediate orders of the king. See MILITIA. Beſides theſe conſtitutional forces, there were in the Engliſh armies and garriſons, at all times from the conqueſt downward, ſtipendiary troops, both national and foreigners; the firſt hired by our kings, with the money paid by perſons commuting for their feudal ſervices, and employed in caſtle guards, foreign garriſons, and protecting the marſhes or borders of the kingdom, adjoining to Wales and Scotland; and the latter, paid out of the privy purſe, or living upon free quarters. They were known by the various names of ruptarii, routers, and ruyters, from a German word ſignifying a horſeman or knight; they were alſo denominated Brabançons, Provençales, Coterelli, and Flemings, and were in reality a ſet of freebooters of all nations, ready to be engaged for hire. Theſe were chiefly called in by our kings in their diſputes with the great barons. Since the time of king Edward III., when it became cuſtomary for our kings to engage with their ſubjects, and other perſons by indenture, to furniſh ſoldiers at certain wages, moſt of our armies conſiſted of ſtipendiary troops: ſuch was the army raiſed and commanded by the biſhop of Norwich, A. D. 1382, the 6th of Richard II., and that of the 16th of Henry V. Theſe ſtipendiary forces were, the garriſons and caſtle guards excepted, kept up only in time of war; and though mercenary, were not ſtanding armies. Their ſubſiſtence was drawn from the grants made by parliament, in which their ſpecific numbers were ſometimes ſtipulated. The firſt ſtanding forces employed by our kings were their immediate body-guards, ſuch as the ſerjeants at arms, the yeomen of the guard, and the gentlemen penſioners; and yet theſe were calculated rather for the ſplendour of a court than the operations of the field. Under the troubles of Charles I., a number of troops were levied by both parties, without any regard to law or cuſtom. Two regiments of guards raiſed by Charles II. in 1660, one of horſe and one of foot, formed the two firſt corps of our preſent army; and theſe were afterwards conſiderably increaſed. In 1661, the firſt regiment, or Royal Scots, were brought back from France, jocularly ſtiled from its antiquity, "Pontius Pilate's guards;" and there was alſo, about the ſame time, an Engliſh corps of cavalry in the French ſervice. The revolution cauſed the military part of the conſtitution to be new modelled, and the army to be voted from year to year, by the act ſtiled the MUTINY *Bill.*

The methods of raiſing the ſtipendiary, or mercenary troops, were either by commiſſions, reſembling our preſent beating orders, authorizing perſons to inliſt volunteers; or by indenture, which was a practice that began about the latter end of the reign of king Edward III., and in that of Henry V. became general. By theſe indentures, different perſons engaged to provide a certain number of able men, properly armed, to ſerve the king for a ſtated time, at a ſtipulated pay and bounty, then ſtyled wages and regards: and in theſe agreements it was uſual for the king to advance part of the pay before-hand, afterwards called "Impreſt Money," and alſo to give ſecurity for the regular payment of the remainder. For this purpoſe, king Henry V. pledged all his jewels, which were not redeemed till after his death. Criminals were alſo ſometimes pardoned on condition of ſerving in the royal army abroad, and finding ſecurity to anſwer any proſecution if called upon at their return. Several of our ſovereigns alſo, under the authority of the royal prerogative, obliged diſtricts, cities, towns, and even individuals, to ſend men and horſes, or to pay contributions for that purpoſe.

The preſent mode of recruiting our armies is by engaging volunteers, who are inliſted to ſerve for an indefinite time, that is, till they ſhall be diſcharged, or for a certain time, with an annexed clauſe, "or during the war." See INLISTING. Preſſing for ſoldiers was practiſed much in its preſent form in the time of queen Elizabeth; and it has been ſeveral times occaſionally authorized by acts of parliament. This, however, in itſelf, is but a bad expedient, and in general timidly, partially, and improperly executed.

The army, as it now ſtands, may date its origin from the reſtoration; though ſome of the eſtabliſhments formed by Charles II., were taken from corps raiſed during the

civil wars; ſuch as the firſt regiment of foot, and the Coldſtream regiment of guards, which laſt came with general Monk from Scotland. The royal regiment of horſe guards, commonly called the *Oxford* Blues, is among the firſt in this eſtabliſhment. The two troops of horſe-guards, embodied by Charles about the ſame time, and of which the privates were all gentlemen, have been for ſome years aboliſhed; and in their room have been ſubſtituted two fine regiments of cavalry, ſubject to military diſcipline like the reſt of the army, and called the firſt and ſecond regiments of *Life* Guards.

The regular army eſtabliſhed by Charles II. conſiſted at firſt of little more than 5,000 men, including garriſons abroad. In 1684, the ſtanding army amounted to 8,000 men; that on the Iriſh eſtabliſhment having been at the ſame time augmented to 7,000. During the two ſucceeding reigns the army was much increaſed, as the nation was engaged in continental wars. Under Geo. I., in 1717, the forces voted by parliament amounted to 16,000 men. The ſtanding army was much augmented during the following reign, on account of foreign wars and internal diſturbances. Every ſucceſſive war has augmented the eſtabliſhment of the army in proportion to our acquiſition of foreign territory. At the concluſion of the American conteſt, the forces were reduced to about 40,000 men for Great Britain and Ireland: and the peace eſtabliſhment, in 1802, conſiſted of 128,999 men, including 17,000 cavalry, ſix regiments of colour in the Weſt Indies, amounting to 4,158 men, and the foreign corps of Swiſs, &c. eſtimated at 5,530. For the different kinds of troops, ſee Cavalry, Fencibles, Foot, Grenadiers, Guards, Infantry, Invalids, and Marines, &c. For the arrangement of an army in an engagement, ſee *Order of* Battle.

An army ſometimes acquires different appellations from the ſervices in which it is employed. Thus, a *covering* army is that which covers a place, by lying encamped or in cantonments for the protection of the different paſſes which lead to a principal object of defence. An army is ſaid to *blockade* a place, when, being well provided with heavy ordnance and other warlike means, it is employed to inveſt a town for the direct or immediate purpoſe of reducing it by aſſault or famine. An army *of obſervation*, is ſo called, becauſe by its advanced poſitions and deſultory movements it is conſtantly employed in watching the enemy. Such a body of troops is employed by beſiegers to prevent relief being brought into a place, or the ſiege being raiſed by the enemy. An army *of reſerve* may not improperly be called a general depôt for effective ſervice. In caſes of emergency, the whole, or detached parts of an army of reſerve are generally employed to recover a loſt day, or to ſecure a victory. It is alſo ſometimes uſed for the double purpoſe of ſecretly increaſing the number of active forces, and affording the aid neceſſary according to preſent exigency, and of deceiving the enemy with reſpect to its real ſtrength. A *flying* army is a ſtrong body of horſe and foot, uſually commanded by a lieutenant-general, which is always in motion, both to cover its own garriſons, and to keep the enemy in continual alarm. Smith's Wealth of Nations, vol. iii. ch. 1. part 1. Robertſon's Charles V. vol. i. p. 112. Paley's Princ. of Mor. & Pol. Philoſophy, vol. ii. p. 425. Monteſq. Sp. of Laws, vol. i. p. 229. Blackſt. Com. vol. i. p. 415. De Lolme's Conſt. of Eng. p. 429, &c. Groſe's Milit. Ant. vol. i.

Army, *Naval*, is a number of ſhips of war, equipped and manned with ſailors and marines, under the command of an admiral, with other inferior officers under him.

Army, *Royal*, is an army marching with heavy cannon; capable of beſieging a ſtrong, well-fortified city.

For the diſeaſes incident to armies, ſee Disease, Camp, Garrison, Hospital, Soldier, &c.

ARNA, in *Ancient Geography*, a town of Italy, in the eaſtern part of Umbria, oppoſite to Perouſia and near the Tiber, mentioned by Silius Italicus, l. viii. v. 458.; now known under the name of "La Civitella d'Arno."

Arna, or *Arne*, a ſmall territory of Greece, in Theſſaly, ſo called from its metropolis. Pliny places it in Phthiotis, a diſtrict of Theſſaly. Strabo ſays, that Homer gives the name of Arna, or Arne, to Aræphium in Bœotia, annexing to it the epithet πολυσταφιλον, on account of its abundance of grapes. It is ſaid to have derived its name from Arne, the daughter of Æolus, by whoſe ſon Bœotius it was built.—*Arna* was alſo a town of Aſia Minor, in Lycia, called by ſome authors Xanthus.—Alſo, a town of Spain, on the right of Bœtis, between Hiſpalis to the ſouth-weſt, and Corduba to the north-eaſt.—Alſo, a town of the iſland of Andros, in the Archipelago.

ARNAB, in *Zoology*, the name of the hare (Lepus) among the Arabs.

ARNÆA, in *Entomology*, a ſpecies of Papilio (*Nymph. gem.*), found in Surinam. The wings are ſlightly indented and brown; poſterior pair bluiſh, with five-ocellated ſpots beneath. Fabricius. *Obſ.* This author ſuſpects that the inſect figured by Cramer, under the ſpecific name *Lea*, may belong to this ſpecies.

ARNAK, in *Ichthyology*, one of the Arabian fiſhes of the Raja genus, deſcribed by Forſkael in his Faun. Arab. p. 9. n. 13. The body is roundiſh and ſilvery; tail without fins, and armed with two ſpines. Forſk. Gmelin. The teeth are granulate.

ARNALDIA, in *Phyſic*, a ſlow malignant kind of diſeaſe, frequent formerly in England; the moſt diſtinguiſhing ſymptom whereof was a falling of the hair.

Authors are much at a loſs for the nature and kind of this diſeaſe, which appears to have been peculiar to our country. From the deſcription given of it in an ancient chronicle, Mollerus concludes it to have been a ſpecies of the venereal diſeaſe, as that diſtemper appeared in thoſe days in this country.

ARNAU, in *Geography*, a town of Bohemia, in the circle of Konigingratz, on the Elbe.

ARNAUD de Villa Nova, ſo called from Villeneuve, the place of his birth, in *Biography*, a philoſopher and phyſician of extraordinary talents, born about the middle of the thirteenth century, ſtudied at Paris and Montpelier, and further improved himſelf by viſiting the different ſchools in Italy. He then travelled to Spain, where he acquired a knowledge of medicine, and of their language, from the Arabian phyſicians. He here acquired ſo much reputation, that a ſect was formed in the country, called from him "Arnoldiſtæ." He is ſaid to have had ſuch faith in aſtrology, as to predict from the aſpect of the ſtars the termination of the world, which he ſuppoſed would happen by the year 1376. He was a great chymiſt, and wrote ſeveral treatiſes on the ſubject. While in Spain, he became acquainted with Raymond Lully, who call's him his maſter. At Paris, he had given his opinion ſo freely on theological matters, particularly of the monks, and of the maſs, that the faculty of theology there condemned fifteen of his poſitions, one of which was, "that the works of mercy and of medicine were more acceptable to God than the ſacrifice of the altar." To avoid the conſequences of their cenſures, and finding the Inquiſition were proceeding againſt Apono, for taking ſimilar liberties with religion, he retired to the court of Frederic of Arragon, who had formerly been his friend, and there wrote his treatiſe concerning the government of health, and his commentaries on the Schola Salernitana. He is ſuppoſed to have died about the year 1312. In 1313, pope Clement

wrote

wrote a circular letter, adjuring every one under their apoſtolical obedience, to diſcover and ſend to him a treatiſe on the practice of phyſic written by Arnaud which he had promiſed to give his holineſs, but was prevented, he ſuppoſed, by his death. Friend's Hiſt. of Phyſ. vol. ii. p. 251. —His works, which were numerous, were collected and printed at Lyons in folio, 1520; and again at Baſle, 1585, with notes by Nicolas Tolerus. Eloy has given a catalogue of the treatiſes in his Dict. Hiſt. among them we find, "Expoſitiones viſionum quæ fiunt in ſomniis, ad utilitatem medicinæ;" "Remedia contra maleficia;" "De conſervanda juventute, et retardanda ſenectute;" and others "ejuſdem farinæ;" but many of them are on more familiar and uſeful ſubjects. He complains in ſeveral parts of his works, of the interference of the clergy in the practice of phyſic, to the great detriment of the profeſſors of the art, as well as of the art itſelf. The evil however continued to increaſe, notwithſtanding the attempts of the popes to check it, until after the revival of letters.

ARNAUL, in *Geography*, a fortified iſland on the weſtern coaſt of the hither peninſula of India, commanding the entrance of the Angaſſyah or Mandavee river, between Bombay and Surat.

ARNAULD, Antony, in *Biography*, an eminent lawyer, was born at Paris in 1560. As advocate to the parliament of Paris, he was diſtinguiſhed for his eloquence and probity, and conſulted by perſons of diſtinction on the moſt important affairs. His pleadings againſt the Jeſuits in favour of the univerſity of Paris, in 1594, which are famous, were publiſhed in 8vo. at Paris in 1594, and in 12mo. in 1717. He alſo publiſhed another work againſt the Society, in 1602, and "Advice to Louis XIII." in 8vo. in 1615. He died in 1619; and ſeveral of his ſons acquired great celebrity. Nouv. Dict. Hiſt.

Arnauld, D'Andilly, the eldeſt ſon of the preceding, was born at Paris in 1588. In ſeveral poſts of diſtinction which he occupied at court, he employed his influence in ſupport of juſtice and virtue; and ſuch was his character, that Balzac ſaid of him; "he was neither aſhamed of the Chriſtian graces, nor vain of the moral virtues." At the age of fifty-five, he retired to Port Royal, and devoted himſelf to religious ſtudies. He died at the age of eighty-five, having retained the full vigour both of his body and mind. Beſides other works, his "Tranſlation of Joſephus," ſaid to be more elegant than faithful, was printed at Paris in folio, in 1667, and in five volumes 12mo. in 1672; and at Amſterdam, in two volumes folio, in 1681. His "Apologetic memoir for the houſe of Port Royal," was written in 1654; "Memoirs of his life by himſelf," were printed in two volumes 12mo.; and "A Poem on the life of Chriſt," was printed in 1685, 12mo. Nouv. Dict. Hiſt.

Arnauld, Henry, brother of the preceding, abbot of St. Nicholas, and afterwards biſhop of Angers, was born at Paris in 1597. For his ſervices to the family of the Barbarini, in 1645, on occaſion of their diſputes with pope Innocent X., they ſtruck a medal in honour of him, and erected his ſtatue in their palace at Rome. From the time of his appointment to the ſee of Angers, in 1649, to his death in 1692, he left his dioceſe only once, which was for the purpoſe of reconciling the duke of Tremouille to his ſon. He is ſaid to have appeaſed the queen mother when ſhe was about to puniſh the inhabitants of Angers for their revolt in 1652, by ſaying to her at the communion, "Receive your God, who, when he was dying on the croſs, pardoned his enemies." It is reported concerning him, that the ſureſt title to his favour was to have offended him. His whole time was devoted to ſtudy, religious exerciſes, and the affairs of his dioceſe; and being exhorted by a friend to allow himſelf one day for relaxation, he replied, "I ſhall willingly do it, if you can find a day in which I am not a biſhop." Although he attained the advanced age of 95, his death was conſidered as premature, and he was lamented as the father of the poor, the comforter of the afflicted, and the beſt of biſhops. His "Negotiations" at the court of Rome, and in other courts of Italy, containing many curious remarks, were publiſhed at Paris, in 1748. Nouv. Dict. Hiſt.

Arnauld, Anthony, an eminent Janſeniſt, was the twentieth child of the advocate of the ſame name, and born at Paris in 1612. Having firſt ſtudied the languages and philoſophy in the college of Calvi, and afterwards theology in the college of Sorbonne, he was, in the year 1643, admitted a member of the Sorbonne. In the diſpute between the Jeſuits and Janſeniſts, concerning frequent communion, Arnauld took an active part; and in 1643 publiſhed his famous book on "The Practice of communicating frequently—Traite de la frequente communion." The frequent celebration of the Lord's Supper was ſtrenuouſly recommended by the Jeſuits as the moſt certain and infallible method of appeaſing the deity, and obtaining plenary remiſſion; but the Janſeniſts, and alſo many other learned and pious doctors of the Romiſh communion, cenſured and condemned this mode of proceeding, whilſt they rejected the intrinſic virtue and efficient operation, called the "opus operatum," attributed to the ſacraments; and maintained that the act of receiving the ſacrament of the Lord's Supper can be profitable only to thoſe whoſe minds are prepared by faith, repentance, and the love of God, for that ſolemn ſervice. Arnauld's treatiſe on that ſubject gave great offence to the Jeſuits; and their enmity againſt him was increaſed by the books written by him in defence of the Janſeniſts, on the ſubject of grace. In 1656, he was excluded from the faculty of divinity of Sorbonne, againſt the judgment of ſeventy-two doctors of this faculty; and from this time he withdrew into ſolitude, where he remained twelve years, and employed himſelf in writing curious treatiſes in various branches of ſcience. When the perſecution of the Janſeniſts was ſuſpended by pope Clement IX. in 1669, Arnauld returned to Paris, and was reſpectfully received both by the pope's nuncio, and by Louis XIV. At their requeſt he defended the Catholic faith againſt the Calviniſts; but his enemies ſucceeding in bringing him into ſuſpicion with the king, he thought it prudent to retire. Accordingly he left the kingdom in 1679, and took up his reſidence in the Netherlands, where he eſſentially ſerved the cauſe of the Janſeniſts, and gained over by his eloquence and ſagacity the Romiſh congregations in Holland to their party. In this retreat he alſo wrote "An Apology for the Clergy of France, and the Catholics of England," in reply to the "Politics of the Clergy of France," written by Jurieu, a Proteſtant miniſter, and publiſhed at the Hague; and this reply produced from the pen of Jurieu, a piece of keen ſatire, entitled "L'Eſprit de M. Arnauld." His "Reflections philoſophical and theological," were produced by Malbranche's treatiſe "On Nature and Grace;" and in a work, "On true and falſe Ideas," he attacked the philoſophical doctrine advanced by this author in his "Search after Truth." His "Practical Morality of the Jeſuits," was levelled againſt this fraternity; and he alſo attacked father Simon on the inſpiration of the ſcriptures, and wrote in defence of the propriety of tranſlating the ſcriptures into the vulgar tongue. Notwithſtanding all the zeal of Arnauld in vindication of the Catholic faith, his orthodoxy was ſuſpected; and in 1690, a canonical warrant was iſſued againſt him, under the contemptuous and illiberal deſcription of "One Arnauld," by the ſuperiors of the ſeveral monaſtic fraternities at Liege. Arnauld, however, perſevered in his attachment to the church, notwithſtanding the charges of hereſy with which he was reproached; and in his laſt moments he received the ſacrament from the hands of his

prieſt, though he had only two days before celebrated maſs. He retained his faculties to the advanced age of 82 years, and died at Bruſſels, on the 8th of Auguſt, 1694. His heart was carried, at his particular requeſt, to Port Royal, and there it was honorably depoſited. Arnauld poſſeſſed a vigorous and active mind; his memory was tenacious, his literature various and extenſive: he excelled as a logician; and in theology and eccleſiaſtical hiſtory he was deeply read; and he was well acquainted with polite literature. His genius was original and inventive; and he is ſaid to have taught in philoſophy, opinions ſimilar to thoſe of Des Cartes, before his writings appeared, and to have maintained the doctrines of Janſenius ſeveral years previous to the publication of that prelate's book on grace. Although Arnauld ſuffered perſecution with the Janſeniſts whilſt he lived, it has been a problem of no eaſy ſolution ever ſince his death, whether he was not an heretic. His writings are chiefly controverſial, and bear evident marks of a ſtrong intellect and lively fancy. In polite literature and philoſophy, he publiſhed "A general and rational Grammar," illuſtrating the univerſal principles of language, reprinted with notes by M. Duclos in 1756; "Elements of Geometry;" "The art of Thinking;" "Reflections on the Eloquence of Preachers;" "Objections to the Meditations of Des Cartes;" and "A treatiſe on true and falſe Ideas." On the ſubject of grace, his principal works are "Reflections philoſophical and theological," and tranſlations of ſeveral pieces of Auguſtine. In the controverſy againſt the Proteſtants, he wrote "The perpetuity of Faith;" "The overthrow of Chriſtian Morality by the Calviniſts;" "The impiety of Calviniſtic Morality;" "An apology for the Catholics;" "The Calviniſts convicted of impious tenets in Morals;" and "The Prince of Orange, a new Abſalom, a new Herod, a new Cromwell," which was extenſively circulated through various courts of Europe by Louis XIV. Againſt the Jeſuits, his moſt famous work is "The practical morality of the Jeſuits," in eight volumes, to which ſeveral learned Janſeniſts are ſuppoſed to have contributed; it was republiſhed at Amſterdam in 1742. His writings upon the holy ſcriptures are "Difficulties propoſed to M. Steyaert;" "Defence of the New Teſtament of Mons;" "The tranſlation of the Miſſal into the vulgar tongue, authoriſed by Scripture and the Fathers;" and an "Hiſtory and Harmony of the Evangeliſts." After his death M. Queſnel publiſhed, in nine volumes, his "Letters" and ſeveral "Poſthumous Pieces," among which is the "Diſſertation on the method of Mathematicians," vindicating his mode of writing, and juſtifying, in certain diſputes, the uſe of terms commonly thought harſh.

Arnauld was at the head of that learned body of Janſeniſt writers, known by the denomination of "Meſſieurs de Port Royal," who paſſed their days in literary purſuits, and pious exerciſes, in the retreat of Port Royal, a manſion ſituate at the diſtance of ſix leagues from Paris, originally a monaſtery, and afterwards a ſanctuary of letters. Gen. Dict. Nouv. Dict. Hiſt. Moſheim's Eccl. Hiſt. vol. iv. p. 232. vol. v. p. 181. 208. 219. 251.

ARNAULD, GEORGE, ſon of an eminent ſurgeon at Paris, applied himſelf, during the latter part of his life, almoſt excluſively to the cure of ruptures, in which he acquired conſiderable knowledge. On account of ſome accident occurring while he practiſed midwifery, occaſioned, as it was ſuppoſed, by miſmanagement, he removed from Paris to London, where he continued to reſide the remainder of his life. In 1748, he publiſhed "Diſſertations on Hernias, or Ruptures, in two parts," in 8vo. In theſe he gives directions for enabling perſons afflicted with ruptures, to avert the danger uſually conſequent to that accident. He ſuppoſes that one eighth part of our ſpecies ſuffer from this complaint, which, though perhaps an exaggerated account, ſhews its frequency, and how neceſſary it is to direct the attention of ſurgeons towards making improvements in its treatment. He gives the ſigns by which the different kinds of ruptures may be diſtinguiſhed, and clear and diſtinct directions for managing them. He relates caſes of cures effected by him after a gangrene had taken place, by cutting out the mortified part of the inteſtine. In 1763, he publiſhed "Plain and eaſy Inſtructions on the Diſeaſes of the Bladder and Urethra," in 12mo. in which he highly commends the uſe of bougies. In his "Memoires de Chirurgia," publiſhed in 1768, in 2 vols. 4to. he gives the whole of Dr. Hunter's treatiſe on the "Hernia congenita," with additional obſervations, from inſpection of a caſe that fell under his notice; alſo further obſervations on ruptures, and obſervations on aneuriſms. We have, by the ſame writer, "Remarks on the compoſition, uſe, and effects of the extract of lead of Goulard, and of his vegeto-mineral water," 1770, 12mo. Biblioth. Chirur. Haller.

ARNAUT BELIGRAD, in *Geography*, a town of European Turkey, in the province of Albania, 40 miles north-eaſt of Valona.

ARNAUTS, in *Military Language*, denote Turkiſh light cavalry, whoſe only weapon is a very crooked ſabre. Some ſuch are in the Ruſſian ſervice.

ARNAY LE DUC, in *Geography*, a town of France, and principal place of a diſtrict, in the department of the Coté d'Or, and chief place of a canton in the diſtrict of Beaune, 25 miles ſouth-weſt of Dijon, and 24 ſouth of Semur en Auxois. The place contains 2543, and the canton 11,550 inhabitants: the territory includes 267½ kilometres and 20 communes. N. lat. 47° 7'. E. long. 4° 26'.

ARNDAL, a ſmall town of Norway, in the dioceſe of Chriſtianſand, and diſtrict of Nidanaſſahn, ſeated on a rock in the middle of the river Nid, and remarkable for a good wharf or landing-place. The houſes ſtand moſtly on the declivity of the rock, and the others are built on piles in the water. The inhabitants paſs from houſe to houſe by means of bridges of boats. The town is commodiouſly ſituated for trade; and many ſhips are employed in the tranſportation of timber. The church ſtands near the ſummit of the rock, and there is an aſcent to it from the houſes by ſteps hewn in the rock. In the neighbourhood of this place are many iron mines.

ARNDORF, a town of Germany, in the circle of Bavaria, and principality of Saltzbach, four miles eaſt of Kemnat.

ARNDT, JOHN, in *Biography*, an eminent Proteſtant divine, was born at Ballenſtadt, in the principality of Deſſau in Germany, in 1555. In conſequence of a vow which he made when he was ſick, whilſt he was proſecuting the ſtudy of medicine, he devoted himſelf to divinity; and was ſucceſſively miniſter of Quedlinburg, and at Brunſwick. His fame, as a preacher, excited jealouſy among his brethren; and being charged with errors, he eſcaped perſecution by retiring to Iſleben; and in 1611, the duke of Lunenburg gave him the church of Zell, and appointed him ſuperintendant of all the churches in his duchy. The charge againſt him was occaſioned by a book which he publiſhed at Jena, in 1605 and 1608, intitled "True Chriſtianity;" aſſerting that many of the irregularities ſubſiſting among Proteſtants were owing to a miſtaken notion of the efficacy of a ſpeculative faith, unproductive of good works: he laid great ſtreſs on the contrary doctrine; and intermixed ſome myſtical ideas and expreſſions, borrowed from the writings of Bernard, Thomas a' Kempis, and other aſcetics. He thus gave offence to ſeveral of his brethren, and particularly to Oſiander, a divine of Tubingen, who attacked him in a treatiſe, intitled "Judicium Theologicum." By Oſiander, and others, it was alleged againſt him, that his ſtyle was infected with the jargon of Paracelſus, Weigelius, and other myſtical

chemists, who pretended, by the power and ministry of fire, to unfold the secrets of nature and the mysteries of religion. Although he seems to have manifested his inclination towards the opinions of these fantastical philosophers, he was declared by many grave and pious divines exempt from any errors of moment, and universally allowed to be a man of exemplary integrity and piety. Arndt died in 1621; and his works have been translated into several modern languages. Gen. Dict. Mosheim's Eccl. Hist. vol. v. p. 337.

Arndt, Joshua, a German divine, was born at Gustrow in 1626, and became professor of logic at Rostock, and preacher, and also ecclesiastical counsellor to the duke of Mecklenburg. He died in 1687, and left several works, particularly "Miscellanea Sacra," 8vo.; "Clavis antiquitatum Judaicarum," 4to.; and "Tractatus de Superstitione." His life, written by his son, was printed at Gustrow in 1697. Nouv. Dict. Histor.

ARNE, Thomas Augustine, was the son of Arne, the celebrated upholsterer of King-street, Covent-garden, at whose house the Indian kings lodged in the reign of queen Anne, as mentioned in the Spectator, N° 50. Arne had a good school education, having been sent to Eton by his father, who intended him for the law. But we have been assured by several of his school-fellows, that his love for music operated upon him too powerfully for his own peace, or that of his companions; for, with a miserable cracked common flute, he used to torment them night and day, when not obliged to attend the school. And he told us himself, that when he left Eton, such was his passion for music, that he used to avail himself of the privilege of a servant, by borrowing a livery, and going into the upper gallery of the opera, which was then appropriated to domestics. At home he had contrived to secrete a spinet in his room, upon which, after muffling the strings with a handkerchief, he used to practise in the night while the rest of the family were asleep; for had his father discovered how he spent his time, he would, probably, have thrown the instrument out of the window, if not the player. This young votary of Apollo was at length obliged to serve a three years clerkship to the law, without ever intending to make it his profession; but even during this servitude, he dedicated every moment he could obtain fairly, or otherwise, to the study of music. Besides practising on the spinet and studying composition by himself, he contrived, during his clerkship, to acquire some instruction on the violin, of Festing, upon which instrument he had made so considerable a progress, that soon after he had quitted his legal master, his father accidentally calling at a gentleman's house in the neighbourhood upon business, found him engaged with company; but sending in his name, he was invited up stairs, where there was a large company and a concert, in which, to his great astonishment, he caught his son in the very act of playing the first fiddle! Finding him more admired for his musical talents than knowledge in the law, he was soon prevailed upon to forgive his unruly passion, and to let him try to turn it to some account. No sooner was the young musician able to practise aloud in his father's house, than he bewitched the whole family. On discovering that his sister was not only fond of music, but had a very sweet toned and touching voice, he gave her such instruction as soon enabled her to sing for Lampe, in his opera of Amelia. And finding her so well received in that performance, he soon prepared a new character for her, by setting Addison's opera of Rosamond, in which he employed his younger brother likewise in the character of the page. This musical drama was first performed March 7, 1733, at Lincoln's-inn Fields, where Mrs. Barbier performed the part of the King; Leveridge, Sir Trusty; Page, Master Arne, who had never appeared in public; Messenger, Mr. Corse; Queen, Mrs. Jones; Grideline, Miss Chambers; and the part of Rosamond by Miss Arne. The opera was performed ten nights successively, and with great applause; the last time, for the benefit of Mr. Arne, jun. the composer. Having succeeded so well in a serious opera, our young musician tried his powers at a burletta, and fixed upon Fielding's *Tom Thumb* for that purpose; which, under the title of the *Tragedy of Tragedies*, having met with great success in 1731, he now got it transformed into the *Opera of Operas*, and setting it to music after the Italian manner, had it performed May 31st, at the new theatre in the Haymarket; the part of Tom Thumb by Master Arne, his brother. Princess Amelia and the duke of Cumberland honoured the second representation with their presence; the prince of Wales, the sixth; the youngest princesses, the eighth; and afterwards it had a considerable run.

In 1736, Miss Arne, his sister, now Mrs. Cibber, who had captivated every hearer of sensibility by her native sweetness of voice and power of expression as a singer, first appeared as a tragic actress, in the part of *Zara*, at Drury-lane, where her brother was engaged as composer; and it is difficult to say which of the two received the greatest applause, the actress for her truly interesting person, and pathetic voice and manner, or the musician for his natural and pleasing strains, particularly the March, which was encored every night, and remained in great favour throughout the kingdom during many years.

In 1738, Arne established his reputation as a lyric and dramatic composer, by the admirable manner in which he set Milton's Comus. In this masque he introduced a light, airy, original, and pleasing melody, wholly different from that of Purcell or Handel, whom all English composers had hitherto either pillaged or imitated. Indeed, the melody of Arne at this time, and of his Vauxhall songs afterwards, forms an æra in English music; it was so easy, natural, and agreeable to the whole kingdom, that it had an effect upon our national taste; and till a more modern Italian style was introduced in the pasticcio English operas of Messrs. Bickerstaff and Cumberland, it was the standard of all perfection at our theatres and public gardens.

In 1742, Mr. and Mrs. Arne went to Ireland, where they remained till 1744; in the autumn of which year he was again engaged as composer at Drury-lane; and on the death of Gordon, the first violin, who was successor to Charke, he accepted of the station in the orchestra of that theatre of leader of the band. His hand was enfeebled by rheumatism, but his skill surpassed that of any performer on the violin who had preceded him.

Mr. Arne and Mr. Boyce were frequently concurrents at the theatres, and in each other's way, particularly at Drury-lane. Arne was aspiring, and always regarded Handel as a tyrant and usurper, against whom he frequently rebelled; but with little effect, except upon his own purse, for he was always a loser when he had oratorios performed in Lent on the same night as Handel. But in his songs for the theatres and public gardens, he was ever triumphant over all competitors. At Vauxhall, particularly, where his ballads, dialogues, duets, and trios, were performed during many years with great applause, and were afterwards circulated all over the kingdom. In the summer of 1745, when vocal music was first added to instrumental, by Mr. Tyers, the proprietor of Vauxhall, Arne's little dialogue of Colin and Phœbe, written by the late Mr. Moore, author of fables for the female sex, was constantly encored every night for more than three months successively.

In 1759, this ingenious and popular composer had the degree of doctor in music conferred upon him at Oxford.

And

And in 1762, quitted his former ſtyle of melody, in which he had ſo well ſet Comus, and furniſhed Vauxhall and the whole kingdom with ſuch ſongs as had improved and poliſhed our national taſte; and when he ſet the bald tranſlation of Metaſtaſio's opera of *Artaxerxes*, he crowded the airs, particularly in the part of Mandane for Miſs Brent, with all the Italian diviſions and difficulties which had ever been heard at the opera. This drama, by the novelty of the muſic to Engliſh ears, with the talents of Tenducci, Peretti, and the doctor's ſcholar Miſs Brent, had very great ſucceſs; and ſtill continues to be repreſented whenever ſingers can be found who are poſſeſſed of ſufficient abilities for its performance. But in ſetting Artaxerxes, though the melody is leſs original than that of Comus, Arne had the merit of firſt adapting many of the beſt paſſages of Italy, which all Europe admired, to our own language, and of incorporating them with his own property, and with what was ſtill in favour of former Engliſh compoſers.

The general melody of our countryman, if analiſed, would perhaps appear to be neither Italian nor Engliſh, but an agreeable mixture of Italian, Engliſh, and Scots. Many of his ballads, indeed, were profeſſed imitations of the Scots ſtyle; but in his other ſongs he frequently dropped into it, perhaps without deſign.

Arne never was a cloſe imitator of Handel; and was almoſt the only Engliſh compoſer of the laſt century, who did not build his fame on imitations of his works, and who was not proud to hear his admirers ſay of his compoſitions—*'tis all Handel!* On which account Arne was never thought by the votaries of their great model to be a ſound contrapuntiſt. However, he had an inward and ſecret reverence for his abilities, and for thoſe of Geminiani, as well as for the ſcience of Pepuſch; but except when he attempted oratorios, theirs was not the merit requiſite for him, a popular compoſer who had different performers and different hearers to write for. In the ſcience of harmony, though he was chiefly ſelf-taught, yet being a man of genius, quick parts, and great penetration in his art, he betrayed no ignorance or want of ſtudy in his ſcores.

The oratorios he produced were ſo unfortunate, that he was always a loſer whenever they were performed. And yet it would be unjuſt to ſay that they did not merit a better fate; for though the choruſes were much inferior in force to thoſe of Handel, yet the airs were frequently admirable. But beſides the great reputation of Handel, with whom he had to contend, Arne never was able to have his muſic ſo well performed; as his competitor had always a more numerous and ſelect band, a better organ, which he played himſelf, and better ſingers.

None of this ingenious and pleaſing compoſer's capital productions had full and unequivocal ſucceſs but Comus and Artaxerxes, at the diſtance of twenty-four years from each other. Roſamond, his firſt muſical drama, had a few ſongs in it that were long in favour, and the Judgment of Paris many: but except when his ſiſter, Miſs Arne, afterwards Mrs. Cibber, ſung in them, he never gained any thing by either. Thomas and Sally, indeed, as a farce, with very little muſical merit, was often acted; and previous to that, Eliza was a little while in favour; but the number of his unfortunate pieces for the ſtage was prodigious! yet none of them were condemned or neglected for want of merit in the muſic, but words, of which the doctor was too frequently guilty of being the author. Upon the whole, though this compoſer, who died March 5th, 1778, had formed a new ſtyle of his own, there did not appear that fertility of ideas, original grandeur of thought, or thoſe reſources upon all occaſions, which are diſcoverable in the works of his predeceſſor Purcell, both for the church and ſtage; yet, in ſecular muſic, he muſt be allowed to have ſurpaſſed him in eaſe, grace, and variety; which is no inconſiderable praiſe, when it is remembered, that from the death of Purcell to that of Arne, a period of more than fourſcore years, no candidate for muſical fame among our countrymen had appeared, who was equally admired by the nation at large.

Of near a hundred and fifty muſical pieces that were brought on the ſtage at the two theatres, from the time of his compoſing Roſamond, to his deceaſe, a period of little more than forty years, thirty of them, at leaſt, were ſet by Arne.

Arne, Michael, the natural ſon of Dr. Arne, was brought at an early age on the ſtage by his aunt Mrs. Cibber, who took great pains in qualifying him for the part of the page in the Orphan, and his father alſo tried to make him a ſinger; but he was naturally idle, and not very quick. However, he acquired a powerful hand on the harpſichord, and played with neatneſs and preciſion ſome of Scarlatti's moſt difficult leſſons. It is recorded with reluctance as a beacon, that his moral character was leſs deſerving of praiſe than his profeſſional. Always in debt, and often in priſon, he ſung his firſt wife to death and ſtarved the ſecond, leaving her in abſolute beggary.

Arne, in *Ancient Geography*, a town of Aſia, in Meſopotamia.—Alſo, a town of the territory of the Eraſbinians, in the vicinity of Thrace.—Alſo, a fountain of Peloponneſus, in Arcadia.

Arne, in *Geography*, a river of Swiſſerland, deſcends from the lofty Alps in the vicinity of Mont Blanc, and forms a junction with the Rhone about a quarter of a league from Geneva; and the two rivers run together for more than half a league before their waters are blended: the ſtream is broad, and on one ſide is the brown and muddy Arne, while on the other are diſtinctly ſeen the clear, blue, and untainted waters of the Rhone. This river, or rather torrent, is ſubject to ſudden and conſiderable ſwellings; and its waters have flowed back on the bed of the river, and in their reverted courſe turned the mills that are conſtructed on its banks. The waters of the Arne, when it has depoſited the ſlime with which it is charged, is of the pureſt quality. Sauſſure, Voy. des Alpes, tom. i. § 13, &c.

ARNEBURG, a ſmall town of Germany, in the circle of Upper Saxony, and old mark of Brandenburg, ſeated on the Elbe. The principal ſubſiſtence of its inhabitants is derived from navigation and traffic in corn, and alſo in agriculture. From the town of Arneburg are denominated a circle and provincial riding. It is 50 miles weſt of Berlin. N. lat. 52° 45′. E. long. 11° 59′.

ARNEDO, a ſea-port town of Peru, with a good harbour, in the Pacific ocean, 23 miles north of Lima. S. lat. 11° 38′. W. long. 76° 54′.

ARNEE, a town of Hindoſtan, in the Carnatic, 14 miles S. of Arcot, and 52 N. W. of Pondicherry.

Arnee, in *Zoology*, a quadruped of the Bos or Ox tribe, a native of India, and which appears to have been firſt deſcribed by Mr. Kerr, in his work on the Animal Kingdom. To Gmelin it was very probably unknown. In the General Zoology by Dr. Shaw it is ſpecifically deſcribed in theſe terms: Bos Arnee. B. Cornibus erectis lunatis ſupra planiuſculis rugoſis.—Ox with upright lunated horns, flat and wrinkled on their upper ſurface. The latter writer obſerves that this Indian ſpecies is known chiefly from its vaſt horns, which are ſometimes ſeen in muſeums; and from Indian paintings, in which it is occaſionally repreſented.

In the work of Mr. Kerr, it is ſaid to have been met with by a Britiſh officer, in the woods above Bengal; and to have been fourteen feet high, meaſuring from the hoofs to the top of the horns. It partakes of the form of the horſe, the bull, and the deer; and is repreſented as a bold and daring animal. The figure of this ſpecies in the work of

Mr.

Mr. Kerr, is copied from an Indian painting, and the ſame figure is again introduced into Dr. Shaw's Zoology. The animal is of a black colour, quite ſmooth, and without either protuberance or mane.

ARNEMUDEN. See ARMUYDEN.

ARNEN, or ARNEM, in *Geography*, a town of Swiſſerland, in the Valais, thirty-five miles eaſt of Sion.

ARNESEIO, a town of Italy, in the kingdom of Naples, and country of Bari, ſeven miles W. S. W. of Andria.

ARNE-SYSSEL, a diſtrict of Iceland, in which is ſituated the epiſcopal ſee of Skaalholt.

ARNEVEL, a town of France, in the department of Sarre; and chief place of a canton, in the diſtrict of Sarrebrued. The place contains 502, and the canton 8514 inhabitants: the territory includes 31 communes.

ARNFELS, a town of Germany, in the duchy of Stiria, ten miles ſouth-eaſt of Landſpurg.

ARNGITZES, a town of Walachia, forty-two miles S. S. E. of Hermanſtadt.

ARNHAUSEN, a town of Germany, in the circle of Upper Saxony and duchy of Pomerania, twenty-four miles eaſt of New Stettin.

ARNHEIM, or ARNEM, *Arnoldi-villa* or *Arenacum*, a large, ſtrong, and populous town of the United Netherlands, the capital of Arnhem or the Veluwe quarter of Guelderland, lies on the north ſide of the Rhine, at the foot of the Veluwe hills, near the place where the Yſſel and the Rhine ſeparate their ſtreams. The ſtreets are regular, the houſes well built, the walls are delightfully planted with elm and lime trees, and the town is the uſual winter reſidence of many families, who ſpend the ſummer on their eſtates in the Veluwe, where they enjoy a much more ſalubrious air than that of the maritime provinces of Holland. The church of St. Walburg is a fine edifice; and that of Euſebius has an excellent chime of bells. Arnheim is fortified with a rampart of earth, paved with brick, and waſhed on one ſide by the Rhine, and on the other by a deep foſſe, dug by Druſus Nero. This city was founded before the time of Tacitus, who mentions it under the name of Arenacum; and it was fortified and inveſted with the privileges of a city by Otho III. duke of Guelderland, A. D. 1233. It is thirty miles eaſt of Utrecht, and forty-five ſouth-eaſt of Amſterdam. N. lat. 52° 2′. E. long. 5° 54′.

ARNIBERG, a mountain of Swiſſerland, in the diſtrict of Engelberg.

ARNICA, in *Botany*. Lin. g. 958. Schreb. 1296. Juſſ. 182. Gærtn. t. 173. Claſs, *ſyngeneſia polygamia ſuperflua*. Nat. Ord. *Compoſitæ diſcoideæ. Corymbiferæ*. Juſſ. Gen. Char. *Calyx*, common, ſhorter than the ray of the corolla; leaflets lanceolate, the length of the calyx, erect. *Cor.* compound, radiate; corollules hermaphrodite in the diſk, very numerous; females in the ray about twenty; proper of the hermaphrodite, tubular, erect, five-cleft, equal; female lanceolate, very long, three-toothed, ſpreading. *Stam.* to the hermaphrodites, filaments very ſhort; anther cylindric; to the females, filaments ſubulate, erect; anthers none. *Piſt.* germen oblong; ſtyle ſimple, the length of the ſtamens; ſtigma bifid. *Per.* none; calyx unchanged. *Seeds*, ſolitary, oblong; down ſimple, in the hermaphrodites pubeſcent, long. *Rec.* naked. *Obſ.* Corollules of the diſk often trifid, with the outer diviſion twice as broad as the others.

Eſſ. Gen. Char. *Rec.* naked; down ſimple; corollules of the ray have five filaments, without anthers.

Species, 1. A. *montana*, mountain arnica. Gærtn. fr. 2. 451. Flor. Dan. t. 63. Woodv. Med. Bot. t. 10. "Leaves ovate, entire, ſtem-leaves twin, oppoſite:" the root is woody; ſtem above a foot high, and not more than half this height in alpine ſituations, ſimple, obſcurely angular; flowers two inches in diameter, of a deep yellow, and placed on upright terminal peduncles; calyx cylindric, compoſed of rough hairy ſcales; ligulate florets about fourteen, three-toothed, ſtriated, twice as long as the calyx, hairy at the baſe; ſeeds oblong, blackiſh, hairy, crowned with a ſtraw-coloured down. A native of moſt parts of the continent of Europe, and of Siberia, flowering in July; cultivated by Miller in 1759. 2. A. *piloſelloides*, mouſe-ear arnica; "leaves perfectly entire, elliptic, villoſe; ſcape one-flowered, woolly; calyx equalling the ray:" the ſtem and leaves covered with down; leaves two or three inches long, and about half this breadth, hairy, eſpecially on the back, pointed; ſcape twice as long as the leaves, very woolly towards the top; flower large; calyx tomentoſe, of the length of the ray; florets of the ray very narrow, of a dark red or purple colour, and male. A native of the Cape of Good Hope. 3. A. *ſcorpioides*, alternate-leaved arnica. Jacq. Flor. Auſt. 4. t. 349. "leaves alternate, toothed." The roots are contorted, and thus ſuppoſed to have ſome reſemblance to a ſcorpion; ſtems ſeveral, from ſix inches to a foot in height, terminated by a deep yellow flower, of two inches diameter; root-leaves roundiſh or oval, deeply ſerrate, on long foot-ſtalks; ſtem-leaves few, nearly ſeſſile, viſcid, ſoft, ſhaggy. The whole plant has a diſagreeable ſmell. A native of Swiſſerland, Savoy, Dauphiné, &c. Cultivated by Miller in 1759. 4. A. *doronicum*, Jacq. Flor. Auſt. 1. t. 92. A cluſii allion. ped. A. ſtiriaca. Villars Dauph. 210. "leaves alternate, ſubſerrate, oblong, rough." The leaves are hairy; ſtem from four to eight inches high, and never bears more than one flower. A native of the high Alps of the Griſons, Dauphiné, Piedmont, and Auſtria. 5. A. *maritima*, ſea arnica. After, helenium maritimum, &c. Gmel. lib. ii. p. 175. "leaves lanceolate, the lower ones ſerrate; ſtem leafy, many flowered." A native of Kamtſchatka and North America. 6. A. *crocea*, ſaffron-flowered arnica; "leaves ovate; repand toothletted, tomentoſe underneath;" ſcape one-flowered, with a few linear bractes; root-leaves oval, often heart-ſhaped, rigid, petioled; florets of the ray furniſhed with ſtamens. A native of the Cape of Good Hope. 7. A. *ciliata*, ciliate-leaved arnica; "leaves ſtem-claſping, ovate, toothed, ciliate, ſmooth; ſtem ſimple, one-flowered." The ſtem is erect, a foot high, angular, hiſpid, with white briſtles; leaves alternate, lower attenuated at the baſe, obovate, gaſh-toothed, ciliate; upper roundiſh, ſcarcely toothed, ſmaller ciliate; flower terminating, red, the ſize of a ſmall pear. A native of Japan. 8. A. *japonica*, japoneſe arnica. Thunb. j. 319. "Leaves gaſh-palmated, toothletted; flowers terminal, ſub-binate;" the ſtem is hollow, round, ſtriated, erect, more than a foot high; leaves petioled, alternate, ſmooth, lobes gaſh-pinnatifid, toothed; petioles of the lower leaves long, of the branches broad; ſtem-claſping, ſtriated, ſhort; flowers peduncled, red, few. A native of Japan. 9. A. *palmata*, palmate-leaved arnica. Thunb. l. c. "Leaves gaſh-palmated, toothed; flowers panicled:" the ſtem is two feet high, ſtreaked, erect, ſmooth; leaves alternate, petioled; lobes of the lower leaves unequal, toothed, the upper undivided, ſerrate; flowers terminating, ſmall, yellow. A native of Japan. 10. A. *gerbera*. "Leaves pinnatifid; lobes rounded;" the lobes of the leaves are imbricated backwards, and, when young, tomentoſe underneath; the ſcape is furrounded with very ſlender leaves, and ſupports one large flower, with a dark purple diſk, and a yellow ray, purple underneath. A native of the Cape of Good Hope. 11. A. *coronopifolia*. "Leaves pinnate; diviſions linear." This very much reſembles the *gerbera*, and is alſo a native of the Cape. 12. A. *opzrina*. Forſt. Auſtr. n. 299. "Shrubby; leaves lanceolate, callous-crenate, tomentoſe beneath; peduncles one-flowered, ſolitary, terminating, ſcaly." A native of New Zealand.

Medicinal Properties. The only ſpecies ſuppoſed to poſſeſs

thefe in any confiderable degree is the *arnica montana*, the virtues of which have been moft extravagantly extolled in Germany. It was firft recommended as peculiarly efficacious in bruifes, and hence obtained the appellation of *panacea lapforum*; and to this refolvent power its utility in various difeafes has been afcribed, particularly in pulmonic complaints, fuppreffio menfium, hepatic obftructions, &c. Of its ufe in paralytic and other affections of a fimilar nature, many teftimonies are adduced: nor have its good effects been lefs praifed in rheumatifm and dropfy; but it is the extraordinary febrifuge and antifeptic powers of the arnica which have been peculiarly celebrated by Dr. Collin of Vienna. With the flowers of this plant made into an electuary with honey, he informs us, that he cured more than one thoufand patients labouring under the different fpecies of intermittent fevers, in the Pazman hofpital, from December 1771 to July 1774, and with the watery extract of the flowers he cured thirty quotidians, forty-fix tertians, and fifty-eight quartans. In putrid fevers the Doctor employed an infufion of the flowers, with which many hundreds of patients were fnatched from the very jaws of death. There are fome cafes, however, in which the Doctor recommends the roots in preference to the flowers, believing the former to poffefs more cordial, tonic, and antifeptic qualities; he therefore prefcribes it where putridity and debility are more prevalent than fever. It was alfo found very efficacious in a malignant dyfentery, in which he adduces many hundred inftances of its fuccefsful employment, confirmed by the practice of Dr. Dietl. In thirteen cafes of gangrenes, this medicine proved its antifeptic virtue in a ftill more evident manner. The Doctor gave nine drams of the powder of the flowers of arnica, mixed with a fufficient quantity of honey, in the courfe of forty-eight hours. Of the infufion in the proportion of one ounce of the flowers to a quart of water, two ounces every two hours. When he employed the root, it was in double this proportion. At firft this plant is apt to occafion vomiting or uneafinefs at the ftomach, fo that it is neceffary to begin with fmall dofes. See Woodv. Med. Bot. vol. i.

Propagation and Culture. 1, 2, 3, 4, 5, the European fpecies, are hardy, and require a moift fituation. They may be propagated by parting the roots in autumn when the ftalks begin to decay, or by the feeds fown in autumn foon after they are ripe, for thofe fown in the fpring often fail; but if the feeds are permitted to fcatter, the plants will often come up of themfelves, and require no other care than keeping them clean from weeds. The other fpecies muft be kept in pots under a frame, or in a dry ftove. They may be increafed by feeds, cuttings, or parting the roots, and muft be treated as other plants from the Cape of Good Hope. See Martyn's Miller's Dict.

ARNICA. See DORONICUM.

ARNICÆ, in *Entomology*, a fpecies of STAPHYLINUS, found on the *Arnica*, and defcribed by Scopoli. It is black, the thorax and antennæ ferruginous; legs teftaceous. Inhabits Europe.

ARNICÆ is alfo a fpecies of MUSCA that inhabits Europe, and is faid to be found chiefly on the difk of radiate flowers, and efpecially on that of *Arnica montana*. It is defcribed by Linnæus in his *Fauna Suecica*; and by Scopoli. The wings are hooked, grey, and fpotted with black.

ARNIS, in *Geography*, a fmall ifland of Denmark, in the duchy of Slefwick, in the gulf of Schely.

ARNISÆUS, HENINGUS, in *Biography*, a celebrated philofopher and phyfician, born at Halberftadt in Lower Saxony, taught medicine at Helmftadt the beginning of the feventeenth century, where he acquired fuch reputation that he was invited to Denmark, and made phyfician and counfellor (archiater) to the king. In 1610, he publifhed "Obfervationes aliquot Anatomicæ," in 4to. In diffecting a woman who died the fixth day after being delivered of her firft child, he faw, he fays, the offa pubis feparated from each other, and the offa ilia from the facrum, and hence accounts for the greater difficulty with which women part with their firft, than with their fubfequent children: "quia articulatio tum primum folvitur." Later obfervations have however fhewn us, that this feparation of the bones of the pelvis is of very rare occurrence, and when it does happen to any conficerable degree, occafions incurable lamenefs. The following year he publifhed, "De partus humani legitimis terminis." This he fixes at the end of the ninth, or the beginning of the tenth month, though he admits a certain latitude, that is, that as the fœtus may be perfect and fit for exclufion fome weeks earlier, fo it may fometimes be detained in the uterus beyond that period.

He wrote alfo feveral political works, which are ftill efteemed. His book "De authoritate principum in populum femper inviolabili," was printed in 1612; and his "Reflectiones politicæ," in 1715. To this work he intended making additions, which were never completed. He was induftrious in his endeavours to acquire information, and for this purpofe travelled over France and England. Haller. Bib. Chir. Gen. Dict.

ARNISSA, in *Ancient Geography*, a town of Greece, in Macedonia.

ARNO, anciently *Arnus*, a river of Italy, rifes in the Apennine mountains, in the duchy of Tufcany; paffes by Florence, divides Pifa into two parts, and enters the Mediterranean, in the gulph of Genoa, twelve miles north of Leghorn, and four below Pifa, to which it is navigable for fmall veffels. It receives in its courfe the Sieva, the Pefa, and the Elfa.

ARNO is alfo a river of Abyffinia, which falls below Emfras, into the lake Tzana.

ARNOBIUS *of Africa*, in *Biography*, a Chriftian divine, flourifhed about the beginning of the fourth century, and taught rhetoric, in the reign of Diocletian, at Sicca in Africa, with great reputation. At this time, he was a blind and zealous idolater; but he afterwards became a convert to Chriftianity, and a diftinguifhed advocate in its defence. The manner of his converfion is thus related by Jerom in his chronicle, at the twentieth year of Conftantine, or the year of Chrift 326. "Arnobius, a rhetorician, is famous in Africa; who, while he taught the youth rhetoric at Sicca, and was yet a heathen, was admonifhed in his dreams to embrace Chriftianity. But when he applied to the bifhop of the place for baptifm, he rejected him, becaufe he had been wont to oppofe the Chriftian doctrine. Whereupon he compofed an excellent work againft his old religion, and thus at length, as by hoftages of his piety, he obtained the feal of the covenant." Dr. Lardner queftions the genuinenefs of this paffage; and he alleges, that Arnobius himfelf doth not any where afcribe his converfion to dreams; that Jerom does not elfewhere mention or even hint at this circumftance; that in Jerom's catalogue, Arnobius is faid to have flourifhed in the time of Diocletian; and that Arnobius fays of himfelf, that he wrote 300 years, more or lefs, fince the rife of Chriftianity, and about 1050 years fince the foundation of Rome, or according to the common computation, in the year of our Lord 297 or 298. Befides, it is improbable, that Arnobius, if he wrote his work when he was a catechumen, as Jerom in the above cited paffage intimates, fhould fpeak of himfelf as a Chriftian, which he does, and that a catechumen fhould undertake the defence of a religion, of which he was at the fame time learning the rudiments. Upon the whole, we may conclude, with Cave and others, that Arnobius became a convert to Chriftianity in the time of the Diocletian perfecution, and in confequence

of obſerving the fortitude with which the Chriſtians endured their ſufferings.

Arnobius's work "Adverſus Gentes," or "Againſt the Gentiles," was probably written ſome time after the commencement of Diocleſian's perſecution, about the year 305 or 306; for he ſpeaks in it of the afflictions endured by the Chriſtians, as if they were actually ſuffering at the time of his writing. This work, which conſiſts of ſeven books, is a valuable defence of Chriſtianity. It ſhews that he was acquainted with the Jewiſh ſcriptures, and with the books of the New Teſtament; though he did not think fit to quote them expreſsly in writing againſt the Gentiles. It evinces the learning and piety of the author; and though it contains a mixture of Pagan errors with Chriſtian doctrines, and though ſome paſſages are obſcure, and the ſtyle, which is ſtrong and nervous, is harſh and unpoliſhed, it may be read with pleaſure and advantage. It is much to the honour of this rhetorician, who poſſeſſed a very conſiderable ſhare of the learning of Greece and Rome, that he embraced the Chriſtian religion in a ſtate of perſecution, and that he employed his talents in its defence. His ſummary of the Chriſtian religion is as follows: "We Chriſtians are men that worſhip the great Lord of the univerſe, according to the direction of Jeſus Chriſt. If you examine it, you will find nothing elſe in this religion: this is the ſum of the whole affair: this is the ſcope and deſign of all our religious offices: to this ſupreme Lord we all bow down; him we worſhip with united prayers; to him we preſent holy, and innocent, and honourable requeſts, fit to be heard by him." The arguments, by which he proves the truth and divine original of Chriſtianity, are deduced from its excellence; from the amiable and perfect character of its author; from the miracles of our Lord himſelf and thoſe of his diſciples; from the great effect of the Chriſtian religion in ſoftening the temper and amending the manners of its votaries, and ſowing the ſeeds and principles of benevolence, peace, and friendſhip among mankind, and in reſcuing them from idolatry and a falſe worſhip; from the extenſive progreſs and influence of the Chriſtian doctrine, inſomuch that there were then Chriſtians, in all countries, as Syria, Perſia, Scythia, Africa, Spain, Gaul, &c.; from its having been embraced under the greateſt difficulties and diſcouragements by men of all ranks, as by orators, grammarians, rhetoricians, lawyers, phyſicians, philoſophers, and the greateſt wits, as well as by men of low condition and inferior attainments; from the abſurdity of ſuppoſing that ſo many people ſhould on a ſudden, without any good reaſon, change their former opinions and cuſtoms, and forſake the religion of their anceſtors, and thus expoſe themſelves to ſingular danger and ſevere ſuffering; and from the character and ſituation of the firſt witneſſes of Chriſtianity, who had no intereſt to induce them to falſify, and who, by withholding their teſtimony, might have avoided many ſufferings, and lived quietly and comfortably among their neighbours: ſo that they muſt have been fully perſuaded of the truth of the things which they related. By ſuch ſolid and convincing arguments did this Chriſtian rhetorician and apologiſt vindicate the truth of our holy religion more than 1500 years ago. He has likewiſe examined and well refuted ſome of the principal objections againſt Chriſtianity. To the Chriſtian religion he bears this honourable teſtimony: "It truſts to its own evidence, and ſtands firm upon its own foundations, whether any man embrace it, or not." Of the time and manner of Arnobius's death we have no account. Among his diſciples we may reckon the learned Lactantius. His treatiſe "Adverſus Gentes," was firſt printed at Rome, in fol. in 1542; at Baſil, in 1546 and 1560; at Paris, in 1580; at Antwerp, with Canter's notes, in 1582, 8vo.; at Cologn, in 1604; at Leyden, with various notes, in 1651, 4to.; and at the end of Cyprian's works, at Paris, in 1666. Lardner's Works, vol. iv. p. 1—22. Cave Hiſt. Lit. t. i. p. 161. Fabr. Bib. Lat. l. iv. c. 3. t. ii. p. 289.

Arnobius *the Younger*, or *of Gaul*, a Chriſtian divine, lived about the year 461, and publiſhed Commentaries upon the 150 Pſalms. He took part with the Pelagians in the diſputes on predeſtination, againſt the followers of Auguſtine. His work was dedicated to Leontius, biſhop of Arles, and Ruſticus, biſhop of Narbonne; and printed at Baſil, in 1522; by Eraſmus, at Cologn, in 1532; and by Laurentius de Barré, at Paris, in 1699; and in the Bibl. Patrum of Paris and Leyden. Fabr. Bib. Lat. t. ii. p. 292.

ARNODI, in *Antiquity*, the ſame with Rhapsodi. The word is compounded of ἀρνὸς, *a lamb*, which was their uſual reward; and ᾠδὴ, *ſong* or *ſinging*.

ARNOLD *of Breſcia*, in *Biography*, an Italian monk, was a native of Breſcia, but in his youth travelled to France, where he became a diſciple of Abelard, and probably imbibed ſome of his notions concerning the Trinity and the Sacraments, that were repugnant to the orthodox creed. On his return to Italy, he aſſumed the monaſtic habit, and taught ſome doctrines that were deemed heretical. His hereſy, however, was chiefly of a political kind. Having perceived the diſcords and animoſities, the calamities and diſorders, that ſprung from the overgrown opulence of the pontiffs and biſhops, he was perſuaded that the intereſt of the church and the happineſs of nations in general required, that the clergy ſhould be diveſted of all their worldly poſſeſſions, and of all their temporal rights and prerogatives. He, therefore, maintained publicly, that the treaſures and revenues of popes, biſhops, and monaſteries, ought to be ſolemnly reſigned and transferred to the ſupreme rulers of each ſtate; and that nothing was to be left to the miniſters of the goſpel but a ſpiritual authority, and a ſubſiſtence drawn from tithes, and from the voluntary oblations and contributions of the people. This doctrine was eagerly embraced by the laity; and it was recommended by the extenſive erudition, irreproachable character, ſingular authority, and vehement zeal of the propoſer. Arnold was honoured as a patriot, and the inhabitants of the dioceſe of Breſcia revolted againſt their biſhop. The church was alarmed, and the reforming monk and his doctrine were condemned in the council of Lateran, A. D. 1139, by Innocent II. Arnold fled from perſecution to Swiſſerland, and found an aſylum at Zurich, where his doctrine was at firſt received with applauſe; but at length he was obliged to leave Swiſſerland, and after the death of Innocent II. in 1151, he returned to Italy, and ſet up the ſtandard of eccleſiaſtical reform and of civil freedom at Rome. His bold harangues on the inalienable rights of men and Chriſtians, rouzed the populace, and produced tumults and ſeditions, which terminated in the emancipation of the inferior clergy from the deſpotic yoke of the cardinals, and in a change of the civil government of the city. Arnold, in fact, poſſeſſed the chief power in Rome during ten years, while the Popes "either trembled in the Vatican, or wandered as exiles in the adjacent cities." On the acceſſion of Adrian IV., Arnold and his followers were driven from Rome, and found protection at Otricoli in Tuſcany. After the coronation of Frederic Barbaroſſa, pope Adrian preferred complaints to the emperor againſt Arnold; and he was ſeized by cardinal Gerard, brought to Rome, and condemned by the prefect of the city to ſuffer death. Accordingly, in 1155, he was burnt alive; or, as Moſheim ſays, crucified, and afterwards burnt; and his aſhes were thrown into the Tiber, leſt the people ſhould worſhip them as ſacred relics. Arnold was undoubtedly of an impetuous and turbulent ſpirit, and his proceedings were imprudent and violent: but one of his

biographers has not untruly obſerved, "that he lived in an age which provoked reform." "With his aſhes," ſays Gibbon, "his ſect was diſperſed," though "his memory ſtill lived in the minds of the Romans." But Moſheim ſays, that "this violent reformer, in whoſe character and manners there were ſeveral things worthy of eſteem, drew after him a great number of diſciples, who derived from him the denomination of *Arnoldiſts*; and, in ſucceeding times, diſcovered the ſpirit and intrepidity of their leader, as often as any favourable opportunities of reforming the church were offered to their zeal." Moſheim's Eccl. Hiſt. vol. iii. p. 119. Gibbon's Hiſt. vol. xii. p. 291, &c.

ARNOLD, NICHOLAS, was born at Leſna in Poland, in 1618; and after having ſtudied in ſeveral univerſities, and viſited England in 1644, was choſen profeſſor of divinity at Franeker in Friſland, in 1652; which poſt he occupied till his death in 1680. He is the author of ſeveral tracts againſt the Socinians; particularly, "A Refutation of the Catechiſm of the Socinians;" "A Commentary on the Epiſtle to the Hebrews;" and "Lux in Tenebris," printed at Leipſic in 1698, 8vo., and explaining paſſages adduced by the Socinians in favour of their ſyſtem. Gen. Dict.

ARNOLD, GODFREY, a German divine, and celebrated eccleſiaſtical hiſtorian, was born at Annaberg, in the mountains of Miſnia in Saxony, in 1666, and ſtudied in the univerſity of Wittemberg, where he acquired reputation by his perſonal conduct and literary improvement. In 1697, he was appointed profeſſor of hiſtory at Gieſſen, but diſapproving of the forms of admiſſion required in the German univerſities, he reſigned his office, and in 1698 retired to Quedlinburg. In 1700, he removed to Altſtedt, where he became chaplain to the ducheſs dowager of Eiſenach. Being obliged to leave this city, in 1705, he was invited to Brandenburg by the king of Pruſſia, and preferred to the office of paſtor of the church of Werben; and in 1707, his Pruſſian majeſty appointed him paſtor and inſpector of the churches of Perleberg, and afterwards hiſtoriographer to that court. Here he died in 1714. He was conſidered as the patriarch of a ſect of German myſtics, called "Pietiſts." Beſides many other works, he wrote in German, "A Hiſtory of the Church, and of Hereſies;" "Hiſtoria Eccleſiaſtica et Hereticа," printed at Leipſic in 1700, 8vo. which incurred the reproach of his being a defender of heretics; and in Latin, "The Hiſtory of Myſtic Theology." The rigid Lutherans have treated him with peculiar ſeverity; and Moſheim repreſents his hiſtory, "as the production of a violent ſpirit, and dictated by a vehement antipathy againſt the doctrines and inſtitutions of the Lutheran church:" he acknowledges, however, that "he became at laſt a lover of truth, and a pattern of moderation." Gen. Dict. Moſheim's Eccl. Hiſt. vol. v. p. 325.

ARNOLD *of Hildeſheim*, an hiſtorian of the thirteenth century, flouriſhed under the emperors Philip and Otho IV. His "Continuation of the Chronicles of the Sclavonians by Helmeldus," is chiefly valuable in its relation to Sclavonia. It was publiſhed at Lubeck in 1659; and by Meibomius in the "Opuſcula Hiſtorica," printed at Helmſtadt in 1660. Dupin.

ARNOLD *of Villanova*. See ARNAUD.

ARNOLD, SAMUEL, Muſ. D. an eminent muſical compoſer, received his muſical education at the Chapel Royal, St. James's, partly under Mr. Gates, and partly under his ſucceſſor, Dr. Nares. He manifeſted early indications of thoſe talents by the cultivation and exerciſe of which he acquired celebrity in the ſcience to which he was devoted; and his application, as well as ſubſequent attainments, fully juſtified the expectations which were formed concerning him both by his parents and preceptors. It is hardly neceſſary to mention that little lively air, "If 'tis joy to wound a lover," which firſt excited popular attention, as it was ſoon ſucceeded by various compoſitions of a ſuperior kind, which evinced the genius and taſte, and eſtabliſhed the profeſſional reputation, of Mr. Arnold. About the year 1760, Mr. Beard, one of the managers of Covent Garden theatre, duly apprized of his extraordinary merit, introduced him to the notice of the public, as compoſer to that houſe; and in the year 1776, he was engaged by Mr. George Colman, to conduct the muſical department at the theatre in the Haymarket. The chief muſical pieces that were produced for many years at this theatre, were compoſed by Mr. Arnold. Having in early life enjoyed the benefit of Handel's direction and ſuperintendance, and having derived from this ſublime compoſer, a taſte for ſacred muſic, he diverted his attention from thoſe lighter pieces in which he had gained reputation, to the compoſition of oratorios; and his performances of this kind ſerved to augment the fame which he had already acquired. In the year 1767, he made choice of the "Cure of Saul," written by the late Rev. Dr. Brown, for the ſubject of his firſt effort in the higher ſtyle of muſical compoſition. Such was his ſucceſs, that this production is generally allowed to be the beſt of its kind ſince the time of Handel. It was generouſly preſented by the author to the ſociety inſtituted for decayed muſicians and their families; and to that ſociety it proved a very valuable acquiſition. The approbation of the public encouraged Dr. Arnold to proceed; and the "Cure of Saul" was ſoon followed by the oratorios of "Abimelech, the "Reſurrection," and the "Prodigal Son;" which were performed during ſeveral ſucceſſive Lents at the theatre-royal in the Haymarket, and Covent-garden theatre, under his own management and direction. About the time of his compoſing the "Reſurrection," he publiſhed in ſcore, four ſets of Vauxhall ſongs, moſt of which are ſingularly ſweet in their melodies, and diſplay in their accompaniments a thorough acquaintance with the characters and powers of the various inſtruments. Of all his oratorios, ſays an anonymous writer, the "Prodigal Son" reflects the greateſt honour on his talents and judgment. So high, indeed, was the fame of this ſacred drama, that in 1773 it was performed with his permiſſion, at the inſtalment of the late lord North, as chancellor of the univerſity of Oxford. In conſequence of his ready compliance with the requeſt made to him for this purpoſe, he was offered an honorary degree in the theatre, but he preferred obtaining it in the academical mode; and, agreeably to the ſtatutes of the univerſity, he received it in the ſchool-room; where he performed, as an exerciſe, "Hughes's poem on the power of Muſic." On this occaſion it is cuſtomary for the muſical profeſſor of the univerſity to examine the exerciſe of the candidate; but Dr. Hayes, then profeſſor of Oxford, returned Mr. Arnold's ſcore unopened, ſaying to him, "Sir, it is quite unneceſſary to ſcrutinize the exerciſe of the author of the Prodigal Son." In 1771, Mr. Arnold married a lady of good family and fortune; and about the ſame year he purchaſed "Marybone gardens," which were then a much frequented ſcene of gaiety and faſhion. Here he provided for the entertainment of the public, ſeveral excellent burlettas, which were very favourably received.

On the death of the late Dr. Nares, in 1783, Dr. Arnold was appointed his ſucceſſor as organiſt and compoſer to his majeſty's chapel at St. James's; and at the grand performances of the commemoration of Handel, in Weſtminſter abbey, the firſt of which took place in 1784, he was one of the ſubdirectors, and preſented with a medal, which his majeſty permitted the ſubdirectors always to wear, as a teſtimony of his approbation of their conduct on that occaſion. In 1786, Dr. Arnold projected the plan of publiſhing

liſhing an uniform edition of all the works of Handel; and he proceeded as far as the 118th number, enriching his edition with beautiful engravings. He alſo publiſhed, about the ſame time, four volumes of cathedral muſic, intended as a continuation of Dr. Boyce's well-known work; three of the volumes are in ſcore for the voices, and one for the organ. In 1789, the Academy of Ancient Muſic choſe Dr. Arnold for the director and manager of this inſtitution; and he conducted it with honour to himſelf, and with ſatisfaction to the academicians and ſubſcribers. In 1796, he ſucceeded Dr. Hayes, as conductor of the annual performances at St. Paul's for the feaſt of the ſons of the clergy; and in this ſituation he uniformly maintained his diſtinguiſhed character as a muſical profeſſor. Dr. Arnold cloſed his life, after a gradual decay, in the ſixty-third year of his age, on the 22d of October, 1802; and his remains were interred, with every mark of reſpect, in Weſtminſter abbey. He had five children, of whom two daughters and one ſon ſurvived him. His ſon, Mr. Samuel Arnold, is the author of ſeveral muſical dramas, which have been well received, and of a novel, entitled, "The Creole;" and he is now making rapid progreſs in the profeſſion of a portrait painter.

Of the abilities of Dr. Arnold as a muſical compoſer, it is needleſs to add any thing by way of eulogium; the public approbation has anticipated the tribute of applauſe which the biographer might be diſpoſed to pay to his memory. His oratorios are not unworthy of the diſciple of ſo great a maſter as Handel: and ſuch was the verſatility of his talents, that he not only acquitted himſelf with high credit in thoſe ſolemn and auguſt ſubjects which relate to our religious duties, but in thoſe tender, playful, and humorous compoſitions which belong to the beſt of our public amuſements. The "Maid of the Mill," the "Agreeable Surpriſe," "Incle and Yarico," the "Surrender of Calais," the "Shipwreck," and "Peeping Tom," will continue to delight as long as a ſenſe of harmony ſubſiſts. Arnold's "Shunamite Woman," one of his lateſt productions, poſſeſſes the genius of his earlier compoſitions, with that additional ſcience which he had derived from ſtudy and experience.

It may be further mentioned to the honour of Dr. Arnold's character and memory, that the exerciſe of his profeſſional talents was not confined either to the amuſement of the public, or to his own private emolument. Many charitable inſtitutions have derived great benefit from his voluntary and gratuitous aſſiſtance. Beſides his profeſſional excellencies, and the general benevolence of his diſpoſition, Dr. Arnold poſſeſſed many qualities which entitled him to the eſteem of thoſe who knew him. "His genius and ſcience," ſays an anonymous writer, who ſeems to have known him well, and to have juſtly appreciated his merit, "procured him a numerous circle of friends, and his ſocial and amiable diſpoſition conſtantly preſerved them. His converſation was pleaſant and unaffected; his heart was framed to feel for the diſtreſs of others; and his friendſhip was zealous and ſincere."

ARNOLDSGRUN, in *Geography*, a town of Germany, in the circle of Upper Saxony, 4 miles eaſt of Oelſnitz.

ARNOLDSTEIN, or Arlstein, a town of Germany, in Carinthia, 7 miles S.W. of Willach.

ARNON, in *Ancient Geography*, a river, or rather torrent of Paleſtine, had its ſource among the mountains of Gilead, in Arabia, traverſed the deſert, running at firſt from north to ſouth, and then from eaſt to weſt, and diſcharged itſelf into the lake Aſphaltites, or the Dead Sea. By its courſe it divided the Amorites from the Moabites. This river gave name to a canton of Paleſtine, ſituate along its banks, on the other ſide of Jordan.

Arnon, in *Geography*, a river of France, which runs into the Cher, near Vierzon.

ARNOSERIS, in *Botany*. See Lapsana.

ARNOSORA, in *Geography*, a town of Italy, in the kingdom of Naples, and province of Principato Citra, 12 miles S.E. of Salerno.

ARNOTA, a town of Wallachia, 18 miles weſt of Kimnick.

ARNOTTA, in *Botany*, a name given by the peaſants of Burgundy, and many other places, to certain roots which they frequently turn up, from five or ſix inches depth, in plowing the ground. They carefully collect theſe, and eat them, after roaſting in the aſhes, or otherwiſe; by which ſort of cooking they acquire the taſte of a chefnut, and are found to be a very wholeſome and nouriſhing food. They are blackiſh on the outſide, and white within, and are of the ſize of a ſmall walnut. They are common in the north of Scotland, and called *arnots*. See Bunium.

ARNOTTO. See Bixa.

ARNOYA, in *Geography*, a river of Spain, which runs into the Minho, near Rivadavia, in Gallicia.

ARNSBURGH, a town of Germany, in the circle of Upper Saxony, and country of Schwartzburgh Rudolſtadt. 3 miles S. E. of Sonderſhauſen.

Arnsburg, is alſo a town of Germany, in the circle and county of Solms-Braunfels, 3 miles N.E. of Muntzenberg, and 6 S.S.E. of Gieſſen.

ARNSFELD, a town of Germany, in the circle of Upper Saxony, and country of Erzgebirg, 5 miles ſouth of Wolkenſtein.

ARNSHAUG, a town of Germany, in the circle of Upper Saxony and diſtrict of Neuſtadt, 1 mile ſouth of Neuſtadt.

ARNSHEIM, a town of Germany, in the circle of the Lower Rhine, and palatinate of the Rhine, 20 miles N.W. of Worms, and 14 S.W. of Mentz.

ARNSTADT, a town of Germany, in the circle of Upper Saxony, and country of Schwartzburg, on the Gera, 12 miles ſouth of Erfurt. N. lat. 50° 40'. E. long. 11° 3'.

ARNSTEIN, a town of Germany, in Thuringia, and county of Mansfeld, between Mansfeld and Quedlinburg.

ARNSTORF, a town of Germany, in the archduchy of Auſtria, 6 miles weſt of Maultern.

ARNTSEE, a town of Germany, in the circle of Upper Saxony, and old mark of Brandenburg, on the ſide of a deep lake formed by an earthquake in the year 811.

ARNULPH, or Ernulph, in *Biography*, biſhop of Rocheſter in the reign of Henry I., was born at Beauvais in France, about the year 1040. Having ſtudied at the abbey of Bec, under Lanfranc, archbiſhop of Canterbury, he came over to England at his ſolicitation; and paſſed through the gradations of prior of the monaſtery of Canterbury, and of abbot of Peterborough, to the ſee of Rocheſter. He held this ſee nine years, and died in 1124, at the age of 84 years. His mind was tinctured in a very conſiderable degree with the ſuperſtition of the age in which he lived. His works are a hiſtory of the church of Rocheſter, known by the title of "Textus Roffenſis;" "An epiſtle on inceſtuous marriages;" and "An epiſtle containing anſwers to divers queſtions of Lambert, abbot of Munſter, eſpecially concerning the body and blood of our Lord." Biog. Brit.

ARNULPHIN, *Arnulphinus*, a coin of the value of a ducat and a half, current in ſome parts of France in the fifteenth century. Du-Cange.

ARNULPHUS, in *Biography*, an Egyptian by birth, and a magician by profeſſion, lived in the reign of Marcus Antoninus, and deluded the Roman people by his pretended miracles

miracles and incantations. Dion the hiſtorian (l. 55.) relates, that in 174, he obtained, by the invocation of Mars and other gods of the air, a ſhower, which ſecured to the Roman army the victory in an engagement with the Germans.

ARNWAY, John, a divine of the Engliſh church, was born of a good family in Shropſhire, in 1601, educated at Oxford, and preferred to the rectories of Hodnot and Ightfield, in his native county, where he was diſtinguiſhed by his learning and his charity. Upon the breaking out of the civil war, he manifeſted his loyalty by cloathing ſoldiers for the king's ſervice, and preaching againſt rebellion. His zeal in the royal cauſe expoſed him to a variety of misfortunes; his houſe was plundered, his eſtate ſequeſtered, and his perſon impriſoned. After the king's death, he was releaſed from priſon, but compelled to leave the kingdom. He continued ſome time at the Hague; but the penury of his circumſtances obliged him to avail himſelf of an offer to remove to Virginia, where he died in 1653. During his reſidence at the Hague, he publiſhed "The Tablet, or the moderation of Charles I. the martyr;" and "An alarm to the ſubjects of England."

ARO, in *Geography*, a river of Spain, which runs into the Mediterranean, 2 leagues ſouth from Palamos in Catalonia.

AROANII, in *Ancient Geography*, mountains of Arcadia, north-weſt of Amilos, inhabited by the Phœnæates.

AROBE, by ſome ſpelt and pronounced *arrole*; in Spaniſh, *arroba*; in the language of Peru, *arrou*: a weight uſed in Spain, Portugal, Goa, Brazil, and throughout all Spaniſh America. All theſe *arobes* are ſcarcely like each other but in name, being very different in weight, and in their proportion to the weights of other countries. The *arobe* of Madrid, and almoſt all over Spain, weighs twenty-five Spaniſh pounds.

AROCELIS, in *Ancient Geography*, a town of Spain, in the county of the Vaſconi, north-weſt of Pompelo.

AROCHA, a river of Italy, in Brutium, the courſe of which is placed by M. D'Anville from north to ſouth into the gulf of Squilace, between Semirlus to the weſt and Targines to the eaſt.

AROCHE, in *Geography*, a town of Spain, in the province of Andaluſia, and country of Seville, on the frontiers of Eſtremadura, near a chain of mountains to which it gives name, extending along Spaniſh Eſtremadura to the frontiers of Portugal, forty-ſix miles north weſt of Seville.

AROE, in *Ancient Geography*, a town of Achaia, now called Patras.

AROER, a town of Paleſtine, on the north bank of the river Arnon, which had belonged to Sihon, king of the Amorites, upon the confines of the country of the Moabites. In the general diſtribution, it pertained to the tribe of Gad; Numb. xxxii. 34. This was probably the Aroer beyond Jordan, mentioned 1 Sam. xxx. 28. There were other towns of this name, ſo called from *Aroer* in Hebrew denoting heath, on account of their ſituation. Reland (t. 1. p. 583.) thinks there was a city of this name near Rabbah of the Ammonites, otherwiſe called Philadelphia, and that it is the Aroer referred to in Joſh. xiii. 25. Judg. iii. 33.

AROKHAGE, in *Geography*, the capital city of a country in Aſia, to which it gives name, correſponding to the ancient Arachoſia, and lying about 100 miles to the ſouth of Candahar. N. lat. 31° 28′. E. lon. 65° 29′.

AROLEC, the name of a weight, in uſe in ſome parts of America, and in quantity equal to twenty-five pounds of our weight.

AROLSEN, in *Geography*, a town of Germany, in the circle of the Upper Rhine, and county of Waldeck, near the river Aar, twenty-nine miles S. S. E. of Paderborne, and thirty-eight W. S. W. of Gottingen. N. lat. 51° 15′. E. long. 8° 30′.

AROMA, in *Modern Chemical Language*, is applied to a certain ſubtle attenuated principle, in which the ſmell of all odoriferous bodies is ſuppoſed peculiarly to reſide.

The term aroma has ſuperſeded that of *ſpiritus rector*, uſed by the older chemiſts down to the time of the modern alterations in chemical nomenclature; but the latter appellation has had a more extended ſenſe; of which, as a part of chemical hiſtory, it may be proper to ſay a few words.

The ancient chemiſts, who united in a rare degree the oppoſite qualities of ardent imagination and patient inquiry, ſuppoſed that in every animal or vegetable there is a certain *aura*, or ſpirit peculiar to that ſingle body, and ſo ſubtle as only to be perceived by the ſenſes of ſmell and taſte, or by particular effects upon the nervous ſyſtem of the animal body. This *aura* then exhibits the proper character of that body, and from its great penetrability, exquiſite ſubtlety, and extraordinary volatility, it was termed the *ſpiritus rector*, or preſiding ſpirit.

If we conſider the appropriate and often intenſe odour poſſeſſed by the fragrant or the fœtid vegetables, by muſk and other animal juices; the *notus odor* whereby living animals diſtinguiſh each other, whereby the hound ſelects his game or recognizes his maſter; the narcotic aura of opium; and the ſickening and often deleterious effluvia of ſeveral of the moſt formidable poiſonous vegetables found in tropical regions; and laſtly the ſubtle matter of contagion which is ſcarcely evident to any ſenſe, and only known by its terrible effects: when all theſe circumſtances are taken in view, we cannot conſider it as a very wild conjecture to ſuppoſe ſomething peculiar in the nature and eſſence of odour independent of all other natural bodies.

The ancient chemiſts, however, have not limited themſelves to general conjecture, but have attempted to analyſe the properties of this odorous principle, to give it "a local habitation and a name;" and in ſo doing they have been carried beyond the ſober bounds of rational inquiry, and have advanced opinions which have long been conſigned to merited oblivion.

We ſhall not attempt the unprofitable taſk of unravelling the myſteries of Paracelſus and other chemiſts of the ſame ſtandard, in order to purſue this inquiry; but ſhall avail ourſelves of the learning and admirable judgment of the excellent Boerhaave, to ſelect juſt ſo much of theſe opinions as is neceſſary to ſhew how the idea of a *ſpiritus rector*, which is very general in its nature, has come to be confined almoſt excluſively to the aroma of vegetables. This ſpirit, as Boerhaave obſerves, was ſuppoſed "to be lodged by the Creator in a tenacious durable matter, not eaſily to be diſperſed either by air, water, or fire, and called *oil*, by whoſe *lentor* it is as it were inviſcated and prevented from flying off and deſerting the body for whoſe direction it was appointed." This oil, however, is more volatile than the common groſs oils, and contains the *ſpiritus rector* in a very ſparing quantity.

The idea and name of *eſſence* and *quinteſſence* have a ſimilar origin. The ancient chemiſts conceived that the four elementary ſubſtances of fire, air, earth, and water, contributed to the compoſition of bodies, and to this was added a *fifth eſſence* (quinta eſſentia) extremely ſmall in quantity, but rich in efficacy, which by its own particular virtue imparted odour, colour, taſte, and inherent characteriſtic qualities.

Having formed this theory, an appoſite illuſtration was requiſite,

requiſite, and none appeared ſo much to the purpoſe as the products obtained by the diſtillation of ſome of the aromatic vegetables. The following example which Boerhaave gives is very clear and intelligible: ſuppoſe cinnamon "which is an aromatic of a moſt fragrant ſmell and pleaſant taſte; on diſtilling a pound of this with boiling water, there will ariſe a milky odorous ſavoury liquor, to the bottom of which ſettles a little ruddy fragrant oil, ſtrong of the virtue of the cinnamon, and ſuch the firſt liquor was. After ſeparating the liquors, let the remaining bark be diſtilled with a ſecond water, upon this will ariſe a limpid watery juice of an acid taſte, a faint ſmell, and affording none of the marks of cinnamon, &c." The inference which the author would draw from this is obvious; the *ſpiritus rector*, or diſtinguiſhing characteriſtic of the cinnamon, reſides in the water and oil, the products of the firſt diſtillation; and the remaining ſubſtance of the bark conſiſts only of the common vegetable principles, is inert in its nature, inodorous, inſipid, and incapable of producing thoſe effects upon the nervous ſyſtem of living animals which it exhibited before diſtillation. Again, if the diſtilled water ſeparated from the oil be expoſed to the air, the whole place will ſmell of cinnamon, and the water will after a while become inſipid, and loſe all its aromatic virtue, yet without ſuffering a greater loſs of weight than common water would have done under ſimilar circumſtances; and alſo if the fragrant oil be expoſed to the air, it will gradually loſe its odour, but will remain nearly of the original weight: and from theſe facts it is inferred, that the *ſpiritus rector* is extremely ſmall in quantity, when ſeparated from thoſe ſubſtances with which it is naturally combined.

The example of the aromatic vegetables correſponding ſo well in theſe important particulars with the theory of a peculiar aroma or eſſential ſpirit, we ought not to be ſurpriſed to find the opinion of Paracelſus and the older chemiſts, diveſted of its myſticiſm and extravagance, ſupported by ſuch reſpectable authorities as Boerhaave, Macquer, Beaumé, and many other excellent chemiſts; and the proceſſes for obtaining the ſpiritus rector have long formed a regular part of the practice of chemiſtry.

As the extraction of the aroma of vegetables makes an intereſting branch of vegetable chemiſtry, we ſhall give the proceſs and the remarks of the celebrated Beaumé, whoſe long experience as a pharmaceutical chemiſt entitles him to the higheſt attention.

"To prepare the ſpiritus rector of thyme, take any quantity of this plant freſh gathered and flowering, put it in an alembic, and moiſten it with a very ſmall quantity of water (which addition however is not requiſite where a ſucculent plant is employed). Diſtil with a water bath in a very gentle heat, not equal to that of boiling water, and a perfectly clear odorous water will ariſe. When about half an ounce of this liquor to the proportion of a pound of the plant has diſtilled over, ſtop the operation, and this liquor is the *ſpiritus rector of thyme*. If however the proceſs be continued till the plants be perfectly dry, a larger quantity of liquor comes over, and this is called *eſſential water of thyme*.

In like manner may be prepared the ſpiritus rector of all other aromatic or acrid plants. This preparation is not uſed however in medicine, probably from being too expenſive, and from not differing very materially in properties from the diſtilled eſſential water, which is yielded in much larger quantities, and prepared by the addition of more water to the plants before diſtillation.

If the liquid ſpiritus rector be kept even in well cloſed bottles, it becomes mouldy and viſcid in a year or two, but the ſame effect takes place much more rapidly when expoſed to the air.

The quantity of aroma furniſhed by the ſeveral odorous plants differs greatly: thoſe that have a high and penetrating ſcent, but yield little eſſential oil in diſtillation, ſuch as the tuberoſe, jaſmine, jonquil, &c. are ſaid to give the greateſt proportion of ſpiritus rector, but in ſo volatile a ſtate that it cannot be procured in union with water in the uſual way. The intermede of alcohol or fixed oil, is required in this caſe.

If the aroma be conſidered as a ſeparate principle, there can be no plea for denying its production when the pungent acrid vegetables are ſubmitted to diſtillation. Thus, muſtard-ſeed, diſtilled with the precautions above mentioned, yields an intenſely pungent aqueous liquid, in which the ſenſible qualities of muſtard are certainly very much condenſed, and it would be called by the older chemiſts the ſpiritus rector of muſtard.

We ſhall treat more fully of theſe proceſſes under the articles *Diſtilled* WATERS *of Pharmacy*, *Diſtilled* SPIRITS, and OIL *Eſſential*.

Even the inodorous plants, ſuch as lettuce or borrage, when diſtilled with care by a very gentle heat, may be made to yield a liquor in which an odour peculiar to each plant may be ſelected, and this may be termed the aroma of theſe vegetables.

By the proceſs of *cohobation*, or re-diſtilling the firſt liquor over freſh materials, the aroma appears to be condenſed in a much ſmaller bulk of watery menſtruum, and at the ſame time the liquor becomes ſuperſaturated with the aromatic eſſential oil of the plant. This is ſhewn in a ſtriking manner in the preparation of that exquiſite oriental perfume, the *Attar of* ROSES. That moſt ſpeedily fatal of all known poiſons, the LAUREL *Water*, is another example of the ſame; the aroma of the laurel has a ſudden and violent operation on the nervous ſyſtem of living animals; now if laurel leaves are diſtilled in a gentle heat with a ſmall quantity of water, the firſt product is a clear liquor holding all the aroma in ſolution, ſmelling powerfully of the plant, and poſſeſſed of a poiſonous quality, whilſt the remaining leaves are inſipid and inert: but if the ſame liquor be again diſtilled with freſh leaves, it receives all the aroma of this ſecond quantity, becomes proportionably ſtronger, and acts with more energy on the living body; and thus by repeating the proceſs, ſo much of the aroma is condenſed into a ſmall bulk of water, that the peculiar qualities of laurel may be exhibited in the moſt ſtriking manner, unincumbered with the common vegetable materials of which the leaf itſelf is compoſed.

The extraction of the aroma of plants is the baſis of the art of perfumery, an art in which there is much room for the exerciſe of ſkill and ingenuity, and to the ſenſes at leaſt it is one of the moſt agreeable branches of technical chemiſtry. We have mentioned that the aroma of ſome exquiſitely ſcented flowers, ſuch as the tuberoſe, jaſmine, or honey-ſuckle, though moſt potent to the ſenſes, is of ſo extremely volatile a nature that it cannot be prepared by common diſtillation with water; and if it does reſide in an eſſential oil, the quantity of that oil is ſo minute as not to be extracted in the uſual proceſſes. The perfumers have therefore adopted a very ingenious method of fixing the aroma in expreſſed oils without the aſſiſtance of any but the gentleſt heat. The oil which is uſed is either oil of ben or the pureſt olive oil, both of which are entirely ſcentleſs. The proceſs is the following: the flowers whoſe aroma is to be extracted, the jaſmine flowers for example, are thickly ſpread upon flakes of wool, previouſly ſoaked

in

in the fixed oil, then are inclofed in tin boxes, and fuffered to remain till the flowers begin to decay and lofe their texture and colour. They are then removed, freſh flowers are added, and the maceration repeated till the fixed oil becomes richly impregnated with the jaſmine ſcent. The wool is then preſſed, and the fragrant oil ſeparated from the flowers is put in clofely-ſtopped bottles, and ſold under the name of *eſſence* of jaſmine, or whatever other flower was employed. Care is taken during the operation to pick the flowers carefully. Theſe eſſences therefore conſiſt of a fixed oil ſaturated with the aroma of the plant, and if theſe eſſences are digeſted in pure alcohol, the oil remains inſoluble in this liquid, but yields to it the aroma; and thus the ſcent alone is transferred to the ſpirit. By this method a ſpirituous water is prepared for the toilette, ſcented with theſe delicate and exquiſite perfumes.

The chemical nature of aroma may be conſidered as ſtill unknown to us; that is to ſay, we are ſtill ignorant whether the powerful ſcent of a plant reſides in ſome ſubſtance of ſo delicate a nature as to have eluded our reſearch, or whether it is only an inherent quality in ſome known part of the plant (and if this is the caſe, probably it is the eſſential oil), which by being volatilized in the air is able to reach our olfactory organs.

Moſt chemical writers have brought the inſtance of the inflammable gas, which, in ſultry evenings, is often found to hover round the fraxinella when in full blow, as an example of aroma in the pureſt form in which it is ever procured. This would certainly be an intereſting ſubject for chemical examination, if we could flatter ourſelves that the means which chemiſtry affords were at all equal to the taſk; but what chemiſt could yet flatter himſelf with the hopes of diſcovering the nature and compoſition of ſcented air, of finding a means of ſeparating the odorous principle of the ſyringa that ſickens with its fragrance, from the breeze that conveys it to his ſenſes; or of diſtinguiſhing by chemical teſts the inconceivably minute portion of the aroma of muſk that loads with its oppreſſive ſcent an extenſive chamber, from the dreadfully active effluvia which ſpreads diſeaſe and peſtilence?

The moſt powerful argument in favour of the peculiar nature of aroma diſtinct from that of eſſential oil, ſeems to be the circumſtance which we have juſt mentioned, namely, that the quantity of aroma emitted by ſeveral of the moſt fragrant flowers, and which is indicated by the extent of atmoſphere ſaturated as it were with perfume, is not in the leaſt degree commenſurate with the quantity of eſſential oil which any proceſs of art can extract from them. We ſhall forbear, however, to enter further into this inquiry, but as we may ſurely infer from the examples of effluvia, of galvaniſm, and of contagion, that the organs of ſenſation in the living animal are more delicate analyſts than the teſts and re-agents of the chemiſts, they certainly ought to be conſidered as at leaſt equally concluſive.

A very few words will be ſufficient on the ſubject of the different ſpecies of aroma which have been ſuppoſed to be detected by various chemiſts. So many of the parts and products of living vegetables are in a certain degree volatile in an atmoſphere of moderate warmth, that the aroma which is equally volatile may readily combine with all or any of them. The gas of the fraxinella has been already mentioned as one example of gaſeous aroma; the pungent vapour of the cruciform plants has been found by late experiments to contain ſulphurated hydrogen, which probably aſſiſts the volatilization of the aroma, and furniſhes another example of the gaſeous. The watery aromas and the eſſential or oily aromas are almoſt indiſtinguiſhably intermixed in the products of the diſtillation of plants, in the old methods of obtaining the ſpiritus rector which have been already deſcribed. All the pure eſſential oils alſo contain aroma as a characteriſtic ingredient, though the intenſity of this principle varies not only in different oils, but in the ſame ſpecies at different ſeaſons; and, as we have mentioned, is almoſt entirely loſt by long expoſure to the air; but whether this change takes place by an actual loſs of the aromatic principle, or by ſome internal chemical change, has not yet been aſcertained. Laſtly, various odorous plants yield an aromatic liquor which is ſlightly acid; the nature of this acid is not ſufficiently known, but it has been ſuſpected to be ſimilar to the benzoic. Some further notice will be taken of this ſubject under the other articles belonging to vegetable matter, and that of VEGETABLE *Analyſis*.

Aroma is by ſome particularly applied to denote myrrh.

AROMA *Germanicum*, is a denomination given by Platerus to elecampane. Some writers give the title *aroma Germanicum* to juniper berries, on account of the great eſteem they are in among that people, for their ſpicy, warm qualities; in which reſpect they are by many preferred to ginger itſelf. *Aroma philoſophorum* is uſed by ſome for ſaffron. Others give the appellation of *aroma philoſophorum* to Paracelſus's aroph.

AROMATA, in *Ancient Geography*, a mountain of Aſia Minor, in Lydia. Strabo.

AROMATA, *Gardefan*, a promontory and town of Ethiopia. It was, according to Ptolemy, the moſt eaſtern point of Africa. Here terminates the kingdom of Adel and the Barbaria of the Periplus; and here the coaſt of Ajam or Azaria commences.

AROMATIC, AROMATICUS, is underſtood of a drug, plant, or the like, which yields a briſk fragrant ſmell, and a warm ſpicy taſte.

The word is formed of αρωμα, which is compounded of αει, *very*, and οδμη or οσμη, *ſmell*.

AROMATIC *Plants*, in *Gardening*, are ſuch as poſſeſs a fragrant aromatic flavour, combined with a ſtrong odoriferous ſmell in many of the kinds. Many of theſe plants are proper to the kitchen-garden, being employed as ſavoury ſweet herbs for various culinary purpoſes; and ſome of them are likewiſe employed for medicinal and domeſtic uſes. The principal ſorts neceſſary to be cultivated in the garden, as aromatics, are the following, being ſpecies of ſeveral different genera. They conſiſt, according to the authors of the General Dictionary of Gardening, of under-ſhrubby and herbaceous perennia's of many years duration, and of annuals and biennials of only one or two years continuance, which of courſe require to be raiſed every year or two from ſeed.

Theſe are of the firſt kind: *thymus*, or thyme; *ſalvia*, or ſage; *ſaturega*, or winter ſavory; *origanum*, or pot marjoram; *origanum*, or winter ſweet marjoram; *hyſſopus*, or hyſſop; *ruta*, or rue; *roſmarinus*, or roſemary; *lavendula*, or lavender. The above have abiding tops, and continue furniſhed with leaves, in moſt caſes, all the year round. But the following are herbaceous, and renew their ſtalks, and ſome of the other parts, every ſpring and ſummer: *mentha*, or mint; *mentha*, or penny-royal; *meliſſa*, or baum; *anethum*, or fennel; *tanacetum*, or tanſey; *artemiſia*, or tarragon; *anthemis*, or chamomile; *mentha*, or peppermint; *liguſticum*, or lovage.

Theſe are of the latter kind: *origanum*, or ſweet marjoram; *ſatureja*, or ſummer ſavory; *ſcandix*, or chervil; *anethum*, or dill; *calendula*, or marygold; *ocimum*, or baſil; *apium*, or parſley; biennial, *carum*, or caraway; *pimpinella*, or aniſe; *angelica*, angelica, biennial-perennial.

Among the perennial kinds, the principal culinary or pot-herb

pot-herb aromatics are thyme, ſage, winter ſavory, marjorams, mint, penny-royal, tanſey, tarragon, and fennel. The others are not uſed as kitchen or culinary aromatics, but moſtly for domeſtic occaſions, as hyſſop, balm, chamomile flowers, lovage, rue, and roſemary. And for ſimple medicinal purpoſes in a family; the peppermint for diſtilling; alſo the lovage and penny-royal occaſionally for the ſame purpoſe; and the lavender for its flowers, both to diſtil for lavender water, and to lay among clothes to give them a ſweet and agreeable ſcent; ſome ſorts of ſage, common mint, and balm, are alſo uſed occaſionally by way of tea; and young green mint and tarragon often in ſallads. But among the annual and biennial aromatics, the ſweet marjoram, ſummer ſavory, chervil, dill, marigold, baſil, parſley, and coriander, are the principal ſorts to cultivate for culinary uſes, &c. The caraway and aniſe are cultivated in ſome inſtances for ſeeds, both to uſe in the kitchen, and for diſtilling; alſo ſometimes the coriander ſeed, but more generally the two former; and the angelica, principally for the young tender ſhoots of its ſtalks which are uſed in confectionary, to candy as a vegetable ſweetmeat, and the ſeeds for medicine; ſome of theſe annual aromatics are alſo in ſome caſes uſed to give flavour to ſallads, as chervil, coriander, baſil, &c.; the young leaves being uſed in ſmall quantities to mix with ſome principal ſallad herbs. See the deſcription of each under its reſpective genus.

All of them, except the baſil, are moſtly of hardy growth, ſo as to ſucceed in any common ſoil and ſituation. The perennial ſorts continue ſeveral years in the ſame plants, among which ſome are durable, both in root and top, and remain green for uſe all the year, as thyme, ſage, winter-ſavory, marjoram, hyſſop, rue, roſemary, &c.: the others are perennial only in root, and annual in ſtalk, as the mints, penny-royal, tanſey, tarragon, fennel, chamomile, &c. and furniſh their reſpective produce for uſe only in the ſpring, ſummer, and autumn.

All the perennial aromatics are eaſily raiſed, either by ſlips, off-ſets, parting the roots, or by ſeed, and may be planted in ſpring, ſummer, or autumn, in beds or borders at from ſix to ten or twelve inches aſunder; but the annual and biennial kinds, continuing in the former only one ſeaſon, and in the latter only till the ſecond year, muſt be raiſed every year or two, from ſeed in the ſpring, in any compartment of common earth in the open ground, except the baſil, which being tender, muſt be raiſed in hot-beds, in order to be tranſplanted in May or June; moſt of the others generally remain where ſown in the natural ground, but may be occaſionally tranſplanted, the ſweet marjoram and ſummer-ſavory in June, &c. and likewiſe the angelica, as being of large growth, in ſummer. As ſome of theſe only afford their uſeful parts at particular ſeaſons, as mint, balm, penny-royal, tarragon, ſweet marjoram, &c., they ſhould be cut and preſerved at ſuch times for winter uſe, as about July and Auguſt. But for the marigold, chamomile flowers, and thoſe of lavender, as well as ſage-tops, marjoram, hyſſop, and ſuch like, which often ſtand the winter, autumn may be better, as they will then be ready in caſe of a ſevere winter. Parſley generally furniſhes proper ſupplies of green leaves all the year; baſil and dill only in ſummer; chervil and coriander, principally in ſummer and autumn, of the ſpring and ſummer ſowings; or if ſome of each be alſo ſown in Auguſt, they will continue green all winter, but the coriander will require a little protection in that ſeaſon; and the caraway, aniſe, and angelica continue only in ſummer and autumn.

In regard to the general culture of theſe plants, the perennial ſorts being planted in beds or borders, continue there, as has been obſerved, ſeveral years, and only require to be kept clean from weeds in the ſummer and autumn, and to be cut down and the decayed ſtalks removed at the latter ſeaſon; and in ſpring to give the beds, &c. a neat dreſſing by clearing off all weeds and litter, and then looſening the ground a little between the plants; and in ſome cloſe running kinds, as mint, &c. to ſpread ſome earth thinly over the general ſurface; and when any particular ſorts appear in a declining ſtate, to make a freſh plantation in the proper ſeaſon: as to the annual ſorts, they only require to be kept clear from weeds during their growth and continuance, and that freſh ſupplies be raiſed every year from ſeed.

AROMATIC *Confection*. See CONFECTIO *Aromatica*.

AROMATIC *Powder*. See PULVIS *Aromaticus*.

AROMATIC *Spirit*. See AMMONIACAL *Preparations*.

AROMATIC *Tincture*. See TINCTURA *Aromatica*.

AROMATICUS CALAMUS. See CALAMUS.

AROMATICS, in *Pharmacy*. The Materia Medica contains a number of vegetable ſubſtances which poſſeſs a fragrant penetrating ſmell, a ſtrong pungent taſte, and a conſiderable ſtimulating power on the ſyſtem in general. Theſe are called *aromatics*, and their characteriſtic properties apper to depend chiefly, if not entirely, on an eſſential oil, which, when extracted from the vegetable, exhibits all its aromatic power in a very concentrated form.

The aromatic property is found in combination with a variety of other vegetable principles, many of which modify its effects on the conſtitution. The ſimple operation of the aromatic principle appears to be ſtimulant in a conſiderable degree; but the effect of ſeveral of the eſſential oils differs ſo entirely from that produced by common ſtimulants, that we cannot include theſe ſubſtances under a ſingle claſs without very great limitation.

As the claſs of *aromatici* is diſtinguiſhed entirely by certain properties of ſmell and taſte, in each of theſe circumſtances it approaches by inſenſible gradations upon the limits of other claſſes.

The aromatic or fragrant ſmell of nutmeg, peppermint, or roſemary, would be denied by none; but the ſtrongly odorous or graveolent ſcent of wormwood or rue would be claſſed by many organs with the fœtid; the odorous principle, however, in each of theſe ſubſtances appears to reſide in the eſſential oil. In taſte, likewiſe, the aromatic, when powerful, proceeds to the acrid, and all the eſſential aromatic oils, when uncombined, produce very acrid, and ſometimes even cauſtic or corroſive effects on the tongue, ſo as to deſtroy the ſurface of the part which they touch, even by a very ſhort application. The vegetables, or parts of vegetables, that contain the aromatic principle, are chiefly the following.

1. *The Spices*, thoſe exquiſite productions of the tropical regions, which, beſides being highly uſeful in medicine, form the moſt grateful condiments for the table. The power of habit in accuſtoming the conſtitution to exceſſive quantities of the hotteſt ſtimulants, and to ſubſtances that produce powerful local effects, is in few inſtances more ſtriking than in the manner in which theſe valuable vegetable productions are employed by the inhabitants of the countries to which they are indigenous. In many of the ſpice-bearing plants various parts of the ſame vegetable are richly impregnated with the aromatic principle, as in the inſtance of the mace and nutmeg, productions of the ſame plant, or the leaves and bark of the cinnamon.

2. *The aromatic barks and woods*, ſuch as the canella, orange peel, ſaſſafras, and many trees of the fir tribe. In many of theſe the aromatic is combined with the aſtringent and the bitter principles, and this union is often of ſingular

ſervice in the formidable bowel complaints ſo common in tropical climates.

3. *The fragrant herbaceous plants*, ſuch as the lavender, mint, thyme, &c. Among this very extenſive claſs of aromatic vegetables are included all the fragrant pot-herbs employed for culinary purpoſes in climates not bleſſed with the ſpices that require a burning ſun. From this claſs alſo are procured ſeveral of the perfumes and other agreeable ſcents for the toilette.

4. *The reſinous aromatics*, ſuch as the Mecca balſam, myrrh, capivi balſam, frankincenſe, Chio turpentine, and many others. The ſtrong ſmelling raiſins and balſams, when ſubmitted to diſtillation, yield a very large quantity of eſſential oil in which their characteriſtic properties of ſmell and taſte reſide, whilſt the reſidue is hard, brittle, almoſt without odour, and inſipid. The graveolent and fœtid gums have the ſame character.

The aromatics are uſed very largely in pharmacy in a great number of forms and combinations, both on account of their proper ſtimulating cordial properties, and as powerful auxiliaries in a variety of inſtances. Their ſtrong and agreeable ſmell and taſte render them peculiarly proper for concealing and correcting thoſe of the more naufeous and unpalatable medicines. As the eſſential oil to which the aromatics appear to owe their properties is ſoluble largely in ſpirit of wine, and partially in water, they are very conveniently employed under the forms of *Diſtilled* Spirits and *Diſtilled* Waters.

AROMATICA, in *Ornithology*, the Gmelinian name of the ſpecies of Columba, or pigeon, called by Briſſon, Columba viridis Amboinenſis; le pigeon verd d'Amboine, by Buffon; and aromatic pigeon, by Latham; from the latter of which Gmelin adopts the name *aromatica*. It is, as the ſynonyms imply, a native of the iſland of Amboyna; and is about ten inches and a half in length, or the ſize of the common turtle. The general colour is olive-green; back bay or cheſnut; on the wing a double bar of black, edged with pale yellow; quill feathers black, with yellowiſh margins. Gmel. &c. The bill of this bird is greeniſh; the upper part of the head is grey, darkeſt behind; the ſides, throat, neck, breaſt, belly, rump, upper tail coverts, and tail, olive-green, but inclining to yellow on the neck and breaſt; the under parts of the tail black at the baſe, and dirty white at the end; the under tail coverts dirty yellowiſh white; wing coverts, like the back, cheſnut; and the legs and claws either grey or red; for Dr. Latham deſcribes them of a grey colour, and in Les Planches eluminées of Buffon, they are painted red.

AROMAZ, in *Geography*, a town of France, in the department of Jura, and chief place of a canton in the diſtrict of Orgelet, ſourteen miles ſouth of Orgelet.

ARON, Peter, in *Biography*, a voluminous writer of muſic in the ſixteenth century, was a native of Florence, of the order of Jeruſalem, and a canon of Rimini. He appears to have ſtudied muſic as a profeſſion under the patronage of Leo X., in whoſe pontificate he was admitted into the papal chapel at Rome. His moſt conſiderable work, in which there is little that is new, was intitled, "Toſcanello della Muſica," and firſt printed at Venice in 1523, and with additions in 1539. This is divided into two books: the firſt containing a penagyric on muſic, an account of its inventors, definitions of terms, &c.; the ſecond, an impartial account of the genera of the ancients, a decalogue or ten precepts concerning counterpoint, an explanation of proper terms, and directions for dividing the monochord, upon the principles of Guido Aretino. Burney's Hiſt. of Muſ. vol. iii.

ARON, in *Geography*, a town of Perſia, in the province of Irak, two leagues from Cachan.

ARONA, a ſmall town of Italy, in the Milaneſe, belonging to Piedmont; ſeated on the ſide of a hill, near the weſt coaſt of lake Maggiore, the environs of which are exceedingly fertile, and ſupply wines that are much valued. Above it riſes a ruined caſtle: two promontories project into the lake at this ſpot; the eaſtern is crowned with the caſtle of Anghiera, and gives name to this valuable province, which, in 1397, was erected into a county by the emperor Wenceſlaus, and has ſince been transferred to the king of Sardinia. In doubling the promontory of Arona, the lake again enlarges, and forms a bay.

ARONABABAD, a town of Perſia, in the province of Irak, twenty leagues ſouth of Iſpahan.

ARONCHES, a town of Portugal, in the province of Alentejo, walled and defended by a caſtle, and containing about 600 inhabitants; 95 miles eaſt of Liſbon. N. lat. 38° 58′. W. long. 6° 14′.

ARONDE, a river of France, which runs into the Oiſe, oppoſite to Compeigne.

ARONDE, in *Fortification*. See Dove-tail, and Queue *d'Aronde*.

ARONDELLE, and Harondelle, in *Ornithology*, the French ſynonymous names of the Sterna tribe; *terns* or *ſea-ſwallows* of Engliſh writers. See Sterna. The term *Arondelle* is alſo applied in a general manner to the ſpecies of Trigla deſcribed by Linnæus under the name of *volitans*. This is one of the flying-fiſhes of our naturaliſts; and in the claſſification of Natural Hiſtory by Lacépède, forms a new genus, which he called *Dactyloptere*. See Trigla *Volitans*.

ARONIA, in *Botany*. See Orontium.

ARO *Orchis*. See Galengal.

AROOL, in *Geography*, a town of the Ruſſian empire, in the Ukraine, on the river Occa, eighty leagues north of Moſcow. N. lat. 51° 48′. E. long. 38° 13′.

AROOSSI, a territory of Abyſſinia, being the ſouthernmoſt diviſion of Maitſha, on the weſt ſide of the Nile, inhabited by the Abyſſinians, a kindred of the Agow. It is bounded on the north by the river Kelti, and on the ſouth by the Aſſar; the Arooſſi running through the middle of that diſtrict. This little territory is deſcribed by Bruce (vol. iii. p. 560), as by far the moſt pleaſant which he had ſeen in Abyſſinia, and perhaps, he ſays, it is equal to any thing which the eaſt can produce. The whole is finely ſhaded with the acacia vera, or Egyptian thorn, that yields the Gum Arabic, which ſeldom riſes above fifteen or ſixteen feet high, and then ſpreads wide at the top, ſo that the branches of different trees touch each other, and under a vertical ſun afford a cool, delicious ſhade. Below theſe trees the ground is chiefly covered with lupines; and wild oats grow up ſpontaneouſly to a prodigious height and ſize, and have, when ripe, the appearance of canes. The inhabitants make no uſe of the grain, though the taſte of the meal, when made into cakes, is very good. The ſoil of this country is a fine black mould, like that of our gardens. Arooſſi is finely watered with ſmall ſtreams.

AROPH, a term uſed by Paracelſus, to denote a medicine endued with a power of breaking or diſſolving the ſtone in the human body. In which ſenſe, *aroph* amounts to the ſame with *lithontriptic*. Van Helmont aſſures us, that he was poſſeſſed of the *aroph*; and from his account, it ſeems to have been a preparation of ſaffron and rye-bread, digeſted with ſpirit of wine, in a horſe-dung heat, and at length diſtilled. Vide Cnoeffel. in Ephem. Acad. N. C. dec. 1. an. 4. obſ. 109.

Aroph *Paracelſi*, is alſo a name given to a kind of chemical flowers, elegantly prepared by ſublimation, from equal quantities of *lapis hæmatitis* and *ſal ammoniac*; ſaid to be of great efficacy in quartan agues, the *plica polonica*, and hypochondriac diſeaſes. This is alſo called *aroma philoſophorum*.

Aroph is alſo uſed to denote Mandragora

AROSBAY, in *Geography*, a town of the Eaſt Indies, on the coaſt of the iſland of Madura, near Java. S. lat. 9° 30′. E. long. 114° 30′.

AROSIA, *Weſtern*. See Wisteros.

Arosia, *Eaſtern*, or *Oſtra Aros*, the ancient name of Upſala.

AROSIS, a river of Perſia, which bounded Perſis on the weſt, and ſeparated that province from Suſiana.

AROUANS, one of the iſlands which are near the mouth of the river of the Amazons in South America.

AROU-HARISI, in *Zoology*, according to Thévenot, the name of the Rhinoceros in the Eaſt Indies.

AROUKORTEKEN, in *Geography*, a country of Tartary, near the great wall of China.

AROURA, a Grecian meaſure, of fifty feet.

Aroura was more frequently uſed for a ſquare meaſure, the half of the plethron. The Egyptian *aroura* was the ſquare of a hundred cubits. Arbuth. tab. 9.

AROW, Islands of, in *Geography*, a cluſter of ſmall iſlands in the Indian ocean, ſituate north-eaſt of Timorland, and nearly ſouth of the coaſt of New Guinea. South lat. from 5° to 7°. E. long. 137°.

AROY, a river of South America, flowing from the lake Caſſipe in the province of Paria, and diſcharging itſelf into a river of this name.

ARPAD, Aradus, or *Rouwadde*, in *Ancient Geography*, an iſland ſituate on the coaſt of Syria. See Aradus and Rouwadde.

ARPAGIUS, or rather Harpagius, formed from ἁρπάζω, *rapio*, *I ſnatch*, in ſome *ancient inſcriptions*, ſignifies a perſon who died in the cradle, at leaſt in early youth. The Romans made no funerals for their arpagii.—They neither burnt their bodies, nor made tombs, monuments, or epitaphs for them, which occaſioned Juvenal to ſay,

" ——Terra clauditur infans,
Et minor igne rogi."

In after-times it became the cuſtom to burn ſuch as had lived to the age of forty days, and had cut any teeth; though theſe they alſo called ἁρπακτοι, or ἁρπαγμενοι, q. d. *rapti*, *raviſhed*. The uſage ſeems to have been borrowed from the Greeks; among whom, Euſtathius aſſures us, it was the cuſtom never to bury their children either by night or full day, but at the firſt appearance of the morning; and that they did not call their departure by the name of death, but by a ſofter appellation, ἡμερας ἁρπαγη; importing that they were raviſhed by Aurora, or taken away to her embraces.

ARPAIA, in *Geography*, a town or village of Italy, in the kingdom of Naples; and Principato Ultra, ſix miles weſt-ſouth-weſt of Benevento; ſuppoſed to be the ancient *Caudium*.

ARPAION, or Arpajou, a town of France, in the department of the Seine and Oiſe, and chief place of a canton, in the diſtrict of Corbeil; 16 miles ſouth of Paris. The place contains 2,093, and the canton 13,826 inhabitants: the territory includes 147½ kiliometres and 19 communes.

ARPA-SOU, a river of Perſia, between Erivan and Tauris.

ARPEGGIO, Arpeggiatura, in *Muſic*, is playing the ſounds of a chord in a rapid manner upwards and downwards, after each other, inſtead of ſtriking them together. In doing this on keyed inſtruments, the fingers of each hand muſt be kept on to preſerve each ſound, till its turn comes for the key to be ſtruck again. The word arpeggio is derived from *Arpa*, the harp; upon which inſtrument the ſounds of a chord are uſually ſtruck in ſucceſſion, by beginning at the loweſt. There are as many kinds of arpeggio as ſounds in a chord, or changes in their ſucceſſion. The violin family having but four ſtrings, and the viol family ſix, can only arpeggio four or ſix ſounds; and from the convexity of the bridges of theſe inſtruments, there is no other way of playing chords with a bow, but in arpeggio.

The abbé Feyton ſays very truly, that the harmonies ariſing from a ſingle ſtring or ſound, when firſt diſcovered, gave birth to arpeggio; or perhaps long before that, it was ſuggeſted by the ſection of the canon, or diviſion of the monochord. The muſical reader will find the examples of ſeveral kinds of arpeggio in the *Muſic Plates*.

ARPENBURG, in *Geography*, a town of Germany, in the circle of Upper Saxony, and old mark of Brandenburg, nine miles ſouth of Saltzwedel.

ARPENT. See Acre.

ARPHAXAD, in *Scripture Hiſtory*, the third ſon of Shem, and father of Salah, was born in the ſecond year after the flood, A. M. 1658, and died A. M. 2096, aged 438 years. Gen. xi. 12. &c. He was diſtinguiſhed above the reſt of his brethren, by having the patriarchal line continued through him. Arphaxad is placed by ſome in Arrapachitis, a province of Syria, towards the north part of the country; but others fix him, with his family, in Chaldæa, where we find his deſcendants till the time of Abraham. Some, who conſider as one and the ſame perſon Arphaxad and Cainan, who is inſerted between him and Salah in the Septuagint verſion, ſuppoſe him to be the founder of the monarchy of China. Some Mahometan authors make Arphaxad both a prophet and an apoſtle, and lodge the chief ſovereignty over the nations of the world in his deſcendants.

ARPI, in *Ancient Geography*, a town of Italy, in Apulia, between Luceria and Sipontum. It was anciently called *Argos Hippium*, and afterwards Argyrippa, the capital of a kingdom founded by Diomedes after the ſiege of Troy; in the time of Livy it was large and populous, and furniſhed Hannibal with 3000 armed men. It is now in ruins, about fourteen miles weſt of Manfredonia, in the province of Capitanata, and kingdom of Naples.

ARPII, a people placed by Ptolemy in Lower Myſia. They inhabited the coaſt at the northern mouth of the Iſter, at the entrance of the Boſphorus. Their capital was called Arpis.

ARPINAS, Joseph Cæsar D', in *Biography*, commonly called *Joſepin*, a famous painter, was born at the caſtle of Arpinas in Naples, in 1560. After receiving ſome inſtruction from his father, who was an artiſt, he was ſent, at the age of thirteen, to Rome, where he waited upon the painters in the Vatican, and at intervals ſketched figures on the pilaſters, which aſtoniſhed the other artiſts. Under the patronage of Gregory XIII. he enjoyed the means of further improvement, by being employed firſt in the ornaments of the Vatican, and afterwards in hiſtory painting; and his bold and free manner was much admired. At Naples he painted the cupola of the Chartreux; and returning to Rome in 1560, he began to paint the great hall of the capitol in freſco. Clement VIII. diſtinguiſhed him by his protection, and made him a knight of the order of Chriſt; and in a journey to France with cardinal Aldobrandini, in 1600, he was created knight of the order of St. Michael, by Henry IV. Arpinas, notwithſtanding the honours that were conferred upon him, was of a diſcontented and querulous temper; and fell out both with Caravaggio his rival, and with Anibal

Carachio. He declined a duel with the former, becauſe he was not a knight; and wiſhing to meaſure ſwords with the latter, Carachio preſented his pencil, and ſaid to him, "With this I defy you." He died at Rome, at the advanced age of eighty years. Notwithſtanding the fire and elevation which diſtinguiſhed ſome of his compoſitions, his colouring was cold, and his attitudes ſtiff and forced, to that his name now ſcarcely exiſts, in the liſt of great artiſts. Although his ſchool was much frequented, he ſeems to have left no eminent diſciples. His beſt performances are the pieces of Roman hiſtory in the capitol; and one of his capital works is his "Battle between the Romans and the Sabines." Arpinas alſo engraved in aqua fortis. Nouv. Dict. Hiſt.

ARPINO, in *Geography*, a town of Italy, in the kingdom of Naples, and country of Lavora, ten miles north of Cafano. This was the ancient *Arpinum*, ſituate to the left of the river Liris, and ſouth of Sora, and famous for being the birth-place of C. Marius and Cicero, two citizens, who, as Pompey ſaid in a public ſpeech, each in his turn preſerved Rome from ruin. It was a city of the Samnites, which, upon its ſubmiſſion to Rome, acquired the freedom of the city, and was inſerted into the Cornelian tribe. The territory of Arpinum was rude and mountainous, and Cicero (Ad Attic. ii. 11.) applies to it Homer's deſcription of Ithaca, Odyſſ. ix 27:

——τραχὺ, ἀλλ' ἀγαθὴ κουροτρόφος, &c.

"'Tis rough indeed, yet breeds a generous race."

Cicero's family ſeat was about three miles from the town, in a ſituation extremely pleaſant, and well adapted to the nature of the climate. It was ſurrounded with groves and ſhady walks, leading from the houſe to a river, called *Fibrenus*, which was divided into two equal ſtreams, by a little iſland, covered with trees, and a portico, contrived both for ſtudy and exerciſe, whither Cicero uſed to retire, when he had any particular work on his hands. "The clearneſs and rapidity of the ſtream, murmuring through a rocky channel; the ſhade and verdure of its banks, planted with tall poplars; the remarkable coldneſs of the water; and above all, its falling by a caſcade into the nobler river Liris, a little below the iſland," give us the idea of a moſt beautiful ſcene, as Cicero himſelf has deſcribed it. The houſe, Cicero ſays, was ſmall and humble in his grandfather's time, according to the ancient frugality, like the Sabine farm of old Curius; but his father beautified and enlarged it into a ſpacious and handſome habitation. It is now poſſeſſed by a convent of monks, and called "the villa of St. Dominic." The villa of Marius was about twelve miles diſtant from Arpino; and on the ſpot now ſtands the only convent of the auſtere order of La Trappe in Italy. Its preſent name is "Caſa Mari."

ARPIS. See ARPII.

ARPONIUM, in *Ancient Geography*, a town of Italy, in Magna Græcia, which, as Diodorus Siculus informs us, was pillaged by the Brutians, during the war of the ſlaves.

ARQUA, or ARQUATO, in *Geography*, a village of Italy, in the Paduan territory, about three miles from Bataglia, famous for having been the reſidence and burial-place of Petrarch. N. lat. 45° 43'. E. long. 11° 43'. There are two other places of this name; one in the March of Ancona, on the frontiers of Abruzzo, and another in the duchy of Milan, ſituate on the Scrivia.

ARQUE, a town of France, in the department of the ſtraits of Calais, and chief place of a canton in the diſtrict of St. Omer, half a league ſouth-eaſt of St. Omer.

ARQUEBUSADE WATER. See AQUA *Vulneraria*.

ARQUEBUSS. See HARQUEBUSS.

ARQUENON, in *Geography*, a river of France, which paſſes by Jugon, in the department of the north coaſts, and runs into the Engliſh channel about 13 miles north of that town.

ARQUES, a town of France, in the department of the Lower Seine, and chief place of a canton, in the diſtrict of Dieppe, one league ſouth-eaſt of Dieppe. It is ſeated on a river of the ſame name, which runs into the Engliſh channel near Dieppe.

ARQUES is alſo a town of France, in the department of the Aude, and chief place of a canton, in the diſtrict of Limoux, three leagues ſouth-eaſt of Limoux. The place contains 488 and the canton 3743 inhabitants: the territory includes 275 kiliometres and 19 communes.

ARRA, in *Ancient Geography*, now called *Maara*, a town of Aſia, in Syria, which was formerly large and well-peopled, but is now reduced to a ſmall place under the government of Aleppo; the territory of which is very fertile in grain and good fruit.

ARRA-BIDA, in *Geography*, a high mountain of Portugal, in Alentejo, on the frontiers of Algarva, forming part of the Sierra or mountain of Calderaon, and ſeeming to be a branch or continuation of the Spaniſh chain to the north of Madrid, called by ſome the mountains of Idubeda, which enters Portugal near the town of Guarda, and purſues its former courſe to the ſouth-weſt. It is chiefly calcareous, and affords beautiful marble.

ARRACAN, ARACAN, or ARRAKAN, a maritime country of the vaſt peninſula which ſeparates the gulf of Bengal from the Chineſe ſea, borders on the ſouth-eaſt province of Britiſh India, is ſeparated on the eaſt from the Birman empire by a range of lofty mountains called Anoupec, and bounded on the north by Meckley, or the country of the Muggaloos, the Caſſay of major Rennell, on the ſouth by the flat lands of Pegu, and on the weſt by the bay of Bengal. This country is called by the Bengal Hindoos, who have ſettled in it, Roſſaun, whence, probably, Rennell has derived the name Roſhaun which he has given to it. The Mahometans ſettled in Arracan call it Rovingaw; and by the Perſians it is denominated Rekan. The proper natives of the country, who uſe a dialect of the Birmah language, call their country Yee-Kein; and by the people of Pegu, the inhabitants are named Takain. From Iſlamabad, N. lat. 22° 20'. E. long. 91° 55'. the coaſts of Arracan and Pegu take a ſouth-ſouth-eaſt courſe to Cape Negrais, the extreme point of Pegu to the ſouth-weſt, in N. lat. 16° and E. long. 94° 27'. Pennant (Outlines of the Globe, vol. iii.) ſays, that the kingdom of Arracan ſtretches along the coaſt to an extent of 200 miles; others make its length above 500 miles, and its breadth from 20 to 200 miles. Its topography, however, is ſtill obſcure. According to Symes (Embaſſy to Ava, vol. i. p. 243, &c.), Arracan, or Yee-Kein, ſtretches ſouth-ſouth-eaſt from the river Naff, the boundary that divides it from the territories of the India company, as far as Cape Negrais, where the ancient Pegu empire commenced. The range of lofty mountains called Anoupectoumiou, or the great weſtern hilly country, nearly encircles it. From the quarter of Baſſien and Negrais, Arracan can only be invaded by water, through the many rivers that interſect the country adjacent to the ſea. From the ſide of Chittagong, entrance into Arracan muſt be effected by a march along the ſea-beach, which is interrupted by ſeveral channels, that chiefly owe their waters to the action of the tide. Arracan thus diſplays a great ſpace of coaſt, very diſproportionate to the internal extent. Cheduba and Ramree, called by the Birmans Magou Kioun and Yamgee Kioun, are extenſive and highly cultivated iſlands, which, with Arracan and Sandowy, form four diſtinct provinces, and comprehend the whole of the Arracan empire. The ancient government

government of Arracan has never been ſo completely conquered as to acknowledge vaſſalage to a foreign prince. It experienced, however, in the two laſt centuries, the uſual convulſions to which all ſtates, and thoſe of the eaſtern world in particular, are liable. The Moguls on the weſt, and the Peguers on the eaſt, had, at different periods, carried their arms into the heart of the country. The Portugueſe, ſometimes as allies, and at other times as open enemies, gained an eſtabliſhment in Arracan, which decayed only with the general ruin of their intereſts in Aſia. Arracan, however, though often exhauſted, was never wholly conſumed; it always roſe from its own aſhes, a free and independent nation

In 1783, Minderagee, who filled the throne of the Birman empire, ſubdued the country, and annexed it to the conqueſts of his father Alompra, conſiſting of Pegu, and the coaſt of Siam, as far as the port of Merghi, in N. lat. 12° 20′. In this conqueſt, the booty moſt highly valued was an image of Gaudma, the Boodh of the Hindoos, made of burniſhed braſs. There were alſo five images of Rakuſs, the demon of the Hindoos, of the ſame metal, and of gigantic ſtature; theſe were accounted valuable, as they were guardians to the ſanctuary of the idol. All the ſpoils taken at Arracan were of braſs, among which was a large gun, thirty feet long, two and a half in diameter at the muzzle, and the calibre ten inches; it was mounted on a low truck carriage, ſupported by ſix wheels, and had ſeveral ſhot of hewn ſtone fitted to the calibre. The ſurrender of Cheduba, Ramree, and the Broken Iſles, followed the conqueſt of Arracan. Many of the Mughs, or ancient inhabitants of Arracan, ſo called from being ſubjects of the Great Mogo, preferred flight to ſervitude, and took refuge in the Dumbuck hills, on the borders of the province of Chittagong, and in the deep foreſts and jungles that ſkirt the frontier, where they formed themſelves into independent tribes of robbers, that have ſince created infinite vexation to the Birmans, and to this day commit mercileſs depredations on the perſons and property of their conquerors. Many ſettled in the diſtricts of Dacca and Chittagong, under the protection of the Britiſh flag; whilſt others accepted the oath of allegiance, and bowed their necks to ſlavery, rather than abandon their country and their houſehold god, to whom the ſectaries of Budhoo are much attached. Arracan, with its dependencies, was afterwards conſtituted a province of the Birman empire; and a Maywoon, or viceroy, appointed to govern it. The reduction of Arracan was completed in the ſhort ſpace of a few months. The country is fertile, abounding with well-watered meadows and paſture lands; the ſoil luxuriant; the mountains are green through the year, though in winter, that is from Auguſt to October, the weather is for the moſt part wet and ſtormy; and the contiguous iſlands uncommonly fruitful. The population is eſtimated at between two and three millions. It produces great quantities of rice, cocoa-nuts, bananas, oranges, and many other kinds of excellent fruit. The rice is produced in ſuch abundance, that it might be improved by proper policy into a lucrative branch of commerce. The trade of Arracan has never been very conſiderable; it is confined to ſalt, bees'-wax, elephants' teeth, and rice. Articles of foreign importation are introduced into other parts of the Birman empire by way of Arracan, and carried over the mountains on the heads of coolies, or labourers: ſuch as European broadcloth, hard-ware, coarſe Bengal muſlins, Coſſembuzar ſilk handkerchiefs, china ware, and glaſs; cocoa-nuts are alſo brought from the Nicobar iſlands, and bear a very high price; and merchants carry down ſilver lace, precious ſtones, and ſome other articles, to no great amount. Poſſeſſion of Arracan and the adjacent iſlands was a very deſirable acquiſition to the Birmans, as it afforded protection to their boats, which, navigating in the north-weſt monſoon through the channel and along the coaſt, make an annual voyage from Baſſien, Rangoon, and Martaban, to Chittagong and Calcutta, where they diſpoſe of the produce of their countries, and in return bring back cloth and commodities of India. Elephants and buffaloes are very numerous, and are uſed inſtead of horſes. The foreſts are infeſted with tigers. The natives of Arracan do not differ from thoſe of China and Siam, except in their colour, which is ſomewhat blacker. They are fond of large flat foreheads, and, in order to obtain them, they apply a plate of lead to the foreheads of their children immediately after their birth. They have large open noſtrils, ſmall ſparkling eyes, and ears ſo long that they reſt upon their ſhoulders. They eat without diſguſt mice, rats, ſerpents, and putrefied fiſh. Their women are tolerably fair, and their ears equally long with thoſe of the men. Buffon's Nat. Hiſt. vol. iii. p. 81. See BIRMAN *Empire*.

ARRACAN, the capital of the above country, is ſeated moſt ſingularly in a valley, ſurrounded with vaſt and craggy mountains; and theſe are aſſiſted by art, ſo as to be made the moſt ſubſtantial fortifications. The entrances are cut through the ſolid rock, as are alſo the gates of the city. The precipitous face of the mountains ſerves for walls; beſides which, it has a citadel and other artificial defences. The city is ſaid to be fifteen miles in circumference, and to contain 160,000 inhabitants. The royal palace is very magnificent, and highly adorned and enriched with works of maſſy gold. Pennant.

ARRACAN is alſo the name of a river, which divides the above country by ſeveral canals, and diſcharges itſelf into the bay of Bengal, about fifty miles below the capital. Its banks are bounded by woods and plantations, that are animated, ſays Pennant, by the gambols of the monkey tribe, or the gay flights of numbers of peacocks. Dr. Buchanan ſays (Symes's Embaſſy to Ava, vol. ii. p. 413), that the Arracan river is not ſo conſiderable as has been ſuppoſed, but takes its riſe in hills at no great diſtance to the north. He adds, that the river coming from Thibet, which is ſuppoſed to be that of Arracan, is in fact the Keenduem, or great weſtern branch of the Ava river. Pennant (Outlines of the Globe, vol. iii.) ſays, that this river is the Tocoſannæ of Ptolemy, and that it is faintly traced beyond the capital. A few miles below Tellakee, at the weſtern foot, ſays Symes (Emb. to Ava, vol. i. p. 244.), the river, till then a ſtreamlet that riſes in the hills, becomes navigable from the influx of the ſea; in two tides a boat reaches the fort of Arracan. From the fort to the ſea, the river expands into a noble ſheet of water, well adapted for trade and the reception of ſhipping.

ARRACHEE, in *Heraldry*, is underſtood of repreſentations of plants forcibly torn up by the roots, with their roots hanging at them.

In this ſenſe, *arrachee* amounts to the ſame with what is otherwiſe called *eradicate*, or *eraſed*. Niſb. Her.

ARRACIFES, *Cape of*, in *Geography*, is ſituated on the coaſt of the Cafres in Africa, about ſixty leagues from the Cape of Good Hope.

ARRACIFFE, a port-town of Brazil, in the captainſhip of Pernambuco, eſteemed the ſtrongeſt in Brazil. The port conſiſts of a ſuburb, in which are ſome large houſes, and repoſitories for ſtores: and it is built upon a narrow paſſage, with a caſtle to defend the entrance. Nevertheleſs, James Lancaſter, with ſeven Engliſh veſſels, made himſelf maſter of the town and caſtle in 1595, and obtained immenſe plunder:

plunder: but ſince that time the Portugueſe have rendered it almoſt inacceſſible to enemies. S. lat. 8° 20. W. long. 36° 10'.

ARRACK. See Arac.

ARRACOURT, in *Geography*, a town of France, in the department of the Meurthe, and chief place of a canton, in the diſtrict of Chateau Salins, five miles ſouth of Chateau Salins.

ARRADEZ, a town of Africa, in the kingdom of Tunis, famous for its baths. See Rhades.

ARRADON, a town of France, in the department of Morbihan, and chief place of a canton, in the diſtrict of Vannes, three miles ſouth-weſt of Vannes.

ARRAGON, derived either by corruption from Tarraconenſis, the name of the Roman province of which it formed a part, or from the little ſtream called Arragon, which falls from the Pyrenées into the Ebro, is a province of Spain, bounded on the north by the Pyrenean mountains, on the weſt by Navarre and the two Caſtiles, on the ſouth by Valencia, and on the eaſt by part of Valencia and Catalonia. Its extent from north to ſouth is about 210 miles, and in breadth about 120. The country is, in general, mountainous, dry and ſandy, badly cultivated, and thinly peopled; but it is interſperſed with delightful fertile vallies, which are well watered, and produce corn, wine, oil, flax, fruits of different ſorts, and ſome ſaffron. Arragon breeds a great number of ſheep and cattle; its rivers abound with fiſh, and its foreſts with game. The mountains are ſaid to have formerly yielded gold, ſilver, and other metals; but they now afford, probably on account of the indolence of the inhabitants, little beſides iron. The principal rivers, beſides the Ebro, which traverſes the province from north-weſt to ſouth-eaſt, are the Cinca, anciently Cinga, the Gallego, Iſuela, Xalon, and Xiloca. The metropolis is Saragoſſa; and the other chief towns are Balbaſtro, Jaca, Hueſca, Calatayd, Daroca, and Alcanitz. The principal inhabitants of this country, in ancient times, were the Celtiberians, and they have been always deemed active, hardy, enterpriſing, courageous, and fond of liberty, but proud and poſitive, and bigotted in their religion. Marcellus, after a ſhort war, taxed them at 600 talents of gold. When they fell under the dominion of the Goths, they frequently revolted, and made valiant and repeated ſtruggles for the preſervation of their liberty. On the irruption of the Moors, theſe people retired into their inacceſſible mountains for the enjoyment of their freedom and independence; and there they erected, for their own ſecurity, a form of government, to which they ſubmitted by common conſent. Arragon was firſt erected into a kingdom by Don Sancho the Great, king of Navarre, who died in the year 1035, in favour of his ſon, Don Ramiro. He was ſucceeded by his ſon, Don Sancho Ramirez, who added to his own dominions part of Navarre, and obtained ſeveral advantages againſt the Moors of Saragoſſa and Hueſca; but was at length mortally wounded at the ſiege of the latter of theſe places, in 1094. The kingdom devolved on his ſon, Don Pedro, who, after defeating the Moors in the plain of Alcaraz, took poſſeſſion of Hueſca, A.D. 1096. He was ſucceeded in the year 1104 by his brother, Don Alonſo, who, by the diſplay of his martial virtues, obtained the ſurname of "the Warrior." Having reduced Tudela, and obtained a ſignal victory over the Moors, he laid ſiege to Saragoſſa, and compelled it to capitulate, after a long and obſtinate defence, A. D. 1118. He diſpoſſeſſed the Moors of ſeveral other ſtrong places, and defeated them in ſeveral battles; but in his attempt to reduce Fraga, the capital of a Moorith government, he provoked an engagement, in which he was overpowered with great ſlaughter; and this defeat affected him ſo much that within eight days he died of grief. After his death the monarchies of Arragon and Navarre were ſeparated; and Don Ramiro, brother to the late king, aſcended the throne of the former kingdom. But in 1137, after a ſhort reign, he abdicated the government in favour of Don Raymond, count of Barcelona, to whom he married his daughter and heireſs, Petronilla. Don Raymond dying in Piedmont, in 1162, was ſucceeded by his eldeſt ſon, Don Alonſo, who enjoyed the ſovereignty of Catalonia, in conjunction with the realm of Arragon. Alonſo having, in 1166, confirmed the liberties of the clergy and nobility in an aſſembly of the ſtates at Saragoſſa, ſoon after, viz. in 1168, collected a powerful army, commenced a war with the Moors, and drove them out of all the places which they held in that territory, which is now called Arragon. Alonſo cloſed a reign, rendered illuſtrious by many military exploits, at Perpignan, in 1196; and the crown of Arragon devolved on his ſon, Don Pedro II.; who, in 1203, paid a viſit to the pope at Rome, acknowledged himſelf a vaſſal to the holy ſee, and continued to pay an annual tribute of 250 double piſtoles. His premature death, in an action with the papal troops before Muret, A. D. 1213, was followed by great confuſion and tumult, both in Arragon and Catalonia; but at length his ſon, Don Jayme, was proclaimed and acknowledged as his ſucceſſor. This prince, being threatened by the pope with excommunication for his vices, aſſumed the croſs, and actually embarked at Barcelona for the Holy Land, A.D. 1268; but he was driven back by a tempeſt, and returned to his own dominions. After a defeat by the rebellious Moors of Valencia, he fell ſick, reſigned the crown, took the habit of a Ciſtercian monk, and penitently bewailing the ill example he had given to his family and ſubjects, expired in 1276; upon which the crown deſcended to his ſon, Don Pedro III. Pedro, having ſubdued the Moors of Valencia, and compoſed the tumults of Catalonia, engaged in an expedition againſt the iſle of Sicily, which he conducted with great ſpirit and ſucceſs, and in conſequence of which he was, with univerſal applauſe, proclaimed king of Sicily. The pope, Martin IV. who took part with his competitor, Charles, excommunicated Don Pedro, and proceeded to give away his kingdom, as a fief of the holy ſee, to Charles de Valois, ſon of king Philip the Hardy, and to publiſh a croiſade againſt the depoſed king of Arragon. In 1284, the king of France took the croſs, and aſſembled a very large army in order to ſeize and ſecure the poſſeſſion. During this conteſt, Don Pedro died, in 1285, and left the crown of Arragon to his ſon Don Alonſo, and that of Sicily to his ſecond ſon, Don Jayme. Alonſo, having entered into a treaty for the marriage of princeſs Eleanor, daughter of Edward I. of England, was ſuddenly taken ill during the magnificent preparations that were made for this purpoſe at Barcelona, and died in 1291. His brother, Don Jayme II. ſucceeded him; and after having conciliated the affection of his ſubjects by many popular acts, he died much regretted, A. D. 1326. His ſon and ſucceſſor, Alonſo IV., purſued the conduct of his father, and cloſed his life and reign, in the year 1336, much beloved and lamented; and on account of the gentleneſs of his adminiſtration, he was ſurnamed "The Kind." His ſon, Don Pedro IV. commenced his reign with all the anxieties of royalty; but protracted it to a very advanced period, and died in the year 1386, with the character of having been in many reſpects the wiſeſt, and in many more the worſt king that ever ſat upon the throne; and of having been better obeyed, and much leſs beloved, than any of his predeceſſors. He was ſucceeded by his ſon, Don Juan, whoſe death, in 1395, occaſioned great confuſion in the

the kingdom of Arragon. After the death of his ſucceſſor, Don Martin, duke of Montalban, there occurred an interregnum, occaſioned by diſputes about the ſucceſſion of the crown. The titles of ſeveral claimants were examined by nine judges appointed for this purpoſe; and at length the majority determined in favour of Don Ferdinand of Caſtile, who was the ſon of Donna Leonora, the eldeſt ſiſter of the two laſt kings; and the reſt alſo acquieſced. Accordingly, he was proclaimed king, A.D. 1412, and in 1413 ſolemnly crowned at Saragoſſa. At his death, in 1416, he was ſucceeded by his ſon. Don Alonſo V., who, in 1443, became ſole and abſolute maſter of the kingdom of Naples; and was afterwards eſteemed the great arbiter of peace and war through all Italy. He died in 1468, reſpected as the greateſt prince that ever ſat upon the throne of Arragon (See ALPHONSO V.). Don Juan II. ſucceeded to his hereditary dominions; and after a reign of 21 years, Arragon, with its dependent dominions, was united to the crown of CASTILE, A. D. 1479, under his ſon Don Ferdinand, who confirmed the laws and privileges of the kingdom of Arragon, in Saragoſſa, Barcelona, and Valencia. Mod. Un. Hiſt. vol. xvii. p. 83—268.'

ARRAGONITE, in *Mineralogy*, *Arragon ſpar*, Kirwan. *Arragonit*, Werner. The colour of this mineral is either greyiſh, or greeniſh white, or pale mountain green; in the center it is often of a violet blue, or browniſh red. It occurs only cryſtalized; and its varieties may be referred to the following forms.

1. A perfect equiangular, ſix-ſided priſm (Arragonite priſmatique of Hauy).

2. A ſix-ſided priſm, two oppoſite faces of which are the largeſt, and correſpond with the two ſides of a dihedral ſummit that terminates the priſm (Arragonite cuneolaire of Hauy).

3. A rounded maſs, deeply ſtriated (Arragonite cylindroide of Hauy).

The cryſtals are ſmall, or of moderate ſize, often grouped in croſſes; their faces are very rarely even and ſmooth, being generally ſtriated longitudinally, and ſometimes concave.

The luſtre is vitreous, and varies from little ſhining to very brilliant.

The fracture is lamellar, but often ſo indeterminate as to paſs into the imperfect conchoidal. The inſide of the cryſtals often preſents diſtinct, minute, wedge-ſhaped concretions, which give that fibrous appearance by which this mineral is characteriſed.

It is almoſt ſemi-tranſparent, and poſſeſſes a double refraction like calcareous ſpar; is conſiderably hard, brittle, eaſily broken: ſp. gr. 2. 94.

Arragonite is entirely ſoluble with effervescence in nitrous or muriatic acid. Before the blowpipe, it ſplits and crackles, and at length is calcined like calcareous ſpar; when pulverized and ſprinkled on a hot coal, it gives out a reddiſh phoſphoreſcent light.

This mineral was named by the celebrated Werner, becauſe it was firſt diſcovered in Spain, on the borders of Arragon and Valencia, where it is imbedded in lamellar and fibrous gypſum; it has ſince been found in the Pyrenées, and at Leogang in the country of Salzburg, in a ſhattery argillaceous rock, or in quartz, accompanied by calcareous ſpar and pyrites.

The cryſtals belonging to the firſt variety, preſent occaſionally a ſingular kind of compoſition, being found to contain internally a ſecond priſm, the axis of which croſſes that of the former nearly at right angles, and is engaged in its very ſubſtance in ſuch a manner as to produce no alteration in its external figure. This arrangement appears in the fracture of the cryſtal, at the croſſings of the ſtriæ; or in a kind of moſaic, repreſenting four triangles united round a common point, upon making a vertical ſection of the whole priſm; of theſe triangles, two oppoſite ones are nearly colourleſs, and the other two are violet.

The repeated analyſes of Klaproth, Vauquelin, and Thenard, have diſcovered nothing in the arragonite but lime and carbonic acid, in the ſame proportions as calcareous ſpar; yet the cryſtalline ſtructure of theſe two ſubſtances is wholly diſſimilar. The primitive form of calcareous ſpar is a rhomboid; the arragonite is diviſible only in two directions; the inclination alſo of the joints in the latter is about 116°, but in the former only 104° 28'; a circumſtance worthy of ſpecial attention, as it is the only inſtance known in which the geometrical and chemical analyſes of chryſtallized bodies are at variance. Mineralogie de Brochant, v. i. p. 576. Hauy Traité, &c. v. iv. p. 337.

ARRAI, in *Geography*, a town of Japan, in the province of Tootomi or Jenſiju.

ARRAIATIO *peditum*, the ranging or arraying of foot-ſoldiers.

ARRAIGN, or ARAIGN, in *Law*, ſignifies to ſet a thing in order, or in its place.

It is derived from the French *arraiſoner*, i. e. "ad rationem ponere, to call a man to anſwer in form of law;" which comes from the barbarous Latin *adrationare*, i. e. *placitare*. —In which ſenſe, to arraign a criminal, is *ponere eum ad rationem*. Thus he is ſaid to arraign a writ of novel diſſeiſin, who prepares and fits it for trial before the juſtices of the circuit. To arraign the aſſize, is to cauſe the demandant to be called to make the plaint, and to ſet the cauſe in ſuch order as the tenant may be forced to anſwer to it. A priſoner is alſo ſaid to be *arraigned*, when he is indicted, and called to the bar of the court, to anſwer the matter charged upon him in the indictment.

But no man is properly arraigned, except at the ſuit of the king, upon an indictment found againſt him, or other record, wherewith he is to be charged: and this arraignment requires, that the priſoner appears to be tried, and holds up his hand at the bar, for the certainty of the perſon, and makes a ſufficient plea to the indictment. 1 Inſt. 262, 263. The priſoner is to hold up his hand only in treaſon and felony; but this is only a ceremony: if he own that he is the perſon, it is ſufficient without it.

It was laid down in the ancient books, that the priſoner, though under an indictment of the higheſt nature, muſt be brought to the bar without irons, or any manner of ſhackles or bonds; unleſs there be an evident danger of an eſcape, and then he may be ſecured with irons. But in Layer's caſe, A D. 1722, a difference was taken between the time of arraignment, and the time of trial; and accordingly, the priſoner ſtood at the bar in chains during the time of arraignment. Priſoners are now generally tried in their irons, becauſe taking them off is uſually attended with great pain and trouble. When the priſoner is at the bar, and confeſſes that he is the perſon named, the indictment is to be read to him diſtinctly in the Engliſh tongue, that he may fully underſtand his charge. After which it is to be demanded of him, whether he be guilty of the crime, of which he ſtands indicted, or not guilty. By the old common law, the acceſſory could not be arraigned, till the principal was attainted, unleſs he choſe it, and waived the benefit of the law; in which caſe, principal and acceſſory might, and may ſtill, be arraigned, and plead, and alſo be tried together. But if the principal had never been indicted at all, had ſtood mute, had challenged above 35 jurors peremptorily, had claimed the benefit of clergy, had obtained a pardon, or had

had died before attainder, the acceſſory, in any of theſe caſes, could not be arraigned; for "non conſtitit," whether any felony was committed or not till the principal was attainted; and it might ſo happen, that the acceſſory ſhould be convicted one day, and the principal acquitted the next, which would be abſurd. The law ſtill continues, that the acceſſory ſhall not be tried, ſo long as the principal remains to be tried hereafter. But by ſtat. 1 Ann. c. 9. if the principal be once convicted, and before attainder, i. e. before he receives judgment of death or outlawry, he is delivered by pardon, the benefit of clergy, or otherwiſe, or if the principal ſtands mute, or challenges peremptorily above the legal number of jurors, ſo as never to be convicted at all; in any of theſe caſes, in which no ſubſequent trial can be had of the principal, the acceſſory may be proceeded againſt as if the principal felon had been attainted; for there is no danger of future contradiction. And upon the trial of the acceſſory, as well after as before the conviction of the principal, it ſeems to be the better opinion, and founded on the true ſpirit of juſtice (Foſter, 365), that the acceſſory is at liberty (if he can) to controvert the guilt of his ſuppoſed principal, and to prove him innocent of the charge, as well in point of fact, as in point of law.

When a criminal is arraigned, he either ſtands *mute*, or *confeſſes* the fact; which circumſtances may be called "incidents" to the arraignment; or elſe he *pleads* to the indictment. For the law, as it formerly exiſted, and now ſubſiſts with regard to ſtanding mute, ſee MUTE. Upon the priſoner's ſimple and plain *confeſſion* of the indictment, the court hath nothing to do but to award judgment; but it is uſually very backward in receiving and recording ſuch confeſſion, out of tenderneſs to the life of the ſubject; and will generally adviſe the priſoner to retract it, and plead to the indictment. For another ſpecies of confeſſion, ſee APPROVEMENT. For the plea of the priſoner, or defenſive matter alleged by him on his arraignment, if he does not confeſs, or ſtand mute, ſee PLEA. For the ſolemnity of the arraignment, and trial of a priſoner, ſee Dalt. c. 185. p. 515. An attainder of high treaſon has been reverſed for the omiſſion of an arraignment. In an action of ſlander, for calling one thief, the defendant juſtifies that the plaintiff ſtole goods, and iſſue is taken thereon; if it be found for the defendant, in B. R. and for felony in the ſame county where the court ſits, or before juſtices of aſſize, &c. he ſhall be forthwith arraigned upon this verdict of 12 men as on an indictment. 2 Hale's Hiſt. P. C. 151.

AR-RAKIN, in *Geography*, a ſmall town of Aſia, in Arabia Petræa, in the diſtrict of Al-Bkaa, probably the antient Petra, the capital of a country called Sela in the bible, and Adriana by the emperor Adrian. Moſt of the houſes are cut in a rock, whence the name, *rakin* denoting to *cut*, and *ar* a *town*.

ARRAN, a province of Perſia, ſituated between Georgia, Aiderbeitzan, and Shirwan, and ſurrounded by mountains.

ARRAN, or *Arr-inn*, i. e. the iſland of mountains, one of the Scottiſh iſlands, ſituated in the Firth of Clyde, between the main land of Airſhire and the coaſt of Kintyre, and forming part of the county of Bute. This iſland is about twenty-three miles long and nine broad, and contains about 7000 inhabitants, who chiefly occupy the parts near the coaſts: the interior mountainous part being for the greateſt part uninhabited. The chief place is the village of Ranza; and the pariſhes are two, viz. Kilbride and Killmore. The principal mountains are Goatfell, Goatfield, Gaoilbheinn, or the mountain of the winds, nearly 3000 feet high, compoſed of immenſe piles of moorſtone, cloathed with lichens and moſſes, and inhabited by eagles and ptarmigans; Bein-bharrin, or the ſharp-pointed; Ceum-na-Caillich, or the ſtep of the Carline or old hag; and Grianan-Athol, inferior to none in ruggedneſs. The lakes are loch Jorſa, where ſalmon come to ſpawn; loch Tana; loch Na-Jura, on the top of a high hill; loch Machrai and loch Knoc-a-charbai, abounding with large eels. The chief rivers are Abhan-mhor, Moina-mhor, Slondrai-machrei, and Jorſa, of which the two laſt are remarkable for abundance of ſalmon. From the mineralogy of this iſland, publiſhed by Mr. Jameſon in 1798, 8vo., it appears to be a mountainous region; the ſouthern parts, however, preſent low and cultivated grounds: the baſe is chiefly ſand-ſtone and granite, the former traverſed by veins of baſalt. Near Lamlaſh, and alſo near to Brodic wood, there is an extenſive vein of pitchſtone, of a greenish colour, and the black alſo occurs. There is alſo granitine, compoſed of quartz, felſpar, and hornblende; micaceous ſchiſtus likewiſe abounds: but there is little coal. The bays of this iſland are thoſe of Lamlaſh, Brodic, and Ranza, where ſhips of any burthen may ſafely ride in all weathers; and it is ſurrounded with fiſheries of various denominations. The climate is ſevere; nevertheleſs in ſummer the air is ſalubrious, and many invalids reſort hither on that account, and for the purpoſe of drinking the whey of goats' milk. The men are ſtrong, tall, and well made; they ſpeak the Erſe language; but have laid aſide the ancient habit. Their diet conſiſts chiefly of potatoes and meal, with an occaſional addition, in winter, of the dried fleſh of ſheep or goats. Their farms are leaſed for nineteen years; and each farm is commonly poſſeſſed by a number of ſmall tenants, who are jointly and ſeverally bound for payment of the rent. The arable land is portioned out by lot, and to each portion or ridge the occupier annexes his mark; and this ſpecies of farm is called "run-rig," i. e. ridge. All the tenants join in ploughing. The paſture and moor-land annexed to each farm are common to all the occupiers. All the farms are open, and incloſures are unknown. The produce of the iſland is chiefly oats and barley; its live ſtock milch-cows and other cattle, horſes, ſheep, and goats. Hogs have been lately introduced. The herring-fiſhery is beneficial. The exports are black cattle, horſes, and barley, herring nets, and thread formed of the flax that is ſown here. The women manufacture the wool for the cloathing of their families, dreſs and ſpin the flax, ſet the potatoes, make butter, ſome of which is exported, and cheeſe for their own uſe. The inhabitants are ſober, religious, and induſtrious; in ſummer they prepare peat for fuel; before and after harveſt, they are employed in the herring fiſhery; during winter the men make herring nets, and the women ſpin their linen and woollen yarn. In ſpring they till their ground; and in autumn they collect and burn fern for making kelp. Among the quadrupeds of this iſland, ſuch as otters, wild cats, ſhrew mice, rabbits, and bats, ſtags, which were formerly numerous, are now reduced to few; and among the ſeveral ſpecies of birds, ſuch as eagles, hooded crows, wild pigeons, black game, grous, ptarmigans, ſtares, daws, green plovers and curlews, are partridges, which now inhabit the iſland, and prove the advancement of agriculture. The government of the iſland is the ſame with that of the county of Bute; and beſides, juſtice is adminiſtered at the baron's baily court, who may fine as high as 20s. decide in matters of property not exceeding 40s. impriſon for a month, and put delinquents in the ſtocks for three hours, but only in the day-time. From the immenſe cairns, monumental ſtones, and many relics of Druidiſm, this iſland muſt have been very conſiderable in ancient times. Little is known concerning this iſland, till the time of Magnus, the Barefooted, the Norwegian victor, who probably included

Arran in his conqueſts of Kintyre. Acho, one of his ſucceſſors, laid claim to it 1263, together with Bute and the Cumrays, and having ſubdued the firſt, was defeated in a bloody engagement at the village of Largs, facing the iſland of Bute, and obliged, after the loſs of 16,000 men, to give up his conqueſts. Arran was the property of the clan. Robert Bruce, with ſeveral of his followers, found an aſylum here in their diſtreſs. About the year 1334, this iſland ſeems to have formed part of the eſtate of Robert Stewart, afterwards Robert II. In 1456, it was ravaged by Donald, earl of Roſs, and lord of the iſles. It was ſtill the property of James II. and was given by his ſucceſſor James III. as a portion to his ſiſter, who married Thomas lord Boyd, created earl of Arran. On the diſgrace of that family, the counteſs was divorced; and both the lady and iſland were beſtowed on ſir James Hamilton, in whoſe family, with the exception of a few farms, it now continues. Pennant's Journey through Scotland, vol. ii. 172. 184.

Arran, or *Arrin*, the name of two cluſters of iſlands near the weſt coaſt of Ireland, the largeſt of each of which is called Arranmore, i. e. the great Arran. The north iſles of Arran are near Donegal, in W. long. 8° 25′. N. lat. 55°. and in one of them a town called Rutland has been built for the herring fiſhery. The ſouth iſles are on the coaſt of Galway, between W. long. 9° 30′, and 9° 43′. N. lat. between 53° 1′, and 53° 7′ 30″. They are three in number, and ſhelter the entrance of Galway bay. They are very fruitful, and produce a ſmall kind of oats without any huſk. They are alſo remarkable for the ſtouteſt calves in the county. Mr. Young mentions that they are ſet for 2000l. per ann. In Arranmore ſeveral Iriſh ſaints were buried, and it is ſtill held in veneration by the neighbouring peaſantry. In this iſland alſo, on a high cliff over the ſea, is Dun Aengus, a circle of monſtrous ſtones without cement, capable of containing 200 cows. This is ſuppoſed to have been one of the Mandræ or incloſures of monaſtic buildings, common in the ſeventh and eighth centuries. Dr. Beaufort's Memoir. Young's Collect. Ledwiche's Antiquities of Ireland.

ARRANGEMENT, or Rangement, the diſpoſition of the parts of a whole, in a certain order. The modern philoſophy ſhews us, that the diverſity of colours of bodies depends entirely on the ſituation and arrangement of the parts, which reflect the light differently; the diverſity of taſtes and ſmells on the different arrangement of the pores, which render them differently ſenſible; and the general diverſity of bodies on the different arrangement of their parts. The happy arrangement of words makes one of the greateſt beauties of diſcourſe.

Arrangements, *Philoſophical*, a title given by the ingenious J. Harris, eſq. to an excellent commentary on the *Categories* of Ariſtotle: it is juſt as happy a ſimplification of *Logic*, as his *Hermes* is of *Grammar*. Both theſe valuable books, ſo well calculated to convey ſenſible and preciſe notions of logic and grammar, might be very uſefully and compendiouſly exhibited in the forms of a logical and grammatical tree, after the manner of genealogical tables.

ARRAPACHITIS, in *Ancient Geography*, the moſt northern province of Aſſyria, according to the diſtribution of Ptolemy. It was watered by the Gyndas. The towns are unknown.

ARRAS, in *Geography*, a city of France, and capital of the department of the ſtraits of Calais, ſituate on the Scarp; before the revolution, the metropolis of the province of Artois. It was taken by the French king Louis XIII.; and annexed to France, in 1640, by the peace of the Pyrenées. Being ſeated on a mountain, it is ſurrounded by quarries, which ſupply ſtone for building. It is divided by a ſtrong wall, a large foſſe, and the brook Chinchron, into two parts, called the town and the city, each of which is well fortified. It has four gates, and a ſtrong citadel with five baſtions. The great ſquare, in which is kept the principal market, is full of fine buildings, ſurrounded with piazzas. The leſſer market contains the town-houſe, the tower of which is covered with a crown, with a brazen lion on the top ſerving for a vane; in the middle of this market is the chapel of the Holy Candle, reported to have been brought by the Virgin Mary above 600 years ago for cure of the diſeaſed inhabitants, and kept in a ſilver ſhrine. The cathedral church of Notre Dame is a large Gothic building, with a high tower, in which is a fine clock, embelliſhed with ſmall figures in bronze, repreſenting the paſſion of Jeſus Chriſt. In this church is a ſilver ſhrine, enriched with pearls and diamonds, and containing a ſort of wool called manna, which, report ſays, fell from heaven 1400 years ago in time of drought, and which was carried in proceſſion when rain was wanted. The greateſt ornament of Arras is the church of St. Vedaſt, with a fine ſteeple, a pulpit of braſs in the form of a tree, ſupported by two bears of the ſame metal. The chimes play a great variety of tunes. There are eleven pariſh churches. The tapeſtry, called *Arras hangings*, derives its denomination from this city. The place contains 19,364, and the canton 29,613 inhabitants: the terrritory comprehends 70 kiliometres and 13 communes. N. lat. 50° 17′. E. long. 2° 56′.

ARRATS, a river of France, which runs into the Garonne, about two miles north-weſt of Auvillard, in the department of the Lot and Garonne.

ARRAY, in *Law*, the ranking or ordering a jury or inqueſt of men impannelled on any cauſe. The word may be derived either from the obſolete French, *array*, *order*; or from *raye*, *a line*, *ſtroke*, &c. Hence, to *array* a pannel, ann. 3 Hen. V. is to ſet forth the men impannelled one by another. By the ſtatute, every *array* in aſſiſe ought to be made four days before. For challenges to the array, ſee Challenge.

Array, in *Military Language*. See Battle.

ARRAYAL de Porate, in *Geography*, a town in Brazil, ſituate on the weſt ſide of Para river, below the junction of its two great branches.

ARRAYERS, or Arrajers, Arraitores, in *Military Language*, is uſed in ſome ancient ſtatutes for certain provincial officers, whoſe duty it was, not only to inſpect the ſoldiers, and ſee that they were able-bodied and fit for ſervice; but alſo that they were properly armed, accoutred, and otherwiſe appointed according to the ſtation and nature of their ſervice. They were likewiſe to arrange both the cavalry and the infantry into their proper bodies, equivalent to the preſent diviſions of troops, ſquadrons, companies, and battalions. In ſome reigns, commiſſioners were appointed for this purpoſe; and the form of the commiſſion of array was ſettled in parliament in the 5 Henry IV.

About the reign of king Henry VIII. or his children, lieutenants began to be introduced, as ſtanding repreſentatives of the crown, to keep the counties in military order; for we find them mentioned as known officers in the ſtatute 4 & 5 Ph. & M. c. 3., though they had not then been long in uſe; for Camden ſpeaks of them in the time of queen Elizabeth, as extraordinary magiſtrates conſtituted only in times of difficulty and danger. But the introduction of theſe commiſſions of lieutenancy, which contained, in ſubſtance, the ſame powers as the old commiſſions of array, cauſed the latter to fall into diſuſe. In this ſtate things continued, till the repeal of the ſtatutes of armour in the reign of king James I. ſtat. 1 Jac. I. c. 2. 21 Jac. I. c. 28

c. 28. After this period, viz. in 1642, king Charles I. oppoſed his commiſſions of array to the ordinance of parliament concerning the militia, and thus brought on the agitation of the queſtion which became at length the immediate cauſe of the fatal rupture between the king and his parliament.

ARRAYOLOS, in *Geography*, a ſmall town of Portugal, in Alentejo; ſituate upon the declivity of a mountain, and containing about 2000 inhabitants, a large monaſtery belonging to the canons of St. John the Evangeliſt, and a monaſtery of Franciſcans. It lies north of Evora, ſouth-eaſt of Montemor, and 6 leagues from Eſtremoz, in which diſtance a ſingle village is not ſeen. The ſoil is ſometimes granite in maſſes, and ſometimes ſlaty granite. In the vicinity are tracts over-grown with broom; but within a league of Arrayolos the lands are cultivated.

ARREARS, Arrearages, Arreragium, or Arrieragium, the remains of an account, or a ſum of money remaining in the hands of an accomptant. The word is derived from the French *arrerages*, which is formed from *arriere*, *behind*.

Arrears is alſo uſed more generally for a remainder of rents or monies unpaid at the due time; whether they be rents of a manor, or any thing reſerved: called alſo, in ſome writers, *arrieragium firmarum*.

Arrears, in *Military Language*, denote the difference between the full pay and ſubſiſtence of each officer, directed to be paid once a year by the agent. Theſe arrears were aboliſhed in 1797. See Pay.

ARREAU, in *Geography*, a town of France, in the department of the Higher Pyrenées, and chief place of a canton in the diſtrict of Bagneres, 13 miles ſouth-eaſt of Bagreres, and 23 ſouth-ſouth-eaſt of Tarbes. The place contains 980 and the canton 5979 inhabitants: the territory includes 175 kiliometres and 19 communes.

ARRENS, a town of France, in the department of the Higher, Pyrenées and chief place of a canton in the diſtrict of Argellez, on the Garonne, 8 miles ſouth-weſt of Argellez.

ARRENTATION, in the *Foreſt Law*, the licenſing an owner of lands in the foreſt, to incloſe them with a low hedge, and ſmall ditch, in conſideration of a yearly rent. *Saving the arrentations*, denotes a power reſerved to give ſuch licences for yearly rent.

ARREST, in *Common Law*, the apprehending or reſtraining of one's perſon, in execution of the command of ſome court of record, or officer of juſtice.

The word *arreſt* is French, and is uſed in that language for a decree or determination of a cauſe debated to and fro: in which ſenſe it ſeems derived from ἀρέσκω, *placitum*, *the pleaſure of the court*.

Hence when a perſon is legally ſtopped, apprehended, and reſtrained of his liberty, for debt, &c. he is ſaid to be arreſted, or put under an arreſt; which is the beginning of impriſonment.

Arreſts are either in *civil* or in *criminal* caſes.

1. An arreſt in a *civil cauſe*, is defined to be the apprehending or reſtraining one's perſon by proceſs in execution of the command of ſome court or officer of juſtice. Wood's Juſt. 575. This arreſt muſt be corporal ſeiſing or touching the defendant's body; after which the bailiff may juſtify breaking open the houſe in which he is, to take him; otherwiſe he has no ſuch power, but muſt watch his opportunity to arreſt him. For every man's houſe is conſidered by the law as his caſtle of defence and aſylum, in which he ſhould ſuffer no violation. This principle is carried ſo far in the civil law, that for the moſt part, not ſo much as a common citation or ſummons, much leſs an arreſt, can be executed upon a man within his own walls. But doors may be broke open in purſuit of one arreſted; otherwiſe, action of treſpaſs, &c. lies for breaking open a houſe to make arreſt in a civil action. But if it appears a bailiff found an outer door, &c. open, he may open the inner door to make an arreſt. Comb. 327. The court of King's Bench has determined, in the caſe of Lee *v.* Gen. Ganſel, that the chamber door of a lodger is not to be conſidered as his outer door; but that the ſtreet door being open, the officers had a right to force open the chamber door, the defendant being in the room and refuſing to open it. Cowp. 1. Peers of the realm, peereſſes by birth, peers of Scotland, a peereſs by marriage, not afterwards having intermarried with a commoner, members of parliament, and corporations, are privileged from arreſts, and of courſe from outlawries. And againſt them the proceſs to enforce an appearance muſt be by ſummons, and diſtreſs infinite, inſtead of a *capias*. Alſo clerks, attornies, and all other perſons attending courts of juſtice (for attornies, being officers of the court, are always ſuppoſed to be there attending), are not liable to be arreſted by the ordinary proceſs of the court, but muſt be ſued by *bill* (uſually called a *bill of privilege*), as being perſonally preſent in court. Clergymen, performing divine ſervice, and not merely ſtaying in the church with a fraudulent deſign, are for the time privileged from arreſts, by ſtat. 50 Edw. III. c. 5. and 1 Ric. II. c. 16.; as likewiſe members of convocation actually attending thereon, by ſtat. 8 Hen. VI. c. 1.; and alſo ambaſſadors, or the domeſtic ſervants of an ambaſſador, "really and *bona fide* in that capacity." Suitors, witneſſes, and other perſons, neceſſarily attending any courts of record upon buſineſs, are not to be arreſted during their actual attendance, which includes their neceſſary coming and returning. A bankrupt coming to ſurrender, or within 42 days after his ſurrender (5 Geo. II. c. 30. § 5. Cowp. 156.): witneſſes properly ſummoned before commiſſioners of bankrupt, or other commiſſioners under the great ſeal (1 Atk. 54.); but not creditors coming to prove their debts (4 Term Rep. 377.); heirs, executors, or adminiſtrators (R. M. 1654.), except on perſonal contracts by themſelves (1 T. Rep. 716.), or in caſes of *devaſtavit* (1 Salk. 98.), are exempted from arreſts. By ſtat. 31 Geo. II. c. 10. no ſeaman aboard his majeſty's ſhips can be arreſted for any debt, unleſs the ſame be ſworn to amount to at leaſt 20*l.*; but by the annual mutiny acts, a ſoldier may be arreſted for a debt which extends to half that value, but not to a leſs amount. In an action againſt huſband and wife, the huſband alone is liable to be arreſted, and ſhall not be diſcharged till he have put in bail for himſelf and his wife (1 Vent. 4). 1 Mod. 8.); and if ſhe is arreſted, ſhe ſhall be diſcharged on common bail (1 Term Rep. 486. 1 Salk. 115.). No arreſt can be made in the king's preſence, nor within the verge of his royal palace, extending by ſtat. 28 Hen. VIII. c. 12. from Charing-croſs to Weſtminſter Hall, or within 200 feet from the gate of any of the palaces and houſes of the king, or any other houſe where the royal perſon ſhall abide; nor in any place where the king's juſtices are actually ſitting. The king hath moreover a ſpecial prerogative (which indeed is very ſeldom executed) that he may, by his writ of proection, privilege a defendant from all perſonal, and many real, ſuits for one year at a time, and no longer; in reſpect of his being engaged in his ſervice out of the realm. And the king alſo, by the common law, might take his creditor into his protection, ſo that no one might ſue or arreſt him till the king's debt were paid (F. N. B. 28. Co. Litt. 131.); but by ſtat. 25 Edw. III. ſt. 5. c. 19. notwithſtanding ſuch protection, another creditor may proceed to judgment againſt him, with a ſtay of execution, till the king's debt be paid;

unleſs ſuch creditor will undertake for the king's debt, and then he ſhall have execution for both. An arreſt in the night, as well as the day, is lawful. 9 Rep. 66. And laſtly, by ſtat. 29 Car. II. c. 7. no arreſt can be made, nor proceſs ſerved, upon a Sunday, except for treaſon, felony, or breach of the peace. But a perſon may be retaken on a Sunday, when arreſted the day before, Mod. Caſ. 231.; or, when he goes at large out of the rules of the King's Bench or Fleet priſon, &c. 5 Ann. c. 9. By 12 Geo. I. c. 29. and 5 Geo. II. c. 27. both made perpetual by 21 Geo. II. c. 3. no perſon can be arreſted, or held to bail, on a writ ſued out of the ſuperior courts, unleſs the cauſe of action be 10*l.* or upwards. And by 19 Geo. III. c. 70. no perſon can be arreſted or held to bail upon proceſs out of any inferior court, for leſs than 10*l.*, but proceedings are to be had in inferior courts according to the directions of 12 Geo. I. c. 29. extended by 19 Geo. III. to debts under 10*l.* It is now ſettled, both in K. B. and C. P. that a defendant may be arreſted in an action on a judgment for 10*l.* for damages and coſts, though the original debt alone were under 10*l.* 4 Term Rep. 570. on the authority of 2 Blackſt. Rep. 1274.

When a perſon is apprehended for debt, &c. he is ſaid to be arreſted; and writs expreſs arreſt by two ſeveral words, *capias* and *attachias*, to take and catch hold of a man; for an officer muſt actually lay hold of a perſon, beſides ſaying that he arreſts him, or it will be no lawful arreſt, 1 Lill. Abr. 96. If a bailiff be kept off from making an arreſt, he ſhall have an action of aſſault; and where the perſon arreſted, reſiſts or aſſaults the bailiff, he may juſtify beating of him. If a bailiff *touches* a man, which is an arreſt, and he makes his eſcape, it is a reſcous, and attachment may be had againſt him. If a bailiff lays hold of one by the hand held out at a window, this is ſuch a taking of him as will juſtify his breaking open of the houſe to carry him away.

2. An arreſt in a *criminal cauſe* is the apprehending or reſtraining one's perſon, in order to be forthcoming to anſwer an alleged or ſuſpected crime. To this arreſt all perſons whatſoever are, without diſtinction, equally liable, and doors may be broken to arreſt the offender; but no man is to be arreſted, unleſs charged with ſuch a crime as will at leaſt juſtify holding him to bail, when taken. There is this difference between civil and criminal caſes; that none ſhall be arreſted for debt, treſpaſs, &c. or other cauſe of action, but by virtue of a precept or commandment out of ſome court; but for treaſon, felony, or breach of the peace, any man may arreſt without warrant or precept. Terms de Ley, 54. But the king cannot command any one by word of mouth to be arreſted; for he muſt do it by writ, or order of his courts, according to law: nor may the king arreſt any man for ſuſpicion of treaſon or felony, as his ſubjects may, becauſe, if he doth wrong, the party cannot have an action againſt him. 2 Inſt. 186. In general, an arreſt may be made four ways; viz. by WARRANT; by officers without warrant, as by a JUSTICE of the peace, the SHERIFF, the CORONER, the CONSTABLE, and WATCHMEN; by a private perſon alſo without warrant; and by an HUE *and* CRY. Arreſts by private perſons are in ſome caſes commanded; ſo that any perſon who is preſent when any felony is committed, is bound by the law to arreſt the felon, on pain of fine and impriſonment, if he eſcapes through the negligence of the by-ſtanders. 2 Hawk. P. C. 74. And they may juſtify breaking open doors upon following ſuch felon; and if they kill him, provided he cannot be otherwiſe taken, it is juſtifiable; though, if they are killed in endeavouring to make ſuch arreſt, it is murder. 2 Hal. P. C. 77. Upon probable ſuſpicion alſo a private perſon may arreſt the felon, or other perſon ſo ſuſpected. 30 Geo. II. c. 24. But he cannot juſtify breaking open doors to do it; and if either party kill the other in the attempt, it is merely man-ſlaughter, 2 Hal. P. C. 82, 83. Every private perſon is bound to aſſiſt an officer, requiring him to apprehend a felon. In order to encourage the apprehending of certain felons, rewards and immunities are beſtowed on ſuch as bring them to juſtice, by ſeveral acts of parliament. By 4 & 5 W. & M. c. 8. perſons who apprehend a highwayman, and proſecute him to conviction, ſhall receive a reward of fifty pounds from the public, to be paid them, or if they be killed, to their executors, by the ſheriff of the county; to which is added by 8 Geo. II. c. 16. ten pounds, to be paid by the hundred indemnified by ſuch taking. By 6 & 7 W. III. c. 17. and 15 Geo. II. c. 18. perſons apprehending and convicting any offenders againſt thoſe ſtatutes reſpecting the coinage, ſhall, if the offence be treaſon or felony, receive a reward of 40*l.* or 10*l.* if the offence amount only to counterfeiting the copper coin. By 10 & 11 W. III. c. 23. any perſon apprehending and proſecuting to conviction a felon guilty of burglary, houſe-breaking, horſe-ſtealing, or private larceny to the value of 5*s.* from any ſhop, warehouſe, coach-houſe, or ſtable, ſhall be excuſed from all pariſh offices. By 5 Ann. c. 31. any perſon ſo apprehending and proſecuting a burglar, or felonious houſe-breaker, or, if killed in the attempt, his executors ſhall be entitled to a reward of 40*l.* By 6 Geo. I. c. 23. perſons apprehending and proſecuting to conviction any one taking reward for helping others to ſtolen goods, ſhall be entitled to 40*l.* By 14 Geo. II. c. 16. explained by 15 Geo. II. c. 34. any perſon apprehending and proſecuting to conviction ſuch as ſteal, or kill with intent to ſteal, any ſheep or other cattle ſpecified in the latter of the ſaid acts, ſhall, for every ſuch conviction, receive a reward of 10*l.* Laſtly, by 16 Geo. II. c. 15. and 8 Geo. III. c. 15. perſons diſcovering, apprehending, and convicting felons and others, being found at large during the term for which they are ordered to be tranſported, ſhall receive a reward of 20*l.* Blackſt. Com. vol. iii. p. 288. vol. iv. 289. Jacob's Law Dict. by Tomlins, art. *Arreſt*.

The method of procuring a man's appearance before a court of juſtice, is different from that above recited, in moſt of the countries of Europe, where the forms introduced in the Roman civil law, in the reigns of the latter emperors, have been inſtituted. The uſual practice is to have the perſon ſued, ſummoned to appear before the court by a public officer belonging to it, a week before the time. If no regard is paid to ſuch ſummons twice repeated, the plaintiff, or his attorney, is allowed to make before the court a formal reading of his demand, which is then granted him, and he may proceed to execution.

In Rome, the method of ſeizing the perſon of a man, againſt whom a demand of any kind was preferred, previouſly to any judgment being paſſed againſt him, was adopted and continued to be followed after the inſtitution of the prætor's court, to whom the civil branch of the power of the conſuls was afterwards delegated; and it laſted till the times of the latter emperors, in whoſe reigns the Roman civil law underwent thoſe alterations which gave it the form it now has in thoſe codes or collections that are in our poſſeſſion. In Rome, however, inſtead of employing a proper officer, and furniſhing him with a writ or order for ſeizing a man's perſon, every one became a kind of public officer in his own cauſe, for aſſerting the prætor's prerogative; and without any oſtenſible legal licence, or badge of public authority, had a right to ſeize by force the perſon of his opponent, wherever he met him. The practice was, that

the "actor," or plaintiff, firſt ſummoned the "reum," or perſon ſued, with a loud voice to follow him before the court of the prætor. If the defendant refuſed to obey this ſummons, the plaintiff, by means of the words "licet antestari," requeſted the by-ſtanders to witneſs the fact, in token of which he touched the ears of each of them; and he then proceeded to ſeize the perſon of his opponent by throwing his arms around his neck "obtorto collo," and thus endeavouring to drag him before the prætor. If the perſon ſued was, by age or ſickneſs, unable to follow the plaintiff, the latter was directed by the Twelve Tables to ſupply him with a horſe. This method of proceeding was afterwards, though very lately and very ſlowly, mitigated. In the firſt place, it became unlawful to ſeize a man in his own houſe, as it was the abode of his domeſtic gods. Women of good family, or "matronæ," were protected from being dragged by force before the tribunal of the prætor. The method of forcibly placing a ſick or aged perſon upon a horſe was aboliſhed during the latter times of the republic. Emancipated ſons, and ſlaves who had obtained their freedom, were afterwards reſtrained from ſummoning their parents or late maſters without the expreſs leave of the prætor, under the penalty of fifty pieces of gold. However, ſo late as the time of Pliny, the old mode of ſummoning or carrying by force before a judge continued in general to ſubſiſt; though in the time of Ulpian, the neceſſity of obtaining the expreſs leave of the prætor was extended to all caſes and perſons; and in the reign of Conſtantine, the method was introduced of having legal ſummonſes ſerved only by means of a public officer appointed for that purpoſe. After that time other changes in the former law took place, from which the mode of proceeding now uſed on the continent of Europe has been borrowed. De Lolme's Conſtitution of England, ch. 10.

Arrest *of judgment, to move or plead in*, is to ſhew juſt cauſe why judgment ſhould be ſtayed, notwithſtanding verdict given. Judgment may be arreſted for good cauſe in criminal caſes, as well as civil, if the indictment be inſufficient. 3 Inſt. 210. Motions in arreſt of judgment may be made at any time before judgment ſigned. Doug. 747. Str. 845. Arreſts of judgment ariſe from intrinſic cauſes appearing upon the face of the record. Of this kind are, firſt, where the declaration varies totally from the original writ; alſo, ſecondly, where the verdict materially differs from the pleadings and iſſue thereon; or, thirdly, if the caſe laid in the declaration is not ſufficient, in point of law, to found an action upon. If judgment is not by ſome of theſe means arreſted within the firſt four days of the next term after the trial, it is then to be entered on the roll or record. See Judgment.

In criminal caſes, whenever the defendant appears in perſon, upon either a capital or inferior conviction, he may at this period, as well as at his arraignment, offer any exceptions to the indictment in arreſt or ſtay of judgment, as for want of ſufficient certainty in ſetting forth either the perſon, the time, the place, or the offence. And if the objections be valid, the whole proceedings ſhall be ſet aſide; but the party may be indicted again. A pardon may be pleaded in arreſt of judgment; and it has the ſame advantage when pleaded here, as when pleaded upon arraignment; viz. the ſaving the attainder, and of courſe the corruption of blood, which nothing can reſtore but parliament, when a pardon is not pleaded till after ſentence. Praying the benefit of clergy may alſo be ranked among the motions in arreſt of judgment. If all theſe reſources fail, the court muſt proceed to pronounce the judgment. See Judgment.

Arrest *of Inqueſt*, or to plead in arreſt of taking the inqueſt, is to ſhew cauſe why an inqueſt ſhould not be taken. See Inquest.

Arrest, in *Military Language*, is the exerciſe of that part of military juriſdiction, by which an officer is noticed for miſconduct, or put into a ſituation to prepare for his trial by a general court-martial.

Arrest, or *Arret*, is ſometimes uſed among French writers, in the ſenſe of the Latin word "retinaculum," to ſignify a ſmall piece of ſteel, which was formerly uſed in the conſtruction of fire-arms, to prevent the piece from going off.

ARRESTANDIS *bonis ne diſſipentur*, a writ which lay for him whoſe cattle or goods are taken by another, who during the controverſy makes or is likely to make away with them, and will hardly be able to give ſatisfaction for them afterwards. Reg. Orig. 126.

ARRESTANDO *ipſum, qui pecuniam recepit ad proficiſcendum in obſequium regis*, &c. is a writ which lay for the apprehenſion of him that hath taken preſs-money to ſerve in the king's wars, and hides himſelf when he ſhould go. Reg. Orig. 24.

ARRESTMENT, in *Scots Law*, ſignifies the ſecuring of a criminal till trial, or till he find caution to ſtand trial, in what are called bailable crimes. In civil caſes, it denotes either the detaining of ſtrangers or natives "in meditatione fugæ," till they find caution "judicio ſiſti;" or the attaching of the effects of a ſtranger in order to found juriſdiction. But, in the moſt general acceptation of the word, it ſignifies that diligence by which a creditor detains the goods and effects of his debtor in the hands of third parties, till the debt due to him be paid or ſecured. *Arreſtment* may be laid on by the authority either of the ſupreme court, or of an inferior judge. In the firſt caſe, it proceeds either upon ſpecial letters of arreſtment, or on a warrant contained in letters of horning, and it muſt be executed by a meſſenger. The warrants granted by inferior judges are called precepts of arreſtment, and they are executed by the proper officer of the court. All debts, in which one is perſonally bound, though they ſhould be heritably ſecured, are grounds upon which the creditor may arreſt the moveable eſtate belonging to his debtor.

Moveable debts are the proper ſubject of arreſtment; under which are comprehended conditional debts, and even depending claims. But there are certain moveable debts which are not arreſtable; ſuch as debts due by bill, future debts, and alimentary debts, including ſalaries of public offices. If, in contempt of the arreſtment, the arreſtee ſhall make payment of the ſum, or deliver the goods arreſted, to the common debtor, he is not only liable criminally for breach of arreſtment, but he muſt pay the debt again to the arreſter. Arreſtment is only an inchoated or begun diligence; for perfecting it, there muſt be an action brought by the arreſter againſt the arreſtee, to make the debt, or ſubject arreſted, forthcoming. In all competitions of arreſtments, regard is had to the dates, not of the grounds of debt, but of the diligences proceeding upon them. In the competition of arreſtments with aſſignations, an aſſignation by the common debtor, intimated before arreſtment, is preferable to the arreſtment; if the aſſignation is granted before arreſtment, but not intimated till after it, the arreſter is preferred. See Poinding.

ARRESTO *facto ſuper bonis mercatorum alienigenorum*, &c. is a writ which lay for a denizen againſt the goods of aliens found within this kingdom, in recompence of goods taken from him in a foreign country, after he hath been denied

denied reſtitution there. This anſwers to what among the ancient civilians was called *clarigatio*, now barbarouſly REPRISALIA.

ARRETE-NEF, in *Zoology*, a common term among the French for the *Remora*, or ſucking-fiſh; alluding no doubt to the fabulous relations of the ancient poets, who feigned that this fiſh, which is ſcarcely more than a foot or two in length, was capable of arreſting the progreſs of a ſhip in full ſail by faſtening itſelf to the bottom of it. See ECHENEIS *remora*.

ARRETIUM VETUS, now *Arezzo*, in *Ancient Geography*, a town of Italy, in Etruria. It was ſeated on a hill not far from Umbria, and was celebrated for its manufacture of earthen veſſels, its wine, a fountain whence were iſſued oracles, &c. See AREZZO.

ARRETIUM *Julium*, a town of Etruria, upon the Arnus, north of the former.

ARRETIUM *Fidens*, another town of Etruria, ſouth of Arretium vetus.

ARRETTED, ARRECTATUS, *quaſi, ad rectum vocatus*, is ſometimes uſed in our ancient law-books for imputed, or laid to.—As, no folly may be arretted to one under age. It is applied alſo to a perſon who is convened before a judge, and charged with a crime.

ARRHA, in *Ancient Geography*, a town of Illyrium. Steph. Byz.

ARRHABON, a river of Aſia, in Armenia, had its ſource in mount Caucaſus, and ran into the Cyrus. Strabo.

ARRHABONARII, derived from ἀῤῥαβων, *arrha, earneſt*, in *Eccleſiaſtical Hiſtory*, a ſect, in the ſixteenth century, who held that the euchariſt is neither the real fleſh and blood of Chriſt, nor yet the ſign of them, but only the pledge or earneſt thereof.

ARRHADA, in *Ancient Geography*, a town of Arabia Deſerta. Ptolemy.

ARRHÆ, or *Argentum Dei*. See EARNEST, &c.

ARRHAPA, in *Ancient Geography*, a town of Aſia, in Aſſyria. Ptolemy.

ARRAPHON, denotes a ſkull without ſutures, found to be the cauſe of incurable CEPHALALGIÆ.

ARRHENA, in *Ancient Geography*, a town of Aſia, in Armenia Major. Pliny ſays, that the rivers Tigris and Arſenius ran near one another through this country.

ARRHENOGOGON, in *Botany*, a name given by ſome to the *parietaria*, or pellitory of the wall.

ARRHEPHORIA, in *Antiquity*, a feaſt among the Athenians, inſtituted in honour of Minerva, and Herſe, daughter of Cecrops. The word is compounded of ἄῤῥητον, *myſtery*, and φέρω, *I carry*; on account of certain myſterious things which were carried in proceſſion at this ſolemity.

Boys, or, as ſome ſay, girls, between ſeven and twelve years of age, were the miniſters that aſſiſted at this feaſt, and were denominated ἀῤῥηφόροι.

This feaſt was alſo called *Herſiphoria*, from Herſe the daughter of Cecrops, on whoſe account it is ſaid to have been firſt eſtabliſhed.

ARRIA, in *Biography*, a Roman lady diſtinguiſhed by her fortitude and conjugal affection, was the wife of Cæcina Pœtus, a man of conſular dignity, who died in the 42d year of the Chriſtian æra. Pliny the younger has preſerved (Epiſt. l. iii. ep. 16.) ſeveral anecdotes, ſome of which are worth recording. Her huſband and her ſon, who was a very amiable and promiſing youth, were both ſeized at the ſame time with a very dangerous diſorder. The ſon died, but the mother concealed the diſtreſſing event from the ſick father; and whenever ſhe appeared in his preſence, aſſumed a cheerful countenance, and anſwered his inquiries reſpecting the deceaſed with ſo much compoſure and ſerenity, that ſhe even prevented the ſuſpicion of his death. When her huſband was apprehended, in conſequence of having joined Scribonianus in a rebellion againſt the emperor Claudius, and was conveyed by ſea to Rome, Arria wiſhed to accompany him in the ſame veſſel; but being refuſed, ſhe hired a fiſhing boat, and followed him. Having arrived at Rome, ſhe determined to die with Pœtus; and to the remonſtrance of her ſon-in-law Thraſea, who aſked her, "Would you wiſh that your daughter ſhould accompany me, if I were to die?" ſhe replied, "Yes, provided ſhe had lived ſo long and ſo happily with you as I have lived with Pœtus." To thoſe who watched her, and who endeavoured to divert the execution of her purpoſe, ſhe ſaid, "You may make my death more painful, but cannot prevent it;" and daſhing her head againſt a wall, fell ſenſeleſs on the ground. Upon her recovery, ſhe calmly ſaid, "I told you that I would find a difficult road to death, if you hindered me from obtaining an eaſy one." When her huſband was ordered to deſtroy himſelf, Arria perceiving his heſitation, plunged a dagger in her breaſt, and then preſented it covered with blood to her huſband, exclaiming, in words celebrated by the ancients, who did not entertain that horror of ſelf-murder which Chriſtians have derived from better principles, "Pœtus, it is not painful." Martial's epigram on this ſubject is well known; but it is remarked, that he has given an ingenious turn to the ſpeech, which injures its noble ſimplicity:

"Caſta ſuo gladium cum traderet Arria Pœto,
Quem de viſceribus traxerat ipſa ſuis;
Si qua fides, vulnus, quod feci, non dolet, inquit,
Sed quod tu facies, hoc mihi, Pœte, dolet."

"When Arria pulled the dagger from her ſide,
Thus to her conſort ſpoke th' illuſtrious bride:
The wound I gave myſelf I do not grieve;
I die by that which Pœtus muſt receive."

Tatler, vol. ii. N° 72.

Arria, the daughter, who was married to Pœtus Thraſea, propoſed to imitate this example of her mother, when her huſband was condemned to death under Nero; but ſhe changed her reſolution upon his requeſt, who deſired her to live in order to take care of their daughter. Tacit. Annal. l. xvi. c. 34. Gen. Dict.

ARRIACA, in *Ancient Geography*, a town of Spain, between Complutum to the ſouth-weſt, and Seguntia to the north-eaſt, on the ſame river with the firſt of theſe towns.

ARRIAGA, RODERIC DE, in *Biography*, a learned Spaniſh Jeſuit, was born at Lucrona in 1592, and gained great applauſe by teaching philoſophy at Valladolid, and divinity at Salamanca. Having voluntarily undertaken the office of teaching theſe ſciences in Bohemia, he removed to Prague in 1624, whence he was deputed thrice to Rome by the province of Bohemia, to aſſiſt at the general congregations of the order of Jeſuits; and after acquiring diſtinguiſhed reputation in the ſeveral offices to which he was appointed, he died at Prague in 1667. Such was the vigour of his mind, that he broke through the trammels of the ſchools in the inveſtigation of philoſophical and theological ſubjects: but deſtitute of the right clue to guide his inquiries, he indulged the wildeſt conjectures in explaining the phenomena of nature, and wandered into the regions of general ſcepticiſm, ſo that he was more ſucceſsful in demoliſhing the opinions of others than in eſtabliſhing any of his own. His works are: "A Courſe of Philoſophy," in one volume folio, printed at Antwerp in 1632, and ſeveral times re-printed; and "A Courſe of Divinity," in eight volumes folio, printed between the years 1643 and 1655, by Balthaſar Moret, at Antwerp.

He-

He was prevented from finiſhing a ninth volume by his death. Gen. Dict.

ARRIAGI, in the *Materia Medica*, a name given by ſome authors, particularly by Serapion and Avicenna, to a fine kind of camphor.

ARRIAN, in *Biography*, a Greek hiſtorian, was born at Nicomedia in Bithynia, where he was prieſt of Proſerpine, and flouriſhed in the ſecond century under the emperors Adrian and the Antonines. After his reſidence at Rome, he became a diſciple of Epictetus, and by his talents and learning he recommended himſelf to the patronage of Adrian. Having been admitted to the honour of a Roman citizen, he was appointed prefect of Cappadocia, and in this ſtation he diſtinguiſhed himſelf by his prudence and valour in the war againſt the Alani and Maſſagetæ. He was afterwards advanced to the dignities of ſenator and conſul. Like Xenophon, he united the literary with the military character, and devoted a great part of his life to the purſuits of learning and philoſophy. Of the numerous hiſtorical writings of Arrian, if we except ſome fragments preſerved by Photius and Tzetzes, two only remain. The firſt is, "The expedition of Alexander the Great, in ſeven books;" a work in high eſtimation, not only on account of the accuracy and fidelity that diſtinguiſh the detail of facts, but for the ſimplicity and ſweetneſs of the ſtyle in which they are recited. As his knowledge of political and military ſcience was more extenſive than that of Q. Curtius, he poſſeſſed a ſounder judgment, and was leſs inclined to the marvellous than that hiſtorian. His facts were collected from the beſt authorities, particularly from the memoirs left by Ptolemy Lagus and Ariſtobulus, who had ſerved under Alexander in his expedition, and who did not publiſh their accounts till after the death of Alexander, and with no other motive beſides that of diſcovering the truth. His ſtyle was formed upon the model of that of Xenophon, and combined ſimplicity and eaſe with ſtrength and elegance; ſo that he was not unjuſtly denominated the ſecond Xenophon. "This work, ſays Dr. Robertſon, (Hiſt. Diſq. concerning India, p. 24.) though compoſed long after Greece had loſt its liberty, and in an age when genius and taſte were on the decline, is not unworthy the pureſt times of Attic literature." Arrian's "Account of the Affairs of India," in which the hiſtory of Alexander is purſued, has been conſidered by many as an eighth book of the former work: though it has been objected that this book is written in the Ionic, but the former ſeven in the Attic dialect, and that its facts are chiefly taken from Megaſthenes, to whom Strabo allows little credit. Dr. Robertſon (ubi ſupra, p. 344.) ſays, that the Indian hiſtory of Arrian is one of the moſt curious treatiſes tranſmitted to us from antiquity. The firſt part of it conſiſts of extracts from an account given by Nearchus of the climate and ſoil of India, and the manners of the natives; and the ſecond contains that officer's journal of his voyage from the mouth of the Indus to the bottom of the Perſian gulf. For the elucidation of this curious monument of ancient navigation, ſee "The Voyage of Nearchus from the Indus to the Euphrates," by Dr. Vincent, 4to. 1797. We may add, that, notwithſtanding ſome particulars, to which objections have been made, and which have been examined by Dr. Robertſon and others, the account of Nearchus's voyage, detailed, probably only in part by Arrian, the promontories, the creeks, the rivers, the cities, and the mountains, which came ſucceſſively in his view, are ſo clearly deſcribed, and the diſtances of ſuch as were moſt worthy of notice are ſo diſtinctly marked, that M. d'Anville, by comparing theſe with the actual poſition of the country, according to the beſt accounts of it, ancient as well as modern, has been able to point out moſt of the places which Nearchus mentions, with a degree of certainty, which does as much honour to the veracity of the Grecian navigator, as to the induſtry, learning, and penetration of the French geographer. Mem. de Literat. tom. xxx. p. 132, &c. See alſo the learned and elaborate work of Dr. Vincent, above cited. Arrian's "Expedition of Alexander" was firſt printed in Greek, at Venice, in 8vo, in 1535; at Baſil, in 1539, 8vo.; at Geneva, by H. Stephens, in 1575, fol.; in Greek and Latin, by Blancard, 8vo. with notes, at Amſterdam, in 1668; by Gronovius, at Leyden, in 1704, fol.; and at Amſterdam, in 8vo., with the notes of Raphelius and others, in 1757. The book "De Indicis" has uſually been publiſhed with the "Exped. Alex." The "Periplus Ponti Euxini," in a letter from Arrian to Adrian, containing a deſcription of a voyage along the coaſts of the Euxine ſea, is ſtill extant, and was probably written while Arrian was prefect of Cappadocia. The "Periplus Maris Erythræi" has been aſcribed by ſome to Arrian, but Salmaſius is of opinion that it was written in the time of Pliny the natural hiſtorian, or a little before his time; and that it could not have been compoſed by Arrian, and addreſſed to Adrian, becauſe mention is made of ſeveral princes who lived in Pliny's time. M. Tillemont apprehends, that it was compiled by that Arrian to whom Pliny the younger wrote ſeveral letters, whom he repreſents as a man of great abilities and eloquence, and who was conſidered as an imitator of Demoſthenes. But this Arrian, having retired from public employments about the time of Nerva, or the beginning of Trajan's reign, could not have been the ſame with the diſciple of Epictetus. The "Periplus Ponti Euxini," and "Periplus Maris Erythræi," were publiſhed together at Baſil, in fol.; at Leyden, in 1577; and among the Ancient Geographers, in 4to. by Gronovius, at Leyden, in 1697; and at Oxford, in 1698, 8vo. The "Tactics" of Arrian was written in the 20th year of Adrian. It treats of the order and arrangement of an army; and alſo the order which Arrian gave for the march of the Roman army againſt the Alani. His book "On Hunting" was publiſhed in Blancard's edition of the works of Arrian: and of his invaluable moral treatiſe, intitled "Enchiridion," containing the diſcourſes of Epictetus, we have an excellent edition by Upton, printed at London in two volumes 4to., in 1739. Gen. Dict. Fabr. Bibl. Græc. l. iv. c. 8. t. iii. p. 269.

ARRIANA, in *Ancient Geography*, a town of Pannonia Prima, in the diſtrict of Norica Ripenſis.

ARRIANA, in *Geography*, a village of Africa, two leagues north of Tunis, in which are ſeen ſome ruins of ancient Carthage, particularly a long range of the arches of the celebrated aqueduct, all of them entire, ſeventy feet high, ſupported by columns ſixteen feet ſquare. The channel, that conveyed the water, lies upon theſe arches, and is high and broad enough for a perſon of an ordinary ſize to walk in. It is vaulted, and plaiſtered in the inſide with a ſtrong cement, which by the ſtream running through it, is diſcoloured to the height of about 3 feet. Shaw's Trav. p. 13.

ARRIB *of Rupees*, in *Commerce*, equal to 100 crores, each crore being 100 lacks, and each lack 12,500*l.*: ſo that an arrib is equal to about 125,000,000 *l.*

ARRIBANTRUM, in *Ancient Geography*, a town of Dardania, a country of Upper Myſia. Ptolemy.

ARRIE'GE, in *Geography*, a river of France, which riſes in the Pyrenées, paſſes by Foix, Pamiers, Savarden, St. Gabelle, &c. and joins the Garonne about two miles from Toulouſe. Gold has been found in ſeveral parts of this river near Pamiers.

Arriége gives name to one of the departments of France, formed of the territory called Couzerans, and the Pays de Foix. It is bounded on the north by the departments of Upper

Upper Garonne, and of Aude; on the eaſt, by the departments of Aude, and the Eaſtern Pyrenées; on the ſouth, by the department of the Eaſtern Pyrenées, and the Pyrenées; and on the weſt, by the department of Upper Garonne. Its ſuperficies is about 1,037,533 ſquare acres, or 529,540 hectares; its population conſiſts of about 194,858 individuals; and it is divided into three communal diſtricts. Its chief town is Taraſcon.

ARRIENNES, a mountain of France, in the department of the Calvados, remarkable for the reſort of birds of prey, ſuch as eagles, falcons, kites, &c. one league from Falaiſe.

ARRIERE, Fr. denotes the rear.

Arriere-*Ban*, or *Ariere-ban*, in the *French Cuſtoms*, is a general proclamation, whereby the king ſummons to the war all that hold of him; both his vaſſals, i. e. the nobleſſe, and the vaſſals of his vaſſals.

M. Caſeneuve takes the word to be compoſed of *arriere*, and *ban*: the *ban*, according to him, denotes the convening of the nobleſſe or vaſſals, who hold fees immediately of the king: and *arriere*, thoſe who only hold of the king immediately.

Arriere *fee*, or *fief*, is a fee dependant on ſome other ſuperior one.

Arriere-fees commenced at the time when the counts and dukes, rendering their governments hereditary in their families, diſtributed to their officers certain parts of the royal domains which they found in their provinces; and even permitted thoſe officers to gratify the ſoldiers under them with parts of the ſame.

Arriere-*guard*. See Rear-*guard*.

Arriere *vaſſal*, or *tenant*, the vaſſal or tenant of another vaſſal or tenant.

ARRIGNO, in *Geography*, a town of the iſland of Corſica, eight miles eaſt of Calvi.

ARRIGONI, Carlo, in *Biography*, an eminent Italian Luteniſt, who arrived in England about the time of the eſtabliſhment of the Royal Academy, or opera, in 1721, where he accompanied on the lute out of the compoſer's book or ſcore, during the whole time of Handel's regency. In 1732, he accompanied Farinelli: he had many ſcholars in ſinging in the great families of this country, and had the reputation of a good compoſer. He left England in 1738, and removed to Vienna, where he compoſed the oratorio of Eſther, which augmented his reputation as a good muſician.

ARRION, in *Geography*, a town of Perſia, in the province of Adir-beitzan, thirty leagues ſouth-eaſt of Tauris.

ARRION, or Carrion, a river of Spain, which runs into the Piſuerga, near its union with the Duero.

ARRO, a river of England, which runs into the Lug, near Leominſter, in Herefordſhire.

ARROBAS, or Arobas, in *Commerce*. See Arobe.

ARROE, in *Geography*, an iſland of Denmark, in the Baltic mountains, but interſected with vallies, and containing three pariſhes. It lies ſouth of the iſland of Funen, and weſt of that of Langeland. N. lat. 54° 55′. E. long. 10° 10′.

Arroe, is alſo a ſmall iſland of Denmark, in the Little Belt, weſt of Funen, and almoſt contiguous to the eaſt coaſt of the duchy of Sleſwick. It gives name to a Sound on that coaſt. N. lat. 55° 16′. E. long. 9° 40′.

ARROESKIOBING, a town of Denmark, in the iſland of Arroe, in the Baltic.

ARROGATION, See Adrogation.

ARROJA de St. Servan, in *Geography*, a town of Spain, in the province of Eſtremadura, three miles ſouth of Merida.

ARROIS, a village of Scotland, in the iſle of Mull.

ARRON, or Aron, a river of France, which runs into the Loire near Decize.

ARRONCHES. See Aronches.

ARRONDIE, in *Heraldry*, Cross-*arrondie*, or *rounded*, is that whoſe arms are compoſed of ſections of a circle, not oppoſite to each other, ſo as to make the arm bulge out thicker in one part than another; but both the ſections of each arm lie in the ſame way, ſo that the arm is every where of an equal thickneſs; and all of them terminating at the edges of the eſcocheon, like the plain croſs.

ARROO, or Arrau, *Iſles*, in *Geography*, iſlands of that part of Aſia called Auſtralaſia, lying to the ſouth-weſt of New Guinea; in S. lat. 6°, and E. long. 135°. Although Pennant claſſes theſe among the ſpicy iſlands, they produce, according to his account, ſago, and not ſpice. During the dry, or weſtern monſoons, the manucodiatæ, or birds of Paradiſe, which breed in New Guinea, and reſide there whilſt the wet monſoon laſts, retire to Arroo; migrating in flocks of 30 or 40, under the conduct of a leader, called by the inhabitants of Arroo, the king: he is ſaid to be black, to have red ſpots, and to fly far above the flock, which never deſert him, but ſettle where he ſettles. During their flight they cry like ſtarlings; but when ſurpriſed with a ſtrong gale, they croak like ravens, and aſcend to the ſuperior regions of the air. They alight on the higheſt trees, and ſeem to feed on berries, or on nutmegs and butterflies; and they are either ſhot with blunt arrows, or caught with birdlime, or nooſes. The bowels and breaſt-bone being extracted, they are dried with ſmoke and ſulphur, ſold for nails or bits of iron, and exported to Banda. The Arroo iſlands appear, in Arrowſmith's chart, divided into five by intervening ſtraits. The chief product is ſago; and the people make expeditions to the main land, where they ſeize captives, and ſell them at Banda. Since 1623, the Arroo iſles have been conſidered as belonging to the Dutch Eaſt India Company, and ſubſervient to thoſe of Banda.

ARROS, a river of France, which runs into the Adour near Aire, in the department of Landes.

ARROSOIR, in *Conchology*, a name aſſigned by modern French naturaliſts, after Brugière and Lamarck, to a new genus of ſhells, formed excluſively of the Linnæan *Serpula penis*, and another analogous ſpecies figured in the ſeventy-ninth plate of Favanne's Conchology. The former is the *Pencillus marinus* of Argenville; *Chineſe watering-pot* of the Engliſh; and *L'Arroſoir de Java* of the French; the latter is alſo called by them *L'Arroſoir de la Nouvelle Zélande*. See Serpula penis.

ARROTINO, L', in *Sculpture*, a ſtatue in the gallery of the great duke at Florence, repreſenting an old man reſting upon one knee, and whetting a kind of broad knife upon a ſtone, with his head erect, and, as it were, liſtening with great attention, but very cautious of being obſerved. The head and the hair of this piece of ſculpture are particularly admired. It is generally thought to have been a peaſant, who, being in the field, happened to overhear ſome of Catiline's accomplices, and diſcovered them: but the hiſtory of that conſpiracy, as alſo of that headed by Brutus's ſons, makes no mention of their being detected by a country labourer. Keyſler's Trav. vol. ii. p. 21. Leonard Agoſtini, cited by Gronovius, ſuppoſes that this ſtatue repreſents a Scythian charged by Apollo with the deſtruction of Marſyas, and that it made part of a group, exhibiting the puniſhment of this audacious rival of Apollo.

ARROU, in *Geography*, a town of France in the department of the Eure and Loire, and chief place of a canton in the diſtrict of Chateaudum, 7 leagues S.S.W. of Chartres.

ARROUKHAGE. See Arokhage.

ARROUX, in *Geography*, a river of France, which riſes near Arnay-le-Duc, and runs into the Loire, between Digoin, and Motte St. Jean, in the department of the Saone and Loire.

A R R

ARROW, in *Archery*, in the Saxon arpe, or arepe, a missive weapon of offence, slender, pointed, and barbed, made to be cast or shot from a bow. See ARCHERY. Minshew derives it from the Latin *arundo*, because the ancients so frequently made the shafts of their arrows from reeds: Skinner refers us to the Anglo Saxon gearo, *paratus*: and Junius to the French *arroser*, because the arrows descended on the enemy like a shower.

The chief of the nations that composed the army of Xerxes had both their bows and arrows made of reeds: the bows, however, of the Lycians were of cornel wood; the arrows of the Indians were pointed with iron; those of the Ethiopians with a sharp stone that they sometimes used to cut their seals with; and the arrows of the Lycians were unfeathered (Herodotus, Polymnia). The Grecians headed their arrows with brass, as well as the Scythians; and from a particular passage in the Odyssey, it is supposed, that the heads of the Grecian arrows were fastened on as they were wanted. The ancient Germans generally prefixed pointed stones to their weapons: and Brotier, in his notes on Tacitus, observes, that many such have been discovered in the German sepulchres. Nor is it an uncommon thing to find arrow-heads of flint in the ancient cairns of stone in our own country. (See Gough, Sep. Mon. vol. i. p. 18.)

Among the Romans, although the tree called *Cornus* was very frequently made use of for the arrow-shaft, yet the most common material was the reed, which grew in Italy, not only with great strength, but in great abundance, particularly in the Pomtine marshes.

The use of the arrow among our early ancestors has been already spoken of (see ARCHERY); the particular material, indeed, of which either the head or shaft was made, has not come down to us: but we can speak of the arrows of the middle ages with a greater degree of certainty.

Roger Ascham thought (Toxoph. ed. 1571. f. 166.) that for the pluming of an arrow, the feathers from the wing of a grey goose were preferable to any other: which strongly reminds us of part of a stanza in the well-known ballad of Chevy Chace, where an English archer aimed his arrow at sir Hugh Montgomery:

"The *grey-goose wing* that was thereon,
In his heartes blood was wett."

The more ancient ballad, however, reads, *swane-feathers*. In the "geste of Robyn Hode," among Mr. Garrick's old plays, in the Museum, the arrows of the outlaw and his companions are particularly described:

"With them they had an hundred bowes,
The strings were well ydight;
An hundred shefe of arrows good,
With hedes burnish'd full bryght;
And every arrowe an ell longe,
With *peacocke* well ydight,
And nocked they were with white silk,
It was a femely sight."

And Chaucer, in his description of the squyers yeoman, says:

"And he was clad in cote and hode of greene;
A shefe of *peacocke* arrowes bryght and shene,
Under his belt he bare full thriftely,
Well coude he dresse his tackle yemanly:
His arrowes drouped not with fethers lowe,
And in his hande he bare a mighty bowe."
Prol. to Cant. Tales.

In the wardrobe accompts of the 28th Edw. I. (p. 359.) is a charge of verdigrease to stain the feathers of the arrows green. Nor are we to suppose that peacock-arrows are only to be found in poetry; a wardrobe accompt of the 4th Edw. II. furnishes this entry; "Pro duodecim flecchiis cum pennis de *pavone*, emptis pro rege de 12 den'." And Gervase Markham mentions that when he wrote, 1634, the peacock feather was sometimes used at the short butt; yet seldom or ever, he complains, did it keep the shaft either right or level. (Art of Archerie, p. 91.)

Ascham says, in the composition of an arrow there are three essential parts; the stele or wand, the feathers, and the head. The stele was not always made of the same species of wood, but varied according to the different modes of shooting practised. He commends sound *ash* for military arrows, and prefers it to *asp*, which in his day, as well as in the time of Charles I., was generally used for the arrows of the army: but for pastime he thought none were better than those made of oak, hard-beam, or birch. Occasionally, it should seem the arrow, toward the head, was pierced with brazil, holly, or other heavy wood, to make it fly the steadier. (Markham's Art of Archerie, p. 86.)

The arrows at Cheviot Chace were drawn to the ear, contrary to the usage of the ancients, as appears not only from many of their reliefs, but the traditionary circumstance of the Amazons parting with the right breast as an impediment to their using the bow. Some of our ancient ballads extend the length of the arrow to an ell; but the cloth-yard appears to have had the preference, and is mentioned not only in the old ballad of Chevy Chace, but by most of our historians, as the particular length of the arrow used by the English archers at the battle of Agincourt, 1415; and by Carew, (Survey of Cornwall, p. 73.) 1602, as in use among the Cornish bowmen. (See Strutt's Sports and Pastimes, p. 50.)

Archers generally speak of an arrow weighing so many shillings; but they consider an arrow of an ounce weight to be the best for flight or hitting a mark at a considerable distance. As to the feathers, those of a goose are preferred; it is also wished that the bird should be two or three years old, and that the feather may drop of itself. Two out of the three feathers are commonly white, being plucked from the gander, but the third is generally brown or grey, being taken from the goose, and from this difference in point of colour informs the archer when the arrow is properly placed. (Archæol. vol. vii. p. 65.)

Mr. Grose, in his Military History, (vol. ii. p. 169.) quotes a curious particular respecting arrow heads from Swinden's History of Great Yarmouth; where the sheriff of Norfolk, in the 42d of Edw. III. being ordered to provide a number of garbs of arrows headed with steel for the king's use, is directed for the heading of these to seize all the flooks of anchors (omnes alas ancarum) necessary for the purpose. Arrows were usually reckoned by the garb or sheaf. For immediate use they were carried in the girdle.

ARROW, *for the Cross-bow*. See BOLT.

ARROW, *Fire*. When the Persians, under Xerxes, encamped on the hill opposite the citadel of Athens, they commenced their attack by shooting against the barricade of wood, which the oracle had declared invincible, arrows wrapped in tow, and fired. (Herodotus, Urania.) This, as far as we remember, is the earliest instance of fire arrows on record. Among the Romans they were seldom used. But the warriors of the middle ages frequently fixed phials of quicklime, or other combustible matter, to their arrow heads, and shot them from the bow; (See Matt. Paris, p. 1090, 1091) and in sea-fights they were found particularly serviceable. Even so low as the time of Edward VI. arrows with wild-fire, and arrows with fire-works, are mentioned among the stores at Newhaven and Berwick. (Grose, Milit. Hist. vol. ii. p. 270.)

ARROWS, *Whistling*. The use of whistling-arrows, at least in this country, cannot be carried to very high antiquity. It seems probable that they were first used on military occasions,

ſions, and eſpecially as ſignals during the quarrel of the roſes. Hall (An. 7. Hen. VIII. fol. 56.) mentions a company of archers who met king Henry VIII. at Shooter's-hill, on a May-day morning, where they diſcharged their bows in his preſence, and the arrows made a loud whiſtling in their flight, "by crafte of the head." The ſtrangeneſs of the noiſe, we are told, ſurpriſed the king: but this is no proof that the uſe of the weapon was a novelty. In this caſe the arrow-head was uſually made with horn, rounded at the end and pierced with ſeveral holes. See Archæol. vol. ii. p. 58. For the practice of divining by *arrows*, ſee Belomancy.

Arrow, in *Aſtronomy*, *Trigonometry*, &c. See Sagitta.

Arrow, in *Fortification*, is a work placed at the ſaliant angles of the glacis, and conſiſts of two parapets, each forty toiſes long. The work has a communication with the covert-way, of about twenty-four or thirty feet broad, called *caponier*; and a ditch before it, of five or ſix toiſes.

Arrow, in *Geography*, the name of a lough, or lake, in the county of Sligo, in Ireland, which is about eight miles long, full of romantic and woody iſlands, and of a very irregular form; and alſo of a river proceeding from the lake, and running northward to Ballydore, where it ruſhes at once into the ſea, breaking over rocks in the moſt romantic manner, from edge to edge, in many falls for the ſpace of 200 yards, before it comes to the principal one, which is twelve or fourteen feet perpendicular. Beaufort. Young.

Arrow, in *Surveying*, is uſed for ſmall ſtraight rods, of which there are ten, about a foot or half a yard long, ſhod with iron ferrils. Their uſe is to ſtick into the ground, at the end of every chain, in meaſuring lines.

ARROWAUKS, or Arwacks, in *Geography*, a name given to the ancient natives of Hiſpaniola, Cuba, Jamaica, and Porto-Rico, as well as of Trinidad, who were a mild and comparatively cultivated people, and who ſeem to have had one common origin, as they ſpeak the ſame language, poſſeſs the ſame inſtitutions, and practiſe ſimilar ſuperſtitions. Columbus treats of them as ſuch; and the teſtimony of many contemporary hiſtorians confirms his opinion. The Charaibes, or Caribbees, regarded them as the deſcendants of a colony of Guiana, a race of Indians to whoſe noble qualities the moſt honourable teſtimony is borne by every traveller who has viſited them, and recorded his obſervations. Mr. Bryan Edwards thinks it extremely probable, that all the various nations of this part of the New World, excepting only the Charaibes, emigrated anciently from the great hive of the Mexican empire. But at what period ſuch emigrations were made; whether the Charaibes were previouſly poſſeſſed of the widely extended coaſt that bounds the Atlantic, or, in poſterior ages, accidentally found their way thither by ſea from the continent, are points concerning which, as it is impoſſible to determine, it is in vain to inquire. Mr. Edwards has given a particular detail of their perſons and corporeal endowments, their intellectual faculties and diſpoſitions, their political inſtitutions, and their religious rites. See his Hiſtory of the Weſt Indies, vol. i. p. 60. &c.

Arrow, *Elf*. See Elf-*arrows*.

ARROWSIKE, in *Geography*, an iſland in the diſtrict of Maine, in America, ſeparated from Parker's iſland by a ſmall ſtrait. It is within the limits of George-town; and contains nearly one-third of its inhabitants, and has a church. It comprehends about 20,000 acres of land.

Arrow, *Magical*, a ſort of weapon very common among the barbarous inhabitants of Lapland, and many other of the northern climates; and ſuppoſed to poſſeſs very ſtrange virtues.

Arrow, *Wildfire*. See Wildfire.

Arrow-*head*, in *Botany*. See Sagittaria.

Arrow-*headed Graſs*. See Triglochin.

Arrow-*root*, *Indian*. See Maranta.

ARRUCI Vetus, in *Ancient Geography*, a town of Spain, in Bœtica, near the mountains.

ARS Notaria. See Art.

Ars *Theſſalica*, *Theſſalian art*, is uſed by *Ancient Writers*, for a ſpecies of magic, whereby it is pretended, they could draw the moon and ſtars out of heaven.

It was denominated *Theſſalian*, from its ſuppoſed inventors, the people of Theſſaly.

Ars, in *Geography*, a town of France, in the department of the Creuſe, and chief place of a canton in the diſtrict of Aubuſſon; five miles north-weſt of Aubuſſon.

Ars, a town of France, on the ſouth-weſt coaſt of the iſland of Ré, two leagues weſt of St. Martin de Ré. N. lat. 46° 12′. W. long. 1° 37′.

Ars, a river of Spain, which runs into the ſea near cape Finiſterre, in Galicia.

ARSA, in *Ancient Geography*, a town of Spain, in Bœtica, to the north-eaſt.

Arsa, a town of Hiſpania Tarragonnenſis, in the territory of the Edutians. Ptolemy.

Arsa, a country of India, on this ſide the Ganges, between the rivers Indus and Hydaſpes. According to Ptolemy it had two cities, viz. Iſaguras or Ithaguras, and Taxila or Taxilea.

ARSACIDÆ, in *Ancient Hiſtory*, a denomination given to the kings of Parthia, commencing with Arſaces I., the founder of the Parthian monarchy, and terminating with Artabanus, who was put to death by order of Artaxerxes, after the Parthians were ſubdued by the Perſians. The moſt probable account of this period, which is ſomewhat perplexed, is as follows. In the reign of Antiochus Theos, king of Syria, Arſaces, a Bactrian, excited the Parthians to ſhake off the Macedonian yoke, and to eſtabliſh the national independence. This happened about the year before Chriſt 250. The ſucceſs of Arſaces induced the Parthians to elevate him to the throne, and he fixed his reſidence at Hecatompolis. Seleucus Callinicus, the ſucceſſor of Antiochus, attempted to recover the Parthian provinces; but he was defeated in a great battle by Arſaces, and made captive; and this event was by the Parthians commemorated at the commencement of their independence; and its anniverſary celebrated with great ſolemnity for many ages. Having poſſeſſed himſelf of Hyrcania and ſome neighbouring provinces, he was at length killed in battle againſt the king of Cappadocia, after a proſperous reign of about thirty-eight years. Blair, in his Chronology, dates his death at the year before Chriſt 245. However this be, he left behind him a great reputation throughout the eaſt; and his ſucceſſors the Parthian kings all took his name, as the Roman emperors did that of Cæſar. The empire founded by him proved an impenetrable barrier againſt the Romans, in their attempts to extend their dominions eaſtward. After various events (ſee Parthia), Artabanus IV. ſucceeded to the throne; and his proſperity had elated him ſo much, that, firſt of all the Parthian monarchs, he aſſumed the double diadem, and the title of the "Great King." But his power was of no long duration. Ardſhir Babegan, or Artaxerxes, excited the Parthians to revolt againſt him; and in a deſperate battle he was defeated, taken, and ſoon after put to death, in 226. Blair refers this defeat to the year 229, and Playfair to 222. By this event, the Parthian empire, which had ſubſiſted under the "Arſacidæ" 475 years, was finally overthrown, and once more transferred to the Perſians. The family of the "Arſacidæ,"

facidæ," however, was not extinguiſhed in Artabanus, but continued to reign in Armenia, till the time of the emperor Juſtinian, holding that kingdom of the Perſian monarchs, to whom the "Arſacidæ" of Armenia were tributaries. Anc. Un. Hiſt. vol. viii. p. 129. vol. ix. p. 210.

ARSACIDES, *Land of*, in *Geography*, high land, covered with wood, ſituate north of New Britain, in that part of Aſia called Auſtralaſia, forms a part of the iſlands of Gower, Carteret, and Simpſon, ſeen by captain Carteret in 1767, obſerved by M. de Bougainville in 1768; and ſeen by M. Surville in 1769, who called it the Archipelago of the Arſacides. This land forms ſome part, at leaſt, of the Solomon iſlands, which were firſt recognized by the Engliſh; though the diſcovery of them is claimed by M. Fleurieu, and other French writers, in favour of French navigators. Theſe iſlands were viſited in 1788, by Mr. Shortland, and called by him New Georgia. See SOLOMON *Iſlands*.

ARSÆ, in *Ancient Geography*, a people of Arabia Felix, according to Ptolemy.

ARSAGALITÆ, a people of India, placed by Pliny beyond the Indus.

ARSAGO, in *Geography*, a town of Italy, in the Milaneſe, four leagues north of Milan.

ARSAMAS, a town of Ruſſia, in the community of Neſhnei Novogorod. It is the capital of the diſtrict of Arſamas, ſituate on the river Teſh, falling into the Occa, and on the road from Moſcow to Aſtracan, 120 leagues ſouth-eaſt from the former, and 200 north-weſt from the latter.

ARSAMATIAS, in *Ancient Geography*, a river of Armenia, over which the Parthians compelled the Romans to build for them a bridge. Lipſius has, without ſufficient reaſon, corrected the text of Tacitus, and called it Arſanias.

ARSAMOSATA, SIMSAT. See ARMOSATA.

ARSANE', a town of Paleſtine, in which Aſa, king of Iſrael, was buried, according to Joſephus, Ant. l. viii. c. 6.

ARSANIAS, ARSEN, a river of Aſia, which had its ſource in the mountains eaſt of the Euphrates, and paſſing through a ſmall lake, traverſed the ſouth-weſt between the mountains, paſſed by Arſamoſata, and diſcharged itſelf into the Euphrates to the ſouth-weſt of that city. Pliny, Dion, Plutarch, and Tacitus, mention this river; and the latter ſays, that it ran between Tigranocerta and Artaxata.

ARSARATHA, a town of Aſia, in Armenia Major. Ptolemy.

ARSCHIN, in *Commerce*, a long meaſure uſed in China, to meaſure ſtuffs; of the ſame length with the Dutch ell, which is two feet eleven lines.

ARSCHOT, in *Geography*. See AERSCHOT.

ARSE-*verſe*, in *Antiquity*, a term, or formula, inſcribed on doors, to prevent fire. It is ſaid to be of Tuſcan origin, where the word *arſe* ſignifies *avert*, and *verſe*, *fire*. Pitiſc. Lex. Ant.

ARSEMINI, in *Geography*, a town of the iſland of Sardinia, ſeven miles ſouth-weſt of Cagliari.

ARSEN, in *Ancient Geography*, a river of the weſtern part of Arcadia, which ran from the north-eaſt to the ſouth-weſt, and diſcharged itſelf into the river Ladon.

ARSENA, a name given by Strabo to the lake Arethuſa in Armenia Major.

ARSENAL, a royal or public magazine, or place appointed for the making and keeping of arms, neceſſary either for defence or aſſault. The Romans had arſenals in all the frontiers of their empire.

The arſenal of Venice is the place where the gallies are built and laid up. This is a fortification of between two and three miles in compaſs; on the ramparts are many little watch-towers, where centinels are ſtationed. Like the arſenal at Toulon, it is both a dock-yard, and a repoſitory for naval and military ſtores. Here the Venetians build their ſhips, caſt their cannon, make their cables, ſails, anchors, &c. —The arſenal of Paris is that where the cannon or great guns are caſt. It has this inſcription over the gate:

"Ætna hæc Henrico vulcania tela miniſtrat,
Tela Gigantæos debellatura furores."

There are arſenals or ſtore-houſes appropriated to naval furniture and equipments.—At Marſeilles is the arſenal for the gallies; and at Toulon, Rochefort, and Breſt, are thoſe for the men of war.

ARSENARIA, in *Ancient Geography*, a Roman colony of Africa, in Mauritania Cæſarienſis. This town was an epiſcopal ſee. It correſponds to the modern ARZEW.

ARSENIAT. See ARSENIC, § 10.

ARSENIC, *Arſenique*, Fr. *Arſenik*, Germ. *Arſenicum*, Lat. Αρρενικον, Αρσενικον, Theoph. & Dioſcorid.

Arſenic is a brittle acidifiable metal, of a bluiſh white colour, eaſily tarniſhing by expoſure to the air: it does not melt, but volatilizes by a gentle heat, exhaling copious white fumes, with a peculiar alliaceous or garlic ſmell; it is ſoluble in nitro-muriatic acid, and is precipitable in the form of a light orange-coloured powder by ſulphuret of ammonia, or of a green colour by ammoniated copper.

§ 1. *Ores of Arſenic.*

Beſides the ores of arſenic properly ſo called, this metal is found in combination with ſilver, copper, iron, lead, cobalt, antimony, and lime, all of which will be treated of in their proper places: at preſent we ſhall confine ourſelves to thoſe ſubſtances which, by the common conſent of mineralogiſts, are arranged as ores of arſenic.

Sp. I. Native Arſenic. *Arſenic teſtacée*, Born. *Arſenic natif*, Hauy and Brochant. *Gediegener arſenick*, Emmerling, &c. *Arſenicum nativum*, Werner. *Arſenicum nigrum*, *Cobaltum teſtaceum*, *Fliegenſtein*, *Scherbenkobelt*, &c. of the older writers.

Its colour when newly broken is a very light lead-grey, often paſſing into tin white; but the ſurface, by a ſhort expoſure to the air, becomes yellow, then blackiſh grey, and finally almoſt black.

It is found generally in maſs, more rarely diſſeminated; in kidney-ſhaped or cluſtered maſſes, or in plates, or carious, branched, bearing impreſſions, &c. Externally it is rough or granular, with little or no luſtre; internally it is little ſhining, with a metallic luſtre.

Its fracture is ſometimes fine-grained, uneven, or curved lamellar; more rarely radiated or bundled. It flies when broken into indeterminate blunt-edged fragments, ſometimes in the form of plates. It is alſo frequently compoſed of diſtinct concretions, either teſtaceous, concentric, or kidney-ſhaped.

It acquires a poliſh by friction, and emits an alliaceous odour; is half-hard and brittle. It rings when ſtruck by a hard body.

Sp. gr. according to Briſſon 5.724 . . . 5.763; according to Kirwan 5.67.

Before the blow-pipe native arſenic fuſes without difficulty, giving out a copious, white, alliaceous fume; by an increaſe of heat it takes fire, burns with a bluiſh flame, and is wholly diſſipated. It depoſits on the charcoal, or any cold ſubſtance that is preſented to it, a white powder, which is oxyd of arſenic.

Native arſenic is not, however, in a ſtate of abſolute purity; it always contains a ſmall and variable proportion of iron; beſides occaſionally a little gold or ſilver.

This mineral is found at Worlich and Joachimſthal, in Bohemia; at Freyberg, Annaberg, Schneeberg, Marienberg, and Johangeorgenſtadt, in Saxony; at Andreaſberg, in the Hartz; at Geiſberg and Seltſpach in Carinthia; at Nagyag in Tranſilvania; and St. Marie-aux-mines in France. It occurs only in the veins of primitive mountains: the ſubſtances that accompany it are red ſilver, realgar, galena, native ſilver, ſpecular cobalt, kupfernikkel, ſpathoſe iron, fahlerz, pyrites, quartz, heavy ſpar, calcareous and fluor ſpars.

Sp. II. Marcaſite or Miſpickel. *Arſenical pyrites*, Kirw. *Fer arſenical*, Hauy. *Arſenik kies*, Germ. *Arſenicum mineralizatum pyritaceum*, Werner.

Of this there are two varieties.

Var. 1. Common Marcaſite. *Gemeiner arſenik kies*, Germ.

Its colour when recently fractured is ſilvery white, but in general its ſurface is yelloviſh, greyiſh, or bluiſh, ſometimes irideſcent. It occurs in maſs, diſſeminated, inveſting, or cryſtallized. The primitive form of its cryſtals is a ſtrait rhomboidal priſm, the angles of whoſe baſe are 103° 20′, and 76° 40′: the other varieties that have been aſcertained are, the rhomboidal priſm with dihedral ſummits (Fer arſen. ditetraedre of Hauy), and the ſame priſm with tetrahedral ſummits (F. ar. quadrioctonal of Hauy). The lateral faces are alſo ſometimes cylindrical, either concave or convex. The faces compoſing the ſides of the priſms are always ſmooth and ſhining; thoſe of the ſummits are croſſed by ſtriæ. Internally the marcaſite is ſhining, with a metallic luſtre. Its fracture is uneven, coarſe, or finely granular; preſenting occaſionally columnar or granular diſtinct concretions. When broken it flies into indeterminate ſharp-edged fragments. It is hard, generally giving fire with ſteel, and diffuſing an alliaceous odour; is brittle, but difficult to break.

Sp. gr. according to Gellert 5.75; according to Hauy 6.52.

When expoſed to the flame of the blow-pipe on charcoal, this mineral gives out a copious arſenical fume, and melts into a globule of brittle iron. Its analyſis has not yet been made with any accuracy, and probably the amorphous kind at leaſt, on account of the variable proportion of its ingredients, is incapable of affording an exalt reſult. The conſtituent parts of pure miſpickel appear to be only arſenic and iron, both of them in the metallic ſtate: but it is often intimately mixed with iron pyrites, and hence affords an uncertain quantity of ſulphur: two ſpecimens analyſed by Vauquelin, yielded reſpectively 38.8 and 4. per cent. of arſenic, which ſeems to ſhew that miſpickel and pyrites, though, when pure and cryſtallized, ſufficiently diſtinct from each other, are ſo intimately blended by nature, as to paſs by inſenſible gradations from the one to the other extreme of the ſeries. In ſeveral of theſe compounds, however, minute inſpection has diſcovered ſmall ſeparate cubes of pyrites; and theſe intermediate varieties are rather to be conſidered as ſimple mixtures than chemical compounds.

The two ſubſtances with which marcaſite is liable to be confounded, are arſenical cobalt and pyrites. It differs from the firſt in being harder, in having a yelloviſh white tint, while the colour of the other is reddiſh white, and in the form of its cryſtals: it is diſtinguiſhed from the latter by giving out when ſtruck an arſenical, inſtead of a merely ſulphureous odour, by the lighter yellow of its colour, and by its cryſtalline forms.

Marcaſite is found in Bohemia, in Saxony, in Sileſia, in Cornwall, and various other places, either in veins, or diſſeminated through primitive mountains. The ſubſtances by which it is accompanied, are generally tin-ſtone and galena; more rarely black blende, ſpathoſe iron, copper pyrites, quartz, fluor, and calcareous ſpars. At Reichenbach in Sileſia, it is found in ſerpentine rock.

Marcaſite appears to be made little or no uſe of: the more brilliant ſpecimens are occaſionally cut and poliſhed, and made into buttons, and other ſmall articles; this is particularly the caſe with ſome found near Dublin, and called Iriſh diamonds.

Var. 2. Argentiferous marcaſite. *Weiſſerz*, Werner.

Its colour is ſimilar to that of the preceding variety, but when expoſed to the air it tarniſhes to a deeper yellow. It is rarely found in maſs, being generally diſſeminated or cryſtallized in minute acicular four-ſided priſms. Externally it is ſhining, internally little ſhining, with a metallic luſtre. Its fracture is fine-grained, uneven, with granular diſtinct concretions.

Its other external and chemical characters correſpond with thoſe of the preceding variety, from which it differs only in a variable proportion of ſilver, from 1 to 10 per cent.; and for which it is often worked.

It is found at Freyberg and Braunſdorf in Saxony; and is uſually accompanied with common marcaſite, red ſilver, galena, copper pyrites, &c.

For the affinities of this mineral with arſenical ſilver, ſee SILVER, *Ores of*.

Sp. III. Sulphurated Arſenic. *Rauſchgelb*, Germ. *Arſenic ſulfuré*, Hauy. *Arſenicum mineralizat. riſigallum*, Werner.

This ſpecies is divided into two varieties, the red and yellow.

Var. 1. Realgar. *Rothes rauſchgelb*, Emmerling. *Arſen. min. riſigall. rubrum*, Werner. *Arſenic ſulfuré rouge*, Hauy. *Rubine d'arſenic*, *Sanderac*, *Rubinſchwefel*, &c.

Its colour is a bright Aurora red, paſſing on one hand to ſcarlet-red, and on the other to yellow-orange. It is rarely found in maſs, more frequently diſſeminated or inveſting, and very frequently cryſtallized. The primitive form of its cryſtals is a long octahedron, with ſcalene triangular faces exactly the ſame as ſulphur. The two pyramids of the octahedron are ſometimes intercepted by a quadrilateral priſm (ſee *Cryſtallographical Plates*, *fig.* 94.), forming the variety A. ſ. r. émouſſé of Hauy: other varieties are derived from bevilling and truncating the angles of the intervening priſm; and a further variety (*fig.* 95.) A. ſ. r. ſurcompoſé of Hauy, is produced by the truncature of all the ſolid angles of the terminating pyramids. The cryſtals are for the moſt part ſmall, and not eaſy to determine. Their ſurface and interior are ſhining or much-ſhining, with a vitreous luſtre. The fracture is uneven granular, paſſing into minute conchoidal: the fragments are indeterminate, blunt-edged. It is commonly tranſlucid, occaſionally ſemi-tranſparent or opaque. The colour of its ſtreak is orange-yellow. It is very tender, ſomewhat brittle, and eaſily broken by the nail. Sp. gr. according to Bergman 3.22. Briſſon 3.33. It is idio-electric, acquiring the reſinous electricity by friction.

Before the blow-pipe it melts eaſily, burns with a blue flame, and a ſulphureous arſenical odour, and is for the moſt part volatilized. Nitrous acid in a ſhort time deprives it of its colour. It has never been accurately analyſed, but conſiſts principally of arſenic and ſulphur.

Realgar occurs native in the vicinity of Ætna and other volcanos, and alſo in the primitive mountains of Germany, Hungary, and Swiſſerland. The ſubſtances that are found moſt frequently to accompany it are native arſenic, red ſilver, and galena.

The ſubſtances that it reſembles are red ſilver and chromated lead; it may, however, be diſtinguiſhed from the firſt by the following properties: the powder of the ſilver ore is red, that of the realgar orange-yellow; the ſp. gr of the

ſilver ore is the greateſt, in the proportion of about 5 to 3; beſides which, it does not become electric by friction, nor does it flame or volatilize by the blowpipe. Chromated lead is more than twice as heavy as realgar, and exhibits the ſame differences with regard to electricity and habitude before the blowpipe as red ſilver.

Native realgar is made no uſe of; for the purpoſes to which the artificial is applied, ſee § 12. of this article.

Var. 2. Orpiment. *Gelbes rauſchgelb*, Emmerling. *Arſen. min. riſigal. flavum*, Werner. *Arſen. ſulf. jaune*, Hauy. *Auripigmentum*, Lat.

Its uſual colour is a beautiful lemon-yellow, paſſing on one ſide into ſulphur-yellow, gold-yellow, or honey-yellow, and on the other into aurora red. It is found diſſeminated, and in maſs. It is internally ſhining, or very ſhining, with a bright waxy luſtre, ſometimes paſſing into the metallic. Its fracture is ſtraight or curved foliated. In maſs it is rarely more than tranſlucid at the edges, but in thin plates is ſemitranſparent. Its ſtreak is of the ſame colour as the mineral itſelf, only a little lighter. It is very tender, ſoft to the touch; when in plates is flexible though not elaſtic. Sp. gr. 3·45. It is idio-electric, and in its chemical characters, correſponds with the preceding variety. It conſiſts of ſulphur and arſenic, but the proportions are not aſcertained with accuracy.

Orpiment is found in the Bannat in Natolia and Servia, at Nagyag in Tranſilvania, Felſobanya in Hungary, &c.

It appears to be a mineral of late formation, being always found in ſtratiform mountains. It is, for the moſt part, accompanied by clay, quartz, &c. &c. ſometimes by realgar.

The cryſtalline forms that are uſually attributed to this mineral are, upon the authority of Hauy, referred to the preceding variety.

Sp. IV. Native oxyd of Arſenic. *Arſenic oxydé natif*, Fr. *Naturlicher arſenik kalk*, Germ. *Arſenicum ochraceum album*, Werner.

Its colour is ſnow-white or yelloviſh, reddiſh, or greeniſh-white; it is found alſo of a clear ſmoke grey. Its common form is that of a ſuperficial earthy friable cruſt on the ſurface of other minerals: more rarely it occurs in an indurated ſtate, either ſtalactitic, cluſtered, or cryſtallized. The cryſtals are always extremely minute, ſometimes capillary, bundled, interlaced, or diverging, ſometimes in octahedrons, ſometimes in quadrilateral tables. When cryſtallized it appears to be tranſlucid, but in the earthy ſtate it is always opaque. It is very tender, often friable, brittle; has a very ſharp diſagreeable taſte. Sp. gr. 3·7.

Before the blowpipe it gives out a white ſmoke, and the uſual arſenical odour; the grey coloured, as being little oxydated, burns with a bluiſh flame: after a time, but not ſo quickly as native arſenic, it is almoſt wholly volatilized. It is ſoluble in fifteen times its weight of boiling water: and appears to be an oxyd of arſenic nearly pure with a variable proportion of oxygen. The only ſubſtance with which it is liable to be confounded, is the Pharmacolite, or native arſeniat of lime: this latter however is inſoluble in water, and leaves a conſiderable reſidue when expoſed to the blowpipe.

The native oxyd of arſenic is a mineral of very rare occurrence; it is found at Joachimſthal in Bohemia, in Saxony, Heſſe, Tranſilvania, and Hungary, in the vicinity of native arſenic, and in certain cobalt mines.

§ 2. *Aſſay and Analyſis of Arſenical Ores.*

Arſenic is a metal in itſelf of ſo little value, and ſo noxious to other metals by its obſtinate adherence to them, rendering them brittle, and debaſing their colour, that in all works in the great, and even in almoſt all docimaſtical aſſays, every method has been reſorted to in order to drive off the arſenic, and its proportion to the whole maſs has only been vaguely eſtimated by the loſs of weight experienced during the proceſs. The methods employed by Bergman, and the reſt of his contemporaries, for aſcertaining the quantity of arſenic in any of its ores, are extremely imperfect; even the accurate Klaproth confeſſes the imperfections of his mode, and till the publication of Mr. Chenevix's Analyſis of the Arſeniates of Copper and Iron, chemiſtry had attained no certainty in the reſolution of this important problem. We ſhall firſt mention the advantages and defects of the methods recommended by Bergman, Kirwan, Klaproth, &c. and then proceed to the more accurate ones of Chenevix.

For the decompoſition either of the *native arſenic* or *marcaſite*, Bergman propoſes to treat the pulverized ore with four times its weight of nitro-muriatic acid, formed of one part nitrous and one and a half or two parts muriatic acid. By this menſtruum the ſilver will be converted into muriated ſilver, and will, together with the ſilex, remain undiſſolved, and the arſenic and iron will continue in ſolution. The filtered liquor is to be evaporated to one-fourth of its bulk, and poured into water; the arſenic will thus be precipitated, and the iron may then be thrown down from the filtered liquor by ammonia, &c. Another way of proceeding is to boil the ore with dilute nitrous acid, in order to take up the ſilver, copper, &c., while the arſenic will remain behind in form of a powder, and may afterwards be taken up by nitro-muriatic acid, and precipitated from its ſolution by water.

To theſe methods, however, it may be objected, 1ſt, That the precipitation of arſenic from its ſolution in nitro-muriatic acid by water, is denied by ſome chemiſts; and even if the fact of precipitation be allowed, ſtill it is certain that ſome of the arſenic will remain in ſolution. 2dly, Antimony, which is often mingled with arſenical ores, will alſo be thrown down by this proceſs. 3dly, The Ammonia added to the remaining liquor, beſides precipitating the iron, &c. will, by deſtroying the exceſs of the nitro-muriatic acid, allow the arſenic acid to combine with the oxyd of iron, and thus induce an error in the proportion of this laſt metal. 4thly, It appears from the uniform experience of Klaproth, and other eminent chemiſts, that arſenic is abundantly ſoluble in nitrous acid, and that the ſilver precipitated from ſuch a ſolution, even by muriat of ſoda, contains a little arſenic; and whichever of the alkalies was afterwards uſed for throwing down the copper, &c. the neceſſary neutralization of the nitrous acid would afford an opportunity for the arſenic acid to combine with the oxyd of copper.

The *native oxyd of arſenic* is propoſed by Kirwan to be diſſolved in boiling water, and of courſe its proportion is to be eſtimated by the loſs of weight ſuſtained by the quantity of ore thus treated. But (beſides other objections) the dark-coloured varieties of this ore are probably not ſufficiently removed from the metallic ſtate, to be thus ſoluble. In order to decompoſe *realgar* or *orpiment*, Bergman directs long-continued ebullition with muriatic acid, adding, if neceſſary, a little nitrous, till the inſoluble reſidue becomes grey. The inſoluble powder is the ſulphur, and the arſenical ſolution is to be decompoſed as before mentioned by water. In this proceſs, however, the ſulphur will ſtill retain ſome arſenic; and a little of the ſulphur will be oxygenated, and converted into ſulphuric acid. Mr. Kirwan recommends

recommends to precipitate the arſenic from the muriatic acid by zinc; but, according to Mr. Chenevix, the precipitate is not pure metallic arſenic, but a mixture of this with arſeniat of zinc.

The analyſes in the dry way of the arſenical ores are ſtill leſs ſatisfactory than thoſe in the humid way above recited. If ſublimation in cloſe veſſels is had recourſe to, a very intenſe and long-continued heat will be inſufficient to volatilize the whole of the arſenic; the ſulphur will alſo riſe at the ſame time and produce orpiment. Roaſting in a muffle, provided the ore is mixed with powdered charcoal, is more effectual; but in this caſe, not only the arſenic, but the ſulphur and antimony, if there happens to be any in the ore, will fly off, and the relative properties of theſe muſt be eſtimated by mere gueſs.

Klaproth's method of treating the unſulphurated ores of arſenic may be deduced from his analyſis of the arſenical ſilver ore, which conſiſts of iron, arſenic, ſilver, and antimony. He firſt digeſts the ore with moderately ſtrong nitric acid, which takes up the arſenic and the greateſt part of the iron and ſilver: the addition of muriat of ſoda throws down the ſilver in the ſtate of muriat combined with a few atoms of arſenic; and afterwards, the arſeniat of iron is thrown down by potaſh; this precipitate being dried and weighed, is afterwards roaſted with charcoal ſeveral times, till it ceaſes to give out arſenical fumes, and is attractable by the magnet: from the loſs of weight ſuſtained by the iron, the quantity of arſenic is then eſtimated. This however, as Mr. Klaproth himſelf obſerves, is a very imperfect method. Another way practiſed by him in the analyſis of the arſenical cobalt is, to digeſt the ore in nitric acid, which oxydates the arſenic and takes up the greater part of it, leaving the reſidual arſenic ſoluble in water. The nitrous ſolution is then evaporated as long as it continues to depoſit oxyd of arſenic, and the oxyd of cobalt afterwards ſeparated by potaſh from the nitrous acid, is preſumed to be pure, becauſe it affords a ſympathetic ink with muriatic acid. From this humid analyſis the combalt ore is ſtated by Klaproth to contain 54.5 cobalt, 45 oxyd of arſenic and $\frac{1}{2}$ ſulphur: a ſpecimen, however, of the ſame ore treated in the dry way, afforded only 44 cobalt; there was therefore required to make up the 100, $\frac{1}{2}$ ſulphur, and 55.5 reguline arſenic. Hence it is evident, that little dependence is to be placed on the eſtimation of the quantity of arſenic from the oxyd precipitated by evaporation of the nitrous ſolution.

A more certain mode of aſcertaining the proportion of arſenic is furniſhed by Mr. Chenevix. Let the ore, previouſly reduced to extremely fine powder, be digeſted in nitric acid ſufficient to acidify and take up the whole of the arſenic; pour off the clear liquor, and boil on the reſidue ſome diſtilled water; filter, and add the water to the nitrous ſolution: then neutralize the exceſs of acid by potaſh, taking care, however, not to have an acceſs of alkali, and add nitrat of lead as long as any precipitate takes place: waſh the precipitate in cold water, dry and weigh it. As the arſenical ores often contain ſulphur, it is poſſible that the arſeniat of lead thus procured, may be mixed with a little ſulphat of lead: to decide this, digeſt the powder in ſome warm dilute muriatic or nitrous acid, and the arſeniat of lead will be diſſolved, leaving the ſulphat behind. 100 parts arſeniate of lead contain, of arſenic acid 33, oxyd of lead 63, water 4, and the 33 parts arſenic acid, denote 22 of the metal.

§ 3. *Reduction of Arſenical Ores, and Preparation of Crude Arſenic, and White Arſenic.*

Arſenic is a ſubſtance of ſuch ſmall value and ſuch little demand, that none of the proper ores of this metal are wrought in the great; the whole of the arſenic of commerce being prepared in Saxony, by roaſting the cobalt ores in the manufacture of zaffre. Theſe conſiſt principally of arſenic, cobalt, iron, and a little ſulphur: the firſt and laſt ingredients of which are got rid of by roaſting: this proceſs, inſtead of being performed in the open air, is done in an oven, the flue of which runs horizontally to a conſiderable diſtance before it bends upwards. By this contrivance the arſenic and ſulphur, when liberated, are for the moſt part depoſited in the horizontal flue in the form of a greyiſh meal, ſtreaked with yellow (ſuch portions as are neareſt the fire being often melted into a ſemitranſparent cryſtalline maſs). In this ſtate it is called *crude arſenic*, or *flowers of arſenic*; the yellow ſtreaks proceed from the ſulphur uniting with the arſenic into orpiment: and beſides this, it is alſo ſullied with other impurities.

The *white arſenic* of commerce is prepared from the crude, by mixing this laſt with potaſh, or as ſome adviſe, with lime, and re-ſubliming. By this the ſulphur and other impurities unite with the alkali, and the white oxyd is driven over into a heated receiver, where it melts into a heavy colourleſs tranſparent glaſs: by expoſure for a ſhort time to the air, this glaſs becomes opaque, and reſembles in its fracture the fineſt white china; and it is in this ſtate that the white arſenic of commerce is found in our ſhops and laboratories.

§ 4. *Preparation of Reguline Arſenic.*

The old method of procuring the regulus of this metal conſiſted in mixing white arſenic with half its weight of black flux, one fourth part of borax, and the ſame proportion of filings of iron or copper, and fuſing the whole as quicky as poſſible in a crucible. When the whole is grown cold, there will be found, on breaking the crucible, a maſs of impure metallic arſenic, of a bluiſh white colour and conſiderable hardneſs and ſolidity. Probably this regulus was originally made from the crude arſenic, in which caſe the addition of iron or copper was for the purpoſe of ſeparating the ſulphur according to the proceſs mentioned for martial regulus of ANTIMONY. (§. 4.—III.) It is obvious, however, that the arſenic muſt contain a variable proportion of iron or copper when prepared according this method, by which its external and chemical characters will be in ſome degree modified. Another way of obtaining the regulus is recommended by Brandt, to which there can be no objection, upon the ſuppoſition that he uſed crude arſenic. He directs that white arſenic ſhould be mingled with ſoap, and ſublimed: in this operation the oil of the ſoap ſerves to de-oxydate the arſenic, and the alkali to keep down any portion of ſulphur that may have been combined with the arſenic.

The white arſenic of commerce being an almoſt entirely pure oxyd of arſenic, the reduction of it into the metallic ſtate is very eaſily effected. The moſt eligible way is to mix the white arſenic with any of the vegetable or animal expreſſed oils, till it becomes of the conſiſtence of very ſoft glazier's putty; it is then to be made up into round or oblong pieces, and dropped into a Florence flaſk, ſo as not to adhere to the ſides. The flaſk with its contents is to be put into a ſand-bath, or over a gentle charcoal fire, and muſt be heated very gradually as long as any thick vapours proceeding from the decompoſition of the oil are given out. When theſe ceaſe, the heat may be by degrees increaſed till the bottom of the flaſk becomes obſcurely red; ſhortly after the flaſk may be withdrawn from the fire, and when cold, upon carefully breaking it, there will be found in the neck and upper part of the veſſel, a cruſt of brilliant triangular cryſtals of oxyd of arſenic, ſemi-tranſparent, and

of

of a yellowiſh grey colour, below theſe there will be a thick amorphous cruſt of regulus, and ſome impurities will remain at the bottom. Let theſe products, except the impurities, be ſeparated from the fragments of glaſs, and pulverized together with half their weight of charcoal; then re-ſublime the whole as before, and the inſide of the flaſk will be found lined with a cruſt and cryſtals of pure and ſhining regulus of arſenic. It is neceſſary that theſe ſublimations ſhould be performed under a chimney, for the vapours that ariſe are intolerably fetid, and extremely noxious to the operator, bringing on in a very ſhort time headach, ſickneſs, and other unpleaſant ſymptoms. Inſtead of a flaſk, an earthen retort may be made uſe of.

§ 5. *External Characters and phyſical Properties of Reguline Arſenic.*

The freſh ſurface of arſenic is of a bright metallic luſtre, and a colour between that of tin and lead; it very ſoon however tarniſhes by expoſure to the air, becoming firſt yellowiſh, then ſlightly irideſcent, and laſtly black, in which ſtate it is alſo wholly deſtitute of luſtre. Its fracture is compact, granular; in hardneſs it is ſaid to be ſuperior to copper, but it is ſo brittle as to be reducible to power in a common mortar without any difficulty, being neither malleable nor ductile. It cryſtallizes in octahedrons or tetrahedral pyramids. Sp. gr. = 8.31, according to Bergman, but according to Morveau = 5.76. It is not ſenſible to the ſmell when cold, yet the fingers after handling it acquire a ſlight metallic odour: it is manifeſt to the taſte by a peculiar acrid flavour; and when heated to volatilization, diffuſes a characteriſtic fetid alliaceous odour.

§ 6. *Chemical Properties of Reguline Arſenic.*

I. Effects of Heat.

Arſenic, when pure, is incapable of being melted: in cloſe veſſels, at a heat inferior to that required for the fuſion of tin, it begins to be volatilized, and is depoſited in the upper and cooler parts unchanged in form or properties.

II. Effects of Atmoſpheric Air.

Atmoſpheric air at the uſual temperature is ſlowly decompoſed by this metal, the oxygenous part uniting with the arſenic, and converting it into a black oxyd, as mentioned § 5. At a heat of about 350° Fahr. the abſorption of oxygen is much more rapid, and vapours of white oxyd begin to be viſible, diffuſing the well-known arſenical ſmell. At a higher temperature combuſtion takes place: thus if a veſſel or crucible be made red hot, and a few pieces of arſenic be thrown in, a denſe white vapour is immediately produced, accompanied by a light blue flame, and in a ſhort time the whole is volatilized. This experiment muſt not be made in an iron ladle, for the affinity between the two metals at this temperature is ſo great, that artificial miſpickel would be formed, and this being very fuſible, the ladle would in all probability be found after the proceſs to have a hole in its bottom.

III. Effects of Water.

Although arſenic is ſo eaſily oxydable, yet it does not appear capable of decompoſing water; at leaſt it may be immerſed in it for any length of time without exhibiting any ſigns of ſolution or oxydation; and a covering of this fluid or of alcohol is the beſt preſervative of arſenic againſt the tarniſhing effect of the air.

IV. Arſenic with Hydrogen.

This combination was firſt diſcovered by Scheele. If liquid arſenic acid be digeſted with zinc, an effervescence will take place; and the air thus diſengaged, has a ſtrong arſenical ſmell, inflames by the contact of a candle, and depoſits on the inſide of the veſſel a brown film, which is metallic arſenic. The ſame gas may alſo be produced by granulated zinc in a hot ſolution of white arſenic in water with the addition of a little muriatic acid.

V. Arſenic with Phoſphorus.

The union of theſe two ſubſtances was firſt obſerved by Margraaff, whoſe experiments have ſince been repeated and confirmed by Pelletier. Phoſphuret of arſenic may be made in four ways: firſt, by ſubliming equal parts of phoſphorus and white oxyd of arſenic, in which caſe, part of the phoſphorus will be acidified at the expence of the metallic oxyd, while the remainder will combine with the metallic baſe; ſecondly, by ſubliming equal parts of reguline arſenic and phoſphorus; thirdly and fourthly, in the humid way, by digeſting equal parts of arſenic or oxyd of arſenic, with the ſame weight of phoſphorus in a flaſk, containing a ſufficient quantity of water. Phoſphorated arſenic is volatilizable in a moderate heat, and is combuſtible on hot coals, exhaling the mixed odour of its ingredients.

VI. Arſenic with Sulphur.

Both arſenic, and the white oxyd, are capable of uniting with ſulphur, by means of fuſion or ſublimation, into a beautiful red or yellow maſs, according to the relative proportion of the ingredients. The yellow is called *orpiment*, or yellow ſulphuret of arſenic, the red, *realgar*, or red ſulphuret. The ſulphur in the realgar is to the arſenic as 1 to 4 nearly, but in the orpiment as 1 to 9 or 10. Both preparations are fuſible, and may be ſublimed, but the realgar is more eaſily melted, and with care may be obtained quite tranſparent, and of a bright red colour; hence it has been called *arſenical ruby*, *rubine d'arſenique*. The ſp. grav. of orpiment, according to Bergman, is = 5.315; but of realgar, only = 3.225.

Theſe two ſubſtances have not been very accurately analyſed, and it is the opinion of ſeveral modern chemiſts, that the differences between them does not depend ſo much on the proportions of the ſulphur and arſenic, as on the preſence of oxygen in the one, and its abſence from the other. Hence they call realgar, ſulphuret of arſenic, and orpiment, ſulphurated oxyd of arſenic. This appears, however, to be a miſtake, for the following reaſons; when regulus of arſenic and ſulphur are mixed together, the combination takes place without the extrication of any gas, but when the oxyd of arſenic is ſubſtituted for the regulus, at the moment of combination a portion of the ſulphur is converted into ſulphureous acid gas, probably on account of a decompoſition of the metallic oxyd. Further, it appears from the experiments of Bucquet, that by continued fuſion orpiment is made of a much redder colour than before, by the volatilization of part of its arſenic; and as an additional confirmation, it may be mentioned that realgar, being ſublimed either with metallic or oxydated arſenic, is converted into orpiment.

It is not very eaſy to make realgar by the direct combination of its elements when they are in a ſtate of purity, on account of the eaſe with which they are volatilized before they have experienced the proper degree of heat. In Saxony, where orpiment and realgar are made in large quantities, the method is to fill an oven like that deſcribed in § 3. with miſpickel and iron pyrites, proportioning the quantities of each according as realgar or orpiment is intended to be produced. Now the ſulphur and arſenic contained in theſe minerals being in natural combination with iron, require for their ſublimation a degree of heat far greater than they could ſuſtain without volatilization, if they were pure.

Sulphurated arſenic is wholly inſoluble in water or alcohol. The nitrous and nitro-muriatic acids, eſpecially when warm, take up the arſenic from the ſulphur. The former of theſe, however,

however, except it is ſo concentrated as to act on the ſulphur alſo, only takes up a portion of the arſenic from realgar, converting it into orpiment. Nitro-muriatic acid completely decompoſes both the red and yellow ſulphuret, hepatic gas being given out at the ſame time, a circumſtance worthy of notice, as affording additional ſtrength to the opinion mentioned above, concerning the ſtate of the metal in theſe compounds. Sulphuret of arſenic is alſo decompoſed by diſtillation with two or three times its weight of *corroſive muriat of* MERCURY, the acid and oxygen of the mercurial ſalt uniting with the arſenic into corroſive muriat of arſenic, § 7.; and the metallic baſe with the ſulphur of the orpiment, forming cinnabar.

In the dry way, the fixed alkalies decompoſe orpiment into alkaline ſulphuret and arſenic, which latter ſublimes; but if the alkali is in exceſs, the arſenic is in part detained as well as the ſulphur. A ſolution of cauſtic potaſh in water being boiled with orpiment, diſſolves it completely, but by the addition of an acid a yellow precipitate is thrown down, which probably is a *hydroſulphuret of arſenic*. Quicklime and orpiment alſo unite by boiling in water, forming an arſenio-ſulphuret of lime, which is ſometimes employed as a WINE-TEST.

VII. Arſenic with Oils.

Any of the expreſſed oils being triturated with arſenic, gradually diſſolve it, and thus acquire a dark colour and conſiſtence like ſalve.

VIII. Alloys of Arſenic.

Arſenic unites with almoſt all the metals, debaſing the red and yellow ones, and deſtroying in a great meaſure the luſtre of all the reſt, except tin. It renders thoſe which are malleable and ductile, brittle, and for the moſt part increaſes their fuſibility and hardneſs. For other particulars, ſee the ſeveral metals.

§ 7. *Salts of Arſenic.*

1. Reguline arſenic is acted upon by ſulphuric acid when concentrated and aſſiſted by heat: if the operation be performed in a retort with a pneumatic apparatus, there will be produced a conſiderable quantity of ſulphureous acid gas, and ſulphur will ſublime into the neck of the veſſel. What remains behind is a white maſs ſimilar to oxyd of arſenic, but combined with a little acid. By the addition of a freſh portion of ſulphuric acid, the ſulphated oxyd is taken up; as the liquor cools, however, a precipitation of cryſtalline grains happens, and theſe are *ſulphat of arſenic*. This ſalt is much leſs ſoluble in water than white arſenic; when expoſed to the flame of a blow-pipe, it fuſes and begins to emit an arſenical ſmoke, but requires a much longer time for its volatilization than the ſimple oxyd. By repeated cohobation with ſulphuric acid, the arſenic approaches more and more to the nature of arſénic acid, but always continues in ſome degree ſulphated.

2. Nitric acid when hot is readily decompoſed upon reguline arſenic, being itſelf changed into nitrous gas, and the metal becoming oxydated. An addition of dilute nitrous acid at a boiling temperature effects a complete ſolution of the reſidual oxyd, and the liquor by evaporation and cooling may be brought to depoſit cryſtals of *nitrat of arſenic*. This ſalt being abſtracted with freſh nitrous acid, and then heated red hot, is wholly converted into arſénic acid. Nitrat of arſenic is ſparingly ſoluble in water, and with the blow-pipe exhibits nearly the ſame appearances as the preceding ſalt.

3. Oxymuriatic acid when pure, freſh made, and in the form of gas, exerciſes a very powerful action on the regulus of arſenic, and exhibits a very ſtriking and beautiful appearance. For this purpoſe, let a common ſix or eight ounce phial be filled in the uſual way with oxymuriatic acid gas procured from ſalt, manganeſe, and ſulphuric acid, in order to have the acid as dry as poſſible (for the further ſecuring of which, the gas produced about the middle of the proceſs is the beſt); ſtop the mouth of the phial with a cork, and place it on a table in an upright poſition; then reduce ſome reguline arſenic to a fine powder, and cautiouſly opening the mouth of the phial, ſhake in from the end of a knife, or in any other convenient way, a little of the powder. As ſoon as it comes in contact with the gas, a white vapour will firſt appear, and will be immediately followed by ignition of the metal, which in its paſſage to the bottom of the veſſel will appear like a ſtream of fire: this phenomenon may be repeated with ſucceſſive portions of powder till the acid is almoſt wholly decompoſed. At the bottom will be found a white acidulous oxyd of arſenic. Liquid oxymuriatic acid alſo is capable of diſſolving reguline arſenic; but during this proceſs, the metal being oxygenated at the expence of the acid, the reſult is muriat of arſenic.

4. Arſénic acid has a remarkable action on its own regulus, though the two appear to be incapable of combining into a proper ſalt. If the regulus is digeſted with the acid, its ſurface becomes ſhortly covered with a white powder, which is oxyd of arſenic. If the acid is kept in a ſtate of fuſion in a retort, and ſmall pieces of the regulus are dropped in from time to time, an inflammation and ſublimation of white arſenic will be manifeſt at each addition. Hence it appears that the oxygen of the arſénic acid quits this to combine with the regulus, till an equilibrium is produced by the one and the other being brought to a common ſtate of oxydation.

Theſe are all the acids which are known to act upon reguline arſenic; many others however are capable of combining with this metal, when previouſly brought to the ſtate of white oxyd. The ſalts hence reſulting we ſhall proceed to mention.

1. Muriatic acid when boiling will take up one third of its weight of oxyd of arſenic; a ſaline precipitate is produced by cooling, and if this is managed gradually, there are formed ſpicular cryſtals of *muriat of arſenic*. This ſalt ſublimes wholly if expoſed in cloſe veſſels to a moderate heat. Before the blow-pipe on charcoal it is decompoſed in part, and flies off, giving out at the ſame time the diſtinguiſhing odour of the metal. It is ſoluble, though ſparingly, in warm water, and the ſolution is decompoſable by an alkali, the oxyd of arſenic being thrown down.

Very dry and concentrated muriatic acid, or oxymuriatic acid, are capable of uniting with a much larger proportion of oxyd of arſenic than the liquid muriatic acid. This combination is called *butter of arſenic*, and is thus prepared: take one part of white arſenic, one and a half of red calcined ſulphat of iron, and three parts of common ſalt; mix them accurately in a mortar, and diſtil in a glaſs retort from a ſand bath. When the heat has been gradually raiſed ſo as to make the bottom of the retort nearly red, and nothing more comes over, the proceſs is finiſhed, and there will be found in the receiver two diſtinct liquors of different conſiſtence. The lower one is of a clear iron brown colour, and is called *butter of arſenic;* the ſupernatant liquor is thinner, of a lighter yellowiſh colour, and is called *oil of arſenic*.

Butter of arſenic is a heavy thick liquor, exceſſively corroſive and poiſonous; on expoſure to the air it exhales a denſe white ſuffocating vapour, deliquiates, becomes turbid, and finally is ſpontaneouſly decompoſed. When, inſtead of this gradual abſorption of moiſture, it is directly mingled with water, an immediate turbidneſs and precipitation

tation enſues of a white pulverulent matter, which was formerly taken for pure oxyd of arſenic; it ſtill, however, as in the caſe with ſimilar metallic precipitates, retains a portion of acid; for by heating in a cloſe veſſel, a little butter of arſenic is ſublimed. Liquid muriatic acid unites very ſparingly and imperfectly with the butter; and if conſiderably diluted with water, produces a decompoſition juſt in the ſame manner as pure water does.

Oil of arſenic, like the preceding, is decompoſed in part by water or alcohol, but the precipitate is not ſo copious: it mingles with liquid muriatic acid without producing any turbidneſs. The addition of a carbonated alkali is followed by effervescence and the precipitation of oxyd of arſenic. By ſpontaneous evaporation it yields cryſtals of muriated arſenic, and a ſlight efflorescence of white oxyd of arſenic.

There are ſeveral other methods of obtaining the butter and oil of arſenic: thus, if orpiment is diſtilled with two or three times its weight of corroſive ſublimate, the ſulphur of the former unites with the mercury of the latter, and produces cinnabar, while the arſenic of the former combines with the oxygen and acid of the latter into the oil and butter of arſenic. It is remarkable, however, that corroſive ſublimate is not decompoſable by oxyd of arſenic; for when the two are diſtilled together, whatever be their relative proportions, the mercurial ſalt riſes unchanged. Indeed the ſuperiority in affinity of muriatic acid for oxyd of mercury over oxyd of arſenic is ſtill more ſtrikingly ſhewn by diſtilling butter of arſenic with oxyd of mercury, in which caſe a little butter of arſenic firſt comes over, then corroſive ſublimate, and finally white arſenic. If, however, *reguline arſenic* is diſtilled with corroſive ſublimate, the produce is butter of arſenic, a little calomel, and running mercury.

Although the ſalts of arſenic have not yet received that notice from chemiſts to which they are entitled, ſtill there has ariſen ſome difference of opinion reſpecting the combinations of this metal with muriatic acid, ſome aſſerting the butter of arſenic to be a proper oxymuriat, while others conſider it as ſcarcely differing, except in concentration, from the muriat. From a careful collation of the ſcattered facts relative to this ſubject, it appears that there is no ſuch ſalt as oxymuriat of arſenic, but that muriatic acid, when its affinities are not weakened by water, will take up a large quantity of arſenical oxyd forming the butter of arſenic; that when by the gradual or ſudden addition of water, the affinities of this latter are brought into action, an unequal partition of the acid and oxyd takes place into a ſoluble and inſoluble muriat of arſenic. Hence we have three diſtinct ſalts compoſed of muriatic acid and oxyd of arſenic: firſt, muriat of arſenic with the ſmalleſt proportion of metallic oxyd, this is ſoluble in water and cryſtallizable by cooling, and is alſo capable of ſublimation without decompoſition; ſecondly, muriat of arſenic with a larger proportion of metallic oxyd (butter of arſenic), decompoſable by water, and not cryſtallizable; thirdly, muriat of arſenic ſuperſaturated with the oxyd, inſoluble in water, decompoſable by ſublimation.

2. Oxymuriatic acid gas paſſed into an aqueous ſolution of white arſenic, is itſelf decompoſed into muriatic acid; and by diſtillation, the water and muriatic acid being drawn off, there remains in the retort ſolid arſenic acid. It is therefore probable that the three muriats of arſenic juſt mentioned differ from each other in the degree of oxygenation of the metallic baſe, as well as in the proportions of it that they contain; the firſt being the leaſt oxygenated, and the latter the moſt ſo.

3. Fluoric acid, when digeſted on white oxyd of arſenic, diſſolves a ſmall proportion; and by evaporation and cooling, a granular cryſtalline ſalt is obtained, *fluat of arſenic*, the properties of which have not been examined into.

4. Boracic acid combines with white arſenic by means of water, but not in the dry way, according to Reuſs. Equal parts of the oxyd and acid digeſted together in a little water are entirely diſſolved, and afforded by evaporation *borat of arſenic* in powder or ſpicular cryſtals.

5. Phoſphoric acid and oxyd of arſenic combine together without difficulty in the moiſt way, and afford cryſtals of *phoſphat of arſenic*. This ſalt is very ſparingly ſoluble in water, and is decompoſable by heat, the oxyd being volatilized.

6. Liquid tartareous acid unites by digeſtion with oxyd of arſenic into a cryſtallizable ſalt, *tartrite of arſenic*; the properties of which are as yet in a great meaſure unknown.

7. Oxalic acid diſſolves very eaſily a conſiderable quantity of white arſenic, and the liquor affords by evaporation and cooling priſmatic cryſtals of *oxalat of arſenic*: theſe melt in a very gentle heat, the water of cryſtallization with part of the acid is evaporated, and the reſidue affords a very beautiful ſaline vegetation. Oxalat of arſenic is ſoluble both in water and alcohol, changes the colour of litmus tincture to red, and ſublimes at a moderate heat; but at a higher temperature the acid is firſt deſtroyed and flies off, leaving behind the metallic oxyd.

8. Acetous acid, by long digeſtion and boiling with white arſenic, diſſolves a ſmall proportion, and depoſits by cooling and evaporation ſmall cryſtalline grains of *acetite of arſenic*, which are very ſparingly ſoluble in water.

9. Benzoic acid, according to Trommſdorff, diſſolves white arſenic with conſiderable caſe, and forms with it *benzoat of arſenic*. This ſalt appears in the form of long ſlender radiating cryſtals, poſſeſſed of a ſour and pungent taſte, which efflorеſce in the air, are very ſoluble in boiling water, and are again for the moſt part depoſited by cooling.

10. *Gallat of arſenic* is not known, nor does the tincture of galls, according to the chemiſts of Dijon, produce any alteration in a ſolution of white arſenic.

11. Pruſſiat of potaſh, when pure, throws down an abundant white precipitate from the ſolution of arſenic in muriatic acid. This is ſoluble in a large quantity of water, and by ſublimation in the dry way affords a ſemi-tranſparent maſs; it is probably a *pruſſiat of arſenic*, but has been as yet ſcarcely at all examined.

The order of affinity of the various acids for oxyd of arſenic is not aſcertained with much certainty. Bergman arranges them in the following order; muriatic, oxalic ſulphuric, nitric, tartareous, phoſphoric, fluoric, arſénic acetous, and pruſſic acids.

§ 8. *Oxyd of Arſenic, or Arſenious Acid.*

Oxyd of arſenic is prepared in the large way according to the method already mentioned in § 3. When pure, it is of an opaque white colour; or if recently fuſed, is perfectly tranſparent and colourleſs. It cryſtallizes artificially (§ 4.) in three-ſided pyramids, the vertical angle of which is generally deeply truncated; the cryſtals are tranſparent, of a dilute wine yellow colour, and not liable to efflorеſce or become opaque by expoſure to the air, probably owing to their containing rather a ſmaller proportion of oxygen than the white arſenic of the ſhops. The ſp. grav. of the fuſed oxyd is about $= 5$. It ſlowly excites upon the tongue a ſweetiſh acid taſte. It is the moſt volatile of any of the metallic oxyds, riſing at 383° Fahr.

Pure water at the temperature of 60° Fahr. will diſſolve about $\frac{1}{80}$ of its weight of this oxyd, but when boiling it takes up $\frac{1}{15}$, the greater part of which it retains even when cold; by evaporation, however, minute three-ſided

pyramidal

pyramidal cryſtals are depoſited: the ſolution is clear and colourleſs. Alcohol alſo, when boiling, will diſſolve about $\frac{1}{70}$ or $\frac{1}{50}$ of its weight.

From many of its properties white arſenic ſeems to hold a kind of middle place between an acid and metallic oxyd: thus, it reddens litmus tincture, but turns ſyrup of violets green, and its aqueous ſolution is incapable of cauſing an effervescence in the carbonated alkalies and earths. In the new chemical nomenclature it is denominated the arſenious acid (acide arſenieux, Fr.); and the ſalts that are formed by its combination with the alkalies, earths, and metals, are called arſenites. Theſe ſeem to hold nearly the ſame relation to arſénic acid and the arſeniats, as ſulphureous acid and the ſulphites do to ſulphuric acid and the ſulphats.

The white oxyd of arſenic is eaſily deoxygenated by carbonaceous matter, by hydrogen, phoſphorus, and ſulphur, as already mentioned § 4. and 6. and is reduced to the ſtate of reguline arſenic: its habitudes with acids are deſcribed § 7.

If to a ſolution of cauſtic pot-aſh in water there be added ſome finely powdered oxyd of arſenic, the whole combines together by a boiling heat into a thick, viſcid, ſcarcely fluid matter, of a brown colour, and nauſeous ſmell, which as it cools becomes ſolid and brittle. This was named by Macquer *liver of arſenic*, and in the modern ſyſtem has obtained the name of *arſenite of potaſh*. By long expoſure to the air it becomes deliqueſcent; it is readily ſoluble in water, but has not been made to cryſtallize. The addition of any of the acids to the ſolution cauſes an immediate decompoſition with a copious precipitation of oxyd. Cauſtic ſoda produces the ſame general effects on white arſenic as potaſh, except that the arſenite of ſoda is cryſtallizable. Either of theſe ſalts, on being ſubjected to a full red heat, is decompoſed; the greater part of the arſenic being volatilized in the form of a denſe white ſmoke, while the remainder in the ſtate of arſénic acid remains united with an exceſs of alkali. In the dry way, the white oxyd of arſenic melts together with the fixed alkalies, forming a maſs not eaſily decompoſable by heat. According to Bergman, potaſh is capable of thus fixing twice its weight of the oxyd, and ſoda three times its weight of the ſame.

When ammoniacal gas is paſſed two or three times over heated white arſenic, the two ſubſtances contract at length ſo intimate an union as to bear even fuſion without ſeparating from each other. In the moiſt way alſo, a combination takes place by the help of a gentle heat, which differs eſſentially from the common liver of arſenic in that the acids occaſion no precipitation. Theſe are ſingular facts, and the nature of the arſenite of ammonia is well worthy of more notice from chemiſts than it has yet obtained.

Quicklime and barytes combine by fuſion with oxyd of arſenic into a vitreous maſs, which however becomes milky and opaque by the continued action of the air. In the moiſt way, lime and white arſenic being boiled together form a ſoluble arſenite of lime, from which a precipitate is thrown down on the addition of an acid. Neither magneſia, alumine, nor ſilex, appear capable of uniting with white arſenic by fuſion, but all or any of them combine into an eaſily fuſible maſs with the arſenites of potaſh, ſoda, lime, or barytes.

But few of the neutral ſalts have been examined with reſpect to their action on arſenious acid. The nitrats of potaſh and ſoda are decompoſed by heat converting the arſenious into the arſénic acid, and therefore this combination is treated of in § 10, *(Arſeniats)*. The effect of white arſenic on acetite of potaſh, as recorded by Cadet and the other chemiſts of the academy of Dijon, is however too remarkable to be omitted. A mixture of theſe two ſubſtances being ſubjected to diſtillation, there firſt paſſed over a limpid liquor, with a ſlight arſenical ſmell; this changed the colour of ſyrup of violets red, cauſed an effervescence in a ſolution of carbonated alkali, and rendered the liquor turbid. The next product was of a reddiſh brown colour, and filled the receiver with a denſe vapour of a moſt peſtiferous odour, different however from that of arſenic; towards the end of the proceſs, ſome reguline arſenic ſublimed into the neck of the retort. The red liquor, after being confined for three weeks in a ſtopped phial, was ſtill ſmoking, and exhaled the ſame deteſtable ſmell as before; it produced no alteration in ſyrup of violets, and occaſioned only a very feeble effervescence with carbonated alkali, depoſiting a little flocculent ſediment: it occaſioned a white precipitate in a ſolution of corroſive ſublimate: being poured into a filter, in order to ſeparate a yellowiſh thick portion that had ſeparated from the reſt, ſcarcely had a few drops paſſed through, than a denſe ſuffocating vapour began to riſe accompanied by an ebullition at the edges of the veſſel, and immediately followed by a beautiful roſe-coloured flame which laſted ſeveral ſeconds.

A hot ſolution of arſenious acid diſſolves ſome of the metals, particularly copper, iron, and zinc; the differences, however, between theſe and the metallic arſeniats have not been aſcertained with much accuracy.

§ 9. *Arſénic Acid.*

The properties of the white oxyd of arſenic that have been mentioned in the preceding ſections, eſpecially its ready ſolubility in water, its cryſtallizability, its taſte, its habitudes with alkalies and metals, had long induced a ſuſpicion of its ſaline nature. This ſuſpicion was at length confirmed by Macquer's valuable diſcovery of the *arſenical neutral ſalt* (ſee § 10. arſeniat of potaſh); but chemiſts ſtill continued ignorant of the preciſe difference between this and the liver of arſenic (arſenite of potaſh). The illuſtrious Scheele firſt cleared up this difficulty, and pointed out a method of procuring the arſénic acid in a ſtate of purity, and uncombined with any other ſubſtances. Bergman's valuable eſſay on the ſame ſubject confirmed and extended the diſcoveries of his friend and countryman, and more recent experiments have brought new acceſſions to the intereſting facts already collected. Arſenic, as well as ſome others of the metallic bodies, is not only a combuſtible and oxydable, but alſo an acidifiable baſe. It combines with oxygen, in at leaſt three different proportions. By the ſpontaneous action of air and moiſture, at the uſual temperature, it is converted into the black oxyd, an additional portion of oxygen is abſorbed by the aſſiſtance of a higher heat, forming the white oxyd; and by means, that we ſhall now proceed to mention, this latter ſubſtance may be ſaturated with oxygen, forming a perfect acid; the *arſenical*, or Arsénic (*acidum arſenicum*, or *arſenici*, *acide arſenique*, *arſenikſaure*.)

The method recommended by Scheele for the preparation of arſénic acid is the following.—Take two parts of finely powdered white oxyd of arſenic, and put it into a capacious tubulated retort, adapted to a quilled receiver, and fixed properly in a ſand-bath; then pour in ſeven parts, by weight, of ſtrong and pure muriatic acid, and cloſe the tubulure of the retort; as ſoon as the acid begins to boil, the arſenic will be rapidly diſſolved; and when the whole is taken up, lower the heat, and add three and a half parts of concentrated nitric acid; the mixture will immediately begin to foam, and there will be a copious extrication of nitrous gas.

The diſtillation is, at the ſame time, to be proceeding gradually, as long as any nitrous gas is produced; and when this ceaſes, one part more of the white oxyd of arſenic may

be added. As ſoon as this is diſſolved, pour into the retort one and a half part of nitric acid, and a freſh effervescence will take place. The whole is now to be diſtilled to dryneſs, and towards the end of the proceſs the heat muſt be increaſed till the bottom of the retort, with its contents, is red hot. After the retort is grown cold, it muſt be broken, and there will be found within it a ſaline maſs, which is the dry arſénic acid. In order to preſerve it in its ſolid ſtate, it muſt be put into a dry, well-ſtopped phial. The proportion of acid thus procured is nearly equal to the quantity of white oxyd employed. The uſe of the muriatic acid in this proceſs, ſeems to be merely that of a ſolvent of the arſenical oxyd, which is thus preſented to the action of the nitric acid in a ſtate of extreme diviſion. The nitric acid is decompoſed into nitrous gas and oxygen, the former of which flies away, while the latter is expended in acidifying the oxyd; by the ſubſequent red heat, the undecompoſed reſidue of the nitrous acid, and the muriatic, are driven off in vapour, and the arſénic acid alone remains behind. It generally, however, corrodes the retort, in a greater or leſs degree; whence the ſolid acid, when boiled with water, leaves a ſmall inſoluble reſidue of ſilex.

Bergman's method is to make a hot ſaturated ſolution of white arſenic in muriatic acid, and to add double the weight of nitric acid. The effervescence, however, thus occaſioned, is ſo great, that a conſiderable portion of the arſenic is driven over in the form of butter of arſenic, and the conſequent produce of acid is much diminiſhed, the quantity of this being eſtimated by Bergman at no more than 80 per cent. of the white oxyd employed. Weigleb, by repeatedly returning the liquor collected in the receiver into the retort with freſh nitric acid, obtained $112\frac{1}{2}$ of arſénic acid for every 100 of oxyd.

Another method of preparing this acid, alſo diſcovered by Scheele, is by oxymuriatic acid. Take one part finely pulverized black oxyd of manganeſe, and mix it with three parts of ſtrong muriatic acid, in a tubulated retort, large enough to allow ample room for the effervescence of the maſs: the retort is to be connected, in the uſual way, with a Woulfe's apparatus, containing the white oxyd of arſenic and a little water. By a gentle heat, the muriatic acid becomes oxygenated at the expence of the manganeſe, and paſſes into the bottles in the form of oxymuriatic acid; here it is decompoſed, and the muriatic acid unites with part of the arſenic, while the oxygen combines with another portion. This compound liquor being then gently diſtilled to dryneſs, and towards the end of the proceſs the bottom of the retort being made red hot, a complete ſeparation will take place; in the receiver there will be found diſtilled muriat, or butter of arſenic, and the ſaline maſs remaining in the retort is arſénic acid.

A ſimpler way of procuring the acid, is to heat together the white oxyd of arſenic, with diluted nitrous acid, in a retort, and when the ſolution is complete, to add ſome ſtrong nitric acid, and proceed to diſtillation: much nitrous gas will be given out, and ſome orange-coloured acid will come over into the receiver; return this upon the maſs in the retort before it becomes dry, together with a freſh portion of ſtrong nitric acid, and thus repeat the cohobation till the extrication of nitrous gas has almoſt ceaſed; then diſtil to dryneſs, and make the bottom of the retort red hot; all the remaining oxyd of arſenic and nitrous acid will be driven off, and nothing will be left behind but pure arſénic acid.

Beſides the above proceſſes, Pelletier has deſcribed another method of procuring the acid of arſenic. He mixes the white oxyd with nitrat of ammonia, and ſubjects the maſs to diſtillation in a luted retort. It is neceſſary to begin with a very gentle degree of heat, for the decompoſition of the ammonical ſalt is otherwiſe ſo rapid, that a large portion of the oxyd of arſenic is carried over into the receiver. But by proper management, the operation goes on more ſlowly and quietly; there paſſes over ſome nitrous acid, and by a ſlight increaſe of the heat, ammoniacal gas is alſo produced; towards the end of the proceſs, a little white oxyd uſually ſublimes, and a ſolid vitreous maſs of arſénic acid remains at the bottom of the retort, which, when heated red hot, becomes perfectly pure.

Arſénic acid is a ſolid vitreous maſs, of a milky white colour: its ſp. gr. according to Bergman, is $= 3.391$. It fuſes at a temperature a little below red heat, and becomes a tranſparent colourleſs fluid; but by cooling, it again becomes milky. When raiſed to a full red heat, it begins to boil, and gives out a portion of its oxygen; being ſlowly converted into white oxyd of arſenic, which ſublimes in proportion as it forms. If this experiment is performed in a covered crucible, after a time, almoſt the whole of the arſénic acid will be diſſipated, and the reſidue will be found cloſely adherent to the ſides of the veſſel, having diſſolved a portion of its earth, and being thus converted into a permanent glazing. Arſénic acid is wholly inſoluble in alcohol; but has ſo ſtrong an affinity with water, as to deliquiate by expoſure to a moiſt air: it diſſolves completely in three or four times its weight of water, and has not been obtained in a cryſtalline form, either by refrigeration or evaporation. It has a ſour, cauſtic, metallic taſte, and reddens litmus tincture, though it produces no change on ſyrup of violets. Charcoal powder, digeſted with the aqueous ſolution, exerts no chemical action whatever on it, but if the mixture is diſtilled to dryneſs in a cloſe retort, as ſoon as the bottom begins to grow red hot, the whole maſs takes fire with violence, and the acid is deoxygenated, a beautiful ſublimate of reguline arſenic being found in the neck of the retort. Sugar, and oil of turpentine, or any of the expreſſed oils, are charred even by digeſtion with a ſaturated ſolution of the acid. Six parts of the acid digeſted with one of ſulphur ſuffer no change, but when the mixture is diſtilled in a cloſe retort, as ſoon as the water is driven off, and the ſulphur begins to melt, a ſudden combination takes place, accompanied by a copious extrication of ſulphureous acid gas, and the whole contents of the retort riſe almoſt inſtantaneouſly, and attach themſelves to the upper part in the form of beautiful realgar. It combines with various alkaline, earthy, and metallic baſes, forming a genus of compound ſalts, known in chemiſtry by the name of ARSENIATS. None of the acids appear to have any action on the arſénic, for though it is ſoluble in ſome of them, it may be ſeparated again unchanged. It unites with the boracic and phoſphoric acids by fuſion, but neither ſuffers nor occaſions any decompoſition.

The order of its affinities, according to Pearſon, are, in the moiſt way, lime, barytes, ſtrontia, magneſia, potaſh, ſoda, ammonia, alumine, metallic oxyds, water.—In the dry way, lime, barytes, ſtrontia, magneſia, potaſh, ſoda, metallic oxyds, ammonia, alumine.

§ 10. *Arſeniats.*

1. *Arſeniat of Potaſh.*

If a ſolution of arſénic acid is dropped into cauſtic potaſh, till the mixture ceaſes to change ſyrup of violets green, and turns tincture of litmus red; thus ſhewing an exceſs of acid; there will be obtained by evaporation a cryſtallizable ſalt, arſeniat of potaſh. But if on the other hand potaſh be added to arſénic acid till the mixture turns ſyrup of violets green, but produces no change on tincture of litmus,

mus, an uncryſtallized ſalt is the reſult, which being evaporated to dryneſs, again deliquiates on being expoſed to the air. Theſe varieties of arſeniated potaſh are, however, rarely made by the direct union of their compotent parts, but from the white oxyd of arſenic and nitre. The phenomena attending this proceſs we ſhall therefore firſt explain, before we enter upon an enumeration of the properties of the ſalt.

Let any quantity of nitre be melted in a crucible, the bottom of which is heated red, and ſmall portions of white oxyd of arſenic be projected at intervals, taking care not to add a ſecond portion till the effervescence and diſengagement of the nitrous gas occaſioned by the former has ceaſed. By degrees the matter in the crucible, provided the heat is not augmented, will grow thick; and being then examined by ſolution and cryſtallization, will be found to redden litmus, and conſiſt of arſeniat of potaſh in a cryſtallizable ſtate, and ſome undecompoſed nitre. If, however, the maſs in the crucible is kept for a few minutes at a little higher heat, it will enter into perfect fuſion, and give out ſome nitrous gas; after a ſhort time it will again grow thick, and being then diſſolved in water, will turn ſyrup of violets green, and refuſe to cryſtallize, forming what Macquer and the old chemiſts call *Nitre fixed by arſenic*.

If a mixture of equal parts of nitre and white arſenic be put into a crucible (or ſtill better, into a Florence flaſk), and the flaſk be heated gradually in a ſand bath, till its bottom is obſcurely red, there will happen a very copious diſengagement of orange-coloured vapours; when theſe ceaſe, the veſſel is to be withdrawn from the fire, and will be found to contain a white ſaline maſs, which, by ſolution in hot diſtilled water, and evaporation, will yield arſeniat of potaſh, formerly called after the inventor *Macquer's neutral arſenical ſalt*. When, on the contrary, two parts of nitre and one of white arſenic are ſubjected to the above treatment, the reſult is an uncryſtallizable deliqueſcent maſs, the alkaline arſeniat of potaſh. This may be converted into the cryſtallizable or acidulous arſeniat, either by the addition of arſénic acid, in which caſe the whole will be arſeniat of potaſh, or by ſulphuric acid, which neutralizing the alkali, the liquor will yield by cryſtallization arſeniat and ſulphat of potaſh. In oppoſition to theſe facts, which are mentioned by Bergman, Scheele, Macquer, and moſt modern chemiſts, Pelletier has recorded an experiment, which, though he draws no concluſions from it, ſeems incapable of being reconciled with the theory of an alkaline and acidulous arſeniat of potaſh. He mixed, according to the proceſs of Lefevre, two ounces of white arſenic with four of nitre, and put the whole into a large crucible, the mouth of which was then cloſed with a ſmaller inverted crucible pierced with a ſmall hole to give vent to the nitrous vapour. It was ſubjected firſt to a very gentle heat for three hours, and then expoſed to a red heat for eight hours longer. The matter thus prepared was a compact ſaline white maſs, eaſily ſeparating from the crucible, and weighing one gros leſs than four ounces. Being diſſolved in diſtilled water and filtered, there was ſeparated a gelatinous maſs, conſiſting no doubt of ſome of the potaſh combined with the earth of the crucible. The clear liquor that paſſed the filter afforded by evaporation cryſtals of arſeniat of potaſh, and the mother water conſiſted almoſt wholly of cauſtic potaſh, which united quietly with ſulphuric acid, and formed ſulphat of potaſh. Here therefore we have an example of the cryſtallized arſeniat formed in the midſt of cauſtic potaſh, a circumſtance wholly unaccountable if an exceſs of acid is neceſſary for this purpoſe.

Arſeniat of potaſh cryſtallizes in rectangular quadrilateral priſms, terminated by four-ſided pyramids. In cloſe veſſels it fuſes at a low red heat, but ſhews no ſigns of decompoſition; when made to boil violently in an open veſſel it gives out oxygen, and acquires alkaline properties. It neither efflorescees nor deliquiates in the air. It is ſoluble in about ſix parts of boiling water, and depoſits cryſtals by cooling. It is decompoſable by lime and barytes, either in ſolution or by fuſion, the acid quitting the alkali to unite with the earths. The ſulphuric, nitric, and muriatic acids, abſtract from it the alkaline baſe, ſetting the arſénic acid at liberty, and forming ſulphat, nitrat, or muriat of potaſh. It decompoſes and precipitates almoſt all metallic oxyds from their combinations, forming inſoluble metallic arſeniats. In the dry way, it is decompoſed by charcoal, and the product is reguline arſenic of great beauty and purity, and carbonated potaſh. Sulphur, iron, and zinc, alſo decompoſe this ſalt, the reguline arſenic combining with one part of them, while the other is oxygenated.

2. *Arſeniat of Soda.*

According to Scheele, if ſoda is ſaturated with arſénic acid, cryſtals of arſeniat of ſoda are obtained, ſimilar in figure to thoſe of the preceding ſalt; however, the ſolution of them has no effect on litmus, but turns ſyrup of violets green. Some arſénic acid ſuperadded, takes away the cryſtallizability of the maſs, which, when evaporated to dryneſs, deliquiates in the air. Pelletier, by decompoſing nitrat of ſoda by oxyd of arſenic, in the manner already recited for preparing arſeniat of potaſh, obtained a permanent ſalt in truncated hexahedral priſms. The other properties of arſeniat of ſoda are unknown; probably, however, they are analogous to thoſe of the preceding article.

3. *Arſeniat of Ammonia.*

Liquid ammonia, ſaturated with arſénic acid, affords by evaporation a ſalt ſimilar in form to the rhomboidal cryſtals of nitrat of ſoda. It turns ſyrup of violets green, but produces no change on litmus; by a gentle heat it becomes opaque, and part of the ammonia flying off, it exhibits an exceſs of acid. In this ſtate it forms long acicular acid cryſtals, which deliquiate in the air. When diſtilled, it firſt gives out ſome ammoniacal gas, then fuſes, and again becomes ſolid after it has parted with ſome oxyd of arſenic which ſublimes. By a further increaſe of temperature it again becomes fluid, and is now found to be wholly changed into arſénic acid. Muriat of Ammonia is decompoſed by diſtillation with three parts of arſénic acid. There firſt riſes muriatic acid, then ammoniacal gas, afterwards oxyd of arſenic, and arſénic acid remains behind; hence it is obvious that part of the arſénic acid is deoxygenated at the expence of a portion of the ammonia.

4. *Arſeniat of Lime.*

If arſénic acid is dropped into lime water, a white precipitate is thrown down, which is reſoluble in a freſh portion of acid; the ſolution being now evaporated, ſmall cryſtals are obtained of arſeniat of lime. Another way of procuring this ſalt is by digeſting chalk in arſénic acid. An effervescence enſues, and afterwards by cooling, copious cryſtals are depoſited. Arſeniat of lime is ſparingly ſoluble in water, and the ſolution is decompoſed by ſulphuric acid, ſulphat of lime being precipitated. The affinity of arſénic acid for lime, is alſo inferior in the moiſt way to nitric, muriatic, or even acetous acid. Yet nitrat, muriat, and acetite of lime are decompoſable by means of double affinity, by the uncryſtallizable arſeniat of potaſh, and the arſeniats of ſoda and ammonia, arſeniat of lime being in all theſe caſes precipitated. This ſalt, if heated ſtrongly in a cloſe crucible, enters into fuſion, forming a white enamel-like maſs, but without undergoing any decompoſition; by mixing with charcoal and ſubſequent heating, the greater

part of the acid is oxygenated, and reguline arſenic is ſublimed. Arſénic acid in the dry way has ſo powerful an affinity for lime, as to be capable of uniting with this earth to the excluſion of ſulphuric, fluoric, and nitric acids.

5. Arſeniat of Magneſia

Acid of arſenic, when digeſted upon magneſia to ſaturation, forms a coagulum; this being diſſolved in a freſh quantity of arſénic acid, and evaporated, yields a jelly which by further privation of its moiſture is converted into an uncryſtallizable viſcous maſs. The ſulphat, nitrat, muriat, and acetite of magneſia, are not decompoſable by arſénic acid, but readily ſo by the alkaline arſeniats; the precipitate thus produced is inſoluble in water, but readily ſo by acids. When heated in a cloſe veſſel with charcoal, it exhibits the ſame phenomena as arſeniat of lime.

6. Arſeniat of Barytes.

This ſalt may be obtained in an earthy form, according to Scheele, by digeſting the acid upon barytes; at firſt the barytes diſſolves readily, but when the acid is ſaturated, a ſpontaneous precipitation of arſeniat of barytes takes place. Fourcroy informs us, that it may be procured in a cryſtalline form by mixing a warm concentrated ſolution of acetite of barytes and arſeniat of potaſh; a decompoſition takes place, and bright ſpicular needles of arſeniat of barytes are depoſited. In the moiſt way this ſalt ſeems undecompoſable except by ſulphuric acid and the eaſily ſoluble ſulphats. In a full red heat, however, even ſulphat of barytes is decompoſed by arſénic acid, the ſulphuric acid being volatilized.

7. Arſeniat of Alumine.

Moiſt earth of alum is readily ſoluble in arſénic acid, and by evaporation it yields a gummy uncryſtallizable maſs. The alkaline arſeniats will occaſion a precipitate in ſulphuric, nitric, and muriatic acids, previouſly ſaturated with earth of alum, and this precipitate is ſoluble in acids, though not ſo in water. It muſt however be remembered, that the earth precipitated from ALUM by an alkali is not pure ALUMINE, and therefore that the preparation here deſcribed is not arſeniat of alumine. Scheele indeed expreſsly mentions, that the ſolution mixed with charcoal, and evaporated to dryneſs, and then ignited in a cloſe veſſel, yields a ſublimate of orpiment, together with reguline arſenic and ſulphureous acid, and that the reſidue, when diſſolved in ſulphuric acid, depoſits after a time ſome cryſtals of alum. The arſénic acid, even by a long digeſtion with white clay, does not take up any portion of it. One part of clay and four parts of acid combine by fuſion into a vitreous maſs; and this, by being again heated with charcoal, affords a beautiful ſublimed regulus of arſenic.

The combinations of ſtrontia, and the other earths with the arſénic acid, have not as yet been examined. The metallic arſeniats will be found under the ſeveral metals.

§ 11. *Hiſtorical Notice concerning Arſenic.*

The native ſulphuret of arſenic, was the only one of the arſenical ores known to the ancients. Ariſtotle ſpeaks of the Σανδαραχη; and his pupil Theophraſtus, in his treatiſe on minerals, mentions the Αρρενικος, corrupted afterwards by Dioſcorides and others into Αρσενικος. Pliny alſo, in his Natural Hiſtory, deſcribes the arſenicum, auripigmentum, and ſandaracha. The Syrian orpiment, probably from its colour, was ſuppoſed to contain gold, and an ineffectual attempt by order of the emperor Claudius to extract this metal from it, is recorded by the Roman naturaliſt juſt mentioned. The ſandaracha of Pliny is realgar, being repreſented by him as friable, of a ruddy colour, and analogous to litharge. His arſenicum is expreſsly ſaid to be of the ſame ſubſtance as ſandaracha, and is thus deſcribed. "The colour of the beſt is ſuperior even to gold; the inferior ſorts are paler, or elſe approach to the hue of ſandaracha. It is of a ſcaly texture." The two laſt do not appear to have been conſidered of the ſame nature as auripigmentum: and the only uſe to which they were applied, was that of a cauſtic in medicine, and a pigment. The firſt mention of white arſenic is in the works of Avicenna, who lived in the 11th century. Paracelſus affirms, that arſenic ſublimed with egg-ſhells becomes like ſilver; and in 1673, Lemery publiſhed the method of obtaining the regulus by ſublimation from a mixture of white arſenic, fixed alkali, and ſoap. Albertus Magnus and Becher conſidered arſenic (by which they meant the white oxyd) as of a ſaline nature. Kunkel was alſo of the ſame opinion; and Macquer, by his diſcovery of the arſenite and arſeniat of potaſh, demonſtrated that in theſe combinations it held the place of an acid. Finally, Scheele proved, that the baſe of arſenic (according to the Stahlian theory then in vogue) was not only ſimilar to, but was actually an acid, by diſcovering the method of obtaining it in an uncombined ſtate.

Arſenic being found in the ores of many metals, often ſerving as a mineralizer to them, and adhering with great obſtinacy to them even when brought into the ſtate of regulus, was long conſidered, like mercury, as an eſſential component part of metallic ſubſtances, nor was this opinion abandoned till the celebrated eſſay of Monnet in reply to a prize queſtion propoſed by the Royal Berlin Academy, in 1773, on the nature and peculiar agency of arſenic in the formation of metals. In this treatiſe he ſhews arſenic to be a peculiar metal, eſſentially differing from all others, and inſtead of being a neceſſary component part of them, is often totally abſent, and when preſent is ſo far from perfecting them, that it always deteriorates and obſcures their characteriſtic properties.

§ 12. *Uſes of Arſenic.*

In the reguline ſtate, it is uſed to whiten COPPER, and enters as an ingredient in ſeveral kinds of SPECULUM METAL. Oxyd of arſenic is employed as a poiſon for rats and other vermin, and a flux in GLASS-*making*. Orpiment and realgar are of extenſive uſe in DYING and CALICO-PRINTING, and as a pigment. For the deleterious properties of arſenic, and its medical uſes, ſee the next article.

ARSENIC, *in Pharmacy, and its Operation upon the Human Body.*—Arſenic is perhaps of all natural ſubſtances, that which exerts the moſt virulent and dreadfully active operation upon the living animal, when taken into the ſtomach or any other part of the ſyſtem.

We are, unfortunately, too familiar with its effects as a poiſon; its cheapneſs and abundance rendering it eaſily acceſſible to malevolence, or obnoxious to careleſſneſs, and the hiſtory of almoſt every year adds to the number of ſufferers from this formidable mineral.

Nevertheleſs, as every poiſon, when judiciouſly managed, may be converted into a powerful medicine, ſeveral very ſkilful practitioners have attempted, and not without advantage, to add this ſubſtance to the materia medica, and hence the effects of arſenic become important to the phyſiologiſt in a double point of view, both that he may relieve and counteract them, when they operate as a poiſon; and manage them with judgment and caution, when they are intended to cure diſeaſe.

We may begin by obſerving, that all the preparations of arſenic appear, as far as experience goes, to operate in a ſimilar manner, though ſome with much more activity than others, in proportion to their quantity; and likewiſe it is fully aſcertained, that ſulphur moderates the operation of this metal in a very ſtriking manner, as indeed it does that of all the other metallic medicines. This comparative mildneſs of the ſulphuret may be the reaſon why the native orpiment and realgar have been employed medicinally for ages by ſome of the oriental nations, particularly, among other caſes, as an antidote to the bite of the cobra, and other venomous ſerpents; and we may remark, that the native arſénical ſulphures (as obſerved by Hoffman, and confirmed by ſubſequent experiments) are much milder and ſafer in their operations, than any of the artificial combinations of theſe two minerals.

When the active arſénical ſalts (the white arſenic for example) have been taken into the ſtomach in the quantity of a few grains or upwards, the moſt dreadful conſequences are obſerved to ſucceed: theſe are, firſt, a moſt horrible and almoſt indeſcribable anxiety at the pit of the ſtomach, to which ſucceeds a very acute burning pain in this organ, generally attended with violent retching and vomiting, whereby, indeed, the life of the ſufferer is ſometimes preſerved, owing to the rejection of the arſenic; this is often followed with ſevere purging, and the pain proceeds with increaſed virulence, to the bowels, and almoſt the whole of the alimentary canal; to this ſucceed, in a ſhorter or longer time, convulſive tremors of the limbs, cold ſweats, and a very ſudden and characteriſtic ſwelling of the emphyſematous kind, which puffs up the face, the neck, and at laſt every other part of the body. If no relief be obtained from theſe dreadful ſymptoms, they quickly proceed to the deſtruction of life; the unhappy ſufferer becomes inſenſible to ſurrounding objects, lying on his belly, with every muſcle diſtorted by the violence of the pain, his hands clenched, his eyes bloodſhot and glaſſy, his jaws now immoveably fixed, and unable to ſwallow either ſolids or liquids, his limbs convulſed with ſevere cramps, his face and neck ſo much ſwelled that the features can hardly be recognized, till at laſt death terminates his agony. On inſpecting the body after death, the ſtomach is always found highly inflamed, partly gangrenous, and often actually corroded by ſphacelated ſpots. The ſame inflammation and partial mortification alſo extend in moſt caſes to parts of the ſmall inteſtines. The body is ſaid to putrefy with remarkable rapidity.

Even when perſons have recovered from poiſoning by arſenic, they feel its effects long after in griping pains, tremors of the limbs, partial paralyſis, loſs of appetite, and often a lingering hectic fever, which remains for a conſiderable time, and without great attention to health, are apt materially to injure the conſtitution. An expoſure to the fumes of arſenic occaſions ſimilar accidents, particularly griping, bloody urine, and contraction of the body, and ſometimes a general eruption like the nettle-raſh; and hence in all chemical operations with this dangerous metal, the operator ſhould be particularly cautious of avoiding its noxious fumes.

Arſenic, when applied to any wounded or ulcerated ſurface of the body, is equally liable to produce the above-mentioned ſymptoms in a greater or leſſer degree; but as the firſt that appear are generally pains in the ſtomach and bowels, and ſwelling of the face, ſufficient warning is hereby given to withdraw the cauſe of them.

A variety of remedies againſt the poiſon of arſenic has been propoſed, all of which are intended to fulfil theſe two indications, to remove the noxious ingredient, and to protect the alimentary canal from its baneful operation. The firſt object is to get rid of the poiſon by moſt copious vomiting and purging; and for this purpoſe all the ſubſtances known to produce theſe effects, may be employed with the greateſt freedom. It has been thought that the rougher mineral emetic and purgative medicines ſhould be avoided, and certainly the milder vegetable ſubſtances appear the moſt eligible; but it is of ſuch infinite conſequence to apply an *immediate* remedy, that the preference due to one over another medicine can hardly ever be equivalent to the miſchief incurred by allowing this moſt corroſive and deleterious of all poiſons to remain a moment longer in the ſtomach than can be avoided. Hence the firſt emetic medicine at hand is always the beſt, nor ſhould the mechanical means of exciting vomiting, as by thruſting a feather down the throat, and the like, be neglected. In the intervals of vomiting, the ſtomach ſhould be deluged with any mild mucilaginous liquid that is at hand; milk, gruel, linſeed tea, broth, oil of any kind, or even warm water, in the largeſt poſſible quantity, ſhould be taken, and where the arſenic itſelf excites conſtant vomiting, as is often the caſe, no other remedy than theſe mucilaginous or oily liquids is required. Theſe ſhould be aſſiduouſly perſevered in till the burning pain and other ſymptoms produced by the arſenic are removed, and only the ſoreneſs conſequent to ſuch a violent exerciſe of the alimentary canal remains; after which a cautious and judicious uſe of opiates will prove of material benefit: but the ſtate of health will require much attention for a conſiderable time, before the conſtitution can entirely recover the effects of ſo rude a ſhock. When the poiſon has remained ſo long in the ſtomach that the ſufferer lies inſenſible, racked with pain and unable to ſwallow, recovery ſeems to be hopeleſs; in ſuch caſes, the moſt probable method of exciting vomiting is to lay ſome tartar emetic upon the tongue, part of which may perhaps be carried by the ſaliva into the ſtomach, and relieve it from the poiſonous mineral.

Some ingenious men have endeavoured to diſcover an antidote to arſenic, in the proper meaning of the term; that is, a ſubſtance which may prove a peculiar corrective to its baneful effects, by uniting with it when in the ſtomach, and deſtroying its acrimony. The well-known effect of ſulphur to mitigate the operation of all metallic bodies, readily ſuggeſted this as the deſired remedy, and the liquid alkaline ſulphuret was propoſed by Navier, an eminent phyſician of Chalons in France. Fourcroy has ſuggeſted the liquid hydro-ſulphures (or ſolutions of ſulphurated hydrogen in water, of which the ſulphurated mineral waters are familiar examples) as an improvement on Navier's remedy. Experience, however, has not confirmed the utility of either of theſe preparations. It is true, that if the poiſon and the antidote were previouſly mixed, and in a ſtate of ſolution, the former would be diſarmed of its terrible powers; but to truſt to the chance of a mere chemical operation in an organ ſo irritable as the ſtomach, ſo dreadfully ſuſceptible of active inflammation, and actually ſuffering under a violent injury, which is haſtening the deſtruction of the whole ſyſtem, is to carry the ideas of a laboratory much beyond the bounds of ſober prudence and ſound practice.

It has been urged, however, that after the immediate danger from arſenic has been removed by the liberal uſe of emetics and emollient liquids, much advantage may be derived from the uſe of the liquid ſulphurets. But at this period we have not (in all probability) any of the arſenic to remove, but only the inflammation, the effects of arſenic, and on what ground can ſulphurated hydrogen be ſuppoſed to be of uſe in inflammation of the ſtomach and bowels?

The medical chemiſt is ſometimes called upon by the magiſtrate to aſcertain the preſence or abſence of arſenic in the ſtomach of perſons who have died with ſome of the violent

lent ſymptoms above deſcribed. Some of the appearances, on diſſection, have been already mentioned. The preſence of arſenic, in ſubſtance, in the ſtomach, is thus aſcertained: firſt, make a ligature round the lower part of the oeſophagus, and another at the pylorus, to prevent any of the contents of the ſtomach from ſpilling; then take out this organ, empty its contents in a baſon, and rinſe the inner ſurface with a little cold water, which add to the other contents. As white arſenic, in ſubſtance, is generally that which is found after death by this poiſon, it will be ſeen in the form of a heavy white powder, from which the ſlime, and other contents of the ſtomach, may be waſhed off by repeated affuſions of cold water, which waſhings, however, ſhould not be thrown away, but added to the liquid contents. Then let the powder be ſubmitted to the following experiments: boil a portion of it in a Florence flaſk, in a few ounces of diſtilled water, and filter the liquid ſolution; add to a part of the clear liquid ſome water ſaturated with ſulphurated hydrogen gas, or a few drops of ſulphuret of ammonia, and if arſenic be preſent, a golden yellow ſediment will fall down, which will appear ſooner if a few drops of acetic acid be added; add to another portion of the ſolution a ſingle drop of a weak ſolution of carbonate of potaſh, and afterwards a ſolution of ſulphate of copper, when the arſenic will be indicated by a yellowiſh green precipitate, ſimilar to that which is known in chemiſtry by the name of *Scheele's green*; collect the ſediments and dry them, or if there is any of the powder to ſpare, take a portion of this, lay it upon red hot charcoal, when it will be entirely diſſipated in a white denſe vapour, having the garlic ſmell peculiar to arſenic.

But a portion of the white powder ſuſpected to be arſenic ſhould be reduced to the metallic ſtate, which may be done in the following neat manner, propoſed by Dr. Black: mix it with two parts of dry carbonate of potaſh, and one of powdered charcoal; procure a tube eight or nine inches long, and one-ſixth of an inch in diameter, of thin glaſs ſealed hermetically at one end; coat the cloſed end with clay for about an inch, and let the coating dry; then put into the tube the mixture of the powder and the flux, and if any of it ſhould adhere to the inner ſurface, let it be bruſhed down by a feather; ſtop the open end of the tube looſely with a cork, and gradually heat the ſealed end only, on a chafing-diſh of hot charcoal. The arſenic, if preſent, will then riſe to the upper part of the tube, on the inner ſurface of which it will form a thin, brilliant, metallic coating, whilſt a portion will eſcape in garlic-ſmelling fumes. When nothing more riſes from the heated end, break the tube, and ſcrape off the metallic cruſt formed on the upper part. Of this, lay a part on heated iron, when it will totally exhale in a denſe ſmoke, with the peculiar arſenical ſmell; put another part between two poliſhed pieces of copper (halfpence, for example, rubbed quite bright), bind them together with wire, and expoſe them ſlowly to a low red heat; if the enclоſed ſubſtance is arſenic, it will leave a white ſtain on the copper.

If it ſhould happen that no white powder is found in the ſtomach, the liquid contents, when filtered along with the waſhings, ſhould be evaporated to dryneſs, and the reſidue examined in the ſame manner as the white powder; but this would be a work of greater difficulty on account of the caſual mixture with the other contents of the ſtomach.

By theſe means the preſence of arſenic, even in very ſmall quantity, may be detected by any one tolerably verſed in chemical experiments; but, for greater ſecurity, it may be adviſable to perform ſeparate and parallel experiments with the white arſenic of the ſhops, and compare the reſults and appearances.

It is a matter of common obſervation, that no vegetable or mineral poiſon, however virulent, exiſts, which in diminiſhed quantity and by prudent precautions may not be converted into a valuable remedy. This obſervation will apply even to arſenic, and we have the moſt reſpectable teſtimony to its value in the cure or relief of ſome complaints which entitles it to conſiderable notice. The medicinal uſe of the ſulphurets of arſenic may be traced back to very early times, and the Greeks and Romans appear to have uſed it with conſiderable freedom. Dioſcorides obſerves that the arſenic (ἀρσενικὸν) is found in the ſame minerals which produce the ſandarach. The beſt for medicinal purpoſes, he adds, is of a golden colour, unmixed with any other ſubſtance, which eaſily ſeparates into ſcales, and comes from Myſia on the Helleſpont. An inferior ſort comes from Pontus and Cappadocia. It is prepared by roaſting on hot coals, with conſtant ſtirring till it takes fire, and alters in colour, when it is to be cooled and carefully pulverized. The ſandarach is prepared in the ſame manner as the arſenic or orpiment, and poſſeſſes the ſame virtues. When taken internally, they have a violent corroſive and aſtrictive operation, exciting a burning on the ſkin, and cauſing the hair to fall off. Theſe arſenical powders were uſed principally as external applications, mixed with pitch, oil, or fat, againſt a variety of cutaneous complaints, itch, phthiriaſis, and other defedations of the ſkin, and alſo to ulcers of the noſtrils and mouth, and condylomata.

Much attention has been beſtowed in modern times to the power ſaid to be poſſeſſed by arſenic of relieving or curing cancers, when employed both as a topical application, and taken into the ſtomach. The progreſs of this diſorder is ſo dreadful, and the remedies uſually employed have proved ſo inadequate to ſtop its ravages, that any medicine, however ſevere, may be employed without cenſure, which affords a chance of permanent relief. We have ſtill to regret that the flattering hopes of a cure, and the real benefit often produced by this metal, have not been confirmed by frequent experiment; but the virtues of this remedy, however, are too important to be neglected. Several medical practitioners and empirics have gained much credit for ſuppoſed cures of cancers by remedies which appear to have been arſenical; and Mr. Juſtamond, in his valuable Surgical Tracts (London, 1789), gives the recipe of an arſenic cauſtic, called "the earl of Arundel's receipt to cure a cancer," and found in the Harleian MSS. which appears to have been divulged by a woman in the lower order of people, in the year 1638, whoſe father had long employed it for the cure of cancers.

Mr. Juſtamond, in his ingenious work above quoted, gives the hiſtory of many caſes of cancer in different ſtages, in which the following arſenical preparations were topically applied:

1. The earl of Arundel's receipt above mentioned, compoſed of one ounce of yellow arſenic, and half an ounce of bole armenic; or elſe of one ounce of the yellow arſenic, half an ounce of the red precipitate, and half an ounce of bole armenic.

2. A ſulphuret of arſenic, formed in the following way: Take four pounds of ſulphur, and one pound of white arſenic, mix and put them into a glaſs retort, on a ſand heat, and lute to the retort a long neck and receiver: raiſe the fire gradually till the mixture be fuſed: reject the ſublimed portion, and reſerve the fixed matter beneath, which muſt be finely levigated.

3. A mixed ſulphuret of arſenic and antimony, formed by melting together in a crucible, with a very moderate heat, the native black ſulphuret of antimony (or the common antimony

timony of the ſhops), with white arſenic, in proportions varying according to the intention; being two parts of arſenic to one of antimony, where a violent arſenical cauſtic is wanted; and two parts of antimony with one of arſenic, where a milder eſcharotic is required.

Mr. Juſtamond began the above arſenical application, to the open or ulcerated cancers, which he uſed in the form of powder or ſcrapings, laid to the moſt ulcerated parts, whilſt he frequently moiſtened the hard retracted edges of the wound with a ſolution of muriated iron, with ſal ammoniac.

The immediate effect of the arſenic was to give a moſt acute and burning pain, which conſtantly attended every freſh application, and probably would be hardly tolerable to any, but to thoſe who are ſuffering under one of the moſt dreadful, haraſſing, and hopeleſs diſorders which ever come under the care of the ſurgeon. The firſt beneficial effect of the arſenical powder, was to correct, and almoſt entirely to remove the ſickening ſtench which attends theſe ſpecies of ulceration; and this was invariably the caſe, even when it failed to give any other relief. Afterwards the powder (where ſucceſsful) evidently improved the condition of the ſore, and by repeating it daily, with much perſeverance and attention, Mr. J. happily ſucceeded in producing a complete cure. It was only, however, in one or two inſtances that this was effected; and in others, the poiſon of the arſenic abſorbed into the ſyſtem, produced its baneful operation with ſo much rapidity, bringing on partial palſy, and ſevere pain with cramp in the bowels, that he was obliged inſtantly to diſcontinue it; with the unpleaſant feeling, that he had added to the already diſeaſed conſtitution of his patient, the ſevere diſorder occaſioned by the arſenical remedy itſelf. Mr. Juſtamond then made a trial of the ſtronger arſenical cauſtic (two parts of arſenic fuſed with one of antimony), to ſchirrous tumours of the breaſt, before they had proceeded to ulceration, with the view of *turning them out* entire, or as it were diſſecting them out by cauſtic, inſtead of the knife. In this he followed the example of Guy and Plunkett, who had been celebrated for this ſpecies of operation, an operation only to be undertaken when the patient is too timorous to ſubmit to the ſafer and more expeditious uſe of the knife. Mr. J. mixed the arſenical cauſtic with an equal weight of opium, brought the powder to the conſiſtence of an ointment by the yolk of an egg, and having the day before ſeparated the cuticle of the tumor by lunar cauſtic, he applied the arſenic over the whole ſurface. The pain was very great for twenty hours, after which it ſubſided. After ſome days the tumor began to ſeparate, and by repeating the cauſtic round the ſeparating edges, the ſchirrous gland, in about two months, "came out entire as a nut out of its ſhell, or as if it had been cleanly diſſected with a knife."

We ſhall proceed to enumerate ſome of the other noted arſenical preparations, employed externally to cancers and ſchirrous tumours. The following is given as Plunkett's celebrated arſenical cauſtic, with which the inventor uſed to extirpate ſchirrous tumours before they had arrived to ulceration.

4. Take of the leaves of the ranunculus acris (crowfoot), and of the flammula vulgaris (leſſer crowfoot, alſo a ſpecies of ranunculus), of each one ounce; of white arſenic levigated, one drachm; of flowers of ſulphur, five ſcruples. The two former plants being freſh gathered and bruiſed, the arſenic and ſulphur are to be added, and the whole beaten into a paſte, which is to be formed into balls, and dried in the ſun. When uſed they are to be beaten up with yolk of egg, and applied on a piece of pig's bladder to the ſurface of the tumour. This is to remain till the eſcharotic ſeparates ſpontaneouſly. The ranunculus, which is an acrid plant, is not here an uſeleſs addition, as it aſſiſts in ſeparating the cuticle, and till this is done the arſenic is ſcarcely able to act.

5. The arſenicum citrinum *(gelber arſenik)* employed at Vienna, is one of the ſtrongeſt of theſe preparations, being compoſed of ten parts of arſenic ſublimed with one of ſulphur. When uſed, the ſcrapings of it are laid on the cancerous ulcer till it is conſumed. The pain which it occaſions is moſt ſevere.

Mr. Febure's arſenical remedy *(Remède éprouvé pour guerir radicalement le Cancer occulte, ou ulceré*, Paris, 1775), which excited much attention at the time, is the following:

6. Take one pint of water; one ounce of extract of cicuta; three ounces of Goulard's extract; one drachm of liquid laudanum; and ten grains of arſenic; mix them into a liquid, with which the cancer is to be ſmeared every morning and evening.

Laſtly, of the external applications, we may mention the following, which is ſimple, and probably as efficacious in ulcerated cancer as any of the preceding.

7. Take a ſolution of white arſenic in water, in the proportion of one grain to two pints, mix it with crumb of bread into a poultice, and apply it to the open ſore.

Febure appears to be the firſt who ventured to recommend the *internal* uſe of arſenic in the cure of cancer; a practice which has rarely been openly followed, though probably this mineral forms the baſis of many of the empirical remedies for this diſeaſe. Febure's internal arſenical medicine is the following:

8. Take of white arſenic, two grains; of ſyrup of chicory with rhubarb, half an ounce; of water, one pint. Of this one table ſpoonful is given every morning and evening, in an ounce of milk, with half a drachm of ſyrup of poppies. The doſe is to be gradually increaſed as the patient can bear it.

Mr. Juſtamond alſo was able to give internally as much as five grains of the arſenical ſulphuret (N° 2.) daily, without injuring the patient.

The inference which the reader will be diſpoſed to draw from all that we have given, concerning the efficacy of arſenic in cancerous complaints, will not probably be very encouraging to its uſe. The actual pain attending its application is always very acute, though perhaps not more ſo than the diſeaſe itſelf; but the quantity of the remedy here requiſite, either for external or internal uſe, is ſo conſiderable, as to incur great danger of poiſoning the conſtitution irremediably, and inducing calamities almoſt equal to thoſe which it is deſigned to counteract.

With more ſatisfaction we can conclude our account of this mineral, with a hiſtory of its employment in another obſtinate and often dangerous diſorder, in which it promiſes very great advantage, unattended with any conſiderable riſk where managed with great prudence and diſcretion. This is, in obſtinate and lingering agues, ſuch as have reſiſted ordinary remedies, and are proceeding gradually to undermine the conſtitution by their periodical and repeated paroxyſms.

We owe the introduction, or at leaſt the publicity of this remedy to Dr. Fowler's highly valuable ſeries of experimental caſes, undertaken in the Stafford infirmary, in 1784, and publiſhed in the following year. The circumſtance that directed his attention to this remedy, was the very great ſale and ſucceſsful operation of certain *patent ague drops*, which were (probably with reaſon) ſuppoſed to be a preparation of arſenic.

Dr.

Dr. Fowler's arſenical ſolution is thus prepared.

9. Take white arſenic in fine powder, and pure ſalt of tartar, of each ſixty-four grains, put them into a Florence flaſk, or other glaſs veſſel, along with half a pint of diſtilled water, heat them ſlowly to boiling, till the ingredients are diſſolved; when cold, add half an ounce of compound ſpirit of lavender, and diſtilled water ſufficient to make up the whole quantity one pint, or rather fifteen ounces and a half troy-weight.

Of this ſolution, one ounce, apothecaries meaſure, contains four grains of arſenic, or one dram, half a grain; and Dr. F. calculates each dram to be equivalent to eighty drops.

In preparing this liquid, the operator ſhould be aware that the ſalt of tartar of the ſhops, even the pureſt, ſeldom makes a perfectly clear ſolution with water, but leaves a ſmall earthy ſediment, which no continuation of the boiling will diſſolve. Inſtead of this alkali, twice the weight of pure nitre has been employed, which promotes the ſolubility of the arſenic, and is perhaps ſomewhat preferable to the ſalt of tartar. Theſe ſalts are not neceſſary to the immediate ſolution of arſenic, but they prevent this metallic oxyd from ſeparating again from the water by long keeping.

The proportion of arſenic to water, in the ſolution, may be varied from the form above given; but as white arſenic requires eighty times its weight of cold water to remain diſſolved, not leſs than this quantity ſhould be employed, and the nitre or alkali ſhould never be omitted, as it is of the utmoſt importance for the practitioner to know preciſely the doſe of arſenic which he preſcribes.

Dr. F. found that for the cure of intermittents it was of importance to give the arſenic in divided doſes as faſt as the patients could bear it, without experiencing inconvenience from its poiſonous effects. Strong adults could generally bear about ten drops of the ſolution (equivalent to one-ſixteenth of a grain of arſenic) for a doſe, which he repeated twice, or, if convenient, thrice a day. By ſlow increaſe, ſome were able to bear as much as twenty drops for a doſe, and this courſe was continued for five days, when, if the fits of the intermittent were ſuſpended, the drops were interrupted for two or three days, and then reſumed for three days longer to prevent a relapſe.

Infants could bear about two drops twice a day, and young or delicate perſons took the ſolution in intermediate doſes from two to ten or twelve drops.

The operation of this powerful remedy was truly ſurpriſing in checking almoſt immediately, and finally removing the paroxyſms of the moſt obſtinate intermittents, ſome of which had reſiſted bark and other remedies for a conſiderable time. In a few, however, it failed entirely; and in others the poiſonous effects of the arſenic came on ſo ſpeedily that it could not be continued, and the cure was completed by bark and other tonics.

Every practitioner will be aware of the great caution neceſſary in the exhibition of a remedy, which, though ſafe in prudent hands, might induce the moſt dangerous accidents if expoſed to careleſſneſs or ignorance. In moſt of the ſucceſsful caſes, the medicine removed the diſeaſe without producing any of the inconveniences attending its uſe in larger doſes; but when the arſenic began to ſhew its poiſonous effects, the ſymptoms were, naufea, often accompanied with a ſlight griping and purging, ſwellings of the ſoft integuments of the body, particularly the face, ſometimes uneaſineſs at the ſtomach, and a ſlight eruption like the nettle-rath; and, in a very few inſtances, head-ach, ſweat, and ſlight tremors. By attending to theſe ſerious and very characteriſtic warnings, and by the aſſiſtance of gentle aperients, opiates, and other means which will readily ſuggeſt themſelves to the prudent phyſician, this terrible mineral may be enliſted into the ſervice of the healing art, whilſt its cheapneſs, inſipidity, and great activity in a very ſmall bulk may ſometimes render it preferable to the ſafer drugs and barks, which oppreſs the ſtomach by their bulkineſs, and diſguſt by their naufeous flavour.

We may add that,

10. The arſeniat of potaſh, deſcribed in § 10. of the preceding article, has been employed in intermittents with the ſame effect as the ſolution, and its ready ſolubility and uniformity of compoſition may perhaps give it a claim to preference. The medium doſe of this ſalt may be a fifth of a grain three times a day.

Arſenic has been occaſionally employed with conſiderable ſucceſs, when applied to the ſurface of the body in a variety of cutaneous complaints; and it might be adopted with more freedom, if it were not for the extreme danger to which any neglect of the warning ſymptoms of poiſoning might expoſe the patient, a danger the more likely to be in chronic complaints often neglected, and not always ſufficiently under medical inſpection. Orpiment mixed with tar, with digeſtive ointment, or other unctuous ſubſtances, has been found of eminent ſervice in tinea capitis, a preſcription handed down to us from the ancients; but if the medical practitioner will venture on this hazardous, and not often neceſſary remedy, he ſhould never forget the much ſuperior virulence and activity which the artificial orpiments and arſenical ſulphurets poſſeſs over the natural. Orpiment and quicklime, boiled in water for a ſhort time, form a liquor which, if often applied to the cuticle, cauſes the hair to fall off; and the growth of it, when thus checked, is ſeldom renewed. Dioſcorides. Plenk's Pharmacologia Chirurg. 1782. Fowler's Medical Reports on the Effects of Arſenic, 1786. Juſtamond's Surgical Tracts, 1789. Pharm. Danica. Henry's Epitome of Chem. 1801, &c.

Arsenic, in *Surgery*, has been long employed as a local remedy. It is chiefly recommended in caſes where a ſtrong eſcharotic is indicated, and eſpecially in cancerous or ſordid ulcers; but, as its effects are entirely cauſtical, our account of the mode in which it ſhould be applied is referred to the foregoing article and to that of Caustic.

ARSENIUS, in *Biography*, archbiſhop of Malveſia in the Morea, was a learned philologiſt, in the ſixteenth century. He ſubmitted to the church of Rome, and thus incurred the diſpleaſure of his brethren of the Greek church; ſo that he was excommunicated by the patriarch of Conſtantinople. He died at Venice in 1535. His works are, "A Collection of Greek Apophthegms," publiſhed at Rome; and "A Collection of Scholia on ſeven of the Tragedies of Euripides," printed at Venice, in 8vo. in 1534. Fabr. Bib. Græc. l. v. c. 41. § 8. t. x. p. 222.

ARSENOTHELYS, among *Ancient Naturaliſts*, the ſame with hermaphrodite.

The Greeks uſe the word both in ſpeaking of men and beaſts.—It is formed from αρσην and θηλυς, *male* and *female*.

ARSENVAL, in *Geography*, a town of France, in the department of the Aube, and chief place of a canton in the diſtrict of Bar-ſur-Aube, twenty-three miles eaſt of Troyes.

ARSIA, in *Ancient Geography*, a ſmall river which had a northern courſe, and ſerved as a boundary between Hiſtria and Illyria, to the north of the Flanatic gulf. It there terminated Italy on the north-eaſt of the Polatic promontory.

ARSIANA, or Ariana, a town of Aſia, in Suſiana, ſeated on a mountain to the weſt of the Tigris.

ARSICARITA,

ARSICARITA, an epiſcopal ſee of Africa, in Numidia.

ARSICUA, a town of Germany. Ptolemy.

ARSINARIUM, a promontory of the weſtern coaſt of Africa, in Lybia Interior, now *Cape* Verd, or Cape Bojador.

ARSINIA, Arceni, a town of Aſia, in Armenia, W. N W. of Amida, and near it.

ARSINNUARITANUS, an epiſcopal ſee of Africa, in Mauritania Cæſarienſis.

ARSINOE is a name given to ſeveral places not only in Egypt, but alſo in other countries; and according to Bryant (Anc. Myth. vol. i. p. 209.), it was ſynonymous with Arſene, Arſine, and Arſiana. Arſinoe, ſays this writer, is a compound of Arez-ain, Sol's ſons; and moſt places ſo denominated will be found famed for ſome fountain. To this purpoſe he obſerves, that Arſinoe in Syria had its name from the ſtreams which iſſued out of the riſing ground on which it ſtands; Arſine and Arſiana in Babylonia had fountains of bitumen; Arſene in Armenia was a nitrous lake; near Arſinoe upon the Red Sea were ſtreams of bitter waters; and Arſinoe near Epheſus had waters equally bitter. The *firſt Arſinoe* we ſhall mention was a town of Egypt, ſeated on the weſt ſide of the Arabian gulf near its extremity, and not far from the ſituation of the modern Suez. Ptolemy and Strabo mention this city; and the latter ſays, that it was called by ſome Cleopatris. It is ſaid, that it was called Arſinoe from a queen of that name in the time of the Ptolemies; and that Cleopatra embelliſhed it with new buildings, whence it was called after her name. In order to bring the trade from India, which began to revive at Tyre its ancient ſtation, to center in Alexandria, Ptolemy Philadelphus undertook to form a canal, an hundred cubits in breadth, and thirty in depth, between Arſinoe and the Peluſiac branch of the Nile; and Mr. Rennell ſtates the diſtance between Peluſium (Tinah), and Arſinoe (Suez), at fifty-ſix Britiſh miles; and by means of this canal he propoſed to convey the productions of India to that capital wholly by water. But the work was never finiſhed. A *ſecond Arſinoe* was a town of Egypt, the chief place of a nome which bore its name, on the weſt ſide of the Nile, above Memphis, ſouth of Acanthon and north of Ptolemais. It was alſo called the "City of Crocodiles," becauſe the inhabitants worſhipped that animal, and bred ſome of the ſpecies in the neighbouring lakes. This city muſt have ſtood at ſome diſtance from the river, ſince Ptolemy calls it a Mediterranean metropolis. It retained its name Arſinoe in the time of Adrian. Imperial Greek medals were ſtruck in this city in honour both of Trajan and Adrian. It is now called Faioum. The province, of which it was the capital, contained the Labyrinth and its twelve palaces, the lake Mœris, and the pyramids deſcribed by Herodotus, but not exiſting in the time of Auguſtus, as they are not mentioned by Strabo; and it is extolled by Strabo (l. xvii.) for its beauty, fertility, and the variety of its productions. It abounded with wine, corn, vegetables, and ſeeds of every kind. A *third Arſinoe* was a port of the Red Sea, to the left of the entrance into it and near the promontory *Dire* or *Diræ*, according to Strabo and Ptolemy. This was ſometimes called Berenice. A *fourth* is placed by Strabo on the Red Sea, conſiderably more to the north than Philoteras. Its warm, ſaline, bitter waters flowed from a high rock and ran into the ſea near this town. A *fifth* was a town of Africa, in the Cyrenaica, between Leptis and Ptolemais; the ſame that was formerly called "Teuchira." A *ſixth* was a town of Cœloſyria, according to Steph. Byz. A *ſeventh*, a town of Aſia, in Syria, ſeated on a hill near a valley which was near Damas. An *eighth*, a maritime town of Aſia, in Cilicia, to the eaſt of the river Orymagdus, in the diſtrict called Cetidis; it had a port and road for ſhips. A *ninth*, a town of Greece, in Ætolia, at the paſſage of the Achelous, near Canopa; ſo called from the wife and ſiſter of Ptolemy II., and mentioned by Cicero. A *tenth Arſinoe* is, according to Strabo, one of the names given to the city of Epheſus. An *eleventh Arſinoe* is a maritime town of the iſle of Cyprus, ſituate to the weſt between old and new Paphos: ſo called from a queen of Egypt, Cyprus having been long ſubject to the Ptolemies. It had a port, a temple, and a grove. A *twelfth Arſinoe* was alſo a ſmall town of Cyprus, on the northern coaſt, at the bottom of a ſmall gulf cloſed to the north-weſt by the promontory Acamas. 13. There was another town of this name on the eaſtern coaſt of the ſame iſland, to the ſouth-eaſt, and very near Salamis. 14. *Arſinoe* was alſo the name of an inland town of Cyprus.

Arsinoe, in *Entomology*, a ſpecies of Papilio (*Nymph. Gem.*) found in the iſland of Amboyna, the wings of which are tailed, indented, fulvous, ſpotted with black; and the poſterior ones marked both above and beneath with two ocellated ſpots. It is figured by Seba and Cramer.

ARSIS, and Thesis, in *Proſody*, are names given to the two proportional parts into which every foot or rhythm is divided.

By *arſis* and *theſis* are uſually meant no more than a proportional diviſion of the metrical feet, made by the hand or foot of him that beats the time.

And in meaſuring the quantities of words the hand is elevated, as well as let fall; that part of the time which is taken up in meaſuring the foot, by lifting the hand up, is termed *arſis* or *elevatio*: and the part where the hand is let fall, *theſis* or *poſitio*. Vid. Auguſtin, de Muſica, lib. ii. cap. 10. In *plaudendo enim quia elevatur & ponitur manus, partem pedis ſibi elevatio vendicat, partem poſitio.*

Arsis and *theſis* are uſed as muſical terms when the ſubject of a fugue or point is inverted or reverſed; i.e. when one part riſes and the other falls. Theſe two words are Greek: *arſis* comes from ἄιρω, *tollo*, I raiſe or elevate; θέσις, *depoſitio*, *remiſſio*, a depreſſion or lowering. Theſe terms were applied by the ancients to the motion of the hand in beating time.

ARSISACA, in *Ancient Geography*, a town of Aſia, ſituate in the interior part of Media. Ptolemy.

ARSISSA, a lake of Aſia, in Armenia, about a degree from eaſt to weſt, called the lake of *Van* or *Argiſh*; between 37° 45′, and 38° 30′ N. lat.

ARSITIS, a country of Aſia, near mount Coronos in Hircania. Ptolemy.

ARSK, a town of Ruſſia, in the government of Caſan, forty miles N. N. E. of Caſan. N. lat. 56° 20′. E. long. 49° 34′.—Alſo, the name of one of the thirteen diſtricts of Caſan, ſituate on the river Caſanka.

ARSKOG, a large foreſt in the northern part of Sweden, in the province of Medelpad.

ARSLAN, a fortified place of Aſia, in Perſia, near Caſbin, in the province of Erach.

ARSMART, in *Botany*. See Polygonum.

ARSOFFA, a fortified town of Aſia, in that part of Arabia which is called the Deſert of Syria; ſuppoſed by ſome to be the ſame with Reſapha in the Palmyrene territory, mentioned by Ptolemy: it is ninety miles ſouth-eaſt of Aleppo.

ARSON, *ab ardendo*, in *the Law of England*, a felony at common law, in maliciouſly and wilfully burning the houſe, or out-houſes, of another, by night or by day. See Hawkins's Pleas of the Crown, book i. chap. 39.

The out-houſes, though not contiguous to the dwelling-houſe, nor under the ſame roof, that are parcel thereof, ſuch as barns and ſtables, may be the ſubject of arſon: and this by the common law, which alſo accounted it felony to burn a ſingle barn in the field, if filled with hay or corn, though not parcel of the dwelling-houſe. The burning of a ſtack of corn was anciently likewiſe eſteemed arſon. The offence of arſon, ſtrictly ſo called, may be committed by wilfully ſetting fire to one's own houſe, provided one's neighbour's houſe is thereby alſo burnt; but if no miſchief is done but to one's own, it does not amount to felony, though the fire was kindled with intent to burn another's. For by the common law, no intention to commit a felony amounts to the ſame crime; though it does, in ſome caſes, by particular ſtatutes. However, ſuch wilful firing one's own houſe in *a town*, is a high miſdemeſnor, and puniſhable by fine, impriſonment, pillory, and perpetual ſureties for the good behaviour. And if a landlord or reverſioner ſets fire to his own houſe, of which another is in poſſeſſion under a leaſe from himſelf and from thoſe whoſe eſtate he hath, it ſhall be accounted arſon; for, during the leaſe, the houſe is the property of the tenant. A bare intent or attempt to burn a houſe, by actually ſetting fire to it, unleſs it abſolutely burns, does not fall within the deſcription of "incendit et combuſſit," which were words neceſſary, in the days of law-latin, to all indictments of this ſort. But the burning and conſuming of any part is ſufficient; though the fire be afterwards extinguiſhed. Alſo, it muſt be a malicious burning; otherwiſe it is only a treſpaſs; and therefore no negligence or miſchance amounts to it. But by 6 Ann. c. 31.; any ſervant, negligently ſetting fire to a houſe or out-houſe, ſhall forfeit 100 *l.* or be ſent to the houſe of correction for eighteen months; in the ſame manner as the Roman law directed: "eos, qui negligenter ignes apud ſe habuerint, fuſtibus vel flagellis cædi."

The puniſhment of arſon was death by our ancient Saxon laws. And in the reign of Edw. I., this ſentence was executed by a kind of "lex talionis;" for the incendiaries were burnt to death; as they were alſo by the Gothic conſtitutions. The ſtatute 8 Hen. VI. c. 6. made the wilful burning of houſes, under ſome ſpecial circumſtances therein mentioned, amount to the crime of high treaſon. But it was again reduced to felony, by the general acts of Edw. VI. and queen Mary; and now the puniſhment of all capital felonies is uniform, namely, by hanging. The offence of arſon was denied the benefit of clergy by 31 Hen. VIII. c. 1. but that ſtatute was repealed by 1 Edw. VI. c. 12.; and arſon was afterwards held to be ouſted of clergy, with reſpect to the principal offender, only by inference and deduction from the ſtatute 4 & 5 P. & M. c. 4., which expreſsly denied it to the acceſſory before the fact: though even it is expreſsly denied to the principal in all caſes within the ſtatute 9 Geo. I. c. 22. Blackſt. Com. vol. iv. p. 220. &c.

ARSON *Appeal of.* See APPEAL.

ARSTAD, in *Geography.* See ARAD and ROUWADDE.

ARSUF, a ſea-port town of Paleſtine, in the Mediterranean, ſix miles north-eaſt from Joppa. It is in ruins: but in its vicinity there is a ſmall iſland called *Arſuffo*.

ARSURA, in *Ancient Cuſtoms*, a term uſed for the melting of gold and ſilver, either to refine them, or to examine their value. Spelman.

The method of doing this is explained at large in the Black Book of the Exchequer, aſcribed to Gervaiſe, in the chapter De Officio Militis Argentarii, being in thoſe days of great uſe, on account of the various places and different manners in which the king's money was paid.

ARSURA is alſo uſed for the loſs or diminution of the metal in the trial. In this ſenſe a pound was ſaid *tot ardere denarios*, to loſe ſo many penny-weights.

ARSURA is alſo uſed for the duſt and ſweepings of ſilverſmiths, and others who work in ſilver, melted down. Du-Cange.

ARSURA is alſo uſed, in ſome writers, for the diſeaſe called *eryſipelas*, or *ignis ſacer*.

ARSURITA, in *Ancient Geography*, an epiſcopal ſee of Africa, in Bizacium.

ART, is defined to be a habit of the mind preſcribing rules for the due production of certain effects; or the introducing the changes of bodies from ſome fore-knowledge and deſign in a perſon endued with a principle or faculty of acting.

The word art is derived from ἀρὸς, *utility, profit;* and is found in that ſenſe in Æſchylus.

According to lord Bacon, it is a proper diſpoſition of the things of nature by human thought and experience, ſo as to make them anſwer the deſigns and uſes of mankind. Nature, according to that philoſopher, is ſometimes free, and at her own diſpoſal; and then ſhe manifeſts herſelf in a regular order; as we ſee in the heavens, plants, animals, &c.—Sometimes ſhe is irregular and diſorderly, either through ſome uncommon accident, or depravation in matter, when the reſiſtance of ſome impediment perverts her from her courſe; as in the production of monſters.—At other times ſhe is ſubdued and faſhioned by human induſtry, and made to ſerve the ſeveral purpoſes of mankind.—This laſt is what we call art.—In which ſenſe, art ſtands oppoſed to nature. Hence the knowledge of nature may be divided into the hiſtory of *generation*, of *pretergeneration*, and of *arts*.—The firſt conſiders *nature* at liberty; the ſecond, her errors; and the third, her reſtraints.

The ingenious Mr. Harris, after purſuing ſeveral regular gradations in his inquiries concerning this ſubject, deduces from it an anſwer to four different queſtions. If it be aſked, "What art is?" We have to anſwer, "It is an habitual power in man, of becoming the cauſe of ſome effect, according to a ſyſtem of various and well-approved precepts." If it be aſked, "On what ſubject art operates?" We can anſwer, "On a contingent, which is within the reach of the human powers to influence." If it be aſked, "For what reaſon, for the ſake of what, art operates?" We may reply, "For the ſake of ſome abſent good, relative to human life, and attainable by man, but ſuperior to his natural and uninſtructed faculties." Laſtly, if it be aſked, "Where it is the operations of art end?" we may ſay, "Either in ſome energy, or in ſome work." Harris's Three Treatiſes, dialogue i.

ART is alſo uſed for ſcience or knowledge, reduced into practice.

Several of the ſchoolmen hold logic and ethics to be arts; inaſmuch as they do not terminate in mere theory; but tend to practice.

In this ſenſe ſome branches of the mathematics alſo are arts; others, matters of doctrine or ſcience. Statics is wholly ſcientifical, as it comprehends the mere contemplation of motion: mechanics, on the contrary, is an art, as it reduces the doctrine of ſtatics into practice.

ART is more commonly uſed to denote a certain ſyſtem or collection of rules, precepts, and inventions or experiments, which being duly obſerved, make the things a man undertakes ſucceed, and render them advantageous and agreeable. In this ſenſe, art is oppoſed to ſcience, which is a collection of ſpeculative principles and concluſions.

The nature and origin of art, and its diſtinction from

ſcience, are conſidered more at large in the preface to this work.

Arts, according to the foregoing definition, may be divided into *active* and *effective*.—Such as leave no external effect after their operation, as dancing, fiddling, &c. are called *active* or *practical* arts: thoſe which do leave an effect behind them, as painting, &c. are called *effective* arts.

Farther, with reſpect to their ſcope and object, they may be divided into *human*, as medicine; and *divine*, as theology.

Arts, *human*, again may be ſubdivided into *civil*, as law, politics, &c.; *military*, as fortification, &c.; *phyſical*, as agriculture, chemiſtry, anatomy, &c.; *metaphyſical*, as logic, pure mathematics, &c.; *philological*, as grammar, criticiſm, &c.; *mercantile*, to which belong the mechanical arts and manufactures. See each in its place.

Arts are more properly divided into *liberal* and *mechanical*.

Arts, *liberal*, or *polite*, are thoſe that are noble and ingenious, or which are worthy of being cultivated without any immediate regard to the lucre ariſing from them. They are ſuch as depend more on the labour of the mind than on that of the hand; or that conſiſt more in ſpeculation than operation, and have a greater regard to amuſement and curioſity than neceſſity. Such are poetry, muſic, painting, grammar, rhetoric, the military art, architecture, and navigation. The liberal arts uſed formerly to be ſummed up in the following Latin verſe:

"Lingua, Tropus, Ratio, Numerus, Tonus, Angulus, Aſtra."

In the eighth century, the whole circle of ſciences was compoſed of the ſeven liberal arts, as they were called; viz. grammar, rhetoric, logic, arithmetic, muſic, geometry, and aſtronomy: the three former of which were diſtinguiſhed by the title of *trivium*, and the four latter by that of *quadrivium*.

Arts, *mechanical*, are thoſe wherein the hand and body are more concerned than the mind; and which are chiefly cultivated for the ſake of the profit attending them.—Of which kind are moſt of thoſe which furniſh us with the neceſſaries of life, and are popularly known by the name of trades and manufactures.—Such are weaving, turnery, brewing, maſonry, clock-making, carpentry, joinery, foundery, printing, &c. Theſe arts, which indeed are innumerable, were formerly compriſed under this verſe:

"Rus, Nemus, Arma, Faber, Vulnera, Lana, Rates."

The mechanical arts take their denomination from μηχανη, *machine*, as being all practiſed by means of ſome machine or inſtrument. With the liberal arts it is otherwiſe; there being ſeveral of them which may be learnt and practiſed without any inſtrument at all; as logic, eloquence, medicine properly ſo called, &c.

The arts which relate to the ſight and hearing, lord Bacon obſerves, are reputed *liberal*, beyond thoſe which regard the other ſenſes, and are chiefly employed in matters of luxury; theſe are uſually called the *fine arts*; ſuch are poetry, painting, ſculpture, muſic, gardening, and architecture.

As all arts have this common property, according to the definition above cited from Mr. Harris's dialogue, that they reſpect human life, it is evident that ſome contribute to its "neceſſities," as medicine and agriculture; and others to its "elegance," as muſic, painting, and poetry. The former ſeem to have been prior in time to the latter. Men muſt naturally have conſulted how to live and to ſupport themſelves, before they began to deliberate how to render life agreeable. Indeed this is confirmed by fact, as no nation has been known ſo barbarous and ignorant, as not in ſome degree to have cultivated the rudiments of theſe neceſſary arts; and hence poſſibly they may appear to be more excellent and worthy, as having claim to a preference derived from their ſeniority. The arts, however, of elegance are not deſtitute of pretenſions, if it be true, that nature formed us for ſomething more than mere exiſtence. Nay farther, if well-being be clearly preferable to mere being, and this, without the other, be contemptible, they may have reaſon perhaps to aſpire even to a ſuperiority. Harris, ubi ſupra, p. 54.

As the hiſtory of the origin and progreſs of the particular arts is recited under their reſpective denominations in the courſe of this work, it is unneceſſary to enlarge in this place. It may be obſerved, however, in general, that moſt of the arts that are neceſſary to the ſubſiſtence, or conducive to the convenience and comfort of mankind, have had a very early origin. Some of them may be conſidered as almoſt coeval with the human race; and others have ſprung up at different periods and in various nations, ſo remote, that the hiſtory of their riſe and of their progreſs for many ages is involved in an obſcurity which precludes any ſatisfactory inveſtigation. The want of food, raiment, and habitations, would naturally ſuggeſt a variety of inventions; and when the firſt and ſcanty demands of neceſſity were ſatisfied, mankind would proceed by further diſcoveries to improve the ordinary means of ſupply, and at length to meliorate and embelliſh the condition which providence had aſſigned them. But for a long time their real exigencies would be few, and their views and wiſhes very limited; and of courſe their progreſs in improvement would be proportionably ſlow and tedious. In a more advanced ſtate of ſociety, their neceſſities and deſires would be multiplied, and they would deviſe new methods of ſupplying and gratifying them; ſo that the arts they had already invented would be improved, and new ones would be diſcovered. At laſt, as a change of circumſtances occurred, or ſome accident ſuggeſted the hint or afforded opportunity, they would proceed from the invention of the neceſſary and mechanical arts to thoſe that contributed to elegance and ornament, as well as ſuperior accommodation. As to the inventions and diſcoveries of the early ages, nothing certain is known. Thoſe arts that may be referred to the claſs of ſuch as are moſt neceſſary and uſeful, were the productions of periods when men had little acquaintance with letters, and when they poſſeſſed no certain mode of tranſmitting an account of them to ſucceeding generations. The records of tradition are obſcure, doubtful, or fabulous; and other modes of conveyance are ſubject to corruptions and mutilations in the lapſe of many ages. To this purpoſe, it may be alleged, that many paſſages in the works of Pliny, who appears to have been induſtrious in collecting whatever he thought to be uſeful or curious, and to have been as deſirous of communicating knowledge as he was diligent in acquiring it, have ſuffered in this way to ſuch a degree, that ſome of them have not been ſatisfactorily illuſtrated even by the beſt commentators. However, it is univerſally allowed, that the arts had their riſe in the Eaſt, and that they were conveyed from thence to the Greeks, and from them to the Romans. The Romans, indeed, ſeem to have been chiefly indebted to the Greeks, by whom they were excelled in point of invention. The Romans acknowledged this ſuperiority, for they ſent their youth to Greece in order to finiſh their education; and from this circumſtance we may infer, that they conſidered that country as the ſeat of the arts and ſciences, and as a ſchool where genius would be excited by the moſt finiſhed models, and the taſte corrected and formed. Pliny and other writers have, nevertheleſs, given hints which lead

us to conclude, that the Romans poſſeſſed a more extenſive acquaintance with the arts than the moderns are perhaps willing to allow, and that ſome inventions, regarded as new, may be only old ones revived and again applied to practice. When Rome, abandoned to luxury and vice, became an eaſy prey to thoſe hordes of barbarians who overſpread the empire, her arts ſhared in the general wreck, and were either entirely loſt, or for a conſiderable time forgotten. The deplorable ſtate of ignorance in which Europe was afterwards plunged during ſeveral centuries, retarded their revival; and it was not till a late period, when favoured and protected by a few men of ſuperior genius, that they began again to be cultivated. It cannot, however, be denied, that ſeveral important diſcoveries, altogether unknown to the ancients, which muſt have had conſiderable influence on the general ſtate of ſociety, were made in ages that can hardly be exempted from the appellation of barbarous. Of this kind were the inventions of paper, painting in oil, the mariner's compaſs, gunpowder, printing, and engraving on copper; ſee the ſeveral articles. After the invention of the compaſs and printing, two grand ſources were opened for the improvement of ſcience. As navigation was extended, new objects were diſcovered to awaken the curioſity and excite the attention of the learned; and the ready means of diffuſing knowledge, afforded by the preſs, enabled the ingenious to make them publicly known. Ignorance and ſuperſtition, the formidable enemies of philoſophy in every age, began to loſe ſome of that power which they had uſurped, and different ſtates, forgetting their former blind policy, adopted improvements, which their prejudices had before condemned.

In countries, however, where civil and eccleſiaſtical tyranny prevailed, the progreſs of the uſeful and elegant arts was ſlow, and ſtruggled with many difficulties. Particular events, indeed, have occurred in all ages and nations which have roufed the exertions of genius, and furniſhed occaſion for making important and uſeful diſcoveries. The hiſtory of Greece and Rome, and even of modern Europe, will afford many obvious facts that ſeem to confirm and illuſtrate this obſervation, and they will be found in detail under the reſpective titles in this work.

It has been well noted by philoſophers, that, during the riſe and growth of ſtates, the *military* arts chiefly flouriſh; when arrived at their height, the *liberal* arts; and when in a declining ſtate, the *voluptuary* arts.

There are alſo divers particular arts; the art of *memory*, the art of *decyphering*, the art of *ſwimming*, art of *diving*, &c.

Democritus maintained, that men learnt all their arts from brutes: that the ſpider taught them weaving; the ſwallow, building; the nightingale, muſic, and ſeveral kinds of medicine.

ART, *term of*. See TERM.

ARTS, *bachelor of*. See BACHELOR.

ARTS, *maſter of*. See MASTER, DEGREE, FACULTY.

ART is alſo applied to divers imaginary, and even ſuperſtitious doctrines and inventions.—Such are Lully's art, or the *tranſcendental* art. This is an art by means of which a man may diſpute whole days on any topic in nature, without underſtanding the leaſt tittle of the thing in diſpute; thus called from its inventor Raymond Lully. It conſiſts chiefly in diſpoſing the ſeveral ſorts of beings into divers ſcales or climaxes, to be run down in a deſcending progreſſion.—Thus, whatever was propoſed as the ſubject of diſcourſe, they would ſay, firſt, it is a being, and conſequently, one true, good, perfect: then, it is either created, or uncreated. Again, every created being is either body or ſpirit, &c.

ART, *ars notoria*, is a pretended manner of acquiring ſciences by infuſion, without any other application than a little faſting, and performing a few ceremonies. It was ſolemnly condemned by the Sorbonne in 1320.

ART, *St Anſelm's*, is a ſuperſtitious manner of curing wounds, by barely touching the linen wherewith thoſe wounds had been covered. Delrio, in his Diſquiſitiones Magicæ, obſerves, that ſome Italian ſoldiers, who practiſed this art, attributed the invention thereof to St. Anſelm: but he aſſures us alſo, that it was really invented by Anſelm of Parma, a celebrated magician.

ART, *St. Paul's*, is a branch of the *ars notoria*, ſo called as being ſuppoſed to have been taught by St. Paul, after his being taken up into the third heaven.

ART *and Part*, is a phraſe uſed in the north of England, and in Scotland. When any one is charged with a crime, they ſay he is *art and part* in committing the ſame; that is, he was concerned both in the contrivance and in the execution of it.

The facts inferring *art and part* need not to be particulary laid in the libel or indictment, for theſe general words, as terms of ſtated ſignification, are ſufficient. Yet theſe facts may be ſet forth, and it is proper ſo to do, if the proſecutor chooſes to confide in the court rather than in the jury. Vide Mackenz. Crim. Law.

One may be *art and part*, 1. By giving counſel to perpetrate, without diſtinction, whether the crime would have been committed without ſuch counſel or not: this being what can never be perfectly known. But it is to be obſerved, that in the more atrocious crimes, he that gives counſel is equally puniſhed as he that commits them; but in the leſs atrocious, leſs ſeverely. And ſometimes reaſons of mitigation are taken from the age, the manner of adviſing, &c.

2. By aid and aſſiſtance, and that either previous, or concomitant, or ſubſequent, to the commiſſion of the crime.

3. By a clear and explicit mandate to commit the crime, or to do ſomewhat unlawful in itſelf, which with great probability might produce it, if executed by the hand of the mandatory, and not that of another.

ART *hermetical*. See HERMETICAL.

ART, *hyſſopic*. See HYSSOPIC.

ART, *military*, comprehends the order and arrangement which is obſerved in the conduct of an army, when it is to fight, to march, or to be encamped, uſually denominated *tactics*; and alſo the conſtruction and application of warlike machines.

ARTA, in *Geography*, a town of Swiſſerland, in the canton of Schwitz, on the ſouth border of the lake of Zug.

ARTA, a river of European Turkey, which runs into the gulf of Arta, near a town of the ſame name.

ARTA, or *Larta*, a town of European Turkey, with a Greek archbiſhop's ſee, in the province of Albania, on the river Afdhas, near a gulf to which it gives name. The cathedral is ſaid to have as many windows and doors as there are days in the year; it is ſupported by above two thouſand marble pillars, and was built by Michael Ducas Comneno, emperor of Conſtantinople. The inhabitants, who are partly Mahometans, and moſtly Chriſtians, are reckoned to be about ſeven or eight thouſand, and carry on a conſiderable trade in tobacco and ſkins. The gulf is on the eaſt ſide of the Adriatic. N. lat. 39° 28′. E. long. 21° 20′.

ARTABA, an ancient meaſure of capacity uſed by the Perſians, Medes, and Egyptians.

The

The Perſian artaba is repreſented by Herodotus as bigger than the Attic medimnus, by three Attic chœnixes; from which it appears that it was equal to $6\frac{3}{4}$ Roman modii, conſequently that it contained $166\frac{2}{3}$ pounds of wine or water; or $126\frac{2}{3}$ pounds of wheat.

The Egyptian artaba contained five Roman modii, and fell ſhort of the Attic medimnus by one modius; conſequently held $133\frac{1}{3}$ pounds of water or wine, 100 pounds of wheat, or 60 of flour.

The Babylonians allowed their god Belus twelve artabas of fine flour for his daily ſuſtenance; which will amount to 60 Roman modii, and conſequently 720 pounds of flour.

The Median artaba was of the ſame content with the Attic medimnus, and conſequently equal to ſix Roman modii, held 160 pounds of water or wine, and 120 of wheat. Beverin. de Pond. & Menſ. part ii. p. 125.

ARTABANUS, in *Ancient Hiſtory*, the common name of ſeveral kings of Parthia. The firſt died in the firſt year of his reign, in conſequence of a wound received in a battle with a tribe of Scythians, about the year before Chriſt 129. The ſecond was of the race of Arſaces, and was king of Media, when he was called to the throne of Parthia, about the year of Chriſt 16; and died much lamented by his ſubjects, about A. D. 48. The third lived in the reign of Veſpaſian or Titus, and eſpouſed the cauſe of a counterfeit Nero; he died whilſt he was meditating the invaſion of Armenia. With the death of Artabanus IV. in the year 226, the Parthian empire terminated. See Arsacidæ.

ARTABRI, in *Ancient Geography*, a people of Europe, in Spain; deriving their name from Artabrum, a promontory near which they dwelt, and correſponding to cape Finiſterre.

ARTACABANE, a town of Aſia, in Aria. According to Pliny, it was larger and more ancient than Alexandria in the ſame country.

ARTACÆON, a ſmall iſland of the Propontis, in the vicinity of Cyzicum. Pliny.

ARTACANA, a town of Aſia, ſituate in the northern part of Aria, on the confines of Parthia, according to Strabo. Q. Curtius makes it the capital of Aria.

ARTACE, the name of a colony eſtabliſhed by the Mileſians in Phrygia, in the year before Chriſt 694. Venus had a temple in this place, whence her name *Artacias*.—Alſo, a fortreſs of Aſia, in Bithynia, ſituate on the Euxine ſea.—A mountain of the peninſula of Cyzicum.—A ſmall iſland of the Propontis, over againſt the mountain of this name.—A port of Aſia, on the coaſt of the Propontis, near to, and weſt of Cyzicum.—A town of Aſia, in Armenia.

ARTACENA, a country of Aſia, in Aſſyria.

ARTACH, a town of Aſia, according to Curopalate.

ARTACII, a people placed by Dion towards Thrace, and ſaid to have been conquered by Craſſus.

ARTACINA, a town of the iſland of Crete. Ptolemy.

ARTÆA, a country of Perſia, according to Pauſanias.

ARTAGERA, a town of Aſia, in Armenia, near which C. Cæſar was dangerouſly wounded by one Addus, according to Velleius Paterculus.

ARTAGICARTA, a town of Greater Armenia, placed by Ptolemy between Arſamoſarta and Tigranocerta.

ARTAGICERTA, Ardis, a town of Aſia, in Armenia, on the weſtern branch of the Tigris, north-eaſt of Armida.

ARTAGIRA, a town of Interior Libya.

ARTAKI, in *Geography*, a town of Aſiatic Turkey, in the province of Natolia, on the ſouth coaſt of the ſea of Marmora, 76 miles ſouth-weſt of Conſtantinople. N. lat. 40° 18′. E. long. 27° 39′.

ARTAKUI, a town of European Turkey, in the province of Romania, 48 miles north-weſt of Gallipoli.

ARTAMIS, in *Ancient Geography*, a town of the Cyrenaic territory in the Pentapolis.—Alſo, a town of Aſia, in Bactriana.

ARTAMOVA, in *Geography*, a town of Siberia, 120 miles ſouth-ſouth-eaſt of Tobolſk.

ARTAN, a town of Aſiatic Turkey, in the province of Natolia, 24 miles ſouth of Akſerai.

ARTANA, or Ortana, a town of Spain, in Navarre, five leagues from Pampeluna.

ARTANES, or Artanus, a river of Aſia, in Bithynia.

ARTANICA, in *Botany*. See Cyclamen.

ARTANISSA, in *Ancient Geography*, a town of Aſia, in Iberia. Ptolemy.

ARTAS, a town of Aſia, in Syria, ſituate at the foot, and to the eaſt of one of the branches of mount Amanus.

Artas *Bay*, in *Geography*, lies in the iſland of Majorca, in the Mediterranean, S.W. from Cape la Padre, the weſtern extremity of the iſland. The town lies between two rivers, which fall into the bay from the weſt and north-weſt. Alcudi Bay is to the north-weſt from the Cape la Padre.

ARTASIA, in *Ancient Geography*, a town of Aſia, in Syria, in the neighbourhood of Antioch.

ARTATUS, a river of Illyria, mentioned by Livy.

ARTAVIVA, in *Geography*, a town of Aſia, in Mingrelia, 110 miles north-eaſt of Trebiſond.

ARTAXATA, in *Ancient Geography*, the metropolis of Armenia, and the reſidence of the Armenian kings. This city was built upon a plain, which Hannibal recommended to king Artaxes as a proper ſite for the capital of Armenia. It was ſituated upon an elbow of the river Araxes, which forms a kind of peninſula, and ſurrounded the town, except on the ſide of the iſthmus; and the iſthmus was ſecured by a rampart and a broad ditch. Lucullus, after having defeated the Armenians under their king Tigranes, would not venture to lay ſiege to Artaxata, which he conſidered as impregnable. The gates of the city were thrown open to Corbulo, the Roman general; but the city itſelf was burnt and razed. It was afterwards called *Neronia*, in compliment to Nero, who ordered Tiridates to rebuild it. The ruins of this city are ſhewn at a place called *Ardachat*.

ARTAXERXES, in *Biography*, the name of three kings of Perſia. The firſt ſurnamed *Longimanus* and Μακρο-χειρ, from the extraordinary length of his arms and hands, ſo that, on his ſtanding ſtraight, they could reach his knees; ſucceeded his father Xerxes, who was murdered by Artabanus, the captain of his guards. The traitor charged the death of Xerxes upon Darius, his eldeſt ſon, and induced the young prince to believe that it was his farther intention to get rid of him in the ſame manner. Darius was therefore, by the counſel and aſſiſtance of Artabanus, immediately aſſaſſinated, and Artaxerxes was placed upon the throne, in the year before Chriſt 464, notwithſtanding the prior claim of his ſecond brother Hyſtaſpes, who was then in Bactriana. Artabanus, having thus far ſucceeded, proceeded to the accompliſhment of the deſign which he had formed of ſecuring the crown to himſelf. But Artaxerxes being informed by Megabyzus of his conſpiracy, prevented the execution of it by the death of the traitor. Thus eſtabliſhed in the throne, notwithſtanding the treaſon of Artabanus, and the hoſtile attacks of his brother Hyſtaſpes, he purſued a much more prudent courſe than that of his father, and deſiſted from impracticable attempts to ſubdue the valiant Greeks, who were fighting for their liberty. At length a war between the Greeks and Perſians, which had been protracted for fifty-one years, was terminated, happily for both

nations, and very honourably to the former. Artaxerxes proceeded, very much to the satisfaction of his subjects, to cultivate the arts of peace, and to redress the evils which had resulted from the frantic ambition of his father. Although he was an absolute prince, he distinguished himself during a long reign by his mildness and humanity. At his court Themistocles, the illustrious Athenian, who had been an avowed enemy to the Persian government, found an asylum; and here he was treated with great distinction and hospitality. Thucydides (l. i. p. 91.) refers the retreat of Themistocles to the commencement of this reign; but other authors, as Strabo, Plutarch, and Diodorus, fix this incident under Xerxes in the preceding reign. In this latter opinion Dr. Prideaux concurs. Artaxerxes was very favourable to the Jews: and he is supposed by Prideaux and many others to have been the Ahasuerus of Scripture, who married Esther, and by whose permission Ezra restored the Jewish worship and civil government at Jerusalem. Archbishop Usher supposes that it was Darius Nothus, the son of Hystaspes, who espoused this illustrious Jewess. See DARIUS, and ESTHER. The seventy weeks of Daniel are reckoned to commence in the reign of Artaxerxes. See PROPHECY. Artaxerxes died within eight months after the beginning of the forty-first year of his reign, and was succeeded by Xerxes, his only legitimate son. Prid. Conn. vol. i. p. 360. &c. and vol. ii. p. 372. 579.

ARTAXERXES II., called *Mnemon* on account of the strength of his memory, was the eldest son of Darius Nothus by his queen Parysatis, and bore the name of Arsaces before his accession to the throne, in the year before Christ 404. It is related (see Athenæus, l. 12.) that when he was attending his father, who was on his death-bed, he desired instruction for the successful conduct of government, and that the dying king gave him this memorable advice; "That," if he expected the felicity and success which he had enjoyed, "it must be by doing in all things that which was just both towards God and man." Artaxerxes had a younger brother named Cyrus, the favourite of his mother, and whom she wished to elevate to the throne upon the following claim: the birth of Artaxerxes had happened before the accession of his father to the throne; but that Cyrus was born the son of a king; a distinction which, however frivolous it may be deemed in modern times, had engaged Darius Hystaspes to prefer Xerxes, the younger of his sons, to his elder brother Artabazanes. Cyrus formed a conspiracy against the life of his brother, for which he was sentenced to death, but pardoned by the intercession of his mother: he afterwards attempted, with the assistance of a Grecian force, to dethrone his brother; but, though victorious, he was killed in battle. His friends on this occasion were all destroyed; but the Greek army kept entire, and in spite of all the force and artifice with which they had to encounter, made their way home by a retreat, which is one of the most brilliant events in history, and is recorded by Xenophon, who was a principal actor in it. Artaxerxes is much censured for the weakness betrayed by him in delivering up to the vengeance of Parysatis all who had been instrumental in the death of Cyrus, though he himself boasted of having inflicted the mortal wound; and for suffering this female monster to murder them with attendant circumstances of the most exquisite torment. She soon after poisoned the queen Statira, by which act she excited the indignation of her son so much, that he confined her to Babylon, and vowed never to enter the city as long as she remained there. At length, however, she was recalled to court, and maintained considerable influence as long as she lived. The throne of Artaxerxes was next endangered by Agesilaus and the Spartans, in the year before Christ 396; but having adopted a more prudent policy than his ancestors, he sowed dissensions in Greece, which compelled the invaders to evacuate the Persian empire. The Athenians united with the Persians; but at length these differences were compromised by the peace of Antalcidas, in the year before Christ 363, which left the Greek cities of Asia subject to the Persian king. Artaxerxes next directed his power against Evagoras, king of Cyprus; and on this occasion the Athenians became the foes, and the Lacedæmonians the auxiliaries, of the Persians. Cyprus, after much bloodshed, became tributary. In an enterprise undertaken by the king in person, in the year B. C. 384, against the Cadusians, a hardy people who inhabited the mountains between the Euxine and Caspian seas, his army was almost wholly lost by famine; but part of it was saved by a seasonable negotiation. The sense of his disgrace on his return so much irritated his temper, which was naturally mild, that he put several of his satraps to death. His attempts for reducing his revolted subjects in Egypt proved at first successful, by the aid of some Greek mercenaries; but they ultimately failed. The close of his reign was disturbed and embittered by those domestic troubles to which eastern despots are peculiarly subject. His eldest son Darius formed a conspiracy against him; but the plot was detected, and the traitor, with all his accomplices, who were of the king's family, were cut off. Three others of the king's sons became afterwards competitors for the throne; and Ochus, the worst of them, removed the other two by poison and assassination. After a reign of 62 years, and at the advanced age of 94, according to Plutarch, but, as Diodorus says, after having reigned 43 years, Artaxerxes sunk under affliction and decay, and left the throne vacant for his successor. So great was the authority of this monarch among the republics of Greece, that the contending states made him the umpire of their various disputes and pretensions, and their deputies held a congress in his presence, that he might adjust their jarring interests. Prid. Conn. vol. ii. p. 615, &c.

ARTAXERXES III., whose name was *Ochus*, succeeded his father in the year before Christ 358. History paints him as a monster of cruelty. Having put to death all the members of the royal family within his reach, he caused his sister Ocha, who was also the mother of his wife, to be buried alive; and inclosing within a court of his palace one of his uncles, with one hundred of his sons and grandsons, he ordered his archers to shoot them all to death. His nobles in great numbers shared a similar fate. Having quelled a revolt in Phœnicia by the utter destruction of Sidon, and reduced Judæa, and carried away into captivity many of its inhabitants, he marched at the head of a great army, consisting chiefly of Greek auxiliaries, into Egypt, and totally subdued it. Here, however, a sacrilegious deed, by which he manifested his contempt of the Egyptian superstition, by killing the sacred bull Apis, and causing his men to eat the flesh, ultimately effected his ruin. Bagoas, a favourite eunuch, by birth an Egyptian, and zealously attached to the religion of his country, prevailed with the king's physician to administer poison to him instead of a medicine, which carried him off in the 21st year of his reign. The zealous devotee caused his body to be cut in small pieces, and given to the cats, and knife-handles to be made of his bones. After destroying the king's other sons, he placed Arses on the throne; but soon murdered him and his family; and thus the race of Ochus became extinct. Prid. Conn. vol. ii. p. 666—682.

ARTEA, or ARTELA, *Point*, in *Geography*, is a low-

point

point ſix leagues nearly eaſt from the river Copalita, on the ſouth-weſt coaſt of Mexico, in the north Pacific Ocean: appearing at a diſtance like a ſmall iſland.

ARTEAGA, Stephano, in *Biography*. See Steffano.

ARTEDI, Peter, born in the province of Ingormanland in Sweden, in the year 1705, received the firſt part of his education at the College of Hurneſand, whence he was removed to Upſal. He was intended for the church, but his diſpoſition leading him to the ſtudy of Natural Hiſtory, in which he was aſſiſted by Linnæus, he preferred practiſing medicine, and applied himſelf to chemiſtry, but his principal attention was turned to Ichthyology, in which he made conſiderable progreſs. In 1732, he came to England in purſuit of his favourite ſtudy, at the ſame time that his friend Linnæus ſet off to examine the natural productions of Lapland. On parting, they mutually aſſigned to each other ſuch manuſcripts as they ſhould be in poſſeſſion of treating on natural hiſtory, in caſe either of them ſhould die in their travels. This event however did not then take place, as they met together at Leyden in the year 1735. It was here that Linnæus engaged his friend to ſuperintend the printing of the third volume of Seba's Theſaurus, which treated of fiſhes. Returning one evening from Seba's houſe to his lodgings, while proſecuting this buſineſs, he fell into the canal and was drowned, being only 30 years of age. Linnæus, who got poſſeſſion of his manuſcripts, publiſhed his "Bibliotheca Ichthyologica," and his "Philoſophia Ichthyologica." in 8vo. in 1738, with the life of the author prefixed. He had before publiſhed his "Claſſification of Umbelliferous Plants from the Calyx." Gen. Biog.

ARTEDIA, in *Botany* (from P. Artedi, a ſtudent of medicine in Sweden), an umbelliferous plant, formerly called gingidium. Lin. g. 332. Schreb. 465. Juſſ. 224. Gærtn. t. 85. Claſs, *Pentandria digynia*. Nat. Ord. *Umbellatæ*. Gen. Char. *Cal. umbel univerſal*, ſpreading, flat, manifold. *Partial*, ſmall, ſimilar. *Involucre univerſal*, about ten-leaved; leaflets ovate-oblong, three-briſtled at the end, nearly the length of the umbel; *Partial*, two or three-leaved, verging outwards; leaflets linear, pinnate, longer than the umbellule. *Cor. univerſal*, difform, radiate; floſcules of the diſk abortive. *Proper of the diſk*, male; petals five, cordate-inflex, erect,—*of the ray*, hermaphrodite, with ſimilar petals, but the outermoſt largeſt. *Stam.* filaments five, capillary in all the florets; anthers ſimple, roundiſh. *Piſt. of the ray*, germ ſmall, inferior; ſtyles reflex; ſtigmas ſimple. *Per.* none; fruit roundiſh, compreſſed, leafy-ſcaled on the edge, bipartile. *Seeds*, two, oblong, roundiſh, ſpreading, ſcales about the edge.

Eſſ. Gen. Char. *Involl.* pinnatifid. *Floſc.* of the diſk, male; fruit, rough with ſcales.

Species, 1. A. *ſquamata*; ſtalks, about two feet high, ſending forth a few lateral branches, with linear multifid leaves, reſembling thoſe of dill; flowers white, in a large terminal umbel; fruit-bearing umbel converging; involucre many leaved, having the leaflets margined at the baſe; petals as in the tordylium; annual, flowering in July. Found on Mount Libanus by Rauwolf, and by Tournefort in Natolia. Introduced by Mr. Thouin in 1788.

Propagation and Culture. The ſeeds ſhould be ſown in autumn in a warm border, where the plants are to remain, for they do not bear tranſplanting. To ſecure their ſeeding, they ſhould be raiſed in a hot-bed, and kept in a greenhouſe.

Artedia *muricata*. See Daucus.

ARTEL, in *Commerce*, a name given to a commercial aſſociation, conſiſting of a certain number of labourers, who voluntarily become reſponſible, as a body, for the honeſty of each individual. The ſeparate earnings of each man are put into the common ſtock; a monthly allowance is made for his ſupport; and at the end of the year the ſurplus is equally divided. The number varies in different aſſociations from 50 to 100; and it is conſidered ſo beneficial to belong to one of theſe ſocieties, that 500, and even 1000 roubles are paid for admiſſion. Theſe ſocieties are not bound by any law of the empire, or even written agreement; nor does the merchant reſtrain them under any legal obligation; yet there has been no inſtance of their objecting to any juſt claim, or of protecting an individual whoſe conduct had brought a demand on the ſociety. Hence ariſes the denomination of *Artelſchiſks*, who are perſons employed by the Ruſſian merchants of St. Peterſburg to collect payment on bills, to receive and pay money, and alſo to ſuperintend the loading and unloading of the different cargoes. Theſe Ruſſians are moſtly natives of Archangel and the adjacent governments, of the loweſt claſs; they are frequently ſlaves, generally of the crown; and yet the merchant has no reaſon to diſtruſt their fidelity, partly from the nature of their aſſociation, and partly from the natural reluctance of the Ruſſian to betray the confidence that is repoſed in him.

ARTEMIDIS, in *Ancient Geography*, a town of Aſia, in Leſſer Armenia, called by Ptolemy, Artemidita, or Artemita.

ARTEMIDORUS, in *Biography*, a remarkable viſionary, who ſpent his whole life in attempting to ſolve the myſteries concealed, as he apprehended, in dreams. For this purpoſe he not only collected all that had been written on the ſubject, but travelled over Greece, Aſia, and Italy, to learn ſuch ſtories relating to them as were current in thoſe countries. He was born at Epheſus, in the time of Antoninus Pius, as we learn from a paſſage in his work, called "Oneirocritica," the interpretation of dreams, which, though blemiſhed by this ſtrange fancy, ſtill keeps its rank, on account of the information it contains relative to ancient rites and cuſtoms. "Rem ſi ſpectes," Gerard Voſſius ſays, "nihil eo opere vanius; ſed utilis tamen ejus lectio erit ob tam multa, quæ admiſcet de ritibus antiquis et ſtudio humanitatis." In this work he aſſumed the ſurname of "Daldianus," from Daldis, a ſmall city of Lydia, the birth-place of his mother. The Oneiro-critica was firſt edited in Greek, by Aldus, in 8vo., in 1518. Cornarius publiſhed a Latin tranſlation at Baſle, in 1537; which was reprinted with the Greek text in 4to., at Paris, in 1604, by Rigaltius. Lucian Philopatris, t. 2. p. 775. Suidas. Fabr. Bib. Græc. l. iv. c. 13. § 5. 8. t. iii. p. 402.

Artemidorus, a geographer of Epheſus, is frequently commended by Strabo, Pliny, and Steph. Byz., and flouriſhed about the 169th olympiad, or the 104th year before Chriſt. His deſcription of the earth is often cited by the ancients. Some fragments of this geographer are collected in the firſt volume of Hudſon's Leſſer Greek Geographers. Fabr. Bib. Græc. l. iv. c. 13. § 9. t. iii. p. 406.

ARTEMIS, in *Entomology*, a ſpecies of Papilio (*Nymph. Phal.* Gmel.) that inhabits Germany and ſome other parts of Europe. The wings are indented, fulvous varied with black: a row of black dots both above and beneath on the poſterior pair. Fabricius, &c.

ARTEMISIA, in *Antiquity*, yearly feſtivals obſerved in divers cities in Greece, particularly Delphi, in honour of Diana, ſurnamed Artemis.

In the artemiſia, a mullet was ſacrificed to this goddeſs, as being thought to bear ſome reſemblance to her, becauſe it is ſaid to hunt and kill the ſea-hare. Athen. lib. viii. The Syracuſans alſo celebrated the artemiſia for three days, with great joy and feſtivity.

Artemisia, in *Biography*, the name of two queens of Caria. The firſt was among the auxiliaries of Xerxes againſt the Greeks, and attended in perſon with five ſhips well equipped, brought from Halicarnaſſus. She manifeſted ſuch valour in the combat as to give occaſion for ſaying, "that his men behaved like women, and his women like men." Being the laſt who fled, ſhe was cloſely purſued by an Athenian ſhip, and, in order to ſecure her eſcape, ſhe directed her galley againſt a veſſel of an enemy, and ſunk it with its crew; the purſuer upon this conceiving that ſhe was a friend, ceaſed chaſing, and ſhe arrived in ſafety on the coaſt of Aſia, where ſhe was entruſted by Xerxes with the conveyance of his children to Epheſus. Her ſtatue was placed at Sparta among thoſe of the Perſian commanders. By pretending to ſacrifice to the mother of the gods, at Latmus, ſhe was admitted into the city, and took poſſeſſion of it. In revenge for this inſult, the goddeſs is ſaid to have excited her ardent paſſion for a young man of Abydos, whoſe eyes ſhe put out in his ſleep becauſe he refuſed to gratify her deſires; and ſhe is reported to have then precipitated herſelf from a rock. Anc. Un. Hiſt. vol. iv. p. 164, &c. Nouv. Dict. Hiſt. The ſecond Artemiſia, the ſiſter and wife of Mauſolus, is principally famous on account of her conjugal affection. See Mausoleum. Beſides erecting this monument to the memory of her huſband, ſhe is ſaid to have mingled his aſhes in her drink, and to have inſtituted a prize for the beſt eulogy on his character. She died ſoon after the rearing of this ſtructure in the year before Chriſt 351. Anc. Un. Hiſt. vol. vii. p. 72. Nouv. Dict. Hiſt.

Artemisia, in *Botany*, a genus of plants, including mugwort, ſouthernwood, wormwood, &c. (derived perhaps, from Ἀρτεμις, Diana, or named after the wife of Mauſolus, king of Caria). Lin. g. 945. Schreb. 1281. Juſſ. 184. Gærtn. t. 164. Claſs, *Syngeneſia polygamia æqualis*. Nat. Ord. *Compoſitæ. Corymbiferæ*, Juſſ. Gen. Char. *Cal.* common, roundiſh, imbricate: ſcales rounded, converging. *Cor.* compound; corollules hermaphrodite, tubular, ſeveral, in the diſk; females almoſt naked, in the circumference; proper of the hermaphrodite, funnel-ſhaped; border five-cleft. *Stam.* in the hermaphrodites; filaments capillary, very ſhort; anther cylindric, tubular, five-toothed. *Piſt.* in the hermaphrodites; germ ſmall; ſtyle filiform, the length of the ſtamens; ſtigma bifid, revolute; females, germ very ſmall; ſtyle filiform, longer than in the hermaphrodites; ſtigma ſimilar. *Per.* none. *Calyx* ſcarcely changed. *Seeds*, ſolitary, naked. *Rec.* flat or villoſe.

Eſſ. Gen. Char. *Recept.* ſubvilloſe, or almoſt naked; down none. *Cal.* imbricate, with rounded converging ſcales. *Cor.* of the ray none.

* *Shrubby, erect.*

Species, 1. A. *vermiculata*; "leaves aceroſe, crowded, very ſmall; panicle racemed; flowers ſeſſile." A ſtiff upright, ſomewhat aſh-coloured, ſhrub; leaves linear, flat, on the upper ſurface tomentoſe, beneath naked, and rather convex; panicle copious, conſiſting of racemes, formed of ſeſſile, ovate, imbricate ſpicules; flowers tomentoſe. A native of the Cape of Good Hope. 2. A. *capillaris*, Thunb. Jap. 309. "leaves ſimple, capillaceous." The ſtem is ſtriated, reddiſh, a foot high; branches ſcattered, ſubfaſtigiate, from upright ſpreading, like the ſtem; leaves many, ſmooth, half an inch long; flowers in cloſe racemes, on the extreme twigs. A native of Japan, where it flowers in October. 3. A. *Judaica*, abſinthium halepenſe, &c. Pluk. Alm. t. 73. f. 2. "Leaves obovate, obtuſe, lobed, ſmall; flowers panicled, pedicled." The ſtem ſuffruticoſe, ſubpubeſcent, aſh-coloured, a foot and a half high; leaves three or five-lobed, ſubtomentoſe, aſh-coloured, middle lobe the broadeſt; flowers roundiſh, rather depreſſed, the ſize of coriander ſeeds. A native of China, Judea, Arabia, &c. 4. A. *Æthiopica*; "leaves palmate, linear, very minute; flowers racemed, peduncled." A ſhrubby plant, one foot high, whitiſh; leaves the ſize of thoſe of heath, in cluſters, ſubtomentoſe; diviſions linear, very narrow; flowers nodding, the ſize of thoſe of wormwood; receptacle naked. A native of the Cape of Good Hope, and of Spain. 5. A. *contorta*; "leaves palmate, linear, minute; panicle racemed, flowers ſeſſile." An upright, tomentoſe, white ſhrub; leaves crowded; flowers imbricate, ſmall, in ſpikes, which ſit cloſe to the branches. Found by Lerche in Perſia. 6. A. *abrotanum*, ſouthernwood. Woodv. Med. Bot. t. 119. α Stem erect, common ſouthernwood. β Dwarf ſouthernwood. "Leaves ſetaceous, very branching." A well-known under ſhrub, common in gardens, riſing three or four feet in height; leaves alternate, petioled, multifid; leaflets linear, very narrow, pale green, tomentoſe-ſcabrous, leſs divided towards the top, where they become trifid, and even linear next the flowers, which are in upright ſpikes at the extremities of the branches; they are numerous, nodding, yellow, but rarely open in England. A native of the ſouthern parts of Europe and of Aſia. 7. A. *arborescens*, common narrow-leaved tree-wormwood. "Leaves tripinnatifid, ſilky, cinereous; leaflets linear; flowers globoſe; flower-bearing branchlets ſimple." The ſtalk is woody, ſix or ſeven feet high; leaves reſembling thoſe of common wormwood, but much whiter, and more finely divided; flowers globular, in ſpikes, terminating the branches. This is by ſome conſidered as a variety of the common wormwood. A native of Italy. 8. A. *argentea*, broad-leaved tree wormwood. "Leaves bipinnatifid, ſilky, white; leaflets lanceolate-linear; flowers globoſe; flower-bearing branchlets wand-like." The whole plant is of a ſilvery colour; receptacle villoſe. A native of Madeira, where it was diſcovered by Maſſon, and introduced here in 1777. 9. A. *aragoniæ*; "leaves linear, bipinnate, hoary; flowers racemed," ſcarcely a foot high; upper leaves ſimple, linear; racemes ſmall, axillary. 10. A. *meſſerſchmidii*; "leaves linear, multifid; racemes erect, ſlender, looſe." The ſtem is upright ſuffruticoſe; the whole plant tomentoſe. 11. A. *Tartarica*; "lower leaves bipinnate; pinnas equal; upper leaves pinnate, linear; racemes erect, looſe, many-flowered." This, like the preceding ſpecies, is a tomentoſe under-ſhrub. They were both found in Tartary by Meſſerſchmidt. See Stechm. p. 19. n. 9 & 10. 12. A. *nitroſa*, Gmel. Sib. 2. t. 50. f. 1. "Lower leaves finely multifid; upper entire, obtuſe; corymbs erect, hoary, oblong, ſpiked, ſeſſile." A native of Siberia. 13. A. *lerchiana*, Gmel. ſib. 2. t. 50. f. 2. 3. "Lower leaves pinnate, ſhort, finely divided; pinnas palmate; upper leaves linear, undivided; corymbs ſeſſile, copious, ſpiked, oblong." A ſhrubby hoary plant obſerved in Aſtracan, and on the banks of the Volga; and a variety by Gmelin between the rivers Jeniſea and Irtis. 14. A. *tenuifolia*. Abſ. ſeriph. Hiſp. Tournef. inſt. 458. "Leaves ſhort, very finely multifid; panicle ſlender, looſe, leafy; peduncles one or two-flowered." Stem woolly. A native of Spain. 15. A. *pauciflora*, Gmel. ſib. 2. t. 52. f. 1. 2. "Branches virgate, filiform; corymbs one-ranked; ſpikes ſubſeſſile." Calyx three or four flowered. A native of the banks of the Volga. 16. A. *italica*, Pluk. phyt. t. 121. f. 2. "Leaves tomentoſe, looſely pinnate; pinnas long, linear; root-leaves dotted; ſpikes denſe; flowers erect." A native of Italy. 17. A. *hiſpanica*; "leaves looſely pinnate; pinnas long, linear; ſpikes very denſe; calyces oblong;" not tomentoſe. A native of Spain. 18. A. *Gmelini*, Gmel. Sib. 2. t. 56. f. 1.

f. 1. "Leaves doubly pinnate, obtuſe, linear; corymbs green, roundiſh, nodding." The leaves are aſh-coloured underneath. Found by Gmelin near the rivers Lena and Angara. 19. A. *lobelii*, Allion. ped. n. 607. A. camphorata. Villar's Dauph. 242. "Leaves petiolate, palmate, multifid, linear; upper ones ſimple, angular." This is a ſmaller plant than common ſouthernwood, and has a ſtrong camphoraceous ſmell. The leaves are leſs hoary, and thoſe about the flowers broader, longer, and not ſo much cut. The corymbs are larger, and thinner, and the flowers of a fine yellow. A native of Piedmont, Dauphiné, &c.

** *Procumbent before flowering.*

20. A. *ſantonica*. Tartarian ſouthernwood or worm-ſeed, Med. Bot. t. 123. "Stem-leaves bipinnate, multifid; branches undivided; ſpikes one-ranked, reflex; flowers with five florets." Stem panicled, rather hoary; lower leaves pinnate, multifid, linear; branches wand-like; ſpikes alternate, recurved; flowers round, nodding, ſolitary; leaves on the branches undivided, nearly linear. A native of Tartary, and cultivated by Miller in 1768. It flowers from September till November. 21. A. *campeſtris*, field ſouthernwood, Hudſ. 357. With. 739. Eng. Bot. t. 338. Smith. 863. Abrotanum campeſtre. Ray Syn. 190. Ger. Em. 1106. "Leaves multifid, linear; ſtems procumbent, wand-like; root fuſiform." Stems proſtrate, ultimately erect, about two feet in length, virgate, panniculate, angular, ſmooth, reddiſh, leafy; leaves irregularly bipinnatifid, rather fleſhy, ſomewhat hairy underneath; radical leaves depreſſed, and with longer foot-ſtalks; thoſe on the ſtem alternate, minute, compound; flowers in racemes, drooping, ſmall, of a brownish green; ſcales of the calyx carinate, and rough at the margin; florets of the diſk about fifteen, yellow, with a purple apex; thoſe of the ray only two or three, very ſmall, ſubulate, cloſed, entire; receptacle naked, convex. It has been found in ſeveral places in Norfolk and Suffolk. This plant differs from common ſouthernwood, as its odour is ſo weak as to be ſcarcely diſcoverable. 22. A. *paluſtris*, marſh ſouthernwood, Gmel. Sib. 2. t. 55. "Leaves linear, pinnate, entire; flowers glomerate, ſubſeſſile." The leaves reſemble thoſe of buck's horn plantain, with five or ſeven ſegments; flowers yellow, receptacle naked. A native of Siberia. 23. A. *crithmifolia*, ſamphire-leaved ſouthernwood. "Leaves compound, divaricate, linear, fleſhy, ſmooth; ſtem riſing, panicled." It has the habit of the A. *campeſtris*; ſtems from half a foot to a foot in height; leaves pinnatifid and trifid. Found by Loefling on the ſandy ſhores of Portugal. Cultivated by Miller in 1768. 24. A. *vallesiaca*, downy ſouthernwood; "leaves pinnate, many-parted, filiform, tomentoſe; flowers ſeſſile, erect, ſubcolumnar, having few florets." An erect ſhrub, a foot high; leaves hoary, bipinnate; pinnas pinnate, and alſo trilobate; flowering branches tomentoſe, alternate; flowers ſolitary, with linear bractes; ſcales of the calyx concave, outer tomentoſe, inner membranaceous. No female florets. A native of Spain, Piedmont, and the Valais, flowering in Auguſt. Introduced by Drs. Pitcairn and Fothergill. 25. A. *maritima*, ſea wormwood, Hudſ. 358. With. 709. Woodv. t. 122. Smith, 864. "Leaves many-parted, tomentoſe, racemes drooping; receptacle naked; female florets three." Root woody, perennial; ſtems erect or decumbent, leafy, furrowed; lower leaves pinnate; pinnas tripartite; upper various, divided, at the top ſimple, all entire at the margin, and white on both ſides; racemes drooping; flowers ovate, nodding. There are three varieties of this ſpecies. A Britiſh plant growing on the ſea-coaſt, and flowering in Auguſt. 26. A. *glacialis*, ſilky wormwood, Jacq. Auſt. App. t. 35. "Leaves palmate, multifid, ſilky; ſtems aſcending; flowers glomerate, level-topped." Leaves ſmall, three-parted, linear, ſegments trifid, ſubfaſtigiate, ſilky white, tomentoſe, very ſhort on long footſtalks; thoſe below ſheathing the ſtems which are a ſpan high, ſimple, ſubtomentoſe, leafy; flowers globoſe, yellow, terminal, on very ſhort peduncles; receptacle hairy. Villars deſcribes it as three or four inches high, with about four terminal flowers, incloſing from forty to fifty florets. A native of the ſouth of Europe, flowering in Auguſt; cultivated by Miller in 1748. 27. A. *rupeſtris*, creeping wormwood, Flor. Dan. t. 801. "Leaves pinnate; ſtems aſcending; flowers globoſe, nodding; receptacle pappoſe;" ſtems near a foot high, ſomewhat hirſute; leaves on long footſtalks, narrow, having two or three pairs of pinnas, with an odd one; pinnas three or five-parted; flowers axillary, on long peduncles, nodding; receptacle hairy. A native of Alpine ſituations, cultivated by Miller in 1748; flowers in Auguſt. 28. A. *ſpicata*, ſpiked wormwood. Jacq. Auſt. 5. App. t. 34. "Root-leaves biternate; ſtem aſcending, ſpiked; flowers erect." Linnæus made this a variety of the rupeſtris, but Haller ſays, though it has the ſame habit, the leaves in this caſe are much broader and each pinna trifid, and the nerve is very broad; on the ſtem the leaves are ſeſſile, ſemipinnate, with four pairs, the laſt largeſt, ſhortly trifid; ſtems not branching, ſcarcely a ſpan high; peduncles one-flowered; leaflets of the calyx ovate, dark coloured, and hence called *Genipi noir*. A native of the Alps of Swiſſerland, Auſtria, Piedmont, and Dauphiné.

*** *Erect herbaceous, with compound leaves.*

29. A. *anethifolia*, dill-leaved wormwood, Gmel. Sib. 2. t. 54. "Leaves multifid, very ſlenderly divided; corymbs roundiſh, nodding, one-ranked, looſely ſpiked;" the ſtem is herbaceous; florets reddiſh; calyces large, green, and ſtreaked with white. A native of Siberia. 30. A. *pontica*, Roman wormwood. Jacq. Auſt. 1. t. 99. "Leaves many-parted, tomentoſe beneath; flowers roundiſh, nodding; receptacle naked." Stems in their natural ſtate ſhort, of two feet high, but when cultivated in gardens, four; upright, reddiſh, ſmooth, hoary, branched. Stem-leaves bipinnate, tomentoſe, with ſharp linear ſegments, uppermoſt entire, ſimple, thoſe at the bottom of the branches and top of the ſtem are ſimple pinnates; flowers in racemes, nodding, hoary; diſk yellow; florets 24, thoſe in the circumference about ſix, female, apetalous, and of a greeniſh yellow; the others hermaphrodite; ſeeds naked; receptacle conical, naked. A native of Germany, Piedmont, &c. flowering in September. Cultivated here in 1683. 31. A. *auſtriaca*, Auſtrian wormwood. Jacq. Auſt. 1. t. 100. "Leaves many-parted, tomentoſe, hoary; flowers oblong, nodding, receptacles naked." Stems from ſix inches to a foot and a half in height; branches numerous, ſending forth ſimple ſhort twigs, which are one-flowered on the ſhorter ſtems, but on the greater many-flowered; leaves on the twigs are firſt entire, then trifid, and ſo on, increaſing the diviſions till they become ſubtriplicate-pinnate; hermaphrodite florets about eight, females from four to ſeven, apetalous. It differs from the maritima in the leaves, being leſs tomentoſe and hoary, roundiſh, and not oblong. A native of Auſtria. 32. A. *annua*, annual wormwood, Gmel. Sib. 2. n. 108. "Leaves three-fold pinnate, ſmooth on both ſides; flowers ſubgloboſe, nodding; receptacle ſmooth, conical." An annual, with an erect, ſmooth, ſtreaked ſtem, riſing to eight feet in height, though ſeldom higher than two in our climate; flowers yellow on axillary racemes; peduncles long, with lanceolate entire bractes; all the florets hermaphrodite. A native of Siberia and China; cultivated by Miller in 1759. It flowers in Auguſt. 33. A. *tanacetifolia*, tanſey-leaved

leaved wormwood, Allion. Ped. n. 608. t. 70. f. 2. Gmel. Sib. 2. t. 58. "Leaves bipinnate, underneath tomentoſe, ſhining; pinnas tranſverſe; racemes ſimple." Stems numerous, ſimple, from ſix inches to a foot high; root-leaves ſheathing, petioled, ovate-pointed, aſh-coloured, having from five to eight pinnas; pinnules three-toothed; pinnules of the ſtem-leaves ſimple; upper oval, lanceolate; ſpikes terminal, compound, with racemes riſing from all the axils; in the terminal ſpike there is a ſtipule to each peduncle, which is one-flowered; flowers nodding, in pairs, all towards the ſame ſide; receptacle naked; perennial. A native of Dauphiné, Piedmont, and Siberia. In high ſituations it is ſometimes entirely tomentoſe. 34. A. *abſinthium*, common wormwood. Hudſ. 358. With. 710. Woodv. Med. Bot. t. 120. "Leaves multifid, of a ſilky white; flowers hemiſpherical, pendulous; receptacle hairy." Root woody, branched; ſtems rather erect, branched, angular, panicled at the top; lower-leaves, bipinnatifid; upper, pinnatifid, or digitate; diviſions elliptic-oblong, obtuſe, entire; racemes erect; flowers nodding, yellow; florets of the diſk numerous, of the ray very few; receptacle very hairy. It grows wild among rubbiſh, rocks, and on road ſides. 35. A. *vulgaris*, mugwort, Hudſ. 359. With. 710. Med. Bot. t. 121. "Leaves pinnatifid, flat, gaſhed, tomentoſe underneath; racemes ſimple; flowers ovate; receptacle naked;" root woody; ſtems four feet high, erect, branched, panicled, furrowed, ſmooth, leafy, purpliſh. Leaves alternate, petiolate, pinnatifid, gaſhed above and ſmooth, of a dark green, underneath tomentoſe, very white; racemes ſomewhat erect, ſimple, leafy; flowers ſeſſile, erect, ovate, woolly; receptacle naked; florets of the ray five. It affects ſimilar ſituations as the preceding ſpecies, and like it flowers in Auguſt. 36. A. *pectinata*. "Leaves pinnate, pectinate, ſmooth, ſeſſile; flowers axillary, ſolitary, ſeſſile, having four florets;" a fragrant annual having a ſtem about eight inches high. It is eaſily to be diſtinguiſhed by its ſimply pinnate leaves; pinnas ſetaceous, parallel, pectinated; flowers ſolitary, from the axils along the ſtems. Found by Pallas in the dry lands of Dauria.

**** *Leaves ſimple.*

37. A. *integrifolia*, entire-leaved mugwort, Gmel. Sib. 2. t. 48. f. 1. "Leaves lanceolate, tomentoſe underneath, entire or with one or two teeth; female florets five." Stems ſimple, about two feet high; leaves narrow, cut into acute ſegments at their edges, ſomewhat like thoſe of buck's horn plantain; flowers axillary, in ſmall looſe ſpikes, large, of a pale yellow. A native of Siberia. 38. A. *japonica*, Japaneſe mugwort, Thunb. Jap. 110. "Leaves on the branches ſmooth, lanceolate-entire, on the ſtem oblong, trifid; flowers racemed, nodding." An underſhrub with an erect angular, ſtreaked, wand-like, ſmooth, ſtem, branched at the top, and above two feet high; leaves on the ſtem alternate; ſeſſile, attenuated, and entire towards the baſe, but towards the top cut, ſerrate, ſpreading; thoſe on the twigs ſimilar, but very ſmall; flowers pointing in the ſame direction, on capillary reflex peduncles. It differs from the cæruleſcens in having ſmooth leaves. A native of Japan. 39. A. *cæruleſcens*, bluiſh mugwort, Hudſ. 359. With. 711. Smith, 866. Gmel. Sib. 2. 131. t. 64. f. 1. Abſ. maritimum lavandulæ folio. Bauh. pin. Ray Hiſt. &c. "Leaves hoary; on the ſtem lanceolate, entire; lower leaves multifid; flowers cylindrical; receptacle naked." Root perennial fibrous; ſtems nearly erect, round, channelled, pubeſcent, leafy panicled; leaves alternate, petioled, hoary on both ſides; racemes erect, ſimple; flowers ovate-cylindrical, ſmall, woolly; florets of the ray three. A native of the ſouthern parts of Europe, on the ſea-coaſt; and found in Lincolnſhire. Cultivated by Tradeſcant, jun. in 1658. 40. A. *dracunculus*, Tarragon. Scop. Carn. n. 1032. Gmel. Sib. 2. t. 59 & 60. f. 1. Draco herba, Ger. Emac. 249. Park. Raii Hiſt. "Leaves lanceolate, ſmooth, quite entire." Stem ſtiff, ſmooth, branched, from one to two feet high; leaves petioled, green on both ſides; flowers yellow, in a kind of ſpike all directed the ſame way; hermaphrodite florets twelve, female ſix; receptacle flat, glutinous, naked. A native of Siberia and Tartary. Cultivated in 1596, by Gerard; flowers appear in Auguſt. Tarragon is frequently uſed in ſalads, eſpecially by the French, to correct the coldneſs of other herbs. The leaves make an excellent pickle, they have a fragrant ſmell, and aromatic taſte. 41. A. *chinenſis*, Chineſe Mugwort. Gmel. Sib. 2. 61. f. 1. 2. Lour. 492. "Leaves ſimple, tomentoſe, obtuſe, lanceolate; below wedge-ſhaped, three-lobed." Stem herbaceous, ſimple, cottony, branched, between two and three feet high; lower leaves obtuſe, three-lobed; upper lanceolate-linear, entire, tomentoſe on both ſides, ſeſſile crowded, ſcattered; flowers ſmall, on terminating erect racemes. A native of China and Siberia. In China the moxa is prepared from this ſpecies. See Med. Prop. 42. A. *maderaſpatana*, Madras Wormwood. Jacq. Hort. 3. t. 88. called by him Tanacetum Ægypt. "Leaves ſimple, lyrate ſinuate; ſtems procumbent; flowers pedunculate, ſolitary, globoſe, oppoſite to the leaves;" an annual, growing cloſe to the ground; branches alternate, ſtreaked, pubeſcent; leaves ſoft, widening outwards; peduncles one-flowered, naked, ſtreaked, villoſe; flowers large, yellow, with a convex diſk. A native of the Eaſt Indies. Introduced in 1780, by M. Thouin. 43. A. *minima*, leaſt wormwood. Burm. Ind. i. t. 58. f. 3. centipeda orbicularis. Lour. 493. "Leaves wedge-ſhaped, repand; ſtem procumbent; flowers axillary ſeſſile." This is a very minute annual; leaves ſmooth; flowers very ſmall, axillary, ſolitary, with ſix or ſeven florets. A native of China, where it was found by Lagerſtrom, and alſo of Japan; introduced here by M. Thouin in 1788. 44. A. *littoralis*, Retz. Obſ. 5—28. n. 77. "Procumbent, ſtrigoſe; leaves ſpatulate, ſerrate-toothed; calyces naked, pedicelled." This reſembles the forty-ſecond ſpecies, but the whole plant except the calyces is covered with a downy or cottony ſubſtance. Gathered by Koenig in the Eaſt Indies, on the coaſt.

Medical Properties. Many of the ſpecies of artemiſia poſſeſs ſimilar ſenſible and medicinal qualities; but thoſe ſpecies which now have a place in the Materia Medica, are ſouthernwood, common wormwood, mugwort, ſea wormwood, and Tartarian ſouthernwood or wormſeed. The firſt has been eſteemed as a ſtomachic, carminative, and deobſtruent, and uſed more eſpecially for removing obſtructions in the uterine ſyſtem. But it is now rarely preſcribed unleſs as an ingredient in fomentations. Common wormwood is intenſely bitter, and is the moſt powerful medicine of the whole genus. Its qualities are ſtated by Bergius to be antiſeptic, antacid, anthelmintic, reſolvent, tonic, and ſtomachic. Though it is now chiefly employed in the two laſt mentioned characters, yet we are told of its good effects in a great variety of diſorders, as intermittent fevers, hypochondriacal affections, viſceral obſtructions, gout, gravel, ſcurvy, dropſy, worms, &c. With ſome it is ſaid to have a narcotic power, and to occaſion head-ache. It may be given in powder, but it is more commonly preferred in infuſion. The Edinburgh college directs a tincture of the flowers. Externally wormwood is uſed in diſcutient and antiſeptic fomentations. Mugwort was by the ancients thought to be very efficacious in promoting the uterine evacuation, and relieving hyſterical complaints, but it is now ſo little valued that

it has been expunged from the Materia Medica by the London college. A ſubſtance called *moxa* is prepared in Japan, from the dried tops and leaves of mugwort, by beating and rubbing them between the hands till only the fine lanuginous fibres remain, which are then combed and formed into little cones. Theſe uſed as cauteries, are greatly celebrated in eaſtern countries for preventing and curing many diſorders; but chronic rheumatiſms, gouty and ſome other painful local affections, ſeem to be the chief complaints for which the moxa can be rationally employed. Sea wormwood, by being leſs powerfully bitter, muſt be conſidered in a proportionate degree a leſs efficient medicine than the common; but as it is leſs diſagreeable to the ſtomach, it is more generally preſcribed; and a conſerve of the tops of this plant is directed in the London Pharmacopœia. Wormſeed is ſo called from the power of theſe ſeeds in deſtroying worms, for which their character has been long eſtabliſhed. The doſe is from one to two drams for an adult, twice a day. See Woodv. Med. Bot.

Propagation and Culture. Moſt of the plants of this numerous genus are hardy perennials, and may be increaſed without much difficulty by ſeeds, parting the roots, ſlips, or cuttings. The firſt ſpecies and a few others that are natives of very warm climates, and of courſe rather tender, muſt be placed in a green-houſe with myrtles, and other hardy exotics, which require a large ſhare of free air, in mild weather, when they ſhould be frequently watered. They love a light freſh ſoil, and may be propagated by ſlips, or cuttings. In general they will ſucceed in a ſhady border, defended from the froſt. See Martyn's Miller's Dict.

ARTEMISIUM, in *Ancient Geography*, a promontory of Eubœa, on the northern ſide of the iſland, above the town of Hiſtria, and oppoſite to the ancient Olyzon, and the Pegaſæan gulf. It had a temple conſecrated to Diana; and it was famous for the firſt victory gained by the Greeks over the fleet of Xerxes. This naval engagement happened on the ſame day with the glorious action at Thermopylæ. The Grecian fleet, conſiſting of 271 ſail, was ſtationed in the harbour; but that of the Perſians, which was much more numerous, had anchored in the road that extends between the city of Caſtanæa, and the promontory of Sepias on the coaſt of Theſſaly. The firſt line of their fleet was ſheltered by the coaſt of Theſſaly; but the ſhips of the other ſeven lines rode at anchor, with their prows turned towards the ſea. On the morning of the ſecond day after their arrival on the coaſt, and after their arrangement was made, there aroſe a dreadful ſtorm, which raged for three days, and which deſtroyed 400 of their galleys, beſides a great number of ſtore-ſhips and tranſports. However, 800 ſhips of war, together with many veſſels of burden, ſailed into the Pegaſæan bay, and anchored in the road of Apheté, which, at the diſtance of a few miles, lies directly oppoſite to the harbour of Artemiſium. The Grecians, who had poſted centinels on the heights of Eubœa, to watch the effects of the ſtorm and the motions of the enemy, upon receiving information of the diſaſter that had befallen the Perſian fleet, poured out a joyous libation, and ſacrificed with devout gratitude to "Neptune the Deliverer." The Perſians, notwithſtanding their loſs, were ſtill confident of victory; and detached 200 of their beſt-ſailing veſſels round the iſland of Eubœa, for the purpoſe of encompaſſing the Grecian fleet, and of preventing any of them from eſcaping through the narrow Euripus. After ſun-ſet the Grecian fleet approached in a line, and were met by the Perſians. At the firſt ſignal, the Greeks formed into a circle; and at the ſecond, began the engagement. Surrounded as they were by the enemy, and crouded into a narrow ſpace, they ſoon took 30 of their ſhips, and ſunk many more. When night came on, with a violent ſtorm of rain and thunder, the Greeks retired into the harbour of Artemiſium, and the enemy were driven to the coaſt of Theſſaly. The greateſt part of the Perſians fortunately eſcaped immediate deſtruction, and gained the Pegaſæan bay; but the ſhips that had been ordered to ſail round the iſland, were overtaken by the ſtorm at a conſiderable diſtance from the ſhore; and, unable to direct their courſe, they were under a neceſſity of contending with the ſtorm during the greateſt part of the night, and they were all wrecked amidſt the ſhoals and rocks of an unknown coaſt. With the dawn of morning the Perſians perceived the extent of their misfortunes: but the Greeks were ſeaſonably reinforced with a fleet of fifty-three Athenian ſhips. Thus aided and encouraged, they ſeized the advantage of the enſuing duſk of the evening, to renew their attack; and, at the appointed time, availing themſelves of their ſkill in fighting, and their knowledge of the coaſt, they ſailed towards the road of Aphete; and having cut off the Cilician ſquadron from the reſt, totally deſtroyed it; and at night returned to Artemiſium. The Perſians, enraged by the diſaſters and diſappointment they had experienced, and dreading the reſentment of their ſovereign, determined to make one other vigorous effort. As the Greeks had availed themſelves of the night, they determined to chooſe the time of action. Accordingly, on the third day at noon, they ſailed forth in the form of a creſcent, which they conceived to be ſtill of ſufficient extent to encloſe the Grecian line. The Greeks, emboldened by ſucceſs, were too confident to decline any offer of battle, though their admirals, and particularly Themiſtocles, would probably have preferred delaying it to a more favourable opportunity. The deficiency of ſkill and courage on the part of the barbarians was ſupplied by the impetuoſity and violence of indignation. The battle was protracted, and remained for a longer time doubtful than on any former occaſion: many Grecian veſſels were deſtroyed, five were taken by the Egyptians, who, on the ſide of the Perſians, diſtinguiſhed themſelves as much as the Athenians did on that of the Greeks. The perſevering valour of the latter at length prevailed; the enemy retired, and acknowledged their ſuperiority, by leaving them in poſſeſſion of the dead and the wrecks. However, the victory was dearly purchaſed; as their veſſels, and eſpecially thoſe of the Athenians, were much ſhattered; and their great inferiority in the number and ſize of their ſhips, made them more ſenſibly feel every diminution of ſtrength. The engagement at Artemiſium, though it was not abſolutely deciſive, contributed greatly to encourage the Athenians, who were now convinced, that the enemies, notwithſtanding their immenſe number, were not invincible. Gillies's Hiſt. of Greece. See ATHENS.

ARTEMISIUM, a town of Caria, ſituate in the eaſtern part of the gulf of Glaucus.—Alſo, a place in the iſland of Delos, Herodotus.—A place in the Peloponneſus, Polybius.—A town of Italy, in Magna Græcia, belonging to the Oenotrians; now *St.* AGATHA.—An iſland of Greece, between that of Eubœa and the promontory Sunium, Arrian.—A mountain of Peloponneſus, in Arcadia, near the river Ladon. Pauſanias mentions a mountain of this name, to which he refers the ſource of the river Inachus, and where was a temple of Diana.—A place of Sicily, where was the camp of Sextus Pompeius, Dion & Appian.—A fort of Greece, built by Juſtinian, at the mouth of the river Rechius or Regius.—A town on the eaſtern ſide of Spain, called alſo Dianium, and now Denia, on the ſea-coaſt of Valencia.

ARTEMISIUS, in *Ancient Chronology*, the name of a Grecian month, the ſeventh of the year among the Macedonians,

nians, in Aſia, at Epheſus, Pergamus, &c. among the Syro-macedonians, Tyrians, Sydonians, and Lycians. Among the Lacedæmonians and Corcyreans it was the ſecond month of the year, and correſponded nearly to our February.

ARTEMITA, in *Ancient Geography*, a ſmall iſle of the Ionian ſea, oppoſite to the mouth of the river Achelous.—Alſo, a large town of Aſia, in Meſopotamia, according to Pliny, but placed by Strabo in Babylonia, 500 ſtadia eaſt of Seleucia, on the banks of the lake Arſiſſa.—A town of Aſia, in the Greater Armenia.—A town of Aſia, in Arabia Deſerta. Ptolemy.

ARTEMIUS, a mountain of Peloponneſus. Pliny.

ARTEMON, or ARTEMAS, in *Biography*, the leader of an ancient ſect among the Chriſtians, and ſuppoſed by Tillemont to have ariſen about the year 200. Euſebius (E. H. l. v. c. 27, 28.), early in the fourth century, ſpeaks of him as the propagator of a hereſy, which Paul of Samoſata endeavoured to revive in his time. Artemas and his aſſociates, according to Theodoret, concurred with other Chriſtians in acknowledging the ſupreme deity, and owning him to be the creator of the univerſe. But they maintained, that Chriſt was a mere man, born of a virgin, and ſuperior in virtue to the prophets. This, he ſaid, was the doctrine of the apoſtles; and they alleged, that all the ancients, as well as the apoſtles themſelves, received and taught the ſame things which they now held; and that the truth of the goſpel had been preſerved till the time of Victor, the thirteenth biſhop of Rome; but by his ſucceſſor, Zephyrinus, the truth had been corrupted. They are accuſed, however, in a work cited by Euſebius, with corrupting the ſcriptures, and tranſcribing them with variations, which they called emendations, but which their enemies denominated corruptions. They are ſaid to have proceeded ſo far as to have rejected the law and the prophets. It was alſo charged upon Artemon and his followers, that they neglected the holy ſcriptures, ſtudied geometry, and admired Ariſtotle, and Theophraſtus, and Galen. From this account it appears, that whatever might be their error, they were men of inquiry and learning; and Dr. Lardner conjectures, they might join with the ſtudy of the ſcriptures that of mathematics and philoſophy. He alſo imagines, that the alterations or corruptions, which were the ſubjects of complaint, related merely to ſome Greek copies of the old teſtament, probably the ſeventy; and though he does not wholly excuſe theſe men, he thinks this conſideration may ſerve to leſſen the injury of their conduct. Lardner's Works, vol. ii. p. 379, and vol. ix. p. 465, &c. The followers of Artemon were called *Artemonites*.

ARTEMUS, in *Geography*, a cape of Spain, in Valencia, called alſo the "Cape of St. Martin," and the "Emperor's point."

ARTENA, in *Ancient Geography*, a town of Italy, in Etruria, in the teritory of the Ceritæ, mentioned by Livy, as deſtroyed by the kings of Rome.—Alſo, a town of Italy, in Latium, in the country of the Volſci; which was taken, ſays Livy, about the year of Rome 351, and totally raſed.

ARTENAY, in *Geography*, a town of France, in the department of the Loiret, and chief place of a canton in the diſtrict of Neuville, 11 miles north of Orleans.

ARTENNA, or AVIS DIOMEDEA, in *Ornithology*, a name given by Ray, Willughby, and other old writers, to the bird called by Linnæus PROCELLARIA PUFFINUS; which ſee.

ARTERN, in *Geography*, a town of Germany, in the circle of Upper Saxony, and county of Mansfeld, 29 miles N. N. E. of Erfurt. N. lat. 51° 17'. E. long. 11° 8'.

ARTERIA ASPERA, in *Anatomy*, the tube by which the air paſſes into and out of the lungs in reſpiration. It is alſo called the trachæa, and windpipe. See LUNGS.

ARTERIA *Venoſa*, a name given by the ancients to what we call the pulmonary vein, or that veſſel whereby the blood is conveyed from the lungs to the left ventricle of the heart. Gor. Def. Med. p. 54.

ARTERIACS, ARTERIACA, medicines proper for diſorders of the *trachæa*, and the voice. This term, ſays Dr. Cullen (Mat. Med. vol. i. p. 172.), conveys no preciſe meaning, and is therefore improper.

Arteriacs are reduced by Galen into three kinds: 1. Such as are void of all acrimony, ſerving to mollify the aſperities of the part; to which kind belong, gum tragacanth, *aſter famias*, *amylum*, or ſtarch, milk, &c. 2. Thoſe of an acrimonious quality, whereby they ſtimulate even the ſound parts; ſuch are honey, turpentines, bitter almonds, iris root, &c. 3. Thoſe of an intermediate kind, ſoft and mild, yet detergent; ſuch are butter, and divers preparations made of almonds, milk, honey, &c.

ARTERIOSA *Vena*, or *arterial vein*, a denomination given to the pulmonary artery, or that veſſel whereby the blood is conveyed from the right ventricle of the heart to the lungs.

ARTERIOSUS *Canalis* is the continuation of the trunk of the pulmonary artery of the fœtus into the aorta. See FOETUS, *Peculiarities in the Structure of*.

ARTERIOTOMY is a ſurgical operation, ſo denominated from αρτηρια, an artery, and τεμνω, I cut. It therefore ſignifies, the artificial ſection, or opening of an artery, for the purpoſe of evacuating blood. The advantages and diſadvantages of this operation, as well as the manner of performing it, are conſidered under the head of BLEEDING: where the ſubject of PHLEBOTOMY is likewiſe diſcuſſed at ſome length.
